## PREFACE

**F**OURTEEN years ago the present Editor wrote the preface to Volume I of the *Cyclopedia of American Horticulture*. The purpose of that work was "to make a complete record of the status of North American horticulture as it exists at the close of the nineteenth century;" it was the effort to include "all the species which are known to be in the horticultural trade," together with outlines of "the horticultural possibilities of the various states, territories and provinces," to present biographical sketches of eminent American horticulturists not then living, and in general to discuss the cultivation and handling of horticultural crops. In the preface to Volume IV of that work the Editor expressed the hope that the *Cyclopedia* would never be revised: "If new issues are called for, mere errors should be corrected; but beyond this, the plates should be left as they are," for it was the purpose of the book that it should stand as a measure of that time. The different volumes have been separately reprinted, but about eight complete re-issues of that *Cyclopedia* have been made, with such corrections of errors as have been reported; in one restricted edition, published by Doubleday, Page & Co., the same work was bound in six volumes, together with an enlarged preface and a key to the families and genera.

The present *Cyclopedia*, although founded on the former compilation, is a new work with an enlarged scope. While the older work will no longer be published, it nevertheless stands by itself; and the two should be quoted as independent cyclopedias. The geographical boundaries are wider in the present work, due to the fact that the United States and Canada have both acquired new tropical connections and interests in recent years. It has not been the effort to cover completely the horticultural floras of Porto Rico, Hawaii, and other islands, for that would involve the tropical flora of the globe; but it is the intention to include the most outstanding species grown in a horticultural way in those islands. A fuller treatment has also been given of the plants grown in southern Florida, southern California, and the other southernmost areas of the continental United States.

The treatment in the former *Cyclopedia* was confined closely to species in "the trade,"—to those plants "sold in the United States and Canada." The present work accepts this basis in general, for the lists of nurserymen, seedsmen, and fanciers indicate very closely the plants that actually are grown, and it would manifestly be impossible as well as undesirable to include all the plants that may be found in botanic gardens, or in the grounds of specialists and amateurs who collect specimens from original sources, or those introduced for purposes of experiment or test or only for scientific study; but "the trade" is interpreted more liberally in this work, to include the offerings of

many European dealers because those dealers supply American customers, to account for species mentioned prominently in European horticultural periodicals as well as in American periodicals, and to insert such plants as are known to be subjects of exchange or to be frequently in cultivation in any region, even though their names may not be found in a commercial list. While it is intended to account for all the species in the trade, it is not intended to name the garden varieties; for the variety lists change too rapidly for discussion in cyclopedic works. The mention of varieties in the leading group-articles is more a matter of record than of recommendation.

Care has been exercised to exclude species that are evidently not now of interest to horticulturists, even though their names may be found in the literature; for the introduction of many dead entries would not only violate the purpose to make a current record, but would make the books too voluminous and would confuse the student with too many names and details. It is desired that the treatment shall be contemporaneous, and that it shall be rescued as far as desirable from the older glasshouse method of transatlantic work. The Cyclopedia aims to account for the plants horticulturally grown within its territory which are now the subjects of living interest or likely to be introduced, to discuss the best practices in the growing of the staple flower and fruit and vegetable crops, to depict the horticultural capabilities of the states and provinces, to indicate the literature of the field, and incidentally to portray briefly the lives of the former men and women who have attained to a large or a national reputation in horticultural pursuits.

The method in the Cyclopedia, in other words, turns about two purposes,—the identification of species, and the cultivation of plants. Both are essential to an understanding of horticulture. The former lends itself readily to usual cyclopedic treatment; the latter expresses itself as a manual of practice. The combination produces an irregular literary product, but it is hoped that the result is not inharmonious.

The cultural details involve special difficulties. The North American continent presents so many conditions that advice for outdoor work cannot be too specific in a work of this kind without leading to serious mistakes. What is advised by a good grower in one place may be contradicted by a good grower in another place. Even in under-glass treatment, in which conditions are largely artificial, difficulties often arise in trying to apply in America the instructions given for European practice. It is not possible for one to grow plants by a book; in this work the cultural details are not directions so much as statements of standard practice: this practice will need to be considerably modified in many cases if the best result for special conditions or objects is to be secured. In the former Cyclopedia the culture was often presented by two persons of unlike experiences for the express purpose of meeting the needs of amateurs; but readers seem to think this to be confusing and the practice has not been followed in the present work. However, special effort has been made to secure the best cultural advice for the plants requiring peculiar or particular handling, and this advice will be found in the discussion of the different crops and plants under their respective heads

and in addition many practical class-articles have been prepared for the aid of the cultivator and designer. These class-articles are mostly as follows:

Alpine Plants	Cuttings	Greenhouse	Nuts
Annals	Design, Floral	Hedges	Orchids
Ants	Diseases and Insects	Herbs	Packages
Aquatics	Drainage	Horticulture	Palms
Arboretum	Dwarfing	Hotbeds and Coldframes	Perfumery-Gardening
Arboriculture	Evaporating Fruit	House-Plants	Pergolas
Autumn-Gardening	Evergreens	Inspection	Planting
Banks	Everlastings	Irrigation	Potting
Basket Plants	Exhibitions	Kitchen-Garden	Pruning
Bedding	Ferns	Labels	Railroad-Gardening
Bees	Fertilizers	Landscape-Gardening	Rock-Gardening
Biennials	Floriculture	Layers	Seeds and Seedage
Birds	Florists' Plants	Machinery and Implements	Storage
Border	Forcing	Manure	Transplanting
Botanic Garden	Forestry	Market-Gardening	Transportation
Bouquet	Frost	Marketing	Vegetable-Gardening
Bulbs	Fruit-growing	Muckland-Gardening	Walks, Drives and Path-
Conservatory	Fungi	Mushrooms	Watering [ways]
Culinary Herbs	Grafting	Nursery	Windbreaks
Cut-Flower Industry	Grasses	Nut-Culture	Window-Gardening

There is marked growth in outdoor horticulture in North America. The largest extension in the present Cyclopedia, so far as taxonomic work is concerned, is in the description of trees and shrubs. There is widespread interest in these subjects. We are beginning to realize our native resources in woody plants, to understand how to make use of our many climates and natural conditions; and to incorporate freely into our cultivated flora many of the trees and shrubs of China and other regions, under the stimulus of the Arnold Arboretum and other agencies. The resources of the Arboretum have been placed at the command of the Cyclopedia through the careful and original work of Alfred Rehder. Similar aids have been extended from other sources, and particularly from the Foreign Seed and Plant Introduction service of the United States Department of Agriculture.

While hardy plants and outdoor gardening seem to be increasing rapidly in favor, there is a decided tendency toward the breaking-up of large fanciers' collections, in private establishments, of old-time glasshouse plants. It is now quite impossible, for example, to find in this country any large private collections of the species of begonias or of the varieties of camellias or of the show pelargoniums; orchid collections of notable extent are few. The demand of the trade is for relatively few species, and the commercial collections are mostly concerned with a few stock kinds and florists' plants, together with a small addition of annual novelties, rather than with the former long lists of many separate and interesting species and varieties. Even private places, especially private greenhouses, are devoted very largely to cut-flowers and florists' plants. It is incumbent on a cyclopedia of this kind, however, to preserve the accounts of these begonias, orchids, palms, cacti, succulents, "stove plants," and others, even though many of them may be known to very few; and the Editor hopes that the amateur will regain his ascendancy and that collections of plants because they are plants may not perish from amongst us.

There has been great extension in recent years in commercial floriculture and in the

forcing of vegetables. We now think in terms of cropping under glass. The range of species of plants involved in these industries is relatively small, but the areas are large, the business is receiving the attention of able men and women, and the glasshouse industries are making important contributions to the lives of the people. The recent growth of the commercial fruit-growing industry is also notable. Once largely restricted to narrow regions and to "fruit belts," the growing of fruits for market has now assumed the proportions of a great industry comparable with the staple agricultural productions. An effort has been made to catch something of the spirit of all these large efforts, as well as to provide information and advice for the amateur and the home gardener.

When the *Cyclopedia of American Horticulture* was made, there were few specialists in the systematic botany of cultivated plants. The Editor hopes that the publication of that *Cyclopedia* has contributed something to the acceleration of interest in this long-overlooked subject. Howbeit, the number of competent specialists, and of those intelligently interested in the subject, is now large enough to have enabled the Editor to cover many of the important groups. The cacti have been placed mostly in the hands of J. N. Rose; a number of tropical plants have been handled anew by W. E. Safford; the orchids, aroids and bromeliads by George V. Nash; euphorbiads by J. B. S. Norton; Citrus and related genera by Walter T. Swingle; Nymphæaceæ by H. S. Conard; the ferns by R. C. Benedict; most grasses by A. S. Hitchcock; special groups by Norman Taylor, chiefly among the composites, palms, and tender araliads; suggestions on cultivated forms and on cultivation have been contributed by C. P. Raffill, of the tropical department, Kew; the survey of families of plants and most of the editorial work on the general introductory key have been in the hands of K. M. Wiegand; and many small groups and special genera have found new treatment by persons who have given them careful study over a considerable period of time. The results of modern scientific studies are now beginning to be positively reflected in the identification of garden plants, and in the advice for the cultivation and handling of horticultural crops and products. With so many persons partaking, it is of course impossible to secure uniformity of taxonomic handling in the various groups, but the gain of having the contributions of specialists will abundantly offset this small technical disadvantage.

And yet, it is true that very much of the work is necessarily compiled from literature rather than constructed from a direct study of the plants themselves. There is no herbarium or other complete and authentic repository of all the species of plants sold by dealers. The best that can be done in very many cases is to accept the name appearing in a catalogue and to attach to it the most authentic or most adaptable description of a recognized botanical species of the same name; there is no telling whether the dealers' plant is properly determined or whether it represents the botanical species bearing the same name. It is impossible now to know how many wrong determinations, inaccurate

and insufficient descriptions, and faulty judgments have been perpetuated from author to author through long series of years. All these matters must be worked out in years to come, when the horticultural plants in the various groups shall have been systematically studied with care. The Editor repeats the hope expressed in the preface written fourteen years ago "that every entry in this book will be worked over and improved within the next quarter century."

Many persons aside from the leading authors have contributed to the enterprise in the most helpful spirit. The Editor's daughter has borne much of the burden of the office and editorial detail. Gardeners, fruit-growers, florists, vegetable-growers, teachers and experimenters, botanists, and the printers, have responded with good fellowship and with something like patriotic pride. Their names will be recorded in the concluding volume; and the public that uses the book will reward them with its gratitude.

Nor should the institutions that have afforded all these persons the opportunities to make their contributions be overlooked. Aside from those agencies already mentioned, the *Cyclopedia* is under special obligation for the use directly or indirectly of books and collections to Cornell University, the United States Department of Agriculture, the New York Botanical Garden, the Brooklyn Botanic Garden, the Missouri Botanical Garden, the Gray Herbarium, the Royal Botanic Gardens, Kew, the agricultural colleges and experiment stations, and others. Seed merchants, nurserymen, and other commercial establishments of standing, have been very ready with suggestions and help.

Many new illustrations have been added, representing the work of several artists. Most of the new work has been made by B. F. Williamson, New York City; F. Schuyler Mathews, Cambridge, Mass.; Miss M. E. Eaton, of the New York Botanical Garden; Mrs. M. W. Gill, Washington; C. H. L. Gebfert, Boston; and Miss Matilda Smith, of the Royal Botanic Gardens, Kew, England, whose initials will be recognized on the plates of the famous *Botanical Magazine*. By permission of Professor Sargent, much of the accurate and beautiful work of C. E. Faxon and others in *Garden and Forest*, a journal that was discontinued more than fifteen years ago and is now out of the market, has been adapted and made available for the present reader; record is made in the text of the pictures of species, at the places where they are used. Some of the work in the old government surveys of the great West has also been brought to the use of the general public.

It is not wholly with satisfaction that one puts forth a work of this magnitude. The responsibility increases with the largeness of the enterprise, for users do not readily purchase new and corrected editions of a work of this extent. Every care has been taken to present an accurate and faithful account, and this is as far as the responsibility can extend. The Editor can not expect to make another *cyclopedia* of horticulture; but he hopes that these six volumes will comprise another step in the collecting, assorting and appraising of our horticultural knowledge.

L. H. BAILEY.

## PREFACE TO SECOND EDITION

**I**N THE five years that have intervened since the Standard Cyclopedia of Horticulture was completed and published, relatively little change has occurred in the general introduction of plants new to cultivation in North America. Many species have been disseminated in an experimental way, as by the Office of Foreign Seed and Plant Introduction of the United States Department of Agriculture, and other agencies, but for the most part they have not yet become a regular part of the commerce in horticultural plants although many of them promise important results. The extensive discoveries of E. H. Wilson, exploring in China and elsewhere for the Arnold Arboretum of Harvard University, are likely to add many riches to our horticulture as they become distributed and known. The unrecognized or improperly named species long in the country are probably many, and it is the part of investigators to uncover them. The introduction of plants from many parts of the world into Florida, southern Texas, California, and other mild regions newly settled has been rapid within the past generation, and the material has not been sufficiently studied. The cultivated flora as a whole is in need of careful exploration. The more than 27,000 Latin-named species and varieties admitted in the Cyclopedia comprise in themselves an extensive flora. How many of these things are now in active cultivation, what their adaptabilities may be, what satisfaction is gained in the growing of them, are problems awaiting the attention of thoughtful students.

If to this imperfectly known flora are added the probabilities of introductions in the future to supply the vast domain of the continent, together with the wide variations and the hybridizations likely to result, the imagination scarcely runs to the limits of the subject. In the marginal regions, as along northern and southern boundaries and in the developing semi-arid parts, great experiments are still to be made in the adaptability of plants, undoubtedly calling for the introduction of species yet strange to us. Species of the native flora are now regularly collected, grown, and introduced to the public, and many of these will probably yield important variations and changes in the future.

The lists of horticultural varieties of fruits, vegetables, and flowers undergo constant changes and fluctuations. Varieties are supplanted by new and often by better ones; fashions and demands change; the legitimate desire for novelty must be met. It is fortunate that the vegetable kingdom is plastic. As these horticultural varieties are often fugitive, and as their adaptation varies so widely in different parts of the country, they are purposely not treated in this Cyclopedia, as well as because the space at the

command of the volumes precludes such extended discussion. Yet, even if the varieties come and go, they are nevertheless one of the first concerns of the horticulturist, particularly in these days when it is so necessary to meet specific requirements of markets and connoisseurs. This knowledge of varieties is to be obtained as other current information is acquired, whether in horticulture, engineering, zoölogy, or medicine,—by means of the trade periodicals, publications of commercial firms and of institutions, correspondence, discussions in societies, and other kinds of alertness.

The special mark of the horticulture of this day is its strong commercial trend. This means that the demand is good for plants and their products. Floriculture, once the exclusive domain of amateurs, has now become a staple industry and a source of national wealth. The same is true of fruit-growing and other fields, although they developed earlier. The investigations of experiment-stations have supplied a base of fact and determinable knowledge on which to build and to protect these industries. Machines and many clever devices have aided their extension. The facilities for communication, transportation, storage, and distribution have aided them as they have assisted other activities. The publication of technical and trade journals tends always to standardize the industries and to make men resourceful. The commercial movement in horticulture tends to reduce the number of species and varieties, as compared with an unorganized amateur activity.

The amateur interest in horticulture preserves the species and the miscellaneous varieties, inasmuch as the plants are grown for the human interest in them. This amateur activity is large. Probably it is larger than ever before, although it may be distanced by the commercial activities and by the market movements. In fact, to a large extent, the amateur is the market. This is true of the trade in species and varieties of iris, peonies, gladioli, and others. By every means, the amateur spirit in horticulture is to be encouraged as a resource to the people and as one of the means of providing a satisfying background to life.

The first volume of this *Cyclopedia* was published in 1914 and the sixth in 1917. Those years saw considerable activity in the introduction of plants. These introductions, numbering 89 species and Latin-named varieties, are described in the addendum to Vol. VI, pages 3565–3573. This is much less than one-half of one per cent of the total number described in the *Cyclopedia*. In 1917, the United States entered the World War, and Canada was already in. We are not to expect so great activity in plant introduction in those fateful years. It would scarcely be worth while to revise the *Cyclopedia* throughout for the purpose of entering the novelties.

Attention should be called to the Finding-List, published as a supplement to Vol. VI, beginning page 3575. This list was made for the purpose of harmonizing current trade names with the botanical names in the *Cyclopedia*. It was compiled in coöperation with the American Joint Committee on Horticultural Nomenclature, representing the national horticultural associations of the country, and it was separately published by the Committee. The Finding-List is practically a current trade index

to the Cyclopedia, and it also includes a few changes in nomenclature. The user of the Cyclopedia should understand the significance of this List.

In the present issue of the Cyclopedia, certain typographical corrections have been made. It has not been thought necessary to introduce such changes in nomenclature as have resulted from new studies of certain genera by different authors, particularly as some of the changes are of doubtful significance in horticulture.

L. H. BAILEY.

# CONTENTS

## VOL. I

	Pages
A SYNOPSIS OF THE VEGETABLE KINGDOM . . . . .	1- 78
Index to the Synopsis . . . . .	78
KEY TO THE FAMILIES AND GENERA . . . . .	79-136
Index to the Key . . . . .	137-147
NAME-LIST: English equivalents of the Latin names of species . . . . .	148-159
GLOSSARY of usual botanical and horticultural technical words . . . . .	160-170
TEXT, A AND B . . . . .	171-602

## FULL-PAGE PLATES

	Facing page
I. The azalea walk, Magnolia, South Carolina (in color) . . . . .	<i>Frontispiece</i>
II. Vegetation areas.—Aquatic, marsh and upland floras, and showing the relation of farm lands . . . . .	18
III. Desert vegetation.—The giant cactus ( <i>Carnegiea gigantea</i> ); also bushes of <i>Opuntia fulgida</i> , and in the foreground the low fine growths of <i>Bigelovia Hartwegii</i> . . . . .	42
IV. Upland vegetation.—Trees on a wind-swept plateau . . . . .	79
V. <i>Anemone coronaria</i> , an old garden favorite . . . . .	171
VI. A good example of aquatic gardening, with water-lilies and Japanese iris . . . . .	230
VII. The flowers of the apple tree . . . . .	313
VIII. The York Imperial apple (in color) . . . . .	331
IX. Arboretum.—Plantation of American oaks at the Arnold Arboretum; <i>Solidago canadensis</i> underplanting . . . . .	352
X. Arboriculture.— <i>Picea pungens</i> , the Colorado blue spruce . . . . .	373
XI. Arboriculture.—A palm plantation, with <i>Corypha umbraculifera</i> in the foreground . . . . .	389
XII. Asparagus, variety Colossal . . . . .	412
XIII. Bean.—The bush lima (in color) . . . . .	460
XIV. Foliage begonias well grown in banks, with ferns and similar plants . . . . .	479
XV. The American blackberry.—The Agawam, about natural size . . . . .	510
XVI. Botanic garden.—The formal garden of the Johns Hopkins University . . . . .	523
XVII. The arrangement of bouquets . . . . .	534
XVIII. Canadian orchard development.—The tidewater country in Nova Scotia . . . . .	562
XIX. Canadian orchard development.—The bench lands of British Columbia . . . . .	575
XX. A border of hardy bulbs (in color) . . . . .	594

	Facing page
XXI. Cherry.—Specimen fruits of one of the heart cherries (in color) . . . . .	612
XXII. Carnations.—Types of the American winter-flowering varieties . . . . .	630
XXIII. <i>Cattleya Lawrenceana</i> . . . . .	686
XXIV. <i>Cælogyne cristata</i> , one of the popular and easily grown orchids . . . . .	710
XXV. Celery.—The cultivation under field conditions, at the hilling-up or banking stage (in color) . . . . .	724
XXVI. Sweet cherry in flower and fruit . . . . .	741
XXVII. Coconut in flower and fruit. Southern Florida. (Fla. Photo. Concern) . . . . .	773
XXVIII. Stowell Evergreen sweet corn . . . . .	803

XXX. Chrysanthemum.—Two of the florist's types (in color) . . . . .	861
XXXI. The White Spine cucumber . . . . .	901
XXXII. The Fay currant, one of the leading red varieties . . . . .	917
XXXIII. <i>Cycas circinalis</i> , the male plant. (Photograph by Henry Pittier) . . . . .	931
XXXIV. Dahlia.—Jeanne Charmet, one of the most beautiful Decorative dahlias (in color) . . . . .	953
XXXV. <i>Dendrobium superbum</i> as grown in the American tropics . . . . .	978
XXXVI. A border of dianthus and digitalis . . . . .	1009
XXXVII. <i>Dracæna Goldieana</i> , a "foliage plant" from tropical Africa . . . . .	1069
XXXVIII. The California poppy.— <i>Eschscholtzia californica</i> . . . . .	1120
XXXIX. <i>Eucalyptus viminalis</i> in California . . . . .	1148

# EXPLANATIONS

The main account of each genus, in large type and separate paragraph for each species, represents the plants probably now in cultivation or at least of major importance.

The "supplementary lists" in smaller type at the end of the articles include names of plants not known to be in the trade but which may be mentioned in horticultural literature, and also such Latin-form names of the trade as are imperfectly understood and cannot be placed under their proper species. These parts are less critical finding-lists of other or extra species.

The Cyclopedia undertakes to account for the species in cultivation within its territory to the close of the year 1912; but in practice the introductions are included to the date of the closing of the different pages.

The size-marks on the illustrations, as ( $\times \frac{1}{3}$ ), indicate the amount of reduction as compared with natural size, this scale being determined merely by measuring the flat diameter of a drawing and not representing bulk or perspective.

## AUTHORSHIP

The practice of the Cyclopedia of American Horticulture in signing the leading and most important articles with the name of the author is here retained. The original author, so far as living or as he has desired, has revised or rewritten his articles for the present work. In very many cases, another person has now revised the articles, and the name of the reviser is indicated by a dagger (†). If the revision has amounted practically to a complete rewriting of the article, the original author's name may not appear, even though some small parts or features of the original article may be retained; this is for the purpose of safeguarding the original author as well as recognizing the work of the present author: the first Cyclopedia stands as the record of its own work.

A name in parentheses, as "(G. W. Oliver)," at the close of a paragraph, indicates that the person is the author of that particular paragraph and of no other in the article. When a person is responsible for more than one paragraph in an article, his part is set off by a separate heading in such a way that it cannot be mistaken.

It is desired to secure experts and specialists for the articles; when this has not been accomplished, the task of revision has fallen to the Editor.

Effort has been made to bring the different parts of the work into as much uniformity of plan and treatment as is possible in an undertaking of this kind; references have been compared; proofs have been submitted to two or more persons in case of difficult or doubtful sub-

jects; and the advice as to cultivation has been checked by practical growers.

## NOMENCLATURE

The nomenclature follows in the main the regulations of the "Vienna code," being the principles adopted by the International Botanical Congress held in Vienna in 1905. This code was adopted by the International Horticultural Congress held at Brussels in 1910, with adaptations to horticultural practice. When no combination has yet been made under the Vienna code, the prevailing usage for the particular genus (as expressed in latest monographs) is followed. That is, there is no attempt to reduce all names to one system except so far as combinations have already been made under the international rules, both because a cyclopedia of horticulture is hardly the place in which to make original combinations (except incidentally), and because there is little likelihood that any of the formal systems will have permanency. The subject of nomenclature, and the attitude of the Editor, will be discussed under "Names and Nomenclature" in Vol. IV. Botanical names should not be changed lightly, or for the purpose of regularizing any particular scheme or plan, or to make them always conform to an arbitrary set of rules. Botanical names do not belong to botanists, to do with them as they will. The public has good rights in these names; and this is particularly true in the names of cultivated plants, for they may then have standardized commercial value. The only stability, of course, is usage; and usage can rarely be forced into hard-and-fast regulations. In this Cyclopedia, the interest is in stability of names rather than in priority of names; therefore it accepts the principle of the "nomina conservanda" of the Vienna code, so far as it retains generic names that have been established in general usage for fifty years following their publication, even though the particular names in that list may not have been adopted in every instance.

Not all the changes in names arise from the application of rules of nomenclature. Many of them are the results of taxonomic studies, which make new definitions for genera and species. In this Cyclopedia, there are marked examples of such changes in the citrus genera, in the cacti, and other groups. These changes are to be expected as a result of closer studies of the various groups, of accumulation of specimens from many regions, and the progressive modification of views as to the constitution of genera and species; they are expressions of a living botany. Such changes will be particularly demanded in horticultural plants, for most of these groups have not yet been studied with critical care.

## PRONUNCIATION

Attention is called to the fact that the names of genera and species in this work are marked to indicate the accepted pronunciation. The indications are accent marks placed over a vowel. The accent designates (1) stress, or the emphatic syllable, and (2) the length of the emphatic vowel. Following the American custom, as established by Gray and others, a grave accent (`) is employed to designate a long vowel, and an acute accent (´) a short vowel.

Thus *officinále* is pronounced offici-nay-li; *micro-cárpus* is pronounced micro-cár-pus. It should be remembered that the final *e* terminates a separate syllable, as *commù-ne*, *vulgà-re*, *gran'-de*. This final *e* takes the short sound of *i*, as in *whip*.

Ordinarily in diphthongs the mark is placed over the second letter. Thus, in *aùrea* the *au* is meant to have its customary long sound, as if written *awe*. In *eù-it* has practically the long sound of *u*, as in *Pseùdo-Quina*, *Pseùd-Acácia*. Double vowels take their customary English sounds, as *ee* and *oo*. Thus, the *oo* in *Hoòkeri* is to be pronounced as in *hook*. In most cases, the letters *oi* (from the Greek, meaning *like to*) are to be pronounced separately: if the *i* is the penultimate syllable (next to the last), it is long, as in *yuccòi-des*; if the *i* is the antepenultimate syllable (third from the end), it is short, as in *rhombòi-dea*. In *diòicus* and *monoicus*, however, the *oi* is a true diphthong, as in *moist*.

These pronunciations follow, in general, the common English method of pronouncing Latin names. However, many of the Latinized forms of substantive and personal names are so unlike Latin in general construction that the pronunciation of them may not follow the rule. As a matter of fact, biological nomenclature is a language of itself thrown into a Latin form, and it should not be a source of regret if it does not closely follow classical rules in its pronunciation of outlying or non-Latin names.

It has seemed best to make an exception to strict literary rules in the case of personal commemorative names in the genitive: we retain, so far as possible, the pronunciation of the original name. Thus, a plant named for Carey is called *Cà-reyi*, not *Carèy-i*; for Sprenger, *Spréng-eri*, not *Sprengèr-i*; for Forbes, *Forbs'-ii*, not *Forbès-ii*. It cannot be expected that uniform consistency has been attained in this matter. It is not always known how the person pronounced his name; and many personal names do not make conformable Latinized words. No arbitrary method of pronouncing personal names is likely to be satisfactory.

It may be well to add what are understood to be the long and short sounds of the vowels:

â as in <i>cane</i> .	ô as in <i>cone</i> .
á as in <i>can</i> .	ó as in <i>con</i> .
è as in <i>mete</i> .	ù as in <i>jute</i> .
é as in <i>met</i> .	ú as in <i>jut</i> .
í as in <i>pine</i> .	
î as in <i>pín</i> .	
y is often used as a vowel instead of i.	

## SPELLING

The original spelling of generic and specific names is preferred; that is, the spelling used by the person who made the name. In some cases this original orthography does not conform to the etymology of the name, particularly if the name is made from that of a person. Such a case is *Diervilla*, named for Diereville. Ideally, the name should be spelled *Dierevillea*, but Tournefort and Linnæus did not so spell it.

In accordance with the best authorities, the digraph *æ* is used in the words *cærulea*, *cærulescens*, *cæspitosa*, *cæsia*; *œ* is used in *cœlestis* and *cœlestinum*.

The type ligatures *æ* and *œ* have been dropped from Latin-made names that have come into the vernacular. Thus, as a common or English name, *Spiræa* becomes *spirea*, *Pæonia* becomes *peonia* or *peony*, *Brodiaëa* becomes *brodiaea*, *Cratægus* becomes *crategus*.

## THE KEYS

There are two groups of keys in the Cyclopedia,—the main key, in Vol. I, to leading families and genera, and the keys to the species in the different genera in all the volumes. The user of the Cyclopedia should forthwith familiarize the method of the keys. Page 79.

To facilitate the study of the plants, the species have been arranged systematically or horticulturally, under the genus, rather than alphabetically; and in large or complex genera, an alphabetical index has been supplied for rapid reference. The grouping of the species is founded preferably on horticultural rather than on botanical characters, so that the arrangement does not always express botanical relationships.

The species-keys are arranged primarily to aid the gardener in making determinations. Every effort is made sharply to contrast the species rather than to describe them. A word of explanation will facilitate the use of the keys. The species are arranged in coördinate groups of various ranks, and groups of equal rank are marked by the same letter. Thus, group *A* is coördinate with *AA* and with *AAA*, and group *B* with *BB* and *BBB*; and the *B* groups are subordinate to the *A* groups, and the *c* groups to the *B* groups, and so on. Moreover, whenever possible, the coördinate keys begin with the same catchword: thus, if *A* begins "flowers," so do *AA* and *AAA*; and this catchword is not used for keys of other rank. As an example, refer to *Abutilon*, page 177. Look first at *A*, beginning "Lvs.," then at *AA*, also beginning "Lvs." Under *AA* are the coördinate divisions *B* and *BB*, each with "Foliage" for the catchword. Under *B* there are no subdivisions, but under *BB* there are divisions *c* and *cc*, each with "Fls." for a catchword. Under *c* there are no subdivisions, but *cc* has two coördinate divisions, *D*, *DD*, each with "Blossoms" for a catchword. Again, *D* happens to have no division, but *DD* has the divisions *E* and *EE* with "Lf.-blades" as the catchword. In other words, if the plant in hand does not fall under *A*, the inquirer goes at once to *AA*. If it falls under *AA*, then he determines whether it belongs to *B* or to *BB*, and so on.

A display of a scheme would stand as follows:

- A. Leaves, etc.
    - B. Flowers, etc.
      - c. Fruits, etc.
        - d. Pods, etc.
        - dd. Pods, etc.
          - E. Seeds, etc.
          - EE. Seeds, etc.
    - cc. Fruits, etc.
  - BB. Flowers, etc.
- AA. Leaves, etc.
- B. Roots, etc.
    - c. Flowers, etc.
      - d. Margins of leaves, etc.
      - dd. Margins of leaves, etc.
    - cc. Flowers, etc.
  - BB. Roots, etc.
  - BBB. Roots, etc.
- AAA. Leaves, etc.

When the genus is large or the treatment is complicated, the key may be placed separately at the beginning rather than to be divided among the paragraphs; this allows the student to see the entire scheme or plan at once. See Acer, page 196.

## ABBREVIATIONS OF BOTANICAL TERMS AND GENERAL EXPRESSIONS

[illegible]

## BOOKS AND PERIODICALS

To aid the student in the verification of the work, and to introduce him to the literature of the various subjects, citations are made to the portraits of plants in the leading periodicals to which the American referrer is most likely to have access. These references to pictures have been verified, as far as possible, both in the MS. and in the proof. A uniform and regular form of citation is much to be desired, but is extremely difficult to secure because periodicals rarely agree in methods. It was decided to omit the year in most cases, because of the pressure for space, but the student who lacks access to the original volumes may usually ascertain the year by consulting the bibliographical notes below.

An arbitrary and brief method of citation has been chosen. At the outset it seemed best to indicate whether the cited picture is colored or not. This accounts for the two ways of citing certain publications containing both kinds of pictures, as *The Garden*, *Revue Horticole*, and *Gartenflora*. The figures given below explain the method of citation, and incidentally give some hints as to the number of volumes to date, and of the number of pages or plates in one of the latest volumes.

Standard works on the bibliography of botany are Pritzels's "Thesaurus" and Jackson's "Guide to the Literature of Botany;" also, Jackson's "Catalogue of the Library of the Royal Botanic Gardens, Kew." Rehder's "Bradley Bibliography," a guide to the literature of the woody plants of the world, is invaluable. The Catalogue of the Library of the Arnold Arboretum, Harvard University, now being printed, will afford an excellent guide to the literature of botany, particularly as it relates to woody plants.

- A.F. . . . The American Florist. Chicago. A trade paper founded August 15, 1885. The volumes end with July. Many pictures repeated in "Gng." (14:1524=vol. and page.)
- A.G. . . . American Gardening. New York. Represents 14 extinct horticultural periodicals, including The American Garden (1888-1890). (20:896=vol. and page.)
- B. . . . The Botanist. Edited by Maund. No years on title pages. Founded 1839. Eight vols., 50 colored plates in each vol. (8:400=vol. and col. plate.) Cumulative index.
- B.B. . . . Britton & Brown. An Illustrated Flora of the Northern U. S., etc. New York, 1896-98. Ed. 2 in 1913. (3:588=vol. and page of ed. 1; (ed. 2) 3:=vol. and page of ed. 2).
- B.H. . . . La Belgique Horticole. Ghent. 35 vols. (1851-1885).
- B.M. . . . Curtis' Botanical Magazine. London. Founded 1787. The oldest current periodical devoted to garden plants. The vol. for 1912 is vol. 138 of the whole work. Index to first 107 vols. by E. Tonks. London. (7690=col. plate.)
- B.R. . . . Botanical Register (1815-1847). Vols. 1-14 edited by Edwards; vols. 15-33 by Lindley. In vols. 1-23 the plates are numbered from 1-1014. In vols. 24-33 they are numbered independently in each vol. There are 688 plates in vols. 24-33. "An Appendix to the First Twenty-three Volumes" (bound separately or with the 25th vol.) contains an index to the first 23 vols. An index to vols. 24-31 may be found in vol. 31. (1198=col. plate. 33:70=vol. and col. plate.)

- B.S.D. . . Bulletin de la Société dendrologique de France Paris. Founded 1906. One vol. each year. Illustrated. (1907:198=year and page.)
- B.T. . . . Britton. North American trees. New York. 1908. All American trees illustrated.
- C.L.A. . . Country Life in America. Founded Nov. 1901. Two volumes a year. (12:75=vol. and page.)
- C.O. . . . Cogniaux. Dictionnaire Iconographique des Orchidées. Colored plates, with descriptions. (6=col. plate.)
- Em. . . . Emerson, G. B. Trees and Shrubs of Massachusetts. Boston. 2 vols. 149 plates.
- F. . . . . The Florist. London. 1840-1884. (1884:192=year and page opp. col. plate.) Editors and title pages changed many times. Known as the Florist, Florist's Journal and Florist and Pomologist. Sometimes improperly called British Florist.
- F.C. . . . Floral Cabinet Knowles & Westcott. London. 1837-1840. 3 vols., 4to.
- F.E. . . . The Florists' Exchange. New York. A trade paper, whose pictures sometimes are repeated in "A. G." Founded Dec. 8, 1888. (11:1298=vol. and page.)
- F.M. . . . Floral Magazine. London. Series I. 1861-1871. 8vo. Series II. 1872-1881, 4to. (1881:450=year and col. plate.)
- F.R. . . . Florists' Review. Chicago. A trade paper. Vol. 1, Dec. 2, 1897, to May 26, 1898. Two vols. a year (4:660=vol. and page.)
- F.S. . . . Flore des Serres. Ghent. (1845-1880.) Inconsistent in numbering, but the plate numbers are always found on the plate itself or on the page opposite. Valuable but perplexing indexes in vols. 15 and 19. 23 vols. (23:2481=vol. and col. plate.)
- F.S.R. . . Flora and Sylva. London. 1903-1905. Edited by W. Robinson. 3 vols. (2:24=vol. and page opposite colored plate. 2, p. 31=vol. and page containing black figure.)
- F.W. . . . The Floral World and Garden Guide. London. Edited by Shirley Hibberd. 1858-1880. No plates until 1868. (1875:33=year and col. plate.)
- G. . . . . Gardening, Illustrated. London. Founded March 1, 1880. Vols. begin with the March number. (10:25=vol. and page.)
- G.C. . . . The Gardeners' Chronicle. London. Series I. (1841-1873) is cited by year and page. Series II or "New Series" (1874-1886), is cited thus: II. 26:824=series, volume and page. Series III is cited thus: III. 26:416. Two vols. a year, beginning 1874. A select index is scattered through 1879 and 1880. Consult II. 12:viii (1879), and similar places in subsequent vols.
- G.F. . . . Garden and Forest. New York. 1888-1897. (10:518=vol. and page.)
- G.L. . . . Garden Life. London. Incorporates The Gardening World after May 1, 1909. Cited only from vol. 16. (16:54=vol. and page.)
- G.M. . . . Gardeners' Magazine. London. Ed. by Shirley Hibberd. Founded 1860. Cited from vol. 31 on. (42:872=vol. and page.)
- Gn. . . . . The Garden. London. Founded 1871. Two vols. a year through 1906. Since then one vol. (56:458=vol. and page opp. col. plate. 56, p. 458=vol. and page containing black figure.) An Index of the first 20 vols. was separately published. Complete Index of Colored Plates to end of 1897 in vol. 54, p. 334.
- Gng. . . . Gardening. Chicago. Founded Sept. 15, 1892. Vols. end Sept. 1. (7:384=vol. and page.)
- Gn. M. . . The Garden Magazine. Garden City, N. Y. Founded 1905. (7:543=vol. and page.)
- Gn. W. . . Gardening World. Founded 1884. Incorporated after 1909 in Garden Life. (7:118=vol. and page.)
- G.O.H. . . Guimpel, Otto & Hayne. Abbildungen der fremden in Deutschland ausdauernden Holzarten. Berlin, 1825. 144 col. plates.
- Gt. . . . . Gartenflora. Berlin. Founded 1852. (Gt. 48:1470=vol. and col. plate. Gt. 48, p. 670=vol. and page containing black figure.)
- G.W. . . . Die Gartenwelt. Founded 1896. The first year it appeared under the title "Hesdörfers Monatshefte für Blumen- und Gartenfreunde." (13:58=vol. and col. plate. 13, p. 58=vol. and page.)
- G.W.H. . . Guimpel, Willdenow and Hayne. Abbildung der deutscher Holzarten. 2 vols. Berlin 1815-20. 216 col. plates.
- G.Z. . . . Illustrierte Garten-Zeitung. Founded Oct. 1856. One col. plate in each month. (4:88=vol. and col. plate.)
- HBK. . . . Hurnboldt, Bonpland & Kunth. Nova Genera et Species, etc. Paris. 1815-25. 7 vols. Folio.
- H.E. . . . Hooker, Exotic Flora. London, 1823-7. 232 col. plates.
- H.F. . . . L' Horticulteur Français. 1st. series 1851-1859. 2nd series 1859-1872. (1853:273=1st. series, year and col. plate. II. 1860:381=2nd. series, year and col. plate.)
- H.H. . . . Hough, Handbook of Trees of the Northern States and Canada. Lowville, N. Y. 1907. All trees of the region illustrated; all parts of the trees, including bark represented by photographic reproductions.
- H.I. . . . Hooker's Icones Plantarum. London. Founded in 1837. Contains up to 1913 3,000 black plates in 30 vols. The plates with botanical descriptions in Latin.
- H.U. . . . J. Horticulteur Universel. Paris. 1839-1845. 8 vols. with col. plates. The first 6 vols. edited by C. Lemaire. Vol. 7 and 8 called Deuxième and Nouvelle série (7:28=vol. and plate.)
- H.W. . . . Hempel and Wilhelm. Bäume und Sträucher des Waldes. Wien, 1889-99. 3 vols. 60 beautiful col. plates and numerous black illustrations in the text (3:45=vol. and col. plate; 3, p. 113=vol. and page containing black figure.)
- I.H. . . . L' Illustration Horticole. Ghent. (1854-1896.) (43:72=vol. and col. plate.) The volumes were numbered continuously, but there were 6 series. Series I=1854-63. Series II=1864-9. Series III=1870-80. Series IV=1881-6. Series V=1887-93. Series VI=1894-6. The plates were numbered continuously in the first 16 vols. from 1 to 614. in vols. 17-33 they run from 1 to 619; in series V from 1 to 190; in Series VI they begin anew with each vol. Valuable indexes in vols. 10 and 20. Series V in 4to, the rest 8vo.
- I.T. . . . Icones Selectæ Horti Thenensis. Bruxelles, 1899-1909. 6 vols. with 240 plates. (6:220=vol. and black plate.)
- J. . . . . Jardin; journal bi-mensuel d'horticulture générale. Paris. Founded in 1887. (10:36=vol. and page opp. col. plate; 10, p. 345=vol. and page containing black figure.)
- J.C.T. . . Journal of the College of Science, Imperial University. Tokyo, Japan. Founded in 1886; 33 vols. up to 1913. Contains black plates and figures in the text of plants of E. Asia. (6:3=vol. and plate.)
- J.F. . . . Le Jardin Fleuriste. Ghent. 1851-1854. Edited by C. Lemaire. 4 vols. with 430 col. plates and black figures in the text. (4:421=vol. and col. plate; 4, p. 66=vol. and page containing black figure.)
- J.H. . . . Journal of Horticulture. London. Founded in 1848 as The Cottage Gardener. Series III only is cited, beginning 1880. (III. 39:504=series, vol., page.)
- J.H.F. . . Journal de la Société d'horticulture de France. Paris. Founded in 1827 as Annales et Journal de la Société roy. d'horticulture de Paris. Only series IV is cited, beginning 1900. (IV 1:209=series, vol. and page containing black figure.)

- J.H.S.** . . . *Journal of the Horticultural Society of London*. Founded in 1846. 9 vols. from 1846-55. A new series started in 1866. The earlier series is cited by the year, the new series by the volume (1846:188=year, page opposite plate; 28:394, fig. 96=vol., page opposite black plate or containing black figure, and fig. in case of several figures.)
- L.B.C.** . . . *The Botanical Cabinet*. Loddiges. 1817-33. 100 plates in each vol. Complete index in last vol. (20:2000=vol. and col. plate.)
- L.D.** . . . *Loiseleur-Deslongschamps, Herbar général de l'amateur*. Paris, 1816-27. 8 vols. with 574 col. plates. There is a second series, 1839-44 in 4 vols. with 309 plates which is very rare and not quoted.
- L.I.** . . . . *Lavallée, Arboretum Segrezianum; Icones selectae*. Paris, 1880-5. 36 black plates of trees and shrubs.
- Lind.** . . . *Lindenia*. Ghent. Founded 1885. Folio. Devoted to orchids.
- Lowe.** . . . *Beautiful Leaved Plants*. E. J. Lowe and Howard. London. 1864. (60=col. plate.)
- M.** . . . . *A. B. Freeman-Mitford. The Bamboo Garden*. London. 1896. (224=page.)
- M.D.** . . . *Mitteilungen der Deutschen dendrologischen Gesellschaft*. Bonn. Founded in 1892. (1912, p. 161=year and page containing black figure; 1910:1=year and page opp. col. plate.)
- M.D.G.** . . *Möller's Deutsche Gärtner-Zeitung*. Erfurt. Founded 1886. (1897:425=year and page.)
- Mn.** . . . . *Meehan's Monthly*. Germantown, Philadelphia. Founded 1891. (9:192=vol. and page opp. col. plate.)
- Mn.N.** . . *Meehan. The Native Flowers and Ferns of the United States*. Philadelphia. 1878-80. 4 vols. in 2 series (II. 2:3=series, vol. and plate.)
- Mx.** . . . . *Michaux. Histoire des arbres forestiers de l'Amérique septentrionale*. Paris, 1810-13. 3 vols. with 138 plates. The English translation under the title *The North American Sylva* has 156 plates. (3:4=vol. and plate.)
- N.D.** . . . *Nouveau Duhamel. Traité des arbres et arbustes*. Paris, 1801-19. 7 vols. with 488 col. plates. The first edition by Duhamel du Monceau was published in 1755 and contains only 250 black plates; the second edition was edited by several botanists and is really an entirely new work. (7:33=vol. and plate.)
- O.** . . . . *Orchis. Beilage zur Gartenflora*. (1910:88=year and col. plate. 1910, p. 88=year and page.)
- O.R.** . . . *Orchid Review*. London. Founded 1893. (18:169=vol. and plate.)
- P.G.** . . . *Popular Gardening*. Buffalo. 1885-90. (5:270=vol. and page.)
- P.M.** . . . *Paxton's Magazine of Botany*. London. 1834-49. (16:376=vol. and page opposite col. plate.) Vol. 15 has index of first 15 vols.
- R.** . . . . *Reichenbachia*. Edited by Fred. Sander. London. Founded 1886. Folio.
- R.B.** . . . *Revue de l'Horticulture Belge et Etrangère*. Ghent. Founded 1875. (23:288=vol. and page opp. col. plate.)
- R.F.G.** . . *Reichenbach. Icones Florae Germanicae et Helveticae*. Leipzig. Founded in 1834. 25 vols. with more than 3,000 col. plates issued up to 1913.
- R.H.** . . . *Revue Horticole*. Dates from 1826, but is now considered to have been founded in 1829. (1899:596=year and page opp. col. plate. 1899, p. 596=year and page opp. black figure.)
- S** . . . . . *Schneider. The Book of Choice Ferns*. London. In 3 vols. Vol. 1, 1892. Vol. 2, 1893. Vol. 3, 1894. (1:390=vol. and page.)
- S.E.B.** . . *Sowerby, English Botany*. Ed. 3. London, 1863-1902. 13 vols. with 1952 plates. The first edition was published 1790-1814 in 36 vols. Only the third edition is quoted.
- S.H.** . . . *Semaine Horticole*. Ghent. Founded 1897. (3:548=vol. and page.)
- S.I.F.** . . . *Shirasawa. Iconographie des essences forestières du Japon*. Tokyo. 1900-8. 2 vols. with 161 col. plates. (2:73=vol. and plate.)
- S.M.** . . . *Sargent. Manual of the Trees of North America*. Boston and New York, 1905. (810=page containing black figure.)
- S.O.B.** . . *Schmidt. Oesterreich's allgemeine Baumzucht*. Wien, 1792-1822. 4 vols. with 240 col. plates. (4:237=vol. and plate.)
- S.S.** . . . . *Sargent. The Silva of North America*. 13 vols. Vol. 1, 1891. Vol. 12, 1898. (12:620=vol. and plate, not colored.)
- S.T.S.** . . . *Sargent. Trees and Shrubs*. Boston and New York, 1902-13. 2 vols. 200 black plates of trees and shrubs, native and foreign. (2:147=vol. and plate.)
- S.Z.** . . . . *Siebold & Zuccarini. Flora Japonica*. Vol. 1, 1835-44. Vol. 2 partly by Miquel, 1845-70. (2:150=vol. and plate.)
- V.** . . . . . *Vick's Magazine*. Rochester, N. Y. Founded 1878. Vols. numbered continuously through the 3 series. Vols. begin with Nov. (23:250=vol. and page.)
- V.F.** . . . *Vilmorin & Bois. Fruticetum Vilmorinianum*. Paris, 1904. (205=page containing black figure.)
- V.O.** . . . *James Veitch & Sons. A Manual of Orchidaceous Plants, cultivated under glass in Great Britain*. London. 1887-94.
- W.D.B.** . . *Watson, Dendrologia Britannica*. London, 1825. 2 vols. with 172 col. plates (2:160=vol. and plate.)

## THE AUTHORS OF BOTANICAL NAMES

By common consent, the Latin name of a plant, in order to be considered by botanists, must first be regularly published by a reputable author in a reputable book or periodical. As an index to this name, the name of its author is published with it whenever an accurate account of the species is given. Thus, "*Berberis aristata*, DC." (p. 490) means that this name was made by De Candolle. This citation at once distinguishes De Candolle's *Berberis aristata* from any other *Berberis aristata*,—for example, from Sims' (p. 492). It is always possible that some other author may have given the same name to some other plant, in which case the older name must stand. In some cases, the fact that there are two plants passing under one name is indicated in the citation: "*Berberis sinensis*, Hemsl., not Poir." (p. 490, nos. 10, 11) means that Hemsley and Poirer applied the name *B. sinensis* to different plants. *B. ilicifolia*, Forst., is not the same as *B. ilicifolia*, Hort. (p. 492, nos. 27, 31); "Hort." means that the particular name is one in use amongst horticulturists,—that it is a garden name.

The citation of authorities gives a clue to the time and place of publication of the species. It is an index to the literature of the subject. It is no part of the idea merely to give credit or honor to the man who made the name. It is held by some that the authority is an integral part of the name, and should always go with it; but common usage dictates otherwise, for the authority is never pronounced with the Latin words in common speech. The authority is a matter of identification, not of language.

Following are the authors most frequently cited in this Cyclopaedia:

- ADANS. Michael Adanson, 1727–1806. France.  
 AIT. William Aiton, 1731–1793. England.  
 AIT. f. William Townsend Aiton, the son, 1766–1849. England.  
 ALL. Carlo Allioni, 1725–1804. Italy.  
 ANDERS., T. Thomas Anderson, Director of Botanic Garden in Calcutta.  
 ANDR. Henry C. Andrews, botanical artist and engraver, conducted The Botanists' Repository from 1799–1811, and illustrated books on heaths, geraniums and roses.  
 ANDR. Edward André, 1840–1911, first editor of *Illustration Horticole*, later editor-in-chief of *Revue Horticole*.  
 ANT. FRANZ Antoine, director of the royal gardens at Schönbrunn, 1815.  
 ARN. George Arnold Walker Arnott, 1799–1868. Scotland.  
 ASCHERS. Paul Ascherson, professor of botany, Berlin. 1834–1913.  
 AUBL. J. B. C. F. Aublet, 1720–1778. France.  
 AUCT., AUTH. Authors; referring to usage by various or many writers.  
 BACKH. J. Backhous, English botanist and traveler.  
 BAILL. H. Baillon, author of the great natural history of plants in French.  
 BAKER. John Gilbert Baker, formerly keeper of the Herbarium of the Royal Gardens, Kew, England.  
 BALT. Charles Baltet, frequent contributor to *Revue Horticole*.  
 BART. William P. C. Barton, 1787–1856. Pennsylvania.  
 BARTR. William Bartram, 1739–1823. American botanist.  
 BATEM. James Bateman, writer and student of orchids. England.  
 BEAUV. Ambroise Marie François Joseph Palisot de Beauvois, 1755–1820. France.  
 BECC. O. Beccari, Italian botanist and writer on E. Indian botany.  
 BECK. Lewis C. Beck, 1798–1853. New York.  
 BEISSN. L. Beissner, Inspector of the Botanic Gardens at Bonn, and Instructor at Poppelsdorf. Pub. "Handbuch der Nadelholzkunde."  
 BENTH. George Bentham, 1800–1884, one of the distinguished botanists of England; one of the authors of Bentham & Hooker's "Genera Plantarum."  
 BENTH. & HOOK. George Bentham and J. D. Hooker authors of "Genera Plantarum." England.  
 BERGER. Ernst Berger, died 1853. Germany.  
 BERNH. Johann Jacob Bernhardi, 1774–1850. Germany.  
 BERT. Carlo Guiseppe Bertero, 1789–1831. Died between Tahite and Chile.  
 BIEB. Friedrich August Marschall von Bierberstein, 1768–1826. German botanist; lived later in Russia.  
 BIGEL. Jacob Bigelow, 1787–1879. Massachusetts.  
 BLUME. Karl Ludwig Blume, born 1796 at Braunschweig, died 1862 at Leyden. Wrote much on Javan plants.  
 BOIS. Désiré Georges Jean Marie Bois, editor of *Revue Horticole*. Paris.  
 BOISS. Edmond Boissier, 1810–1886. Switzerland. Author of "Flora Orientalis" and other works.  
 BOJER. W. Bojer, 1800–1856, author of a Flora of Mauritius. Austria.  
 BONPL. Aimé Bonpland. 1773–1858. France.  
 BORKH. Moritz Balthasar Borkhausen, 1760–1806. Germany.  
 BR., N. E. N. E. Brown, Royal Botanic Gardens, Kew, England.  
 BR., R. Robert Brown, born 1773, Scotland, died 1858, London. Author of many important works.  
 BRIT. Nathaniel Lord Britton, Director of New York Botanical Garden, New York City.  
 BRONGN. Adolphe Théodore Brongniart, 1801–1876. France.  
 BUCH.-HAM. Francis Buchanan, later Lord Hamilton, wrote on Indian plants.  
 BUCKL. Samuel Botsford Buckley, 1809–1884. United States.  
 BULL. William Bull, plant merchant. London.  
 BULL. Pierre Bulliard, 1742–1793, author of the great "Herbier de la France" in 12 folio volumes, with 600 plates.  
 BUNGE. Alexander von Bunge, 1803–1890. Russia.  
 BURM. Johannes Burmann, 1706–1779, professor at Amsterdam, wrote on plants of Ceylon and Malabar.  
 BURM. f. Nickolous Laurens Burmann, 1734–1793. Son of Johannes.  
 CARR. Elie Abel Carrière, 1816–1896, distinguished French botanist and horticulturist, editor of *Revue Horticole*.  
 CASP. Robert Caspary, professor of botany at University of Königsberg. 1818–1887.  
 CASS. Alexandre Henri Gabriel Cassini, Comte de. 1781–1832. France.  
 CAV. Antonio José Cavanilles, 1745–1804. Spain.  
 CERV. Vincente Cervantes, 1759(?)–1829. Spanish botanist.  
 CHAM. Adalbert von Chamisso, poet and naturalist, 1781–1838. Germany.  
 CHAPM. Alvan Wentworth Chapman, 1809–1899, author of "Flora of the Southern United States."  
 CHOIS. Jacques Denys Choisy, 1799–1859. Switzerland.  
 CLOS. Dominique Clos, professor of botany and director of the gardens at Toulouse. Born 1821.  
 COGN. Alfred Cogniaux, French botanist.  
 COLEBR. Henry Thomas Colebrooke, 1765–1837. England.  
 COLLA. Luigi Colla, 1766–1848. France.  
 COULTER. John M. Coulter, University of Chicago.  
 CUNN. Richard Cunningham, 1793–1835. Colonial botanist in Australia.  
 CUNN., A. Allan Cunningham, born 1791, Scotland, died 1839, Sidney, Australia. Brother of Richard.  
 CURT. William Curtis, 1746–1799. England. Founder of the Botanical Magazine, now known as Curtis' Botanical Magazine.  
 CURTIS. Moses Ashley Curtis, 1808–1873. North Carolina.  
 DC. Augustin Pyramus De Candolle, 1778–1841, projector of the Prodrômus, and head of a distinguished family. Alphonse De Candolle, the son (1806–1893), and Casimir De Candolle, the grandson, are also quoted in this work.  
 DECNE. Joseph Decaisne, 1809–1882. France.  
 D. DON. See Don, D.  
 DESF. René Louiche Desfontaines, 1750–1833. France.  
 DESV. Augustin Nicaise Desvaux, 1784–1856. France.  
 DEVR. Willem Hendrik de Vriese, 1807–1862, professor of botany at Leyden. Wrote on medical plants and plants of the Dutch East Indies.  
 DICKS. James Dickson, 1738–1822, Scotch writer on flowerless plants.  
 DIELS. Ludwig Diels, professor of botany, Marburg, Germany.  
 DILL. Johann Jacob Dillenius, professor of botany in Oxford. 1687–1747.

- DIPP. Dr. L. Dippel, of Darmstadt, Germany. Dendrologist; pub. "Handbuch der Laubholzkunde."
- DON. George Don, 1798-1856. England.
- DON, D. David Don, brother of George, 1800-1841. Scotland.
- DONN. James Donn, 1758-1813, author of "Hortus Cantabrigiensis." England.
- DOUGLAS. David Douglas, 1799-1834, collector in north-western America. Scotland.
- DRUDE. Prof. O. Drude, of Dresden, Germany.
- DRY. Jonas Dryander, 1748-1810. Sweden.
- DUCHESNE. Antoine Nicolas Duchesne, 1747-1827. France.
- DUMORT. Barthélemy Charles Dumortier, 1797-1878. Belgium.
- DUNAL. Michel Felix Dunal, 1789-1856. France.
- DUNN. Stephen Troyte Dunn, Kew, England.
- DYER. W. T. Thistleton-Dyer, Director of Kew Gardens, 1885-1905, editor of the *Flora of Tropical Africa*, etc.
- EATON, A. Amos Eaton, 1776-1842, author of a "Manual of Botany for North America," 1st ed. 1817; 8th ed. 1841.
- EATON, D. C. Daniel Cady Eaton, professor at Yale College, and writer on ferns.
- EHRRH. Friedrich Ehrhart, 1742-1795. Germany.
- ELL. Stephen Elliott, 1771-1830. South Carolina.
- ELLIS. John Ellis, 1711-1776. England.
- ENDL. Stephan Ladislaus Endlicher, 1804-1849, professor at Vienna. Numerous works.
- ENGELM. George Engelmann, 1809-1884. Missouri.
- ENGLER. Prof. A. Engler, of Berlin, joint author of Engler and Prantl's "Natürlichen Pflanzenfamilien."
- ESCH. Johann Friedrich Eschschol, 1793-1831. Germany.
- FÉE. Antoine Laurent Apollinaire Fée, 1789-1874. France.
- FENZL. Edward Fenzl, professor and custodian of botanical museum at Vienna, 1808-1879.
- FERN. Merritt Lyndon Fernald, assistant professor of botany, Cambridge, Mass.
- FISCH. Friedrich Ernst Ludwig von Fischer, 1782-1854. Russia.
- FORB. John Forbes, catalogued heaths, willows, conifers, and other plants at Woburn Abbey.
- FORSK. Pehr Forskal, 1736-1768, collected in Egypt and Arabia.
- FORST. Johann Reinhold Forster, 1729-1798. Germany. (Also Georg Forster, the son.)
- FRANCH. A. Franchet, Jardin des Plantes, Paris. 1834-1900.
- FRASER. John Fraser, 1750-1811, traveled in America 1785-96. Had a son of same name.
- FROEL. Joseph Aloys Froelich, 1766-1841. Germany.
- F. v. M. Ferdinand von Mueller, royal botanist of Australia, author of many works on economic plants. See Muell.
- GAERTN. Joseph Gaertner, 1732-1791. Germany.
- GAGNEP. François Gagnepain. French botanist, writing chiefly on Asiatic plants.
- GAUD. Charles Gaudichaud-Beaupré, 1789-1864. France.
- GAWL. See Ker.
- GMEL. Samuel Gottlieb Gmelin, 1743-1774. Russia.
- GOEPP. Heinrich Robert Goeppert, 1800-1884, professor at Breslau. Wrote much on fossil botany.
- GORD. George Gordon, 1806-1879, author of the "Pine-tum," London, 1858.
- GRAEBN. Paul Graebner, professor of botany. Berlin.
- GRAY. Asa Gray, 1810-1888, Harvard University, Massachusetts. America's most noted botanist.
- GREENM. J. M. Greenman, writes from Harvard University on Mexican plants. Now at the Field Museum, Chicago.
- GRIFF. William Griffith, 1810-1845. England.
- GRISEB., GRIS. Heinrich Rudolph August Grisebach, 1814-1879. Germany.
- HARMS. Prof. Hermann Harms. Berlin.
- HASSK. Justus Karl Hasskarl, born 1811. Germany.
- HAYNE. Friedrich Gottlob Hayne, 1763-1832, professor at Berlin. Medicinal plants; trees and shrubs.
- HAW. Adrian Hardy Haworth, 1772-1833. England.
- HBK. Friedrich Alexander von Humboldt, 1796-1859. Germany. Aimé Bonpland, 1773-1858. France. Karl Sigismund Kunth, 1788-1850. Germany. Authors of a great work on plants of the New World.
- HEMSL. W. Botting Hemsley, Keeper at Kew, has written many reviews of genera of horticultural value in *The Gardeners' Chronicle* and elsewhere.
- HENFR. Arthur Henfrey, 1819-1859. English botanist.
- HENRY. Augustine Henry, collector of Chinese plants. Cambridge, England.
- HENRY, L. Prof. Louis Henry. Writer on woody plants. Paris.
- HERB. William Herbert, 1778-1847. England.
- HOCHST. Christian Friedrich Hochstetter, 1787-1860, described many African plants.
- HOFFM. Georg Franz Hoffmann, 1761-1826. Germany.
- HOOK. William Jackson Hooker, 1785-1865. England.
- HOOK. f. Joseph Dalton Hooker, the son, 1817-1911. England.
- HORT. Hortorum, literally of the gardens. Placed after names current among horticulturists, but not necessarily all horticulturists. Often used with less exactness than names of authors. Frequently indicates garden or unknown origin. Many of these plants have never been sufficiently described.
- HOST. Nicolaus Thomas Host, 1761-1834. Germany.
- JACQ. Nicolaus Joseph Jacquin, 1727-1817. Austria.
- JAUB. Hippolyte François de Jaubert. French botanist. Born 1798.
- JUSS. Antoine Laurent Jussieu, 1748-1836, the first to introduce the natural families of plants. France.
- KARSTEN. Hermann G. K. W. Karsten. German botanist, 1817-.
- KARW. Wilhelm Karwinsky von Karwin, collector in Brazil; died 1855.
- KAULF. Georg Friedrich Kaulfuss, professor at Halle; died 1830. He described the ferns collected by Chamisso.
- KER. John Bellenden Ker, 1765 (?) - 1871, botanist, wit and man of fashion. First known as John Gawler. In 1793 was compelled to leave army because of sympathy with French Revolution. His name was changed in 1804 to John Ker Bellenden, but he was known to his friends as Bellenden Ker. First editor of *Edwards' Botanical Register*.
- KER-GAWL. See Ker.
- KIRCHN. G. Kirchner, writer of the botanical part of "Arboretum Muscaviense."
- KLATT. Friedrich Wilhelm Klatt, a German botanist.
- KLOTZSCH. Johann Friedrich Klotzsch, 1805-1860, curator of Royal herbarium at Berlin, monographer of Begoniaceæ.
- KOCH. Karl Koch, 1809-1879. Germany.
- KOEHNE. Emil Koehne, professor at Berlin. Pub. "Deutsche Dendrologie."

- KOMAR. Vladimir Leontyevitch Komarov, writer on plants of eastern Asia. St. Petersburg.
- KOST. Vincenz Franz Kosteletzky. Bohemian botanist.
- KOTSCHY. Theodor Kotschy, assistant curator at Vienna, 1813-1866. Wrote on oriental plants.
- KRÄNZL. F. Kränzlin, Berlin, writes on orchids in *The Gardeners' Chronicle*.
- K. SCH. See Schumann.
- KUNTH. See HBK.
- KUNTZE. Otto Kuntze. German botanist; chiefly known as a strong advocate of priority in nomenclature. 1843-1907.
- LAG. Mariano Lagasca, 1776-1839, one of Spain's most distinguished botanists.
- LAM. Jean Baptiste Antoine Pierre Monnet Lamarck, 1744-1829, author of the Lamarckian philosophy of organic evolution. France.
- LANGS. Georg Heinrich von Langsdorf, 1774-1852, Russian consul-general in Brazil.
- LAUTH. Thomas Lauth, 1758-1826, professor of anatomy at Strassburg, wrote a 40-page monograph on *Acer* in 1781.
- LECQ. Henry Lecoq, born 1802, once professor at Clermont-Ferrand, wrote an elementary botany, a dictionary of botanical terms, a book on hybridization, etc.
- LECONTE. John Eaton LeConte, 1784-1860. Pennsylvania.
- LEDEB. Karl Friedrich von Ledebour, 1785-1851. Russia.
- LEHM. Johann Georg Christian Lehmann, 1792-1860, professor at Hamburg, wrote several monographs, and described many new plants.
- LEHM., F. C. F. C. Lehmann, German collector in South America.
- LEICHT. Max Leichtlin, horticulturist, Baden-Baden, Germany.
- LEM. Charles Lemaire, 1800-1871, works on cacti and botany of cultivated plants. Belgium.
- LEVEILLE. Augustine Abel Hector Lèveillé, professor of botany, Le Mans, France.
- L'HER. C. L. L'Héritier de Brutelle, 1746-1800. France.
- LICHTST. August Gerhard Gottfield Lichtenstein, 1780-1851. Germany.
- LIND. & ROD. L. Linden and E. Rodigas, once administrator and editor, respectively, of *L'Illustration Horticole*.
- LIND. J. Linden, 1817-1898. Belgium. For many years director of *L'Illustration Horticole*.
- LIND., L. Lucien Linden, associated with J. Linden for some years on *L'Illustration Horticole*.
- LINDL. John Lindley, 1799-1865, one of the most illustrious of English horticulturists.
- LINGELSH. Alexander Lingelsheim. Breslau, Germany.
- LINK. Heinrich Friedrich Link, 1767-1851. Germany.
- LINN. Carolus Linnæus (Carl von Linné), 1707-1778, the "Father of Botany," and author of binomial nomenclature. Sweden.
- LINN. f. Carl von Linné, the son, 1741-1783. Sweden.
- LIPSKY. Vladimir Ippolitovitch Lipsky, writer chiefly on plants from Central Asia. St. Petersburg.
- LODD. Conrad Loddiges, nurseryman near London, conducted Loddiges' Botanical Cabinet from 1817-33, 20 vols., 2,000 colored plates.
- LOES. Theodor Loesener, professor of botany, Berlin.
- LOISEL. Jean Louis Auguste Loiseleur-Deslongchamps, 1774-1849. France.
- LOUD. John Claudius Loudon, 1783-1843, an extremely prolific English writer.
- LOUR. Juan Loureiro, 1715-1796, missionary in China. Portugal.
- MAKINO. Tomitaro Makino. Tokyo, Japan.
- MARSH. Humphrey Marshall, 1722-1801. Pennsylvania.
- MART. Karl Friedrich Philipp von Martius, 1794-1868, professor at Munich, monographer of palms, founder of the great *Flora Brasiliensis*, and author of many works.
- MAST. Maxwell T. Masters, late editor of *The Gardeners' Chronicle*, wherein he has described great numbers of new plants of garden value; author of "Vegetable Teratology," etc. 1833-1907.
- MATSUM. Jinzo Matsumuro. Tokyo, Japan.
- MAXIM. Karl Johann Maximowicz, 1827-1891, one of the most illustrious Russian systematic botanists; wrote much on Asian plants.
- MEDIKUS. Friedrich Casimir Medikus, 1736-1808, director of the garden at Mannheim, wrote a book of 96 pages in German on North American plants in 1792.
- MEISN. Karl Friedrich Meisner, 1800-1874. Switzerland.
- METT. Georg Heinrich Mettenius, 1823-1866, professor at Leipzig, wrote on flowerless plants.
- MEY. Ernst Heinrich Friedrich Meyer, 1791-1851. Prussia.
- MEY., C. A. Carl Anton Meyer, 1795-1855, director botanic garden at St. Petersburg, wrote on Russian botany.
- MEZ. Dr. Karl Mez, director of the botanic garden at Königsberg; monographer of the bromeliads.
- MICHX. André Michaux, 1746-1802. France, but for ten years a resident of North America.
- MICHX. f. François André Michaux, the son, 1770-1855. France.
- MILL. Phillip Miller, 1691-1771, of Chelsea, England, author of a celebrated dictionary of gardening, which had many editions.
- MIQ. Friedrich Anton Wilhelm Miquel, 1811-1871. Holland.
- MITFORD. A. B. Freeman-Mitford, English amateur, author of "The Bamboo Garden."
- MOENCH. Konrad Moench, 1744-1805. Germany.
- MONCH. See Moench.
- MOORE. Thomas Moore, 1821-1887, curator of Chelsea Botanic Garden, author of "Index Filicum," and other well-known works.
- MOQ. Alfred Moquin-Tandon, 1804-1863. France.
- MORR. Charles Jacques Edouard Morren, of Ghent, 1833-1886.
- MOTT. S. Mottet, frequent contributor to *Revue Horticole*, translator of Nicholson's "Dictionary of Gardening."
- MUELL. ARG. Jean Mueller, of Aargau, 1828-1896, wrote for De Candolle's "Prodromus," vol. 16.
- MUELL., C. Carl Mueller, 1817-1870, who edited vols. 4-6 of Walpers' "Annals."
- MUELL., F. Ferdinand von Mueller, royal botanist at Melbourne, has written much on Australian and economic botany. 1825-1896.
- MUHL. Henry Ludwig Muhlenberg, 1756-1817. Pennsylvania.
- MURR. Johann Andreas Murray, 1740-1791. Germany.
- MURR., A. Andrew Murray, 1812-1878, author of "The Pines and Firs of Japan." London, 1863.
- NAUDIN. Charles Naudin, 1815-1899, botanist, frequent contributor to *Revue Horticole*.
- N. E. BR. N. E. Brown describes many new plants in *Gardeners' Chronicle*. See Br., N. E.

- NEES. Christian Gottfried Nees von Esenbeck, 1776-1858. Prussia.
- NICHOLS. George Nicholson, curator at Kew, author of "The Dictionary of Gardening." 1847-1908.
- NUTT. Thomas Nuttall, 1786-1859. Massachusetts.
- O'BRIEN. James O'Brien, current writer on orchids in *The Gardeners' Chronicle*.
- OLIV. Daniel Oliver, once curator at Kew, and founder of the Flora of Tropical Africa.
- ORPH. Theodor Georg Orphanides, professor of botany at Athens. Died 1886.
- ORTEGA, ORT. Casimiro Gomez Ortega, 1740-1818. Spain.
- OTTO. Friedrich Otto, 1782-1856. Germany.
- PALL. Peter Simon Pallas, 1741-1811, professor and explorer in Russia. Germany.
- PAMPAN. Renato Pampanini, writer on Chinese plants. Florence, Italy.
- PAV. See Ruiz. & Pav.
- PAX. Ferdinand Pax, professor at Breslau, Germany.
- PAXT. Joseph Paxton, 1802-1865. England.
- PERS. Christian Hendrick Persoon, 1755-1837. Germany.
- PHIL. Rudolph Amandus Philippi, 1808-1904. Santiago, Chile.
- PLANCH. Jules Emile Planchon, professor at Montpellier. France. 1833-1900.
- POHL. Johann Emmanuel Pohl, 1782-1834, professor at Vienna, wrote a large book on travels in Brazil.
- POIR. Jean Louis Marie Poiret, 1755-1834. France.
- PRAIN. Sir David Prain, Director of the Royal Botanic Gardens, Kew, since 1905.
- PRESL. Karel Boriweg Presl, 1794-1852. Bohemia.
- PURSH. Frederick T. Pursh (or Pursch), 1774-1820. Germany, but for twelve years in the United States.
- RADDI. Guiseppe Raddi, 1770-1829. Italy.
- RAF. Constantino Samuel Rafinesque-Schmaitz, 1784-1842. Professor of Natural history, Transylvania University. Lexington, Kentucky.
- R. BR. Robert Brown, born 1773, Scotland, died 1858, London. Author of many important works.
- REGEL. Eduard von Regel, 1815-1892, German, founder of *Gartenflora*; Director Botanic Garden at St. Petersburg.
- REHD. Alfred Rehder, Arnold Arboretum, Massachusetts.
- REICHB. Heinrich Gottlieb Ludwig Reichenbach, 1793-1879. Germany.
- REICHB. f. Heinrich Gustav, 1823-1889, son of the preceding. Orchids.
- RICH. John Richardson, 1787-1865. Scotland.
- RICHARD. Louis Claude Marie Richard, 1754-1821. France.
- RIDDELL. John Leonard Riddell, 1807-1865, professor of chemistry in Cincinnati and New Orleans.
- ROB. B. L. Robinson, Director Gray Herbarium of Harvard University; is editing "The Synoptical Flora of North America."
- ROD. Emile Rodigas, for some years connected with *L'Illustration Horticole*.
- RODR. J. B. Rodrigues, Brazilian botanist, writer on palms and Brazilian botany.
- ROEM. Johann Jacob Roemer, 1763-1819. Switzerland. Also M. J. Roemer.
- ROSCOE. William Roscoe, 1753-1831. England.
- ROSE. J. N. Rose, assistant curator, United States National Herbarium, Smithsonian Institution. Mexican plants.
- ROTH. Albrecht Wilhelm Roth, 1757-1834. Physician at Vegesack, near Bremen.
- ROXBG. William Roxburg, 1759-1815. India.
- ROYLE. John Forbes Royle, born 1800, at Cawnpore, died 1858 London. Professor in London. Plants of India.
- RUIZ. & PAV. Hipolito Ruiz Lopez, 1764-1815, and José Pavon, authors of a Flora of Peru and Chile. Spain.
- RUPR. Franz J. Ruprecht, 1814-1870. Russia.
- RYDB. Per Axel Rydberg. New York Botanical Garden. S. & Z. See Sieb. & Zucc.
- SABINE. Joseph Sabine, 1770-1837. England.
- SAFFORD. W. E. Safford, United States Department of Agriculture, Washington.
- SALISB. Richard Anthony Salisbury, 1761-1829. England.
- SALM-DYCK. Joseph, Prince and High Count Salm-Reifferscheidt-Dyck, born at Dyck, 1773, died 1861. Wrote on Aloe, Cactus, Mesembryanthemum.
- SARG. Charles Sprague Sargent, Director Arnold Arboretum, author of "Silva of North America."
- SAV. L. Savatier, writer on Japanese plants.
- SAVI. Gaetano Savi, died 1844. Italy.
- SCHEIDW. Michael Joseph Scheidweiler, 1799-1861, professor of botany and horticulture at Horticultural Institute of Ghent.
- SCHK. Christian Schkuhr, died 1811. Germany.
- SCHLECHT. Diedrich Franz Leonhard von Schlechtendahl, 1794-1866. Professor at Halle, wrote several memoirs in Latin and German.
- SCHNEID. Camillo Schneider, author of "Handbuch der Laubholzkunde." Vienna.
- SCHOTT. Heinrich Wilhelm Schott, 1794-1865. Wrote much on aroids with Nyman and Kotschy.
- SCHRAD. Heinrich Adolph Schrader, 1767-1836. Germany.
- SCHULT. Joseph August Schultes, 1773-1831. Germany.
- SCHUM. Christian Friedrich Schumacher, 1757-1830. Germany.
- SCHUMANN. Karl Moritz Schumann, 1851-1904, professor of botany, Berlin. Wrote much on Cactaceae.
- SCHUR. Philipp Johann Ferdinand Schur, 1785-1848. Germany.
- SCHW., SCHWEIN. Lewis David von Schweinitz, 1750-1834. Pennsylvania.
- SCHWEINF. George Schweinfurth. Germany. Born 1836.
- SCHWER. Graf Fritz von Schwerin, German authority on Acer.
- SCOP. Johann Anton Scopoli, 1723-1788. Italy.
- SEEM. Berthold Seemann, Hanover, 1825-1872. Wrote on palms, and botany of the voyage of the *Herald*.
- SIBTH. John Sibthorp, 1758-1796, author of a Flora of Greece. England.
- SIEB. & ZUCC. Philipp Franz von Siebold, 1796-1866, and Joseph Gerhard Zuccarini, 1797-1848. Germany.
- SIMS. John Sims, 1792-1838. England, for many years editor of Curtis' Botanical Magazine.
- SMALL. John Kunkel Small. New York Botanical Garden.
- SMITH. James Edward Smith, 1759-1828. England.
- SOLAND. Daniel Solander, 1736-1782. England.
- SPACH. Eduard Spach, born 1801 Strassburg, died 1879. Author of "Histoire Naturelle des Vegetaux."
- SPAETH. L. Spaeth, Berlin, nurseryman, died 1913. H. L. Spaeth, the present head of the firm.
- SPRENG. Kurt Sprengel, 1766-1833. Germany.
- STEUD. Ernst Gottlieb Steudel, 1783-1856. Germany.
- STEV. Christian Steven, 1781-1863. Russia.
- ST. HIL. Auguste de Saint Hilaire, 1779-1853. France.
- SWARTZ. Olof Swartz, 1760-1818. Sweden.

- SWEET. Robert Sweet, 1783-1835, author of many well-known works, as "Geraniaceæ," "British Flower Garden."
- SWINGLE. Walter T. Swingle, United States Department of Agriculture, Washington.
- TAUSCH. Ignaz Friedrich Tausch. Died 1848. Austria.
- TENORE. Michele Tenore, 1780-1861. Italy.
- THORE. Jean Thore, 1762-1823, physician at Dax.
- THUNB. Carl Peter Thunberg, 1743-1822, wrote "Flora Japonica" (1784). Sweden.
- TOD. Augustino Todaro, director of the botanic gardens at Palermo. 1818-1892.
- TORR. John Torrey, 1796-1873. New York.
- TRAUTV. Ernst Rudolph von Trautvetter.
- TREL. William Trelease, professor of botany, University of Illinois.
- TUCKM. Edward Tuckerman, 1817-1886. Massachusetts.
- TURCZ. Nicolaus Turczaninow. Died 1864.
- UNDERW. Prof. Lucien M. Underwood, Columbia University, New York, N. Y., has written much on ferns, etc.
- URBAN. Ignatius Urban, of the Königl. Bot. Garten, near Berlin, writer on Brazilian and West Indian plants.
- VAHL. Martin Vahl, 1749-1804. Denmark.
- VAN HOUTTE. Louis Van Houtte, 1810-1876, founder and publisher of *Flore des Serres*.
- VEITCH. John Gould Veitch, 1839-1867, and successors, horticulturists at Chelsea, England.
- VENT. Etienne Pierre Ventenat, 1757-1808. France.
- VERL. B. Verlot, contributor to *Revue Horticole*.
- VERSCH. Ambroise Verschaffelt, 1825-1886, founder and publisher of *L'Illustration Horticole* at Ghent, Belgium.
- VILL. Dominique Villars, 1745-1814. France.
- VILM. Several generations of the family of Vilmorin, Paris, seedsmen and authors of many books and memoirs on botany and horticulture. Pierre Philippe André Leveque de Vilmorin, 1746-1804. Pierre Vilmorin, 1816-1860. Henry L. de Vilmorin, died 1899.
- VOSS. A. Voss, author of botanical part of Vilmorin's *Blumengärtnerei*.
- WAHL. Georg Wahlenberg, 1781-1851. Sweden.
- WALDST. Franz Adam, Graf von Waldstein, 1759-1823. Austria.
- WALL. Nathanael Wallich, born 1786, Copenhagen, died 1854 London. Wrote on plants of India and Asia.

# The Standard Cyclopedia of Horticulture

## A SYNOPSIS OF THE PLANT KINGDOM

By KARL M. WIEGAND

Most modern botanists, as well as zoölogists, now think that organisms have descended, through the ages, from ancestors which differed in many ways and often markedly from the present organisms, but were in general of a less specialized type. It is, indeed, thought that the original life was of an exceedingly simple nature, and that during the countless ages its descendants have gradually diverged from one another much as the branches of a tree diverge from its trunk, until we have the enormous wealth of species and extreme diversity, and great complexity of structure exhibited by the plants and animals existing today. Just as through descent in the human race we have groups of individuals called families, the members of which are more closely related to each other by descent than to other individuals, so we have groups of related species and genera forming similar natural families. The attempt of the so-called systematic botanist of the present day is to interpret the evolutionary history of plants, to discover these natural families, and to represent this knowledge of history and relationship in a synopsis of the plant kingdom. Such a synopsis, therefore, attempts to show an actual "blood relationship,"—the real genealogy of the plant kingdom. Before the theory of evolution became widely accepted as a result of Darwin's labors, systems of classification were either wholly arbitrary, and planned simply for convenience in dealing with the vast number of existing organisms (e.g., the sexual system of Linnæus), or they were based on the morphological relation of the flower to a certain floral plan. Since, however, the floral plan depends largely on descent, these last-named systems often accidentally approached in many respects very closely to the natural systems based on evolution. Instead of placing the "highest" types of plants (the most recent) last in their classification, as is now done, the idealists placed them first,—hence the Ranunculaceæ, with parts separate and hypogynous, and therefore most ideal, is found first in such a classification. The fusion of parts in the Compositæ, and the union of parts in the Gamopetalæ were thought to represent a less perfect condition. Likewise, the Apetalæ, with parts lacking, were still less perfect, and therefore were placed later. The Gymnosperms were somewhat arbitrarily placed next, followed by the Monocotyledons, in which the grasses were placed last. These in turn were followed by the ferns and the lower groups. This was the system used in Bentham and Hooker's "Genera Plantarum," a great work which, notwithstanding the change in system, is still a standard authority in descriptive botany.

In the system adopted for the present synopsis, that used by Engler and Prantl in the great German work, "Die Natürlichen Pflanzenfamilien," the sequence is from the most primitive and the most ancient toward the most specialized and most modern,—from the lower algæ to the fungi, mosses, liverworts, ferns, gymnosperms, and flowering plants. Here the Monocotyledonous line culminates in the highly specialized Orchidaceæ, and the Dicotyledonous line in the equally specialized Compositæ. These two families, therefore, are now thought to represent the present culmination of nature's handiwork in the two great lines of development in flowering plants.

In the present synopsis of the Pteridophyta and Spermatophyta, the treatment of large groups, sequence of families and family limits, is, except in a few cases, that of our most recent great work edited by Engler and cited above. Among the mosses and lower plants, an abridgment of the system used in Strasburger, Noll, Schenk and Karsten's "Text-Book of Botany," and other text-books, has been used. The statistics as to genera and species are taken from Engler and Prantl, and are intended as general information, and may not in all cases conform to the limitations as worked out by the different authors in the Cyclopedia. In some cases, particularly in Cactaceæ, other authorities have been followed.

As no genera of the Thallophyta or Bryophyta are definitely treated in the body of the Cyclopedia, these two groups have been introduced into the synopsis largely as a background and as a proper perspective to the plant kingdom. Therefore, in these groups no divisions smaller than classes have been considered. In the Pteridophyta and Spermatophyta, the plan has been to include in the synopsis every family that has at least one genus represented in the body of the original Cyclopedia. A few other families of minor horticultural value have found place in the present Cyclopedia and are not included in this synopsis. Although the treatment in each case has been of necessity reduced to great brevity, it is hoped that the condensed account of important structural characteristics, size of family, range, and economic value will be of aid in forming a conception of what each family represents. To render this conception more vivid, a list of the important cultivated genera and their common names has been appended to the treatment of each family.

The number of species in the plant kingdom is not definitely known. It has been estimated that more than 120,000 species of Spermatophyta and more than 60,000 species of lower plants are described. According to the treatment in Engler and Prantl, these legions are classified in 640 families, of which 278 are of the higher plants and 362 of plants below the Spermatophyta. The number of known species, however, is being rapidly increased as research and exploration progress, so that the numbers given above are at best only approximate. The figures are also modified by disagreement as to what are species and what are varieties, some persons recognizing more or fewer species than others in a given genus or group.

The names of the natural families are mostly derived from the names of a leading genus (as *Verbenaceæ*, *Ranunculaceæ*) or from some marked characteristic of the group as a whole (e.g., *Compositæ*, composite or compound flowers, *Cruciferae*, cross-like flowers). Commonly the family name terminates in the form *aceæ*, with the accent long on the antepenultimate syllable (e.g., *Rosaceæ*, pronounced Ro-say-si-ee). The simple termination *x* is used mostly for subfamilies and tribes, but there are marked exceptions, as in *Leguminosæ*.

The illustrations accompanying this text are designed to show mainly such structural characteristics as are of importance in the separation of families. For this reason, floral diagrams have been freely introduced. These

diagrams are idealized cross-sections of the flower, and show particularly the number of parts in each floral set and their exact position, both of which are very frequently of diagnostic importance. The illustrations have been prepared by F. Schuyler Mathews under the direction of the writer. They were in part drawn from life, and in part adapted from standard texts. The most frequent sources are Baillon, "Natural History of Plants"; Engler and Prantl, "Die Natürlichen Pflanzenfamilien," Strausburger, Noll, Schenk and Karsten, "Text-Book of Botany"; Warming, "Systematic Botany."

The following is an outline of the vegetable kingdom as treated in the succeeding pages:

- Division I. Thallophyta.  
 Class I. Bacteria.  
 II. Cyanophyceæ.  
 III. Flagellata.  
 IV. Myxomycetes.  
 V. Peridineæ.  
 VI. Conjugatæ.  
 VII. Diatomæ.  
 VIII. Heterocontæ.  
 IX. Chlorophyceæ.  
 X. Characeæ.  
 XI. Phæophyceæ.  
 XII. Rhodophyceæ.  
 XIII. Phycomycetes.  
 XIV. Eumycetes.  
 XV. Lichenes.
- Division II. Bryophyta.  
 Class I. Hepaticæ.  
 II. Musci.
- Division III. Pteridophyta.  
 Class I. Filicinae.  
 Sub-class I. Eusporangiatae.  
 Order 1. Ophioglossales.  
 Family Ophioglossaceæ, page 7.  
 Order 2. Marattiales.  
 Family Marattiaceæ, 7.  
 Sub-class II. Leptosporangiatae.  
 Order 3. Filicales.  
 Family Hymenophyllaceæ, 8.  
 Cyatheaceæ, 8.  
 Polypodiaceæ, 8.  
 Ceratopteridaceæ, 8.  
 Schizæaceæ, 9.  
 Gleicheniaceæ, 9.  
 Osmundaceæ, 9.  
 Order 4. Hydropteridales.  
 Family Marsileaceæ, 9.  
 Salviniaceæ, 10.
- Class II. Equisetinæ.  
 Order 5. Equisetales.  
 Family Equisetaceæ, 10.
- Class III. Lycopodinae.  
 Order 6. Lycopodiales.  
 Family Lycopodiaceæ, 10.  
 Order 7. Selaginellales.  
 Family Selaginellaceæ, 10.
- Division IV. Spermatophyta or Siphonogamia (Phanerogamia).  
 Sub-division I. Gymnospermæ.  
 Order 8. Cycadales.  
 Family Cycadaceæ, 11.  
 Order 9. Ginkgoales.  
 Family Ginkgoaceæ, 11.  
 Order 10. Coniferales.  
 Family Taxaceæ, 11.  
 Pinaceæ, 12.  
 Order 11. Gnetales.  
 Family Gnetaceæ, 12.
- Sub-division II. Angiospermæ.  
 Class I. Monocotyledonæ.  
 Order 12. Pandanales.  
 Family Typhaceæ, 13.  
 Pandanaceæ, 13.  
 Order 13. Helobiae.  
 Family Naiadaceæ, 13.  
 Aponogetonaceæ, 13.
- Family Alismaceæ, page 13.  
 Butomaceæ, 14.  
 Hydrocharitaceæ, 14.  
 Order 14. Glumifloræ.

 Campanulaceæ, 76.  
 Compositæ, 76.

## DIVISION I. THALLOPHYTA

Plants characterized rather indefinitely by the absence of an archegonium around the egg, and the absence of the type of antheridium found among the higher plants. The plant body is rarely differentiated into organs simulating stem and leaves, and no true vascular tissue is found in the group. Formerly the Thallophyta were divided into the Algæ, Fungi, and Lichens; but this, though a good classification on physiological grounds, does not indicate actual relationship so well as the modern division into fifteen classes founded on structure, as follows:

### CLASS I. BACTERIA

Unicellular or filamentous organisms without green color, possibly "degenerated" from the Cyanophyceæ, with no true nucleus, the cell-wall often gelatinous: reproduction wholly asexual by division into two equal portions and subsequent separation (fission); or by asexual spores, one of which may be produced in each cell. Bacteria are probably the smallest known organisms, some being not over .00003 inch in diameter. In form, the cells are either oblong, spherical or spiral, and may be separate or united in groups or chains, and may be either motile by means of cilia or non-motile. Bacteria, while showing little structural diversity, have become highly specialized physiologically, and it is on this basis that the species are usually distinguished. Many cause disease among animals and human beings, while others cause disease among plants. Nitrifying bacteria in the soil are of vital importance to higher plants. Bacteria and fungi are the causes of decay.

### CLASS II. CYANOPHYCEÆ (Blue-green Algæ)

Unicellular or filamentous algæ of blue-green color; true nuclei wanting: cell-wall often gelatinous: reproduction wholly asexual by fission or by asexual spores borne as in the bacteria. The blue-green algæ inhabit water, damp soil, damp rocks, or damp tree trunks, where they often form filamentous or gelatinous, dark green patches. The aquatic forms prefer water containing much organic matter and hence are abundant in sewers. Certain species inhabit flower-pots in greenhouses, and brick walls.

### CLASS III. FLAGELLATA (Flagellates)

Simple unicellular aquatic organisms intermediate between the Thallophyta and Protozoa. During a portion of their life they possess no cell-wall, and often show amœboid movements. The cells contain a nucleus, pulsating vacuole, and chlorophyll; and one or more cilia are present. Some reduced forms are colorless and saprophytic. Reproduction is wholly asexual by fission and thick-walled resting spores. Found in waters of ponds and streams.

### CLASS IV. MYXOMYCETES (Slime Molds)

A very distinct and independent group, formerly often classified in the animal kingdom. The plants consist of naked masses of protoplasm called plasmodia, which contain many nuclei but no chlorophyll. These are found in forests and damp, shady places. When ready to fruit, the plasmodia move toward the light and away from the water, hence ascend grass stems, stumps and logs, where they transform into elaborately constructed sporangia. The asexual spores, each enclosed by a cell-wall, are distributed by the wind, germinate, produce a ciliated bit of naked protoplasm which swims in the soil moisture, multiply by division and at length fuse with neighboring protoplasts to form the plasmodium, which latter may be sometimes a foot in breadth. During unfavorable weather, the plasmodia are often transformed into sclerotia. *Plasmodiophora brassicæ*, which is the cause of the club-root of cabbage, is the only Myxomycete of great economic importance.

### CLASS V. PERIDINEÆ

A small group mostly inhabiting the sea, more rarely fresh water. They are unicellular, free-swimming organisms with nucleus, vacuole, chromatophores, and cilia. The cell is usually surrounded by a cellulose, sculptured, or pitted and transversely furrowed, wall. Reproduction is by cell-division and swarm-spores. Sexual reproduction has recently been discovered. The Peridineæ often form an important part of the plankton in the sea.

### CLASS VI. CONJUGATÆ

Green filamentous or unicellular fresh-water algæ: cell-wall and nuclei present: reproduction by division of the plant body, and by sexual spores, which latter result from the union of two body cells by means of a connecting tube (conjugation). Plants of the sub-group Desmidiaceæ are not filamentous, but often star-shaped, lunate, or geminate in outline. The Zygnemaceæ are filamentous with star-shaped (Zygnema), spiral (Spirogyra), or plate-like chloroplastids. The Conjugatæ are of little economic importance.

### CLASS VII. DIATOMEÆ (Diatoms)

Unicellular algæ of very peculiar and interesting habit. The wall consists of two silicious valves, one of which fits over the other like the lid of a box. These valves are frequently very beautifully sculptured. Through division, new cells and new walls are formed, which are always smaller than before, until finally as a limit a sexual spore is produced which reestablishes the size of the cell. Diatoms inhabit stagnant water, wet rocks, and the sea. They are either free-floating or pedicelled and attached. The silicious walls will resist burning. Diatoms contain little, if any, chlorophyll, and are mostly saprophytic. A large part of the oceanic plankton is composed of Diatoms.

### CLASS VIII. HETEROCONTÆ, or CONFERVÆ

A small group of green algæ, inhabiting wet soil or water, but of little, if any, economic importance. The zoöspores have unequal cilia; and the chloroplastids are yellowish green and oil-producing. Asexual resting spores also occur. Conjugating zoöspore-like gametes are found in some genera. Botrydium and Conferva are examples of this class.

### CLASS IX. CHLOROPHYCEÆ

A large and important group of fresh-water, or rarely marine, algæ. Plant body unicellular, filamentous, or even thalloid: the cells contain chloroplastids and produce starch: reproduction sometimes vegetative, but also by asexual zoöspores; sexual reproduction con-

sists of the fusion of two zoöspore-like gametes, or the fusion of one such gamete and a specialized non-motile egg. The latter condition is characteristic of the higher forms in nearly all the sub-groups of the Chlorophyceæ. The plant body in the Order Siphonales is peculiar in that it consists of a continuous tube without cross-walls. Some common genera in this class are *Volvox*, *Chlamydomonas*, *Pandorina*, *Protococcus*, *Pediastrum*, *Scenedesmus*, *Hydrodictyon* (Water-net), *Ulothrix*, *Ulva* (Sea-lettuce), *Edogonium*, *Cladophora*, *Caulerpa*, and *Vaucheria*.

#### CLASS X. CHARACEÆ (Stoneworts)

Attached plants (1 inch to 1 yard in length) of fresh or brackish water, consisting of a slender stem, which bears at each node a whorl of branches, usually again bearing whorled branchlets. The internodes consist of one immense multinucleated cell often as much as 3 inches long; which is naked or inclosed in a sheath of smaller cells. The branches are similarly constructed though the cells are correspondingly smaller. Asexual spore-reproduction is absent. Sexual reproduction is by means of an egg-cell inclosed in a jacket of spiral wall-cells, and of sperm-cells inclosed in an antheridium which has a multicellular wall. These sexual organs are borne at the nodes of the branchlets. The fertilized egg and its investment becomes a thick-walled resting structure. Many species of *Chara* and *Nitella*, the only two genera, have the power to deposit lime from solution, and thus become incrustated with that substance, hence the popular name. In this way the Characeæ have played a part in the filling up of calcareous lakes and the production of new land. They are mostly inhabitants of calcareous waters.

#### CLASS XI. PHÆOPHYCEÆ (Brown Seaweeds)

A large group of salt-water algæ, well known in all waters of the globe, but most abundant in the colder regions. Plant body attached, usually thalloid and branched, but very diverse; in some cases filamentous, in others disk-shaped or globular. The larger forms of *Laminaria* are sometimes 200 feet long. The chromatophores of the Phæophyceæ contain a brown pigment which gives to these plants a brown or yellowish color instead of green. The thallus is often very tough and cartilaginous, to resist the waves. Zoöspores are often produced. In sexual reproduction, the gametes are either similar and motile, rarely non-motile, or more often the sperm is motile while the egg is much larger and non-motile. Details of structure in respect to reproduction, however, are very great.

The thallus of various species of Phæophyceæ yields iodine and soda. Some species (e.g., *Laminaria saccharina*) yield mannite and are used in the Orient for food. The dried stalks of *L. digitata* and *L. Cloustoni* have been used in surgery. *Fucus* and other genera are used as manure.

One species, *Sargassum bacciferum*, has accumulated in great quantities in the Atlantic Ocean between the Bermuda Islands and the Spanish coast, in the so-called "Sargasso Sea."

#### CLASS XII. RHODOPHYCEÆ (Red Seaweeds)

Mostly marine algæ, a few only inhabiting fresh water, widely distributed, but most abundant in the tropics and temperate region at lower depths. The thallus is very diverse, filamentous, branched, often thalloid, attached by holdfasts, and red, violet, or purple in color, rarely green. True starch is not found. Asexual spore-reproduction is frequent. These spores are non-motile and produced in fours (tetraspores). Sexual reproduction is by dissimilar gametes, the antheridium becoming without change a single non-motile sperm-cell. The egg-cell is prolonged upward into a slender tube (trichogyne). The fertilized egg

by division gives rise to a globular mass of short filaments (cystocarp) which produce asexual spores. These spores in turn give rise to the mature plant. The cystocarp and its spores, thus following fertilization, suggest the alternation of generations found in the mosses and liverworts and all higher plants. About 300 species of Rhodophyceæ have been described.

Carraheen, or Irish moss, used in jellies and puddings, is the dried thallus of *Chondrus crispus* and *Gigartina mamillata* of northwestern Europe. Agar-agar, used in the preparation of culture media in bacteriology and mycology, is obtained from various species of this group.

#### CLASS XIII. PHYCOMYCETES

A large group of parasitic or saprophytic organisms (fungi), without chlorophyll: thallus (mycelium) of much-branched filaments (hyphæ); usually without cross-walls (non-septate), as in the algal group Siphonæ: asexual reproduction by motile or non-motile spores which are usually borne in sporangia, and by conidia which are cells abstracted from the tips of specialized hyphæ: sexual reproduction diverse, either by the conjugation of similar gametes, or by the conjugation of a specialized antheridial branch (male) and an enlarged oogonial branch (female) which contains the egg; free sperm-cells are rare. The order Oömycetes, with differentiated gametes, contains the following important fungi: *Saprolegnia* (water-mold), a whitish, aquatic mold growing on decaying plants, insects, or living fishes; *Olpidium brassicæ*, parasitic in cells at the base of the stem of young cabbage plants causing their death; *Phytophthora infestans* (potato disease); *Plasmopara viticola*, downy or false mildew of the grape; *Albugo candida*, white rust of Cruciferae; *Pythium* of *Baryanthum*, causing damping off of seedlings. Order Zygomycetes, with similar gametes, contains *Mucor mucedo*, white mold of bread, fruits, etc.; *Rhizopus nigricans*, a mold on bread, fruit, etc.; *Empusa muscæ*, parasitic on houseflies, causing their death and producing a white halo about them on the surface where they die.

#### CLASS XIV. EUMYCETES

A very large and important group of saprophytic or parasitic organisms (fungi) without chlorophyll: thallus (mycelium) composed of fine tubular threads, which are septate: sexual organs usually obscure or apparently wanting: asexual reproduction by spores or by conidia, a modified form of which is termed basidia. The conidia and basidia do not always represent homologous organs. The group is divided into Ascomycetes and Basidiomycetes. The Ascomycetes are characterized by a group of usually 8 spores inclosed in a unicellular sac (ascus), which is produced immediately after the imperfect sexual fertilization. The asci are borne in spherical bodies (perithecia) or in open cups (apothecia). The Perisporiaceæ, Discomycetes, Pyrenomycetes, and Tuberales are orders within this sub-class. Among the many important economic fungi belonging here are the following: Erysipheæ (Downy Mildews); *Aspergillus* and *Penicillium* (Fruit Mold, Blue Mold); *Morchella* (Morel), edible; *Nectria* (Currant Cane Rust and Tree Canker); *Claviceps purpurea* (Ergot), parasitic in the ovaries of grains; *Taphrina* (including *Exoascus*), causing witches' broom, leaf curl of peach, plum pockets, etc.; *Saccharomyces* (Yeast), causing fermentation in saccharine solutions. The Basidiomycetes are characterized by the production of four spores on a special hyphal tip or thread (basidium). Each spore is raised on a minute slender stalk (sterigma). These spores, in some cases, if not in all, follow immediately after a nuclear fusion, which probably represents a reduced sexual act. In this group are the Ustilaginæ (Smuts), infesting the ovaries of grains, etc.; the Uredinæ (Rusts), which infest a wide variety of cultivated and wild plants, and among which may be men-

tioned the wheat rust; the Hymenomycetes (Mushrooms, Toadstools, and Bracket Fungi), which are saprophytic or inhabit timber; and the Gasteromycetes (Puff-balls), which are saprophytic. The rusts exhibit alternation of generations to a most remarkable degree, the different generations often inhabiting different host plants and possessing a wholly different appearance, as well as a wholly different method of spore-formation. The Hymenomycetes are saprophytic, except the genus *Exobasidium* which inhabits the living foliage of various plants, the genus *Armillaria* which infests living tree-trunks, and many genera of the Polyporaceæ (Bracket Fungi) which also attack the wood of living trees. The last-mentioned fungi, including *Armillaria*, inhabit the trunks and branches of forest trees, causing their death.

#### CLASS XV. LICHENES (Lichens)

Green, gray or highly colored plants of very diverse habit and habitat, either thalloid, fruticose or crustaceous, and growing on the soil, bark of trees, rocks, or rarely on foliage: propagation by division of the thallus or by the separation of special minute powdery parts (soredia): spore-reproduction by ascospores borne in perithecia or apothecia, rarely by basidiospores. The lichen thallus is not a single organism, but is probably a symbiotic structure, comprised fundamentally of fungus hyphæ between which many unicellular green algae are distributed, usually in a definite fashion. The fungi belong to the Ascomycetes in the great majority of cases, rarely to the Basidiomycetes. The algae may belong to the Chlorophyceæ, in which case they are unicellular, or to the Cyanophyceæ, in which case they are either unicellular or in chains. Because the symbiotic structure behaves as a unit, it has been decided to continue to treat the lichens as a class by themselves, rather than to consider the algal and fungal components independently in their respective groups. Except as soil-producers, lichens are of little economic importance: *Cetraria islandica* furnishes Iceland moss; *Stictia pulmonaria* was once used in medicine; *Cladonia rangiferina* furnishes the main food of the reindeer in Lapland, and, possibly, of other arctic animals; *Roccella tinctoria* of Africa and the East Indies is the source of the chemical indicator, litmus and of the dye orchil or orseille.

#### DIVISION II. BRYOPHYTA (Mosses and Liverworts)

Small green plants of simple structure, either thalloid or differentiated into stem and leaves: true roots wanting: vascular tissue absent: alternation of generations well developed, the gamete-bearing generation dominant: female gamete (egg) inclosed in a flask-shaped multicellular archegonium: male gametes (sperm-cells) inclosed within a multicellular antheridial wall: fertilized egg producing the spore-bearing generation (sporogonium) which consists of a parasitic or semi-parasitic capsule usually borne upon a seta.

The Bryophytes are divided into two great classes, namely the Hepaticæ (Liverworts) and the Musci (Mosses). Each of these in turn is divided into several orders, which, as usual, contain one or more families. Mosses and liverworts are widely distributed over the earth, the latter seeming to prefer limestone regions.

The Hepaticæ are characterized by a spore-bearing generation consisting of a stalked or sessile simple capsule, which contains spores and elongated sterile elaters, and splits into teeth or valves at maturity. The plant body (gamete-bearing generation) consists either of a thalloid, algal-like, dichotomously branching, ribbon-like structure, or of a slender axis bearing the very thin leaves, one cell in thickness, and destitute of a midrib. The leaves are usually arranged in two lateral rows, with often a third row of small dissim-

ilar leaves on the under side, so that the shoot is strongly dorsi-ventral. The lateral leaves frequently bear at the base a curious lobe that is infolded or even flask-shaped, and probably aids in the conservation of water on the dry rocks and tree trunks which many of these plants frequent. The under side of the stem or thallus is usually provided with rhizoids that take the place of roots. The thalloid liverworts are inhabitants of damp or wet situations, some being aquatic: in the North, they are found on damp soil, wet rocks, or among damp moss. The majority of foliose liverworts inhabit similar places, only comparatively few genera and species being xerophytic. Filaments of the alga, *Nostoc*, penetrate the cavities in the thallus of *Anthoceros* and there form endophytic colonies. Vegetative reproduction is accomplished by the branching of the thallus, or by the production of special buds, called gemmæ, either on the edge of the leaf or thallus, or in special cup-like receptacles borne on the surface of the thallus.

The Hepaticæ are divided into four principal orders as follows: Order I.—**Ricciales**. Thalloid, floating or amphibious: sexual organs sunken in the thallus: capsule sessile, thin-walled, endophytic, irregularly dehiscent. Order II.—**Marchantiales**. Thalloid: archegonia and antheridia usually borne on special branches of the thallus: capsule often stalked, usually regularly dehiscent. *Marchantia* was formerly used as a remedy in diseases of the liver, hence the name liverwort. Order III.—**Anthocerotales**. Thalloid: one chloroplast in each cell: sexual organs superficial: capsule very slender, chlorophyll- and stomate-bearing, continuing to elongate by basal growth. Order IV.—**Jungermaniales**. Thalloid or foliose: capsule usually splitting to the base into four valves.

The Musci (Mosses) differ from the Hepaticæ mainly in the more elaborate capsule, which in the young state commonly contains chlorophyll, is provided with stomates, and contains a central column of sterile tissue (columella) encircled by the spore-bearing chamber. The dehiscence of the capsule is apical and transverse, and consists in the formation of a lid (operculum) which falls off exposing the mouth of the annular spore-chamber. This mouth is surrounded by a single or double row of numerous hygroscopic teeth (peristome), which, by their bending, regulate the escape of spores in wet and dry weather. No elaters are produced. The sporogonium of the moss is, therefore, not only a more independent structure from the standpoint of nutrition than is that of most liverworts, but is constructed along wholly different lines. On the summit of the capsule is usually found a delicate, diversely shaped, hood-like cap not organically connected with it and easily detached, called the calyptra. This is the enlarged upper portion of the archegonium, which, after rupture, is borne aloft on the summit of the growing sporogonium. The plant-body (gamete-bearing generation) is never thalloid; and the leaves, which are provided with a midrib, are frequently of several cells in thickness. The germination of the spore does not result at once in a moss plant, but produces a creeping filamentous branched, algal-like growth (protonema) on which at length are borne the buds that give rise to the moss-stem proper.

The Musci are subdivided as follows: Order I.—**Sphagnales** (Bog or Peat Mosses). Structure of stem and leaf peculiar, consisting of dead, tracheid-like cells without protoplasm and provided with pits or thickening bands, regularly interspersed among slender, living cells containing protoplasm and chloroplastids. Under ordinary conditions, the tracheid-like cells are filled in part with air, and hence the plant has a grayish hue. In the presence of rain or abundant soil-water, the water is drawn into the cells by capillarity until the still apparently dry plant contains a surprisingly large quantity of water, which will flow out on squeezing

in the hand. The capsule possesses no peristome, and the spore-sac is continuous over the top of the columella. Peat mosses are large, branched plants growing in extensive colonies in wet or damp situations in northern countries. They are especially abundant on the floating moors which surround certain small ponds, and by their decay play an important part in the filling in of these ponds. They continue to thrive in these "bogs" until the conditions at length become too dry. Peat mosses, therefore, form a large component of "peat," and in this way the Sphagnales have played a very interesting part in the evolution of the present surface of the earth. Because of the power to retain water, sphagnum is of economic importance to nurserymen and florists, who use this moss extensively in packing stock for shipment, in germinating seeds, and for other purposes. Some species of sphagnum are eaten in Lapland by the reindeer. Mixed with the hair of the reindeer, they are used for stuffing mattresses. Order II.—**Andreales**. A small group of rock mosses. The spore-chamber is continuous over the summit of the columella, and the capsule dehiscence by four longitudinal slits. Order III.—**Phascales**. A small group of minute terrestrial mosses with few leaves, but a persistent protonema: capsule indehiscent, at length decaying. Order IV.—**Bryales**. A large group containing the majority of the mosses: capsule dehiscing by an operculum; peristome present; spore-sac interrupted at the summit by the columella. Certain species were formerly used as astringents and diuretics. *Leskea sericea* has been used to stop the flow of blood from wounds. Species of *Hypnum* and *Fontenalis* are used in Norway and Sweden, by the peasants, to fill cracks in the walls of huts. *Hypnum triquetrum* is sometimes used in place of sphagnum for packing plants.

With the exception of sphagnum, the mosses and liverworts do not seem to be in the trade.

### DIVISION III. PTERIDOPHYTA

Eggs borne in archegonia: sperm-cells in antheridia: alternation of generations clearly evident, the spore-bearing generation dominant: true vascular tissue present; also true roots.

#### CLASS I. FILICINÆ (Ferns)

Sub-class I. *Eusporangiatæ*. Sporangial wall several cells in thickness

##### Order 1. OPHIOGLOSSALES

1. **Ophioglossaceæ** (from the genus *Ophioglossum*, *adder's tongue*, in reference to the fruiting spike). **ADDER'S-TONGUE FAMILY**. Fig. 1. Plants small or of medium size, often somewhat fleshy: leaves various, entire or often much divided, not circinate in veneration; veins forking or netted; base of leaf cap-like, enclosing the succeeding leaf: sporangia scattered, borne on the margin of the much modified fertile portion of the leaf, which is usually separated from the sterile by a stalk, globular in form; the walls several cells in thickness; annulus wanting; dehiscence by a straight horizontal or vertical fissure: prothallium subterranean, tuber-like, chlorophyllless, containing mycorrhizal fungi, saprophytic.

Three genera and about 50 species occur, of general distribution. Several species of *Botrychium* and one of *Ophioglossum* are found in the eastern United States. The sheathing base of the leaf, the solitary, thick-walled sporangia without an annulus, and the subterranean saprophytic prothallia are important characteristics.

Two genera are sometimes grown in North America: *Botrychium* (Moonwort Ferns, Grape Ferns) and *Ophioglossum* (Adder's Tongue).

##### Order 2. MARATTIALES

2. **Marattiaceæ** (from the genus *Marattia*, named in honor of Maratti, Italian botanist). **MARATTIA FAMILY**. Fig. 1. Stately tropical ferns with thickened, often erect, stems: leaves usually very large, from nearly entire to several times pinnate, circinate, inclosed when young by the prominent stipules: indusium present or absent: sporangia in sori on the under face of the leaf, either separate or united into a capsule-like body (synangium); the walls several cells in thickness; annulus wanting, or greatly reduced; dehiscence by clefts, pores, or, in case of the "synangia," first by valves and then by slits: prothallium a green heart-shaped thallus on the surface of the soil, sometimes branched.

Four genera and about 23 species are found in tropical regions, but extend into the south temperate

1. MARATTIACEÆ: 1. Angiopteris, sorus. 2. Marattia, synangium. OPHIOGLOSSACEÆ: 3. Ophioglossum, a, whole plant; b, dehiscent sporangia. 4. Botrychium, sporangia. EQUISETACEÆ: 5. Equisetum, a, cross-section stem; b, fruit stem; c, sterile stem; d, sporophyll and sporangia; e, spore and elater. LYCOPODIACEÆ: 6. Lycopodium, a, fruit branch; b, sporophyll and sporangium. SELAGINELLACEÆ: 7. Selaginella, a, fruit spike; b, spore showing prothallium and archegonia.

zone. The fern-like habit, the prominent stipules, the thick-walled sporangia borne in sori or synangia, the absence of a well-developed annulus, and the green thalloid emersed prothallia, are important characteristics. The family is probably very old geologically.

The thick, starchy stem of *Angiopteris* and some *Marattias* are locally used for food. The fleshy stipules of *Marattia frazinea* are eaten; the spicy leaves of some species are used to season food. The slime from the stipules of *M. Douglasii* is used medicinally by the Hawaiians.

Three genera are known to American horticulture and are occasionally grown as ornamental greenhouse plants: *Angiopteris*, *Danaë*, and *Marattia*, representing less than a half-dozen cultivated species.

*Sub-class II. Leptosporangiatæ. Sporangial wall one cell in thickness*

### Order 3. FILICALES

**3. Hymenophyllaceæ** (from the genus *Hymenophyllum*, signifying *membrane-leaved*). FILMY-FERN FAMILY. Fig. 2. Very delicate ferns, small or minute in size, frequently epiphytic: leaves entire, 1-3-pinnate, or dichotomously divided, rarely thalloid or orbicular, reduced in thickness to a single layer of cells between the veins, and thus often resembling the leaves of mosses; stomates absent; ultimate or all veins dichotomous: sori marginal, raised on a slender columnar pro-

2. HYMENOPHYLLACEÆ: 1. Hymenophyllum, section of sorus. CYATHEACEÆ: 2. Alsophila, sporangium. POLYPODIACEÆ: 3. Aspidium, a, pinnule with sori; b, section of sorus. 4. Adiantum, prothallium with young fern plant. 5. Polypodium, a, archegonium; b, antheridium; c, sperm. 6. Penanema, sporangium. GLEICHENIACEÆ: 7. Gleichenia, sporangium.

jection of the veinlet: indusium cup-shaped: sporangium thin-walled; dehiscence vertical or oblique; annulus complete, horizontal: prothallium thalloid or filamentous, often much branched.

There are 2 genera and about 200 species growing upon rocks and trees in the damp, shady forests of the tropics, and in New Zealand. One species reaches central Europe and another reaches Kentucky. The family is readily distinguished by the delicate leaf, pedicelled sorus and equatorial annulus.

The Hymenophyllaceæ require a warm and very humid atmosphere, and, therefore, most species are difficult to cultivate.

Several species of Hymenophyllum and Trichomanes are in cultivation in America.

**4. Cyatheaceæ** (from the genus *Cyathea*, signifying *cup+contain*, in reference to the cup-shaped indusium). CYATHEA FAMILY. Fig. 2. Usually tree ferns with large, much-compounded, circinate leaves: sori globular, borne on the under side of the leaf: veins forking: indusium usually present, bi-valvular, cupular or unilateral: sporangia thin-walled, sessile or short-pedicelled, obovoid; annulus complete at the pedicel, oblique, dehiscence transverse: prothallium ordinary, green.

This family has 7 genera and about 300 species, of which 115 belong to *Cyathea*, 112 to *Alsophila*, and 44 to *Hemitelia*. They are distributed in the tropics of

both hemispheres. The Cyatheaceæ is closely related to the Polypodiaceæ from which it differs only in the slightly oblique annulus which passes just at one side of the insertion of the pedicel, and is therefore uninterrupted at that point.

The dense, woolly covering of the stem of many species is sometimes collected for stuffing pillows. The starchy pith of some New Zealand Cyatheaceæ was formerly used for food. In India, an intoxicating drink is prepared from the pith. Several species are important greenhouse ferns.

Five genera at least are listed in the American trade: *Alsophila*, *Cibotium* (Scythian Lamb), *Cyathea*, *Dicksonia*, *Hemitelia*.

**5. Polypodiaceæ** (from the genus *Polypodium*, signifying *many feet*, in allusion to the branched rootstock of some species). POLYPODY FAMILY. Fig. 2. Ferns of very diverse habit, rarely arborescent: leaves of normal texture, entire or pinnatifid or multisect, circinate; veins forking: sori mostly on the under side of the leaf; indusium peltate, fringed, capillary, cupular, elongated, unilateral or wanting: sporangia thin-walled, long- or short-stalked; annulus vertical, interrupted by the pedicel; dehiscence transverse: prothallium thalloid, green, growing upon the surface of the soil, mostly bisexual.

Polypodiaceæ has more than 100 genera and about 4,000 species of wide distribution; especially abundant in humid regions and in forests. The largest genera are: *Dryopteris* (or *Aspidium*), 450 species; *Polypodium*, 500 sp.; *Asplenium*, 150-200 sp.; *Elaphoglossum*, 80-100 sp.; *Adiantum*, 80 sp.; and *Pteris*, *Blechnum*, *Polystichum* and *Aspidium* about 50-70 species each. The family is most closely related to the Cyatheaceæ. The presence of sori, the thin-walled sporangium with vertical interrupted annulus and transverse dehiscence are distinctive. This comprises the larger number of ferns, and is often called the Fern Family.

Some of the most striking variants are the walking-leaf fern with undivided lanceolate leaves which take root at the apex and repeat the process several times, all the plantlets remaining for a time connected; the hart's-tongue fern with broadly lanceolate-oblong, entire frond; the epiphytic staghorn fern with erect, forked, fertile fronds and orbicular entire, sterile fronds closely imbricated over the short stem and support. In many species the fertile and sterile fronds are dimorphic. The stems of some species are slender and climbing; others long, slender and creeping; some are very stout and erect (tree ferns).

The ferns are of little economic importance except as ornamental plants. The starchy rootstocks of some species are eaten locally, as are also the young shoots. The rootstock of *Dryopteris* (*Aspidium*) *Filix-mas* is a reputed vermifuge.

About 60 species are in cultivation in America. Among these are: *Adiantum* (Maidenhair Fern); *Aspidium* (Shield F.); *Asplenium* (Spleenwort); *Camp-tosorus* (Walking-leaf F.); *Dennstædtia* (*Dicksonia*) (Fragrant F.); *Onoclea* (Sensitive F., Ostrich F.); *Pellaea* (Cliff Brake); *Phegopteris* (Beech F.); *Platyce-rium* (*Staghorn F.*); *Polypodium* (*Polypody F.*); *Polystichum* (*Holly F.*, *Christmas F.*); *Pteris* (Common Brake); *Scolopendrium* (*Hart's-tongue F.*).

**6. Ceratopteridaceæ** (*Parkeriaceæ*) (from the genus *Ceratopteris*, meaning *horn-fern*). CERATOPTERIS FAMILY. Aquatic ferns rooting in the mud: leaves of two sorts, the ones less divided with broader segments and veins more or less anastomosing; the more aerial fertile ones much divided, with narrow segments, and revolute margins which later almost completely inclose the scattered sporangia: indusium wanting: sporangia globular, thin-walled with a very diverse broad nearly complete or nearly wanting annulus; rarely the annulus wanting; dehiscence transverse: prothallia unisexual, thalloid; antheridia not superficial.

Only one genus and a few species of tropical distribution are known, the only aquatic species among the true ferns. The habit, the absence of sori, the variable annulus, and the sunken antheridia are distinctive.

This fern is sometimes cooked and eaten as greens.

One or two species are frequently grown for aquaria and aquatic gardens.

7. **Schizæaceæ** (from the genus *Schizæa*, cleft, alluding to the leaves). **CURLY-GRASS FAMILY**. Fig. 3. Ferns of very diverse habit, some extremely small, others climbing: stem mostly oblique or horizontal: leaves very diverse, usually pinnate or palmate; veins forking: sporangia thin-walled, usually scattered, at first marginal, later sometimes exceeded by the margin of the frond, often appearing spiked or paniced, sessile; no apparent indusium; annulus transverse, apical, complete; dehiscence vertical; fertile portion of the frond usually much modified: prothallium of all genera except *Schizæa* ordinary; that of the latter genus filamentous and extremely branched, resembling that of the filmy ferns.

In this family are 4 genera and about 70 species, mostly tropical, rare in the colder regions. Two species reach the eastern United States, one of which extends to Newfoundland. The solitary sporangia and transverse apical annulus are important characteristics.

The curly grass (*Schizæa pusilla*) inhabits bogs, where it may form extended mats of dry, woolly "grass" 1-3 inches high. The sterile leaves are without laminae. *Lygodium palmatum* is the "climbing fern" of eastern America. The leaf, not the stem, of this plant has unlimited growth, and twines.

Four genera are in the American trade: *Anemia*, *Lygodium*, *Mohria*, and *Schizæa*.

8. **Gleicheniaceæ** (from the genus *Gleichenia*, named in honor of W. F. Von Gleichen, 1717-1783). **GLEICHENIA FAMILY**. Fig. 2. Terrestrial ferns with peculiar foliage: leaves several times forking owing to the arrested growth of the main divisions which develop in succeeding seasons, only the ultimate branches pinnate (except in one genus); indusium none: sporangia in sori on the under side of the leaf, thin-walled, sessile, pear-shaped; annulus complete, running obliquely around the back and over the top; line of dehiscence extending vertically down the ventral side from a constricted apical place in the annulus: prothallium ordinary, green.

Two genera and about 26 species occur in tropical lands and the south temperate zone. The family is related to the *Schizæaceæ* but the habit is very different. The peculiar forking of the leaves, as well as the unusual annulus and peculiar dehiscence, are characteristic.

A few species of *Gleichenia* are in cultivation in North America.

9. **Osmundaceæ** (from the genus *Osmunda*, derived from *Osmunder*, the Saxon name of the god Thor). **OSMUNDA FAMILY**. Fig. 3. Ferns of ordinary habit, rarely aborescent: rhizome mostly vertical, thick: leaves large, circinate, 1-3-pinnate, rarely thin and stomateless; petiole somewhat sheathing at the base; fibrovascular bundle 1; veins forking; indusia wanting: sporangia scattered on the under side of the ordinary leaf, or on the margin or on both sides of modified fertile portions of the leaf, thin-walled, short-stout-pedicelled, globular; annulus imperfect, consisting of a group of cells on one side; line of dehiscence vertical, extending from this group up over the summit: prothallium ordinary, green.

There are 3 genera and 10 or 12 species of general distribution, and others in the Australian region. Three species occur in the eastern United States. The family is related to the *Gleicheniaceæ* and *Schizæaceæ*. The peculiar dehiscence, and the scattered sporangia with the annulus consisting of a group of cells, instead of a ring, are distinctive.

The family has practically no economic importance, except as ornamental plants, except that the root

masses are used as matrix on which to grow orchids and other epiphytic plants (see *Osmundine*). Some have been used in medicine, although their virtues are questionable. The family contains some of our most stately native ferns.

All three genera are in American horticulture: *Leptopteris* (leaves thin and no stomates); *Osmunda* (Royal Fern, Cinnamon Fern), *Todea* (Grape Fern).

#### Order 4. HYDROPTERIDALES

10. **Marsileaceæ** (from the genus *Marsilea*, in honor of Giovanni Marsigli, or Aloysius Marsili, Italian naturalists.) **MARSILEA FAMILY**. Fig. 3. Perennial marsh or aquatic plants with filiform and creeping rhizomes: leaves all from rootstocks, circinate; rachis without blade or with four leaflets borne together at the apex; leaflets, when present, fan-shaped, rounded at apex; veins dichotomous: sporangia of two sorts, macrosporangia bearing macrospores which give rise to egg-cells, and microsporangia bearing microspores which give rise to sperm-cells, both borne together in tiny chambers (sori) in globular capsule-like conceptacles (sporocarps) which arise from the rootstock or lower portion of the leaf, and are either stalked or sessile:

3. **SCHIZÆACEÆ**: 1. *Anemia*, sporangium. **OSMUNDACEÆ**: 2. *Osmunda*, sporangium; a, front view; b, back view. **SALVINIACEÆ**: 3. *Salvinia*, a, whole plant; b, section of sporocarps showing sporangia. **MARSILEACEÆ**: 4. *Marsilea*, a, whole plant; b, sporocarp germinating; c, sporocarp emitting gelatinous thread with sori. 5. *Pilularia*, a, cross-section of sporocarp; b, sporocarp emitting sporangia.

male and female prothallia very much reduced, remaining inclosed within the spore-wall, which in the case of the macrospores early becomes ruptured on one side to expose the archegonia.

Two genera (*Marsilea* and *Pilularia*) and about 60 species occur, of which 52 or 54 belong to *Marsilea*. The distribution is general, though mainly tropical. *Marsilea* is represented in the United States by one native and one introduced species. The family is closely related to the *Salviniaceæ*, but the peculiar habit and unusual sporocarps are distinctive.

At maturity, a gelatinous mass escapes from the sporocarp, and on this mass the sori are borne in somewhat characteristic fashion in different species. The leaflets of the clover-like leaves of *Marsilea*, in emerged forms, show sleep movement, as do those of clover. These leaflets float upon the water to the varying depths of which the petioles accommodate themselves; but the plant may grow emerged on mud, in which case the petioles are erect like clover. The leaves of *Pilularia* are filiform, pointed, and destitute of blade.

In Australia, the sporocarps of *Marsilea Nardii* and *M. Drummondii*, which contain much starch and other nutritious material, are used by the natives for food. They are ground into a powder, mixed with water and baked. Fish and *marsilea* "fruits" form almost the sole food of some tribes.

One species, *Marsilea quadrifolia*, is in cultivation in America for aquatic gardens.

11. **Salviniaceæ** (from the genus *Salvinia* in honor of A. M. Salvini, Italian scientist). **SALVINIA FAMILY.** Fig. 3. Small, floating aquatic plants, resembling large Lemnas (*Salvinia*) or foliaceous liverworts (*Azolla*): stem reduced or wanting; leaves few, orbicular or oval (*Salvinia*); or numerous, minute and imbricated (*Azolla*); sporangia and spores of two sorts as in *Marsilea*, but borne on basal columns in the single cavity of the sporocarp; at first both sorts of sporangia are present but only one kind matures so that the sporocarp becomes entirely "male" or entirely "female;" prothallium partly endosporous, only a portion of either the male or female prothallium emerging from the spore wall.

The family has 2 genera and about 15 species, of which 11 belong to *Salvinia*; generally distributed but principally tropical. Each genus is represented in the eastern United States by one native species. The family is related to the *Marsileaceæ*, but the habit, the structure of the sporocarps, and the separation of macrosporangia and microsporangia in different sporocarps are distinctive.

The "roots" of *Salvinia* represent a modified leaf. Each leaf of *Azolla* is two-lobed, one lobe floating, the other submerged. A small cavity inclosed by the upper lobe is always inhabited by a nostoc-like alga, between which and the *Azolla* there is indication of a symbiotic relationship. *Azolla* possesses true roots.

The family is of almost no economic importance.

One species of *Salvinia* and two species of *Azolla* are occasionally grown in water-gardens.

## CLASS II. EUISETINÆ

### Order 5. EUISETALES

12. **Equisetaceæ** (from the genus *Equisetum*, meaning *horse-bristle*). **HORSE-TAIL FAMILY.** Fig. 1. Plants of striking appearance, often with rhizomes and with a straight, aerial, striated axis bearing whorls of connate, scale-like leaves at the nodes: from the nodes also frequently arise slender branches of different structure which bear different but still scale-like leaves: the stem is hollow, and besides the central canal often contains numerous additional large canals imbedded in the outer tissue: spores of one kind (not microspores and macrospores): sporangia 5-9, borne on the under surface of peltate, polygonal scales which form a terminal cone; dehiscence longitudinal; spores green, provided with several hygroscopic "elaters" which aid in dissemination: prothallia green, unisexual, the female largest, branched.

A single genus and about 24 species are known, of which one section is tropical, the other of temperate distribution. Ten species are native in the eastern United States. The family is very distinct and shows no definite relationship to any existing plants. The habit, the undifferentiated spores, the peltate sporophylls, and the dioecious emergent prothallia are dis-

tinctive. The arrangement of the canals and also of the stomates along the stem are important in the distinction of species.

The stems of *E. hiemale*, rich in silica, were formerly much used for scouring and for polishing woods, and are still used to some extent. *E. arvense* and *E. sylvaticum* have been used for polishing tin vessels, hence the name "tinweed." Several species have been used in medicine, as diuretics. *E. giganteum* is employed as an astringent. *E. arvense* and *E. palustre* are bad weeds in parts of Europe.

Several species have been advertised by American dealers in native plants.

## CLASS III. LYCOPODINÆ

### Order 6. LYCOPODIALES

13. **Lycopodiaceæ** (from the genus *Lycopodium*, *wolf-foot*, from a fancied resemblance). **CLUB-MOSS FAMILY.** Fig. 1. Branched plants of moderate size, stems often erect when short, usually prostrate, pendent, or creeping: leaves very numerous, small, subulate or oblong, moss-like, often imbricated; rarely the leaves all basal (*Phylloglossum*): sporophylls either similar to the leaves, or much modified and forming terminal "cones;" sporangia and spores of one sort (not macrospores and microspores), the former reniform, borne at the base of a leaf on the upper side; dehiscence longitudinal: prothallia more or less cylindrical or amorphous, in some species green, in others colorless, saprophytic, subterranean or subcortical.

The club-moss family contains 2 genera and about 100 species, all but one of which belong to *Lycopodium*, distributed in all parts of the world except the very dry regions. The majority of the epiphytic species are tropical, but several terrestrial species extend to the arctic circle. Twelve of the species are native in the eastern United States. The family is not closely related to any other. The habit, the undifferentiated spores, and the prothallium are distinctive.

The branching of *Lycopodium* is of two types, the dichotomous, and the monopodial (a central axis from which lateral branches arise). On these types subgenera are based.

The spores of *Lycopodium* (principally of *L. clavatum*), which are produced in great quantities, are used by apothecaries for coating pills, and by metal-workers. These spores are highly inflammable and were formerly used in theaters to produce flashlights. *L. Selago* is emetic, drastic, vermifugal, and emmenagogue. *L. myrsinitis* and *L. catharticum* are purgative. Several other species have been used locally for various complaints. The creeping stems of *L. clavatum* and *L. complanatum* are often used for Christmas and church decorations.

Several species of *Lycopodium* (Club-moss, Ground Pine, Creeping Pine) are gathered or protected in America for decorative purposes or for the spores.

### Order 7. SELAGINELLALES

14. **Selaginellaceæ** (from the genus *Selaginella*, diminutive of *Selago*, ancient name of *Lycopodium*). **SELAGINELLA FAMILY.** Fig. 1. Moss-like or lycopodium-like plants, often of moderate size, usually profusely and dichotomously branched, more rarely monopodial; creeping, pendent or erect, sometimes climbing and several meters long, or minute and 1-3 cm. long; leaves moss-like, very small, usually densely placed, often imbricated, often of two sizes (the branches therefore strongly dorsiventral); ligule present, borne at the base of the leaf on the upper side; roots borne on "rhizophores" which are probably modified branches: spores of two sorts (microspores and macrospores) in separate sporangia, borne in the leaf axils: sporophylls frequently modified, forming a cone or spike: prothallia

endosporeous, the spore wall of the macrospores soon rupturing and exposing the archegonia.

The one genus, *Selaginella*, and about 500 species are widely distributed, but mostly tropical. The majority prefer damp forests, but some (e.g., *S. rupestris*) are xerophytic. Three species are native in the eastern United States. The family is related to the Lycopodiaceæ superficially, but not in the spores and in the prothallia, which are more closely allied to another family, the Isoetaceæ. The habit, the foliar ligule, the undifferentiated spores, and the endosporeous prothallia are distinctive.

The spores of *Selaginella* have been used in the same manner as those of Lycopodium, but are less easily obtainable. *S. concinna* and *S. obtusa* have been used for diarrhea and dysentery. Several Mexican species are used locally for medicine. *S. convoluta* is employed in the East Indies as an aphrodisiac. The rosette-like *S. lepidophylla* of Mexico is the best-known "resurrection plant." When dry, it rolls into a ball and becomes brown; when the air is humid, the branches spread out and the green upper surfaces are exposed.

Many species of *Selaginella* are in choice American collections, but very few are commonly in the trade. They are mostly grown for greenhouse and for table decoration under the name of "lycopodium."

## SPERMATOPHYTES or SIPHONOGAMIA (PHANEROGAMIA)

### SUB-DIVISION I. GYMNASPERMÆ

#### Order 8. CYCADALES

15. **Cycadaceæ** (from the genus *Cycas*, the Greek name of a certain palm). **CYCAS FAMILY.** Fig. 4. More or less woody plants, with thick, unbranched, columnar or tuberous stem: leaves alternate, pinnate: stamens and carpels borne in cones or in temporarily terminal clusters: scales of the staminate cone bearing very many scattered anthers on the under side: the carpels open, not forming a closed ovary, either leaf-like pinnatifid and bearing marginal ovules, or peltate with 2 or more suspended ovules; the latter very large, often 1 inch long, orthotropous, with 1 integument, becoming drupe-like.

Cycadaceæ has 9 genera and about 85 species, distributed in tropical and subtropical regions. *Zamia* is the largest genus, with 30 species. The family stands isolated among the gymnosperms. The palm-like habit, pinnate leaves, very numerous scattered stamens, and, in *Cycas*, the leaf-like carpel, are distinctive. Differences more important to the morphologist are to be found in the embryology, especially in the fertilization by motile sperm-cells. The leaves are circinate when unfolding, like those of a fern. The Cycadaceæ represent an ancient family far more numerous in past geologic ages. Many fossil species are known.

Various species of *Cycas* in the Moluccas and Japan, especially *C. revoluta*, yield a sago in the pithy part of the stem which the natives bake into bread. The Hottentots eat the pith of *Encephalartos*, making from it "Kafir bread." The seeds of *Cycas* and *Zamia* are edible. The leaves of *Cycas* are used at funerals and church festivals as "palm branches."

Several genera are in cultivation in America for greenhouse use and outdoors in the South. These are *Bowenia*; *Ceratozamia* of Mexico; *Cycas* (Sago Palm) of the far East; *Dioon* of Mexico; *Encephalartos* of South Africa; *Macrozamia* of Australia; *Stangeria* of South Africa; *Zamia* (Coontie, Comptie) of tropical America.

#### Order 9. GINKGOALES

16. **Ginkgoaceæ** (from the genus *Ginkgo*, the Japanese name). **GINKGO FAMILY.** Fig. 4. Much-branched tree

with deciduous leaves: secondary wood without true vessels; resin-tubes present: leaves alternate, fan-shaped like the pinnules of *Adiantum*; veins forking: anthers borne in pedicelled pairs on a slender axis, without bracts, the whole somewhat catkin-like: no true pistillate cone; ovules borne in pairs at the summit of branched peduncles, each ovule surrounded at the base by a fleshy ring; fruit drupaceous. Fertilization is by means of motile sperms.

A single genus of one species occurs in China and Japan. Fossil species are known. The family is distantly related to the Coniferae, but the peculiar foliage, as well as the absence of cone structure and the great reduction of sporophylls, is distinctive.

*Ginkgo biloba* (ginkgo, maidenhair tree, Kew tree), the only species, is grown as a park tree.

4. **CYCADACEÆ:** 1. *Cycas*, a, leaf; b, carpel with ovules; c, male scale with anthers. 2. *Zamia*, female cone. **GINKGOACEÆ:** 3. *Ginkgo*, a, leaf; b, ovules; c, stamen.

#### Order 10. CONIFERALES

17. **Taxaceæ** (from the genus *Taxus*, the classical name, probably from the Greek meaning *bow*, for which the wood is used). **YEW FAMILY.** Fig. 5. Much-branched trees or shrubs, with resin-tubes in the bark and no true vessels in the secondary wood: leaves alternate, needle-like or scale-like, persistent: stamens borne on the protected portion of more or less apically thickened or peltate scales (sporophylls) forming a small cone: pistillate cones wanting; ovules borne singly or two together on a fleshy or rudimentary carpel (sporophyll), inverted or straight, the outer integument forming an arillus: fruit a dry seed surrounded by the fleshy often highly colored arillus; the receptacle also often enlarged and forming a fleshy part of the fruit.

Taxaceæ has 8 genera and about 70 species widely distributed, of which 40 belong to the genus *Podocarpus*. The family is related to the Coniferae, but differs in the reduction of the pistillate cone to a single ovule, in the modification or suppression of the sporophyll, and in the aril or arillus. The closely related Ginkgoaceæ has a different staminate inflorescence. Fertilization is by means of pollen-tubes.

The timber produced by the tropical eastern species of *Podocarpus* and of *Dacrydium* (heron pine and

damion pine) is highly valued. The yew wood is hard and susceptible of a high polish. It is used in cabinet work and for bows. The seed and shoots of yew are said to be poisonous, but the arillus is harmless.

In cultivation in America are a few genera for ornamental purposes: *Cephalotaxus*, East Asia; *Podocarpus*, Chile, Japan, Australia, grown in the South; *Taxus* (Yew), Europe, Asia, North America; *Torreya* (California Nutmeg), California to Florida.

18. **Pinaceæ** (from the genus *Pinus*, the classical Latin name). **PINE FAMILY**. Fig. 5. Tree or shrub, with no true vessels in the secondary wood, but with resin-tubes: leaves linear, or needle-like, or scale-like, alternate or opposite, evergreen or deciduous: anthers and ovules both in true cones plainly subtended by scales (sporophylls); the staminate scales usually bearing 2-6, rarely more, anthers on the under side; the pistillate bearing 1-2, rarely many, ovules on the upper side, or peltate and ovule-bearing under the crown or at its base; ovules with 1 integument: fruit

5. **TAXACEÆ**: 1. *Taxus*, a, male cone; b, fruit (seed and aril). **PINACEÆ**: 2. *Tsuga*, female cone. 3. *Picea*, female cone-scale with ovules. 4. *Pseudotsuga*, female cone. 5. *Chamæcyparis*, female cone. 6. *Sequoia*, female cone. 7. *Juniperus*, a, female cones (berries); b, cross-section berry. **GNETACEÆ**: 8. *Ephedra*, a, female inflorescence; b, male inflorescence.

a dry woody cone with dry, often winged seeds between the scales; or berry-like through the union of the fleshy cone-scales.

Sub-family 1. **Cupressineæ**.—Cone-scales opposite; ovules erect: leaves opposite or whorled.

Sub-family 2. **Abietineæ**.—Cone-scales alternate; ovules inverted: leaves alternate.

There are 25 genera and about 240 species, widely distributed but most abundant in temperate regions. The largest genus is *Pinus* with 70 species. The family is related to the **Taxaceæ** and **Ginkgoaceæ**, from which it differs in the presence of true staminate and pistillate cones. It also differs from the latter in the absence of motile sperm-cells.

The **Pinaceæ**, like other **Gymnosperms**, is an old group, more abundant in former geologic ages. Many fossil species are known. The *Sequoias* of California were formerly more abundant, extending to Greenland. The young plants of many **Cupressineæ** possess foliage

quite different in appearance from the mature foliage, the leaves being longer and more spreading. These juvenile forms have been called *Retinisporas*, a name which has been applied also to all cultivated species of *Chamæcyparis*. Juniper "berries" are fleshy cones with peltate, fused scales. The leaves of *Larix*, *Pseudolarix* and *Cedrus* are deciduous. The branchlets and leaves are deciduous in *Taxodium*. The cone-scales of many **Abietineæ** are double, an outer thinner 3-toothed scale, and a thick inner scale that bears the ovules (see *Pseudotsuga*).

Among the **Pinaceæ** are some of our most valuable timber trees; e. g., cedar, arborvitæ, spruce, fir, hemlock and redwood. The resin from various pines when distilled yields spirits of turpentine and rosin; when dry-distilled, it yields tar. Venice turpentine is the resinous exudation of European larches: Canada balsam that of *Abies balsamea*. Dammar resin is from the Malayan *Agathis Dammara*. Kauri resin is the semi-fossilized resin of *Agathis australis* of Australia and New Zealand. Sandarac resin is from *Callitris quadrivalvis* of Northwest Africa. Amber is the fossilized resin of prehistoric conifers around the Baltic. Oil of savin is from the leaves and twigs of *Juniperus sabina*, and oil of cedar from *Thuja occidentalis*. Juniper berries, from *J. communis* of Europe and America, are diuretic and also used for flavoring gin. Edible seeds are produced by *Pinus Pinea* (stone pine) of the Mediterranean, *P. Cembra* of Europe and Siberia, *P. Parryana* and *P. edulis* of the southwestern United States, *Podocarpus nerifolia* of the East Indies, *Araucaria brasiliana* of Brazil, and *A. Bidwillii* of Australia. Bread is made by the Laps and Eskimos from the inner bark of *Pinus sylvestris* and *Abies alba*; also from various **Pinaceæ** by our northwestern Indians. Deodar (*Cedrus Deodara*) is sacred to the Hindoos. *Cedrus Libani* is the cedar of Lebanon. Pine bark was formerly used for tanning.

Many genera are in cultivation in America. Among these are: *Abies* (Fir, Balsam); *Araucaria* (Norfolk Island Pine, Monkey Puzzle); *Callitris* (Cypress Pine); *Cedrus* (Cedar of Lebanon, Deodar); *Chamæcyparis* (White Cedar, Yellow Cedar, Hinoki Cypress, Sawara Cypress, Retinispora, Japanese Cedar); *Cryptomeria*; *Cupressus* (Cypress, Monterey Cypress); *Juniperus* (Red Cedar, Juniper, Savin); *Larix* (Larch, Tamarack, Hackmatack); *Libocedrus* (Incense Cedar, White Cedar); *Picea* (Spruce); *Pinus* (Pine, Pannon, Soledad); *Pseudolarix* (Golden Larch); *Pseudotsuga* (Douglas Spruce, Red Fir); *Sciadopitys* (Umbrella Pine); *Sequoia* (Big Tree of California, Redwood); *Taxodium* (Bald Cypress, Deciduous Cypress); *Thuja* (Arborvitæ, White Cedar); *Thuyopsis*; *Tsuga* (Hemlock Spruce).

## Order 11. GNETALES

19. **Gnetaceæ** (from the genus *Gnetum*, derived from *Gnemon*, said to be the old Malay name of the plant). **GNETUM FAMILY**. Fig. 5. Very peculiar semi-woody plants of diverse habit: leaves large and broad, or modified, or reduced, or opposite, or whorled: no resin-tubes in the stem; secondary wood containing true vessels: true flowers present, with a 2-4-parted perianth, unisexual, rarely bisexual; stamens 2-8; pistillate perianth becoming juicy or wing-like in fruit and enclosing one naked orthotropous seed with 1 or 2 integuments.

The family consists of 3 genera and about 35-40 species, widely distributed. It is distinguished from the **Conifera** by the presence of a perianth, the absence of resin-tubes, and the presence of vessels in the secondary wood. The endosperm development, also, approaches that of the **Angiosperms**. The fertilization is by means of pollen-tubes. The three genera are very distinct: *Ephedra*, of the tropics of both hemispheres, is much branched, with slender jointed striate

equisetum-like stems, leaves scale-like at the distant nodes; Gnetum of South America, except one species, is a group of vines or shrubs with large broad leaves like those of an Angiosperm; Welwitschia of South Africa is a desert plant with a thick subterranean stem bearing two ribbon-like leaves 6 feet long, lying flat on the ground, and with a terminal cluster of cone-like flower-spikes.

It is doubtful whether any of these are regularly in the American trade.

## SUB-DIVISION II. ANGIOSPERMÆ

### CLASS I. MONOCOTYLEDONEÆ

#### Order 12. PANDANALES

**20. Typhaceæ** (from the genus *Typha*, the old Greek name). CATTAIL FAMILY. Fig. 6. Perennial marsh herbs, with creeping rootstocks, and long-linear, erect, mostly basal leaves: flowers monœcious, naked, in a dense terminal spike, which is staminate above and pistillate below, each sex subtended by one bract-like spathe; perianth 0; stamens 2-5; filaments connate, bearing long, silky hairs; carpels 1; ovary 1-celled, raised on a stipe which also bears long, silky hairs; ovule 1, suspended; style slender: fruit a nutlet; seed albuminous.

A single genus and about 12 species occur in the tropical and temperate zones. Fossil species are known. The family is closely related to the Sparganiaceæ, with which it was formerly united. These two families constitute a very distinct group of simple-flowered Monocotyledons. The habit, the flowers borne in spikes without perianth, the hairy pedicels, the absence of bracts, and the simple pistil, are together distinctive.

The starchy rootstocks are sometimes used for food. The leaves are woven into matting, and into chair-bottoms, and are used for calking barrels. The pollen has been used as a substitute for the spores of *Lycopodium*. The rootstock is used in East Asia for dysentery and urethritis, and the leaves in various localities for thatching cottages. A vain attempt has been made to utilize the silky hairs of the fruit for making velvet.

Two species of *Typha* (Cattail Flag, Reed Mace), both native, are in the American trade for water-gardens.

**21. Pandanaceæ** (from the genus *Pandanus*, derived from a Malay name). SCREW-PINE FAMILY. Fig. 6. Shrubby or arborescent plants: stems simple or branched, with prop-roots: leaves spirally arranged, densely placed, sword-shaped, often canaliculate, clasping, stiff; edges and midrib often spiny-serrate: flowers on simple or branched spadices, diœcious, naked; spathes caducous; stamens densely packed, separated or united in fascicles, scattered over the spadix, and not in definite flowers; pistillate spadix simple; ovaries numerous, coherent in bundles, or isolated, not in real flowers; stigma sessile; ovules solitary or several: fruit drupaceous, cohering in multiple fruits; seed albuminous.

There are 3 genera and about 350 species, natives of the tropics of the Old World. The family is unique. The floral structure, while much like that of *Typha*, suggests also the Palmaceæ. As in *Typha*, actual flowers cannot here be distinguished.

The fleshy pericarps of some are eaten. The strong odor of the staminate flowers is either agreeable or disagreeable, depending on the species; in the former case the flowers are used for perfumery. The leaves of *Pandanus utilis* are made into bags for shipping coffee, and the plant is now cultivated for that purpose in the West Indies.

Ten to 15 species of *Pandanus* (Screw Pine, Candelabrum Tree, Chandelier Tree) are in greenhouse cultivation in America.

#### Order 13. HELOBIÆ

**22. Naiadaceæ** (from the genus *Naias*, derived from the Greek, meaning "a water nymph"). PONDWEED FAMILY. Fig. 6. Immersed aquatic herbs: leaves mostly cauline, opposite or alternate, the floating often differing from the submerged in shape and texture: flowers axillary or spicate, bisexual or unisexual; perianth of 4 herbaceous segments, or wanting; stamens 1-4, rarely more; carpels 1-9, mostly distinct, 1-celled, 1-ovuled: fruit a nutlet; endosperm none; embryo curved, rarely straight.

Naiadaceæ has 10 genera and about 100 species widely distributed, but most abundant in temperate regions. The largest genus is *Potamogeton* with 50 species. The family is a very heterogeneous one which has been divided or united in many ways by different authors. As here treated it is distinguished by the aquatic habit, greenish, often reduced perianth, few stamens, and few, separate, 1-seeded carpels. A spathe-like bract usually incloses the inflorescence.

The dried leaves of *Zostera* and *Posidonia* have been used since ancient times in Venice to pack glassware. They are now widely used for packing. Plants of *Potamogeton* and *Zostera* are employed as manure. Several species of *Potamogeton* (Pondweed) and one of *Zannichellia* are possibly in the American trade, for water-gardens.

6. TYPHACEÆ: 1. *Typha*: a, inflorescence; b, male flower; c, female flower. PANDANACEÆ: 2. *Pandanus*, a, portion male inflorescence; b, female inflorescence, vertical section. NAIADACEÆ: 3. *Naias*: a, male flower; b, female flower. 4. *Potamogeton*, a, flower; b, vertical section nutlet.

**23. Aponogetonaceæ** (from the genus *Aponogeton*, derivation obscure). APONOGETON FAMILY. Aquatic herbs with tuberous rhizomes, and basal, submerged or floating leaves; blade linear to oval, palmately parallel-veined, with transverse veinlets; the general tissue between the veins often wanting, thus producing a remarkable openwork latticed effect: flowers spicate, bisexual, regular, hypogynous; perianth of several petaloid parts; stamens usually 6, rarely more; carpels mostly 3, rarely 4-6, separate; ovules 2-6, mostly basal, anatropous: fruit pouch-like; endosperm none.

The single genus, with its 15 species occurs in Africa, Madagascar, tropical Asia and Australia. The family is related to the Naiadaceæ, with which it was formerly united, and from which it is distinguished by the petaloid perianth, several ovules, and straight embryo.

The roots are sometimes eaten by natives.

*Aponogeton distachyus* (Cape pondweed, water hawthorn) is cultivated in water-gardens.

**24. Alismaceæ** (from the genus *Alisma*, the Greek name). WATER-PLANTAIN FAMILY. Fig. 7. Herbace-

ous marsh plants with milky juice: leaves mostly basal, sheathing, with a scale in the axil; blade various, floating or erect, often sagittate, varying in size and width with the depth of the water, palmately parallel-veined with cross veinlets; flowers bisexual or unisexual, regular, hypogynous, in whorls of 3; sepals 3, more or less hyaline; petals 3, white and petaloid; stamens 6 to many, in several whorls; carpels very many, separate or rarely coherent, spirally arranged or in a whorl, 1-ovuled, rarely 2-5-ovuled; fruit dry, rarely dehiscent; seed basal, anatropous, exalbuminous; embryo curved.

The family has 10 genera and about 50 species, distributed throughout the warmer and temperate zones. The family is related to the Butomaceæ and Juncaginaceæ, which are all peculiar in having an axillary intravaginal scale. The whorled flowers, differentiated perianth, numerous carpels, and mostly solitary, basal, exalbuminous seeds are distinctive.

The acrid juice formerly led to the occasional use of these plants in medicine. The tubers and rhizomes of *Sagittaria* were eaten by the American Indians as wappato, and are cultivated in China. They are said to come into the Chinese market at San Francisco, preserved in liquid.

Two genera are in cultivation for water-gardens: *Alisma* (Water Plantain), native; and *Sagittaria* (Arrowhead), some native.

25. **Butomaceæ** (from the genus *Butomus*, signifying *ox + to cut*, in reference to the rough leaves). Fig. 7. Aquatic or marsh herbs: leaves basal, with an axillary scale, sometimes with milky juice; blade linear or oval; veins palmately parallel with cross veinlets, or nearly veinless: flowers solitary or umbelled, bisexual, regular, hypogynous; sepals 3, subherbaceous; petals 3, colored, imbricated; stamens 9 or more, whorled; carpels 6 or more, separate; ovules numerous, borne

Two genera are in cultivation for water-gardens: *Butomus* (Flowering Rush), and *Limncharis* (Water Poppy).

26. **Hydrocharitaceæ** (from the genus *Hydrocharis*, derived from the Greek meaning *water and rejoice*). FROG'S-BIT FAMILY. Fig. 7. Submerged aquatic herbs, rarely floating, the flowers usually at first inclosed by a 2-bracted spathe: leaves alternate or opposite, very diverse, cordate, linear or ribbon-like: flowers usually unisexual, regular, epigynous; perianth in 2 series, composed of 3 imbricated or valvate, calicoid parts, and 3 convolute petaloid parts, rarely of only 3 divisions; stamens in 1 to several series of 3, some often staminodia; carpels 2-15; ovary inferior, 1-celled with parietal placentæ, or imperfectly several-celled; stigmas 3-6; fruit not regularly dehiscent, submerged, somewhat fleshy; seeds many, exalbuminous.

There are 14 genera and about 40 species widely distributed. The family is related to the Alismaceæ and Naiadaceæ. The differentiation into calyx and corolla, the usually numerous stamens, the inferior, 1-celled ovary with parietal placentæ, and the exalbuminous seeds are together characteristic. The plants of this family are very diverse in appearance and often striking. Fossil species are known. The pollination of *Vallisneria* is very remarkable. (See Kerner and Oliver, "Natural History of Plants").

*Elodea canadensis*, introduced into Europe from America, has there become so abundant as to impede navigation. The plants of *Hydrocharis*, *Stratiotes*, and *Elodea* are used as fodder and as manure in Europe. The starchy rootstocks of *Ottelia* and *Boottia* are eaten in India as pot-herbs; also the tubers and fruits of *Enalua*. The fibers from the leaves of *Enalua* are used in India. *Vallisneria alternifolia* is employed in India in the preparation of sugar.

Five genera are in cultivation in America, mostly for aquaria: *Elodea* (Waterweed, Ditch-Moss, Water Thyme, Water Pest); *Hydrocharis* (Frog's-Bit); *Limnobia* (American Frog's-Bit); *Stratiotes* (Water Soldier, Water Aloe); *Vallisneria* (Eel-Grass, Tape-Grass).

#### Order 14. GLUMIFLORE

27. **Gramineæ** (from the Latin signifying *grass*). GRASS FAMILY. Fig. 8. Herbs, or sometimes almost tree-like: stems hollow or solid; leaves usually linear, in 2 ranks; composed of a sheath which is usually open down the front, a sessile blade, and a ligule at the juncture of blade and sheath: flowers bisexual or unisexual, naked, or with the perianth reduced to 1-3 tiny scales, borne in specialized spikelets composed of 3 or more 2-ranked scales, the first 2 empty (called empty glumes), the others termed flowering glumes or lemmas, and 1 scale on each secondary flower-bearing axis, called a palea or palea; stamens 2-3, exserted for wind-pollination; carpel 1; ovary 1, 1-celled, 1-ovuled; stigmas feathery, usually 2: fruit a caryopsis; seed with endosperm, and embryo with an absorbing organ.

Gramineæ is a family of 300-400 genera and perhaps 5,000 species distributed all over the earth. The largest genera are *Panicum* with 300-400 species, *Paspalum* with 160 species, and *Poa* with 100 species. The Gramineæ and Cyperaceæ form a very distinct group. The usually hollow stem, the open sheaths, the ligule, the 2-ranked leaves, and the peculiar spikelet-structure are the best characters to separate Gramineæ from Cyperaceæ. The Indian corn is one of the most modified of grasses. It is monœcious. The staminate spikelets are arranged on finger-like branches of the tassel at the summit of the plant; the pistillate spikelets are borne on the cob, which is supposed to be composed of similar finger-like portions grown together. Each spikelet is 2-flowered, but only 1 flower bears an ovary. The kernel is this ovary, and the chaff on the cob represent the glumes and paleas. The grasses are divided into 13 tribes.

7. ALISMACEÆ: 1. *Alisma*, a, inflorescence; b, flower; c, floral diagram; d, fruit. 2. *Sagittaria*, a, fruit; b, achene. BUTOMACEÆ: 3. *Butomus*, flower. HYDROCHARITACEÆ: 4. *Elodea*, female flower branch. 5. *Vallisneria*, a, habit and flower; b, female flower.

between the margins and midrib of the carpel: fruit dry, dehiscent; seed anatropous, exalbuminous; embryo straight or curved.

The family contains 4 genera and about 5 species, natives of the temperate and tropical zones of the Old World, and the tropics of the New World. The family is related to the Alismaceæ and Juncaginaceæ, from the former of which it differs principally in the numerous ovules and their peculiar position.

The roots and seeds of *Butomus* were once used as emollients. The baked roots of *Butomus* are eaten in North Asia.

The grasses are among the most useful of plants. The following, among others, are, or have been, used as medicine: Rhizome of *Agropyron repens* (quick- or quack-grass) is emollient, and aperient (several other grasses have the same properties). Root of *Arundo Donax* (reed) is diuretic and sudorific. *Phragmites communis* was formerly considered depurative and anti-syphilitic. *Calamagrostis* was used by the French peasants as a diuretic. *Perotis latifolia* is used in India for the same purpose, as are also the seeds of *Coix Lacryma-Jobi* in China. The roots of *Manisuris granularis* are used in India for intestinal troubles. The aromatic, fragrant roots of various *Andropogons* (or *Cymbopogons*) are used for medicine and for perfume in India and elsewhere, e. g., *A. Nardus* (false spikenard, citronella), *A. citratus* (lemon-grass). *A. lanier* and *A. Schœnanthus* (sweet rush, ginger-grass, geranium-grass) are used in Africa and Arabia as a stimulant, antispasmodic and diaphoretic, and for perfume.

The following are used for food: Seeds of wheat, barley, rye, oats, rice, Indian corn and millet; also seeds of *Andropogon arundinaceus* var. *vulgare* (sorghum), and var. *Durra* (durra). *Pennisetum americanum* (pearl millet) is an important food of the negro races, and *Poa abyssinica* and Eleusine are important in East Africa. Sugar is obtained from the stems of several species, most important of which are *Saccharum officinarum* (sugar-cane), and *Andropogon arundinaceus* var. *saccharatus* or *A. Sorghum* (sugar sorghum).

Many grasses are used as fodder for cattle, as, for instance, our pasture and hay grasses: *Poa pratensis* (June grass, Kentucky blue grass), *Phleum pratense* (timothy), *Festuca ovina*, etc. (fescue), *Agrostis alba* (red-top), *Dactylis glomerata* (orchard-grass), *Cynodon Dactylon* (Bermuda-grass). Some grasses are poisonous to stock, e. g., *Lolium temulentum* (darnel), and the Peruvian *Festuca quadridentata*.

Straw from cereals is used for matting, upholstery, bedding, hats and for making paper.

The bamboos yield very important building material in the East. Like the palms, the bamboos are used for almost every conceivable purpose, and are among the most useful of plants.

Several grasses, other than those above mentioned, contain a fragrant principle, e. g., roots of *Vetiveria zizanioides* (vetiver or kus-kus of India) used to perfume rooms, and to keep insects out of clothing. *Hierochloa odorata* (vanilla- or holy-grass) is used in Europe in religious ceremonies, and by the American Indians for making baskets. *Anthoxanthum odoratum* is the European sweet-grass, now introduced into America.

The most important ornamental species are *Phalaris arundinacea*, *Stipa pennata*, *Cortaderia argentea*, *Lagurus ovatus*, *Hordeum jubatum*, *Miscanthus sinensis*, *Briza*, *Arundo*, *Phragmites*, *Erianthus*, *Pennisetum*, *Thysanolaena*, and Bamboos.

In America 70-80 genera are cultivated, or are important as natural fodder plants or weeds. Among these are: *Agropyron* (Quack-Grass, Couch-G., Quick-G.); *Agrostis* (Bent-G., Red-Top, Cloud-G., Tickle-G., Fly-away-G.); *Aira* (Hair-G.); *Andropogon* (Silverbeard-G., Johnson-G., Lemon-G.); *Anthoxanthum* (Sweet Vernal-G.); *Ammophila* (Beach-G., Marram-G.); *Arundinaria* (Large Cane, Switch Cane, Scotch Cane); *Arundo* (Giant Reed); *Avena* (Oats); *Bamboo*; *Briza* (Quaking-G.); *Bromus* (Brome-G., Rescue-G.); *Calamagrostis* (Reed Bent-G., Blue-joint-G., Pony-G.); *Calamovilfa* (Purple Bent-G.); *Cenchrus* (Sand-bur, Bur-G.); *Chloris* (Finger-G.); *Cinna*; *Coix* (Job's Tears, Tear-G., Corn Beads); *Cortaderia* (Pampas-G.); *Cynodon* (Bermuda-G.); *Cynosurus* (Crested Dog's-tail, Silky-awned Dog's-tail); *Dactylis* (Cock's-foot, Orchard-G.); *Dactyloctenium* (Crowfoot-G.); *Desmazeria* (Spike-G.); *Deschampsia* (Hair-G., Hassock-G.); *Digitaria* (Crab-G., Finger-G.); *Distichlis* (Salt-G., Marsh Spike-G.); *Echinochloa* (Barnyard-G.); *Eleusine* (Crab-

G., Yard-G., Dog's-tail, Wire-G., African Millet); *Elymus* (Lyme-G., Wild Rye, Terrel-G.); *Eragrostis*; *Erianthus* (Woolly Beard-G., Plume-G., Wool-G., Ravena-G.); *Euchlœna* (Teosinte); *Festuca* (Fescue-G.); *Glyceria* or *Panicularia* (Reed Meadow-G., Manna-G.); *Cortaderia*; *Hierochloa* (Vanilla-G., Holy-G., Seneca-G., Sweet-scented-G.); *Holcus* (Meadow Soft-G.); *Hordeum* (Squirrel-tail-G., Wild Barley, Barley); *Hystrix* or

8. GRAMINEÆ: 1. a, part of a grass panicle; b, spikelet. 2. Avena, a, portion of panicle; b, spikelet; e.g., empty glume; fl.g., flowering glume or lemma; pal., palea or palea; c, ground-plan of spikelet. 3. Phleum, spikelet. 4. Phalaris, sheath and ligule.

*Asprella* (Bottle-G.); *Lolium* (Darnel, Rye-G.); *Milium* (Wild Millet-G.); *Miscanthus* (Eulalia, Himalaya Fairy-G.); *Oplismenus*; *Oryza* (Rice); *Oryzopsis* (Mountain Rice); *Panicum* (Panic-G., Old-Witch-G., Millet, Broom Corn Millet); *Pennisetum* (Pearl Millet); *Phalaris* (Canary-G., Gardener's Garters); *Phleum* (Timothy-G., Herd's-G.); *Phragmites* (Common Reed); *Phyllostachys* (Bamboo, in part); *Poa* (Blue-G., Kentucky Blue-G., Meadow-G.); *Saccharum* (Sugar-cane); *Secale* (Rye); *Setaria* (Millet, Hungarian-G., Foxtail-G., Pigeon-G.); *Spartina* (Cord-G.); *Sphenopholis*; *Stenotaphrum* (St. Augustine-G.); *Stipa* (Feathered-G., Espartago-G., Porcupine-G.); *Tripsacum* (Gama-G., Sesame-G.); *Triticum* (Wheat, Spelt).

28. **Cyperaceæ** (from the genus *Cyperus*, the ancient Greek name). **SEDGE FAMILY**. Fig. 9. Herbaceous plants with grass-like habit and solid stems; leaves alternate, in 3, rarely 2, vertical rows, linear; sheaths closed; flowers bisexual or unisexual, regular, hypogynous, borne in variously disposed spikelets, subtended and hidden by overlapping scales none of which are regularly empty as in the grasses; no true paleas; perianth reduced to bristles, scales, or 0; stamens 2-3; carpels 2-3; ovary 1-celled, 1-ovuled; style 1; stigmas 2-3; fruit an achene; seeds basal, anatropous, albuminous.

There are 65 genera and about 3,000 species, inhabiting the whole earth. More than 500 species belong to the genus *Carex*, 400 to *Cyperus*, and 200 to *Scirpus*. They are abundant in swampy regions. The family is closely related to the Gramineæ, from which it differs in the often 3-ranked leaves, solid stem, the absence of paleas and of regular empty glumes, and the presence, in most cases, of a perianth and 3 carpels. Most divergent from the ordinary is *Carex*, the flowers of which are monœcious, and the pistillate, though naked, are inclosed in a flask-shaped structure called a peri-

gynium, which probably corresponds to the modified palet of the grass spikelet. The elongated perianth forms the wool of the wool-grass or cotton-grass. The scales of the spikelet are in 2 ranks in *Cyperus* and *Dulichium*; in many ranks in the other genera.

The Cyperaceæ are of far less economic importance than the Gramineæ. The rhizomes of several species of *Carex* were formerly used as a remedy in syphilis. *Scirpus lacustris* is astringent and diuretic, but other

much-branched spadix, with or without a subtending spathe, the latter often woody; flowers unisexual, rarely bisexual, often sunk in the spadix; perianth of 6 parts in 2 series, greenish, often woody, valvate in the staminate, imbricated or convolute in the pistillate flower; stamens 6, rarely 3 or many, on or around a disk, separate or united; carpels 3, rarely fewer, separate or forming a 1-3-celled ovary; each cell 1-ovuled, but all except one seed in the ovary may abort; stigmas usually 3; fruit a berry or drupe; pericarp fleshy or fibrous; seeds albuminous.

Palmaceæ has 128 genera and about 1,000 species of tropical distribution; 10-15 species are found in the southern United States. The largest genera are *Calamus* with about 200 species, *Bactris* with 90 species and *Chamædorea* with 60 species. The family is very distinct, having no close relatives, but it evidently belongs to the spathe- and spadix-bearing group. The habit, coriaceous plicate leaves which are entire in the bud, the woody flowers and inflorescence, the 3 sepals and 3 petals, the usually 6 stamens, and the 3 carpels, each with 1 seed, are together distinctive.

Palm leaves are always entire in the bud, and if later pinnatifid or palmatifid, become so on unfolding. In this respect the palms are unique. The leaves are plicate in the bud, and, on opening, the plates of the fan expand and either remain united or, more frequently, split down along the folds. In the pinnate species the rachis between the folds elongates so that the divisions are separated, and the well-known palm leaf is produced. The splitting may be at the top of the fold, or at the bottom, depending on the genus, and is an important characteristic in classification. Some of the largest seeds in the plant kingdom belong to the Palmaceæ, as, for example, the coconut. This fruit is produced from an originally 3-celled ovary, 2 cells of which abort.

Next to the grasses, the palms are the most generally useful of all plants. It is said that probably there is not a species but that is useful in some way. Many yield textile fibers. The wood is used to build houses and the leaves to thatch the roofs. The leaves are also made into mats, baskets, hats, and the like. The fibrous bud-sheaths are used as hats, or for fiber. Some species contain starch or sugar in the trunk. The fruits of many contain sugar, protein, starch, or oil. Comparatively few are medicinal. "The palm is called King of Plants and is said to supply all the wants of an inhabitant of the tropical zone. It yields sugar, milk, solid cream, wine, vinegar, oil, cordage, cloth, cups, wood for building, thatch and other products." Coconuts, the fruit of *Cocos nucifera*, form one of the most important foods of the tropics. The date fruit (*Phoenix dactylifera* of the Sahara) is also important. *Metroxylon Rumphii*, and other species, yield sago. A fermented liquor known as palm wine, laymi or arrack, is made from the juice of *Arenca saccharifera*, *Borassus flabelliformis*, *Metroxylon Rumphii*, *Mauritia vinifera*, and others. The central bud of the cabbage palm and others is used for food. Most palm oil is from the fruit of *Elæis guineensis* of West Africa, which is now cultivated in America. It is used like olive oil, or in the North for making soap. Vegetable wax is obtained from the leaves and stems of *Ceroxylon andicolum* of Peru, also from *Copernicia cerifera* (carnauba wax). The famous 'giant double coconut is from *Lodoicea sechellarum* of the Seychelle Islands. The fruit of *Areca Catechu* of the East Indies and India yields an astringent juice which, mixed with the leaves of the betel pepper and lime, is chewed by the inhabitants of tropical Asia. Coconut fiber is important for making ship cables. The very slender stems of *Calamus*, often 300 feet or even 500 feet long (it is reported 1,200 or 1,800 feet, but not verified) and scarcely larger than a pipe-stem or a finger, are called rattan, and used for furniture. Much of the dragon's blood of the druggists

9. CYPERACEÆ; 1. *Scirpus*, a, portion of inflorescence; b, flower. 2. *Eriophorum*, spikelet. 3. *Carex*; a, inflorescence; b, vertical section perigynium. PALMACEÆ; 4. *Chamærops*, a, spathe and spadix; b, floral diagram. CYCLANTHACEÆ; 5. *Cyclanthus*, inflorescence. 6. *Carludovicia*, inflorescence.

species also possess this property. The foliage of *Eriophorum* has been used for dysentery. The spongy pith of the *Eriophorum* stem was used by German peasants for tapeworm. The tubers of *Cyperus esculentus*, now a weed in all countries, were cultivated by the Egyptians for food. The leaves of many species of Cyperaceæ have been woven into mats, chair-bottoms, and the like. The Egyptians made parchment from the pith of *Cyperus Papyrus*. The rhizomes of *Eleocharis tuberosa* are used in the manufacture of starch, in China and India. *Cyperus scariosus* and *C. pertenuis*, of India, are fragrant and used in making perfumery. Some carices are used in making rugs.

Several genera are in cultivation in America, mostly for water-gardens, table decorations, and the conservatory: *Carex* (Sedge); *Cyperus* (Umbrella Palm, Egyptian Paper Plant, Egyptian *Papyrus*, Chufa); *Dulichium*; *Eleocharis*; *Eriophorum* (Cotton-Grass, Wool-Grass); *Mapania*; *Scirpus* (Bulrush Sedge).

#### Order 15. PRINCIPES

29. **Palmaceæ** (from the Latin name *palma*). **PALM FAMILY.** Fig. 9. Woody plants of various habit, low, or arborescent, or climbing, usually unbranched, sometimes pinnate: leaves forming a crown at summit of stem except in *Calamus*, alternate, coriaceous, palmately or pinnately veined, entire or pinnatifid or palmatifid, often very large: inflorescence a simple or

is the red juice of the fruit of *Calamus Draco*. Palm-leaf fans are made from the palmately veined leaves of several species. The saw palmetto (*Sabal serrulata*) of the southern states is medicinal. The seeds of *Phytelphas macrocarpa* have a very hard endosperm known as vegetable ivory, used for carving as a substitute for ivory.

Probably 100 genera are in the trade. Except in the tropics, they are almost entirely ornamental greenhouse plants. Among these are: Areca (Betel Nut); Attalea; Bactris; Calamus; Caryota (Fish-tail Palm, Wine Palm, Toddy Palm); Ceroxylon (Wax Palm); Chamædorea; Cocos (Coco Palm, Coconut, Pindo Tree); Corypha (Talipot Palm); Dæmonorops; Elæis (Oil Palm); Erythea (Blue Palm); Geonoma; Hedyscepe (Umbrella Palm); Howea (Flat Palm, Thatch Leaf Palm, Curly Palm); Livistona; Oreodoxa (Royal Palm, Cabbage Palm); Phoenix (Date Palm); Phytelphas (Ivory Palm); Rhapsis; Rhipidophyllum (Blue Palmetto, Needle Palmetto); Sabal (Dwarf Palmetto, Blue Palm, Cabbage Palmetto); Serenæa (Saw Palmetto); Thrinax; Trachycarpus (Fortune's Palm); Washingtonia or Pritchardia (Weeping Palm).

#### Order 16. SYNANTHÆ

30. **Cyclanthaceæ** (from the generic name *Cyclanthus*, which has reference to the spiral arrangement of the flowers). CYCLANTHUS FAMILY. Fig. 9. Stemless or caulescent, palm-like, somewhat woody plants, often climbing; leaves alternate, coriaceous, cleft or parted; flowers in a dense terminal unbranched spike (spadix), with several bract-like spathes beneath; staminate flowers grouped in 4 bundles accompanying the pistillate, or both in conspicuous alternating spirals; staminate perianth reduced and fimbriate, or 0; stamens 6 to many, borne in groups; perianth of the pistillate flower 0, or of 4 fleshy parts accompanied by 4 long, twisted, exerted staminodia; carpels 4, united below, sunken in the spadix; ovary 1-celled, many-ovuled, with parietal placentæ; fruit multiple, a berry-like spike. The tissue of the spadix splits into valves, coiling up from the base to apex and thus inclosing the fruitlets which deliquesce.

This family has 5 genera and about 50 species, of which 35 belong to Carludovica. They are confined to the tropics of America, and stand intermediate between the Palmaceæ and Araceæ. The family is distinguished by the combination of palm-like foliage, numerous ovules, thick spadix, and closely associated staminate and pistillate flowers.

The flowers of *Cyclanthus bipartitus* of Brazil are vanilla-scented, cultivated, and cooked with meat as an aphrodisiac. The leaves of *Carludovica palmata* furnish the material for the panama hats.

Several species of Carludovica are in the American trade as greenhouse plants.

#### Order 17. SPATHIFLORÆ

31. **Araceæ** (from the genus *Arum*, the ancient name of these plants). ARUM FAMILY. Fig. 10. Herbs, shrubs, or trees, of the most diverse habit and appearance, often climbing, or epiphytic with aerial roots, rarely floating, usually subfleshy; juice sometimes milky; leaves ensiform or broad, parallel- or netted-veined, entire or variously cut; flowers bisexual or unisexual, rarely reduced to a single stamen and carpel, regular, hypogynous or epigynous, disposed on an unbranched fleshy axis (spadix), which is usually subtended by a special bract (spathe); perianth 0, or of 4-8 parts; stamens 1 to many; carpels 1 to several; ovary superior or inferior, 1 to several-celled, 1 to many-ovuled; style and stigmas various; fruit a berry; seeds albuminous, outer integument fleshy.

Araceæ has over 100 genera and about 900 species, widely distributed, but most abundant in the tropics.

especially as epiphytes in the deep, damp forests. The majority in the temperate regions are swamp-plants. The largest genera are Philodendron with 100 species, and Arisæma with 50 species. The family stands as the type of the spathe-bearing plants. Its close relatives are the Lemnaceæ, Palmaceæ, and Cyclanthaceæ, from which it is distinguished more by general habit and texture than by structural details.

The pollination of the Araceæ is often complicated and remarkable (see Kerner and Oliver). The transfer of the pollen is mostly accomplished by flies, which are frequently attracted by lurid color and carrion scent. The leaves of Monstera are remarkable for their peculiar perforations, while the massive petioles of other Araceæ are sometimes mottled like snakeskin. Pistia is a much-reduced floating aquatic, transitional to the Lemnaceæ. The aerial roots of the epiphytic species are frequently covered with a special water-absorbing tissue. The unfolding spathes of the Araceæ are noted for the heat evolved. The tissues are usually very mucilaginous and filled with needle-like crystals of calcium oxalate. These crystals are supposed to give the pungent flavor to Indian turnip simply by mechanically penetrating the tongue.

Many species have been used locally for medicine. *Lagenandra toxicaria* of Ceylon is extremely poisonous.

10. ARACEÆ: 1. Arisæma, spathe and spadix. 2. Arum spadix with male and female flowers. LEMNACEÆ: 3. Lemna, a, whole plant; b, male and female flowers, and spathe. BROMELIACEÆ: 4. Bromelia, flower. 5. Ananas, a, fruiting inflorescence; b, floral diagram. COMMELINACEÆ: 6. Commelina, flower. 7. Tradescantia, flower.

*Dieffenbachia Seguine* and *Arisæma triphyllum* are violent irritants when chewed, causing the mouth to swell. *Arum maculatum* of Europe was used by the ancients as an excitant. The roots of *Symplocarpus* have been used for asthma and colds. The roots of *Acorus Calamus* (sweet flag) are aromatic and used for coughs, colds, and the like. The thick rootstocks and roots of many have been used for food, e. g., *Oreontium aquaticum* of North America, *Colocasia antiquorum* of India, *Alocasia macrorrhiza* (taro) of the Pacific Islands, and *Peltandra virginica* of North America. The rhizomes of *Arisæma maculatum* and *Calla palus-*

*tris*, mixed with cereals, according to Linnæus, serve for food among the Laps and Finns. Portland arrow-root is derived from Arums. The delicately flavored, juicy fruits of *Monstera deliciosa* are eaten in Mexico. The shoots of *Xanthosoma sagittifolium*, called carai-be cabbage, are eaten as a vegetable in the Antilles. The aerial roots of aroids are used to tie bundles of sarsaparilla sent to Europe and America.

Because of their odd habit and strange appearance, as well as, in some cases, for real beauty, many Araceæ are in cultivation, mostly as conservatory plants. Many genera are in the American trade. Among these are: *Acorus* (Sweet Flag); *Alcasia*; *Amorphophallus* (Devil's Tongue, Snake Palm, Stanley's Wash-Tub); *Anthurium*; *Arisæma* (Indian Turnip, Jack-in-the-Pulpit, Dragon Root, Fringed Calla); *Arum* (Black Calla, Solomon's Lily, Lord and Ladies, Cuckoo Pint, Wake-Robin of England); *Biarum*; *Caladium*; *Calla*; *Colocasia*; *Dieffenbachia*; *Heliconia* (Hairy Arum); *Monstera* (Ceriman, Shingle Plant); *Nepenthes*; *Orontium* (Golden Club); *Peltandra* (Water Arum); *Pistia* (Water Lettuce, Tropical Duckweed); *Pothos*; *Saurum*; *Schizomatoglossis*; *Spathiphyllum*; *Symplocarpus*, or *Spathyema* (Skunk Cabbage); *Xanthosoma* (Malanga); *Zantedeschia*, or *Richardia* (Calla Lily, Lily-of-the-Nile).

32. **Lemnaceæ** (from the genus *Lemna*, an old Greek name of uncertain origin). DUCKWEED FAMILY. Fig. 10. Tiny aquatic plants floating or submerged, the plant body reduced to an oval or oblong, flat or globular thallus, which multiplies rapidly by marginal buds, and may or may not bear 1 or more roots on the under side: flowers unisexual, naked, monœcious; the staminate consisting of 1 stamen; the pistillate of 1 flask-shaped, 1-celled pistil, with several ovules; the latter orthotropous or anatropous, the micropyle transformed into a cap: fruit a several-seeded utricle.

There are 3 genera and about 25 species, distributed over the whole earth, except the arctics. The family is related to the Araceæ, from which it is supposed to have degenerated. The flowers, which rarely occur, are borne in minute pits in the edge or upper surface of the thallus, either 1 staminate and 1 pistillate, or 2 staminate and 1 pistillate together; in some genera provided with a spathe corresponding to the spathe in the Araceæ. The roots, when present, are balancing organs to resist the upsetting of the plant by the waves. *Wolffia* is the tiniest flowering plant, the whole plant sometimes in size only half the diameter of a pinhead.

By the very rapid vegetative multiplication of some species, ponds are often completely covered with a green coating, and these plants may then become of economic importance.

*Lemna* and *Spirodela* are often grown in aquaria.

#### Order 18. FARINOSÆ

33. **Bromeliaceæ** (from the genus *Bromelia*, in honor of Olaus Bromel, a Swedish botanist). PINEAPPLE FAMILY. Fig. 10. Herbs or subshrubs, mostly epiphytic: leaves usually basal, alternate, linear, trough-like, sheathing at the base, mostly stiff and spiny-serrate, usually covered in part or all over with peltate scale-like hairs or glands: flowers in spikes, racemes, panicles or heads, often in the axils of imbricated, highly colored, bracts, usually bisexual, regular, epigynous or hypogynous; perianth of 6 parts, definitely differentiated into calyx and corolla; parts free or united; stamens 6, often borne on the perianth; anthers intorse; ovary inferior or superior, 3-celled; ovules many; style 1; stigmas 3: fruit a berry or capsule, more or less surrounded by the persistent perianth; seeds albuminous.

The family has 40 genera and about 900 species, almost exclusively of tropical and subtropical America. *Tillandsia usneoides* reaches Florida and Texas.

*Tillandsia* is the largest genus with 120 species. The family is closely related to the Liliaceæ and Amaryllidaceæ. The peculiar stiff leaves, the conspicuous bracts, the herbaceous calyx, the mealy endosperm, and, in general, the epiphytic habit, are distinctive. There are few families more easily recognized than this.

The most important economic species is the pineapple (*Ananas sativus*), the fruit of which is an important article of commerce. Its unripe juice is used as a vermifuge and diuretic. Florida or Spanish moss (*Tillandsia usneoides*) is used in the preparation of a stiptic ointment. It is also used to stuff mattresses, under the name of vegetable hair. *Billbergia tinctoria* is the source of a dye. The leaves of pineapple yield a beautiful fiber. *Bromelia Pinguin* is a vermifuge employed in the West Indies.

There are several genera grown in America, all for ornamental purposes except the pineapple. Among these are: *Æchmea*; *Ananas* (Pineapple); *Billbergia*; *Bromelia* (Pinguin of Jamaica, Wild Pine); *Cryptanthus*; *Dyckia*; *Guzmania*; *Nidularium*; *Pitcairnia*; *Tillandsia* (Spanish Moss, Florida Moss, Long Moss); *Vriesia*.

34. **Commelinaceæ** (from the genus *Commelina* dedicated to J. and G. Commelin, Dutch botanists of the early 18th century). SPIDERWORT FAMILY. Fig. 10. Herbs with knotty stems, and somewhat sheathing, alternate, flat or channeled, cauline leaves: flowers usually bisexual, almost or quite regular, hypogynous; perianth of 6 parts, in 2 series, differentiated into a green calyx and colored corolla; the petals separate or united into a tube, mostly quickly disappearing, and dissolving into a viscid liquid; stamens 6, or reduced to 3, with or without staminodia; some anthers often sterile and altered; the filaments usually provided with characteristic long hairs; ovary superior, 2-3-celled, few-seeded; style 1; stigma usually capitate: fruit a capsule.

Twenty-five genera and about 300 species occur, widely distributed in the tropics and subtropics. Eleven species reach the northeastern United States. The largest genus is *Commelina*, with 88 species. The family is not closely related to any other. The general habit, the complete differentiation of the perianth into calyx and corolla, the slight irregularity of the flower, the peculiar stamen-hairs, and the transformed anthers, are together distinctive. The peculiar deliquescent character of the petals in many genera is of interest.

The rhizomes of several species of *Commelina* contain starch, besides the mucilage, and are eaten. The rhizome of *C. Rumphii* is an emmenagogue. The tubers of *Aneilema medicum* are used in China for coughs and lung diseases. A decoction of *Cyanotis axillaris* is used by the Indians for dropsy. The family is most important from the point of view of ornamental use.

Several genera are grown in America, all for ornament. Among these are: *Aneilema*; *Cochliostema*; *Commelina* (Day Flower); *Dichorisandra*; *Tradescantia* (Spiderwort, Wandering Jew); *Zebrina* (Wandering Jew).

35. **Pontederiaceæ** (from the genus *Pontederia*, named in honor of Ponteder, professor at Padua in the 18th century). PICKEREL-WEED FAMILY. Fig. 11. Upright or floating, fleshy, water- or swamp-plants: leaves alternate; petioles sheathing; blade cordate, oval, or orbicular, or reduced to the linear flattened petiole: flowers not bracted, bisexual, irregular, hypogynous; perianth of 6 similar parts, in 2 whorls, more or less connate, persistent; stamens 3 or 6, rarely 1, inserted unequally on the perianth-tube; anthers intorse; ovary superior, 3-celled and ovules many, or 1-celled and 1-seeded; style 1; stigmas 3: fruit a capsule, or an achene enveloped by the fleshy persistent base of the perianth; embryo as long as the endosperm.

The family contains 6 genera and about 20 species, of which 9 belong to the genus *Heteranthera*, and about 5 to *Eichhornia*. They are distributed in the swamps of

II. Vegetation areas.—Aquatic, marsh and upland floras, and the relation of farm lands.

the warmer parts of the earth, except Europe. The family is most closely related to the Liliaceæ, from which it differs in the irregular flowers, in the sympodial method of growth, in anatomical characters, and principally in the abundant mealy endosperm.

A decoction of the root of *Monochoria vaginalis* of the Far East is used for liver and stomach complaints; the root is chewed for toothache; pulverized and mixed with sugar it is used for asthma; the leaves bruised and mixed with milk are used for cholera; and the shoots are edible. *Eichhornia crassipes* is a floating fleshy plant with beautiful flowers. It has become so abundant in Florida as to interfere seriously with steam-boat navigation in the rivers. The large violet flowers of both *Eichhornia* and *Pontederia* are valued in cultivation for water-gardens.

Two genera are frequent in cultivation: *Eichhornia* (Water Hyacinth), from South America; and *Pontederia* (Pickerel-weed), native.

#### Order 19. LILIFLORÆ

36. **Juncaceæ** (from the genus *Juncus*, classical name, derived from *jungere*, to join). RUSH FAMILY. Fig. 11. Rush-like or grass-like herbs or shrubs: flowers numerous, very small, bisexual, regular, hypogynous; perianth of 6 similar, separate parts, greenish or brownish, chaffy; stamens 3 or 6 in 2 whorls; carpels 3; ovary 1-

11. PONTEDERIACEÆ: 1. *Pontederia*, floral diagram. JUNCACEÆ: 2. *Luzula*, flower. 3. *Juncus*, a, flower; b, floral diagram. LILIACEÆ: 4. *Dracena*, flower. 5. *Fritillaria*, floral diagram. AMARYLLIDACEÆ: 6. *Leucoium*; a, flower; b, floral diagram. 7. *Narcissus*, flower.

or 3-celled; ovules 3 to many; stigmas 3: fruit a capsule; seeds mostly very small, albuminous, anatropous.

**Juncaceæ** has 7 genera and about 175 species, of which 160 belong to the genus *Juncus*, widely distributed in temperate and cold regions, both north and south, but rare in the tropics. The family is closely related to the Liliaceæ, from which it differs only in the rush- or grass-like habit and scarious perianth. Fossil species are known. The leaves are sheathing and the blades are either flat, or tubular and nodulose. Distichia of the Andes is densely heath-like or moss-like.

The stems and leaves of many species are used for binding, or for weaving into mats. Light hats are made from the pith of certain species in India and China. The pith is also used for candlewicks.

In cultivation in America are 2 genera for water-gardens: *Juncus*; *Prionium*, woody. *Xanthorrhoea* is transferred to the Liliaceæ.

37. **Liliaceæ** (from the genus *Lilium*, classical Latin

name). LILY FAMILY. Fig. 11. Herbs, shrubs, or trees, usually with rootstocks or bulbs, sometimes climbing: leaves alternate, rarely with petiole and blade: flowers bisexual, rarely unisexual, regular, hypogynous, rarely epigynous, not subtended by spathes; perianth petaloid, of 6 similar parts, in 2 series, the parts separate or connate, rarely differentiated into a green calyx and colored corolla; stamens 6, rarely fewer, hypogynous, or borne upon the perianth; carpels 3, rarely more or fewer, united, rarely free; ovary usually 3-celled; ovules 1 to many in each cell; styles and stigmas 1-3: fruit a capsule or berry.

There are about 200 genera and 2,000 species, distributed in all parts of the world. The large genera are *Smilax* with 200 species, *Allium* with 250 species, *Asparagus* with 100 species, *Aloe* with 85 species and *Scilla* with 80 species. The Liliaceæ, taken in the broader sense, as is done by Bentham & Hooker, and by Engler, is an easily recognized group except in unusual cases. The regular, 6-parted perianth, 6 stamens, and 3-celled superior ovary are distinctive. The family has been divided by Engler into 11 tribes. The Liliaceæ furnishes a host of cultivated plants.

The following plants, among others, have been or are used in medicine: *Amanthium muscatolicum* of North America as a narcotic and a fly poison; various species of *Uvularia* of North America as a gargle and for rattlesnake bites; the root of *Polygonatum* sp. in Europe as a vulnerary, and the berries as an emetic and purgative; the berries of *Smilacina racemosa* of North America as a tonic; the root of *Convallaria majalis* of Europe as a purgative; the leaves of *Streptopus amplexicaulis* of North America as a gargle; the roots of *Ruscus* of Europe as a diuretic and emmenagogue; the roots of *Smilax* sp. of the tropics (the sarsaparillas of commerce) as a tonic and diuretic; the roots of *Asparagus officinalis* in Europe as an aperient, the berries as a diuretic and aphrodisiac, and the shoots as a sedative and cardiac; the roots of *Cordylone* of the southern tropics for dysentery; the flowers of *C. deflexa* as an emmenagogue; the resin from *Xanthorrhoea hastilis* (Botany Bay gum, with a fragrance like benzoin) in Australia for throat troubles; the resin of *X. australis* (grass tree gum, earth shellac, or nut pitch) for various purposes; the tubers of *Ophiopogon japonicus* (serpent's beard) in China and Japan for abdominal troubles; the bulbs of *Gagea* of Europe as an emetic; the flowers of *Hemerocallis* of Europe as a cordial; the leaves of species of *Aloe* of the Old World as a tonic, purgative, and emmenagogue (*A. Perryi* is Socotrine aloes, *A. vera* is Barbadoes aloes, and *A. spicata* is Cape aloes); the bulb of *Urginea maritima* (squills) of the Mediterranean as a diuretic, expectorant, and emetic; *Allium* sp. as a vermifuge and carminative; the bulbs of *Hyacinthus*, *Muscari*, and *Ornithogalum* of Europe as purgatives and diuretics; *Ornithogalum altissimum* of the Cape as a remedy for asthma and catarrh; *Anthericum* and *Asphodelus* as diuretics and emmenagogues; *Tulbaghia* of the Cape as a vermifuge and for phthisis; the poisonous root of *Veratrum album* (white hellebore) of Europe as a violent purge and emetic, and to exterminate vermin; *V. nigrum* (black h.) of Europe, and *V. viride* (green h.) of the United States, occasionally, for the same purpose; *Schœnocaulon officinalis* (cavaddilla or sabadilla) of Mexico for vermin and as a vermifuge; the narcotic, poisonous root and seeds of *Colchicum officinale* of Europe as a cathartic, emetic, and sedative; and *Helonias bullata* of North America as a vermifuge. The roots of *Gloriosa*, also, are poisonous. *Dracæna Draco*, the dragon tree of the Canaries and Teneriffe, famous for the extreme age and size of the trees, was superstitiously revered by the ancients. The red resinous astringent exudation of these plants was called dragon's blood.

The following have been used for food: Bulbs of *Camassia esculenta*, western United States; bulbs and

leaves of *Allium* sp. (onion, leek, eschalot or shallot, rochambole); shoots of *Polygonatum*, Europe, United States; shoots of *Asparagus officinalis*; roots of *Cordyline* sp., in South Sea Islands, and there called *ti*. The seeds of *Ruscus* are a substitute for coffee.

A few have been used for other purposes: Roots of *Yucca* for soap; fibers of New Zealand flax (*Phormium tenax*) for fabrics; and the fragrant root of *Dianella nemorosa* for incense.

For ornament, great numbers of genera and species are in cultivation.

Very many genera are in cultivation, some common, for ornamental purposes unless otherwise stated. Among these are *Agapanthus* (African Lily, Lily-of-the-Nile); *Alettris* (Colic Root), native; *Allium* (Onion, Chives, Cives, Garlic, Leek, Shallot), ornament and food; *Asphodeline* (True Asphodel, King's Spear); *Asphodelus* (Branching Asphodel); *Bessera* (Mexican Coral Drops); *Brevoortia* (Floral Fire-Cracker); *Brodiaea*; *Calochortus* (Star Tulip, Globe Flower, Mariposa Lily, Butterfly Tulip); *Camassia* (Camass); *Chionodoxa* (Glory-of-the-Snow); *Chlorogalum* (Soap Plant, Amole); *Clintonia*, native; *Colchicum* (Meadow Saffron, Autumn Crocus); *Cordyline* (*Dracæna*); *Dasyllirion*; *Dracæna* (Dragon Tree); *Erythronium* (Dog's-tooth Violet, Adder's Tongue); *Eucomis* (Royal Crown, Pineapple Flower); *Fritillaria* (Crown Imperial, Black Lily, Checkered Lily); *Funkia* (Day Lily, Plantain Lily); *Galtonia* (Giant Summer Hyacinth); *Gasteria*; *Gloriosa* (Climbing Lily); *Haworthia*; *Helonias* (Swamp Pink, Stud Pink); *Hemerocallis* (Yellow Day Lily, Lemon Lily); *Hyacinthus* (*Hyacinth*); *Kniphofia* (Red-hot-poker Plant, Torch Lily, Flame Flower); *Lachenalia* (Cape Cowslip); *Lapageria* (Chilean Bellflower); *Leucoerinum* (Sand Lily); *Lilium* (Lily, Easter Lily, Madonna Lily, Tiger Lily, Japan Lily, Turk's-cap Lily); *Littonia* (Climbing Lily); *Maianthemum* (False Lily-of-the-Valley, Two-leaved False Solomon's Seal), native; *Medeola* (Indian Cucumber Root), native; *Melanthium* (Bunch Flower); *Milla* (Mexican Star, Mexican Star of Bethlehem, Frost Flower, Floating Star); *Muscari* (Grape Hyacinth, Musk Hyacinth, Feathered Hyacinth); *Narthecium* (Bog Asphodel); *Nolina*; *Nothoscordum* (Yellow False Garlic, Streaked-leaved Garlic); *Oakesia* (Wild Oats), native; *Ornithogalum* (Star of Bethlehem); *Paradisea* (St. Bruno's Lily, St. Bernard's Lily); *Paris* (Herb Paris, Love Apple, True Love); *Phormium* (New Zealand Flax); *Polygonatum* (Solomon's Seal); *Ruscus* (Butcher's Broom); *Sansevieria* (Bow-string Hemp); *Scilla* (Squill, Wild Hyacinth, Bluebell, Harebell, Spanish Jacinth, Sea Onion, Starry Hyacinth, Cuban Lily, Hyacinth of Peru, Peruvian Jacinth); *Semele* (Climbing Butcher's Broom); *Smilacina* (False Solomon's Seal), native; *Smilax*; *Streptopus* (Twisted Stalk), native; *Tricyrtis* (Toad Lily); *Trillium* (Wake-Robin, Birthroot, Bethroot, White Wood Lily, Ground Lily), native; *Triteleia* (Spring Star-Flower); *Tulipa* (Tulip); *Urginea* (Sea Onion, Squills); *Uvularia* (Bellwort, Wild Oats), native; *Veratrum* (False Hellebore, White Hellebore, Green Hellebore, Black Hellebore, Indian Poke); *Xanthorrhoea* (Grass Tree, Grass Gum, Black Boy); *Xerophyllum* (Turkey's Beard); *Yucca* (Spanish Bayonet, Adam's Needle, Bear Grass, Silk Grass); *Zygadenus* (Fly-poison).

38. **Amaryllidaceæ** (from the genus *Amaryllis* named for a nymph celebrated by Virgil). **AMARYLLIS FAMILY**. Fig. 11. Caulescent or acaulescent herbs, bulbous- or fibrous-rooted: leaves alternate, elongated, entire: flowers bisexual, regular or irregular, epigynous, usually borne singly or in clusters from a spathe-like bract; perianth of 6 similar parts in 2 series, usually connate below into a tube and sometimes with a tubular or cup-shaped crown in the throat; stamens 6, some occasionally staminodial; anthers introrse; ovary inferior, 3-celled; ovules numerous, anatropous; style 1; stigmas 1-3: fruit a capsule, rarely a berry; seeds albuminous.

There are 71 genera and about 800 species, widely distributed but most abundant in the steppe regions of the tropics and subtropics. Five species are found in the northeastern United States. The largest genera are *Crinum* with 60 species, and *Hypoxis*, and *Hippeastrum* with 50 species each. The family is most closely related to the *Liliaceæ*; less closely to the *Iridaceæ*. The 6-parted perianth, 6 stamens with introrse anthers, and inferior 3-celled ovary, are together distinctive.

The bulbs or rootstocks of some species have been used in medicine. Those of *Narcissus Pseudo-Narcissus* and *Leucoium vernum* are vigorous emetics. Those of *Crinum zeylanicum* of the Moluccas, *Amaryllis Belladonna*, of the Cape of Good Hope, and *Buphane toxicaria* of South Africa are violent poisons. The latter is used by the Kafirs to poison their arrows. In South America the farinaceous tubers of the *Alstroemeria* are eaten. The most important plants are the *Yuccas*. From the terminal bud of these, a sugary liquid is obtained which by the Mexicans is made into a fermented drink, called pulque; when distilled this drink is called mescal. The juice of the leaves has been used for syphilis, scrofula, and cancers. The leaf-fibers yield vegetable silk or sisal hemp, and are also made into paper. Razor-strops and cork are made from the pith. The flowers are sometimes boiled and eaten.

Forty or more genera are in cultivation in America, as ornamental plants in greenhouse and garden. Among these are: *Agave* (Century Plant, Sisal Hemp, Pulque Plant); *Alstroemeria*; *Amaryllis* (*Belladonna Lily*); *Beschorneria*; *Bomarea*; *Bravoa* (Mexican Twin Flower); *Cooperia* (Evening Star, Giant Fairy Lily); *Crinum* (St. John's Lily, Florida Swamp Lily); *Eucharis* (*Amazon Lily*, Star of Bethlehem); *Eurycles* (Brisbane Lily); *Furcraea*; *Galanthus* (Snowdrop); *Griffinia* (Blue *Amaryllis*); *Hæmanthus* (Blood Lily); *Hippeastrum* (*Amaryllis*, Lily-of-the-Palace, Barbadoes Lily); *Hy-menocallis* (Spider Lily, Sea Daffodil); *Hypoxis* (Star Grass), native; *Leucoium* (Snowflake); *Lycoris* (Golden Spider Lily); *Narcissus* (*Narcissus*, Jonquil, Daffodil, Pheasant's Eye); *Nerine* (Guernsey Lily); *Pancratium* (Spider Lily, Spirit Lily); *Polianthes* (Tuberose); *Sprekelia* (*Jacobean Lily*); *Tecophilæa* (Chilean Crocus); *Vallota* (Scarborough Lily); *Zephyranthes* (*Zephyr Flower*, Fairy Lily, *Atamasco Lily*).

39. **Taccaceæ** (from the genus *Tacca*, from the Malay name). **TACCA FAMILY**. Fig. 12. Herbaceous plants: leaves large, entire, or commonly pinnatifid or bipinnatifid, all basal: flowers saucer- or urn-shaped, bisexual, regular, epigynous; perianth of 6 nearly separate similar parts in 2 series; stamens 6, borne on the base of the perianth; filaments queerly broadened and cucullate; ovary inferior, 1-celled, or incompletely 3-celled; ovules numerous; placenta parietal; style umbrella-like, the terminal disk variously lobed, and bearing the peculiar stigmatic pores beneath: fruit a capsule or berry; seed albuminous.

**Taccaceæ** has 2 genera and 10 species, inhabitants of the tropics of both hemispheres, mostly of the Malay archipelago. A very distinct family of doubtful relationship, even suggesting several Dicotyledonous families, but probably close to the *Dioscoreaceæ* and *Amaryllidaceæ*. The acaulescent habit, the epigynous bisexual flowers, the six queer stamens, and the 1-celled, many-ovuled ovary, are together distinctive.

Several species of *Tacca*, e. g., *T. pinnatifida*, possess tubers from which a starchy meal, called arrowroot, is made in the East. Straw hats are made from the stems of *Tacca* by the Tahitians.

*Tacca pinnatifida* and *T. cristata* are cultivated sparingly in America.

40. **Dioscoreaceæ** (from the genus *Dioscorea*, named in honor of Dioscorides). **YAM FAMILY**. Fig. 12. Climbing or twining herbs or shrubs: leaves alternate, mostly arrowhead-shaped: flowers bisexual or unisex-

ual, regular, small, and inconspicuous; perianth of 6 similar parts, in 2 series; stamens usually 6, or the 3 inner staminodia; ovary inferior, 3-celled, rarely 1-celled; placentæ axile or parietal; ovules 2 in each cell, superposed, anatropous; stigmas 3, or each 2-parted; fruit a capsule or berry; seed albuminous.

Nine genera and about 170 species, of which 150 belong to the genus *Dioscorea*, are distributed very generally in the tropics and in the subtropics, and extend sparingly into the north temperate zone. They are most abundant in South America and the West Indies. One species reaches north to southern New England. The family is related to the Amaryllidaceæ and Liliaceæ. The climbing habit, peculiar leaves, definite stamens, inferior 3-celled ovary, and 2 albuminous seeds are distinctive. Most Dioscoreaceæ spring from a tuberous base, which is sometimes very large and conspicuous. Odd tubers are borne in the leaf-axils of species of *Dioscorea* and *Rajania*.

The tuberous root of *Dioscorea Batatas* yields the yams of eastern commerce, a very important article of food in the Far East. Those of several other species, including our own native *D. villosa*, are also cultivated in various parts of the tropics. The leaves of some species are used in intermittent fevers. The tubers of *Tamus communis* were formerly employed as a purgative, and were also applied to bruises, hence the name "beaten woman's herb." The shoots are eaten like asparagus.

Two genera are in cultivation in the United States, mostly in the South: *Dioscorea* (Yam, Chinese Potato, Cinnamon Vine, Air Potato); *Testudinaria* (Hottentot's Bread, Tortoise Plant, Elephant's Foot), rarely grown.

41. **Iridaceæ** (from the genus *Iris*, the rainbow). **IRIS FAMILY.** Fig. 12. Herbs or sub-shrubs with fibrous roots or often tuberous rootstocks (corms); leaves mostly basal, equitant, linear; flowers usually showy, bisexual, regular or irregular, epigynous, each with 2 spathe-like bracts; perianth of 6 petaloid parts in 2 series, usually unlike, generally connate into a tube; stamens 3, the inner whorl wanting, separate or connate; anthers extrorse; ovary inferior, 3-celled, rarely 1-celled; ovules few to many, anatropous; style 1; stigmas 3; fruit a capsule; seeds albuminous.

The iris family has 57 genera and about 1,000 species of wide distribution. The two main centers are the Cape of Good Hope and subtropical America. The family is not plainly related to any other, perhaps most closely to the Amaryllidaceæ. The ensiform equitant leaves, the 6-parted showy perianth, the 3 extrorse stamens, and the inferior 3-celled ovary, are together characteristic.

The rootstocks of many Iridaceæ are purgative and diuretic, e. g., *Iris florentina*, *I. germanica*, *I. pallida*, and *I. versicolor*. The rootstock of *I. florentina* is fragrant and used for sachet perfume and tooth-powder (orris root). *I. Pseudacorus* and *I. versicolor* have been used for dropsy and diarrhea. *I. fetidissima* was an ancient remedy for scrofula and hysteria. The stigmas of *Crocus sativus* have been renowned since earliest times as an emmenagogue; they are deep orange in color, and used also in dyeing and as a condiment. Iris-green of the painters was prepared by treating violet iris flowers with lime. The seeds of *I. Pseudacorus* have been used as a substitute for coffee. The rootstocks of *Homeria collina* of South Africa are very poisonous. The family contains many well-known ornamental plants.

In America, many genera are in cultivation, all for ornamental purposes. Among these are: *Belamcanda* (Blackberry Lily, Leopard Flower); *Crocus*; *Freesia*; *Gladiolus*; *Hermoadactylus* (Snake's-head Iris); *Iris* (*Fleur-de-lis*, *Iris*, *Cladwin*); *Ixia*; *Moræa* (Wedding Iris); *Schizostylis* (Crimson Flag); *Sisyrinchium* (Blue-eyed Grass, Satin Flower, Rush Lily); *Sparaxis* (Wand Flower); *Tigridia* (Tiger Flower, Shell Flower); *Trionia* (Blazing Star).

## Order 20. SCITAMINEÆ

42. **Musaceæ** (from the genus *Musa*, the Arabic name). **BANANA FAMILY.** Fig. 12. Large, semi-ligneous herbs, the stout stem enveloped at base by the sheathing petioles, unbranched; leaves alternate, entire, convolute, pinnately parallel-veined; flowers bisexual, or unisexual, irregular, epigynous, borne in the axil of a bract in spikes with subtending spathes; nectaries ovarian; perianth of 6 parts, in 2 series, the parts unequal in size and shape, separate or variously united; stamens 6, 5 fertile and 1 staminodium; ovary inferior, 3-celled; ovules solitary and basal, or numerous and axile, anatropous; style 1; stigmas usually 3; fruit

12. **TACCACEÆ:** 1. *Tacca*, flower. **DIOSCOREACEÆ:** 2. *Dioscorea*, leaf and fruit. **IRIDACEÆ:** 3. *Crocus*, a, vertical section whole plant; b, floral diagram. 4. *Sisyrinchium*, flower. **MUSACEÆ:** 5. *Musa*; a, flower, st., stamen; b, floral diagram. **ZINGIBERACEÆ:** 6. *Zingiber*, a, flower; st., stamen; b, floral diagram.

fleshy and pulpy or drupaceous, indehiscent, dehiscent or separating into fruitlets; seeds with perisperm; embryo straight.

Six genera and about 60 species occur, 30 of which belong to the genus *Heliconia* and 20 to *Musa*, of general tropical distribution. Fossil species are known. The family is related to the Marantaceæ, Zingiberaceæ and Cannaceæ; with the last it is often united. These families all have irregular flowers of the same type, and inferior ovaries; but the Musaceæ differ in their slightly differentiated calyx and corolla, in the 5 fertile stamens, and in the absence of aromatic principles.

The banana (*Musa paradisiaca*, *M. sapientum*, etc.) is the most important economic plant, the fruit of which is widely used for food. The pith of the stem, top of the floral spike, and also the shoots, are eaten as vegetables. The fibers from the petioles of *Musa textilis* are made into thread and fabrics. The leaves are used to thatch huts. The traveler's tree (*Ravenala madagascariensis*) holds sufficient water at the leaf bases to serve for drink. The water is obtained by boring the sheath. The seeds of this tree are eaten.

Four genera are in cultivation in the South and in conservatories, for ornament; and one also, *Musa*, for the fruit: *Heliconia* (Balisier, Wild Plantain); *Musa* (Banana, Plantain Tree, Chumpá, Adam's Fig); *Ravenala* (Traveler's Tree); *Strelitzia* (Bird of Paradise Flower).

43. **Zingiberaceæ** (from the genus *Zingiber*, the Indian

name). GINGER FAMILY. Fig. 12. Herbs with creeping or tuberous rhizomes, rarely with fibrous roots; leaves basal or cauline, alternate, sheathing; blade with ligule at top of petiole, linear or elliptic, the pinnately parallel veins strongly ascending; flowers bisexual, irregular, epigynous; perianth of 6 parts, in 2 series, differentiated into a tubular 3-toothed or spatheform somewhat herbaceous calyx, and a tubular unequally 3-lobed corolla; 1 stamen only is fertile, opposite this is a large petaloid staminodium, and there are sometimes other smaller ones; ovary inferior, 3-celled, rarely 1-celled; ovules many in each cell; style 1; stigma usually 1: fruit a capsule; seed with large perisperm, small endosperm, and straight embryo.

There are 24 genera and about 270 species, distributed in the tropical regions of the eastern hemisphere. Only 2 genera are in America. The largest genera are *Amomum*, with 50 species, and *Alpinia*, with 40 species. The family is related to the Musaceæ, Marantaceæ and Cannaceæ, but differs in the ligule, the aromatic oil, the sharp differentiation of the perianth, the single stamen, and the large single staminodium.

To the spicy aromatic flavor of the rhizomes and fruits the family owes its useful qualities. Ginger is from the rhizomes of *Zingiber officinale*, cultivated from India. Cardamon fruits are from *Elettaria Cardamomum* of farther India. Curcuma or turmeric is from the rhizomes of *Curcuma longa*, cultivated from south-east Asia. This is used in medicine, and for flavoring pickles. In it is a yellow dye. The seeds of *Amomum Melegueta* of west Africa are the grains of para-

dise of commerce. Galangal, used in perfumery, is the rootstock of *Alpinia Galanga* of the East Indies.

Several genera are in cultivation in America, mostly grown for ornamental purposes in greenhouses and principally in the South. Among these are: *Alpinia* (Shell Flower); *Amomum*; *Curcuma* (*Curcuma*, Turmeric); *Elettaria* (commercial Cardamon seeds); *Hedychium* (Butterfly Lily, Ginger Lily, Garland Lily); *Kæmpferia*; *Zingiber* (Ginger).

44. **Cannaceæ** (from the genus *Canna*, the origin of the name not clear). CANNA FAMILY. Fig. 13. Similar to the Marantaceæ in all but the following structural details: no joint nor ligule at summit of petiole; ovules many in each cell of the ovary; embryo straight.

This family contains a single genus and 25-50 species of tropical and subtropical America.

The starchy rhizome of *C. edulis* is grown and eaten in the West Indies and Australia. The arrowroot starch of the English and French is derived from *C. coccinea* of the West Indies and South America. The cannas are popular ornamental garden plants.

45. **Marantaceæ** (from the genus *Maranta*, named for Maranti, a Venetian botanist and physician of the 16th century). ARROWROOT FAMILY. Fig. 13. Herbs with rhizomes: leaves mostly basal, with an articulation at the summit of the petiole; blade linear to oval, pinnately parallel-veined; inflorescence usually surrounded by spathe-like bracts; flowers bisexual, irregular, epigynous; perianth of 6 parts, plainly differentiated into calyx and corolla, the latter somewhat irregular; one stamen of the inner set fertile, petaloid, with lateral anther, the two others of the inner whorl transformed into enlarged staminodia; usually 1 or 2 of the outer whorl also present as petaloid staminodia; ovary inferior, 3-celled, rarely 1-2-celled; ovule 1 in each cell; style flat and twisted or lobed; fruit a capsule or berry; seeds with perisperm, and aril; embryo curved.

Marantaceæ has 12 genera and about 160 species, of damp situations in the tropics, mostly American. The largest genus is *Calathea* with 60 species. The family is related to the Cannaceæ, Zingiberaceæ, and Musaceæ. The joint at the summit of the petiole, the type of stamen-irregularity, the 1-seeded cells of the ovary, and the curved embryo are distinctive.

The rhizome of *Maranta arundinacea* is cultivated in tropical America, and furnishes the maranta arrowroot of commerce; rhizomes of some other species are eaten. Many species are ornamental, mostly for conservatory.

Five or 6 genera are in cultivation in America, as *Calathea* (Rattlesnake Plant); *Maranta*; *Phrynium*; *Stromanthe*; *Thalia*.

#### Order 21. MICROSPERMÆ

46. **Orchidaceæ** (from the genus *Orchis*, an ancient name of these plants). ORCHID FAMILY. Fig. 13. Herbaceous plants of very diverse habit and structure; terrestrial, epiphytic or saprophytic, sometimes climbing; the terrestrial with fibrous roots or with thickened tuber-like roots, the epiphytic often with the base of the leaf and adjoining stem swollen, forming a pseudobulb; the saprophytic without chlorophyll; the epiphytic often with aerial hanging roots are provided with a water-absorbing layer (velamen): leaves alternate, succulent, coriaceous or membranous, linear to oval: flowers bisexual, rarely unisexual, irregular, epigynous; perianth of 6 parts, in 2 series, usually all petaloid; one petal larger, forming the lip (labellum); stamens originally 6, but all except 1 or 2 wanting, or reduced to staminodia, united with the pistil; pollen-grains compound, granular, or aggregated into masses (pollinia) which are either free in the anther or attached by a stalk to a viscid apical or stigmatic gland; carpels 3; ovary inferior, 1- or 3-celled; ovules very numerous; style united with the stamens to form the column; stigma in the front of the column, or on a projecting lobe; fruit a capsule; seeds very minute.

13. **CANNACEÆ**: 1. *Canna*, a, flower; b, floral diagram. **MARANTACEÆ**: 2. *Maranta*, a, flower, pistil removed; b, floral diagram. **ORCHIDACEÆ**: 3. *Lycaste*, a, flower; b, column, front view; c, pollinia and gland; d, floral diagram. 4. *Cypripedium*, a, flower; b, column, under side; c, column, side view; d, floral diagram. (st., fertile stamen; ster., sterile stamen; stig., stigma; g., gland; p., pistil).

This is an important family of more than 400 genera and between 6,000 and 10,000 species. Orchids are very widely distributed, except in the arctics, but are most numerous in the tropics. Those of temperate regions are mainly terrestrial; those in the tropics commonly epiphytic. The large genera are *Epidendrum*, 500 species; *Habenaria*, *Dendrobium*, *Bulbophyllum*, and *Oncidium*, 200–600 species each; *Masdevallia*, *Odontoglossum*, and *Maxillaria*, each 100 or more species.

From the standpoint of the intricate and very special mechanisms evolved in order to insure cross-pollination, the orchids are the most wonderful of our insect-pollinated plants. For a detailed account see Darwin's "Fertilization of Orchids," or Kerner and Oliver's "Natural History of Plants." In general, the insect visiting the showy flower for the honey comes in contact with the sticky gland above the stigma, thereby pulling it out, along with the attached pollen masses. While the insect is going to another flower, the pollen masses dry and bend down until they are in position to strike the viscid stigma, which tears away and retains some of the pollen. The method of pollination in *Cypripedium* is fundamentally different. Some orchids (e.g., *Catasetum*) possess a sensitive explosive mechanism that forcibly ejects the pollen mass, often to the distance of 2 or 3 feet. The minute seeds of the orchids are well adapted to be disseminated by the wind and find lodgment in the crevices of the bark of trees and on other supports.

Orchids are divided into large groups as follows:

Group I. *Diandra*. The two lateral stamens of the inner whorl fertile; the dorsal of the outer whorl staminodial or fruitful, the others absent. *Cypripedium*, *Selenipedium*, *Paphiopedilum*, and others.

Group II. *Monandra*. The dorsal stamen of the outer whorl fruitful, all the others wanting. By far the majority of the species belong here. Subgroup I. Pollinia connected by caudicles with a gland at base of anther near stigma. Subgroup 2. Pollen without caudicles or with these attached to a gland at apex of anther.

The family is very distinct and easily distinguished. Its only near relatives are the *Burmanniaceæ*. The peculiar structure of the stamens and pistil, together with the minute exalbuminous seeds are distinctive.

The *Orchidaceæ* is perhaps the most important family from the standpoint of ornamental gardening. To grow these singular, fantastic, showy, and often sweet-scented flowers has in recent years become almost a craze. It is estimated that, whereas Linnaeus knew but a dozen exotic orchids, at the present day more than 2,500 are known to English horticulturists. Plants in the family useful for other purposes are few. The most important is vanilla, derived from the capsule of *Vanilla planifolia* of Mexico, and now widely cultivated in the tropics. Faham (*Angræcum fragrans* of Bourbon) has a fragrant, bitter-almond-like taste; the leaves are used for indigestion and tuberculosis, and are known as Bourbon tea. Salep is derived from the roots of various terrestrial orchids of the Mediterranean region. The roots of helleborine (*Epipactis latifolia*) are used for rheumatism. The root of *Spiranthes diuretica* of Chile is renowned as a diuretic. The flowers of *Habenaria conopsea* are used for dysentery. *Spiranthes autumnalis* and *Habenaria bifolia* are said to be aphrodisiac. The roots of *Cypripedium parviflorum* var. *pubescens* are frequently used in America as a substitute for valerian.

## CLASS II. DICOTYLEDONEÆ

### Sub-class 1. *Archichlamydeæ* (*Choripetalæ* and *Apetalæ*)

#### Order 22. VERTICILLALES

47. *Casuarinaceæ* (from the genus *Casuarina*, derived from the resemblance of the branches to the feathers of the bird cassowary). **CASUARINA FAMILY.**

Fig. 14. Shrubs, or much-branched trees, with the habit of the horse-tail (*Equisetum*) or *Ephedra*: branches whorled, jointed, striate; leaves replaced by striate, many-toothed sheaths; flowers monœcious or diœcious, the staminate in spikes, the pistillate in heads; perianth of the staminate flower of 2, rarely 1, bract-like parts; stamen 1; perianth of the pistillate flower 0; ovary 1-celled, rarely 2-celled, 2–4-ovuled; stigmas 2; fruit

14. **CASUARINACEÆ:** 1. *Casuarina*, a, portion of male inflorescence; b, diagram of whorl of flowers; c, female flower; d, female flower, cross-section. **SAURURACEÆ:** 2. *Saururus*, a, flower; b, floral diagram. **PIPERACEÆ:** 3. *Piper*, a, inflorescence in fruit; b, portion of spike with flowers; c, female flower, vertical section. **CHLORANTHACEÆ:** 4. *Chloranthus*, a, flower, vertical section; b, floral diagram.

dry, often samaroid, inclosed by the woody valve-like bracts; seeds 2, or 3–4, orthotropous, ascending.

A single genus containing about 20 species occurs in Australia and the neighboring islands, extending to Madagascar and to southeast Asia. The family is very distinct and its relationships are in doubt. It is placed here in the system because of the simple flowers. The peculiar habit, reduced staminate flowers, and peculiar fruit are characteristic.

The wood of *Casuarina equisetifolia* is very hard, and called ironwood. It is used in ship-building, and by the Indians for war-clubs; the powdered bark is used to dress wounds, or for diarrhea. A brown dye is obtained from the same plant.

A few species of *Casuarina* (Beefwood, She Oak) are cultivated in the South for timber and ornament.

#### Order 23. PIPERALES

48. *Saururaceæ* (from the genus *Saururus*, meaning lizard's tail, in allusion to the long slender spike). **LIZARD'S-TAIL FAMILY.** Fig. 14. Herbs: leaves alternate, large and broad; flowers bisexual, regular, in a long, dense spike; perianth 0; stamens 6 or fewer, hypogynous or united with the pistil; carpels 3–4, separate, or united in to a 3–4-celled ovary; ovules 2 to several, parietal; stigmas as many as the carpels; fruit of follicles, or a lobed berry.

Three genera and about 4 species are found in temperate or subtropical Asia and North America. The family is related to the *Piperaceæ*, with which it is frequently united. From that family it differs in having several carpels in each flower and several parietal ovules for each carpel.

*Saururus cernuus* (lizard's tail), a native herb, is in the trade as a garden plant for wet soil.

49. *Piperaceæ* (from the genus *Piper*, an ancient name of pepper). **PEPPER FAMILY.** Fig. 14. Herbs, shrubs, or rarely trees: leaves alternate, rarely opposite or whorled; flowers in dense spikes, bisexual, or unisexual, regular; perianth 0; stamens 1–10; ovary

1-celled; ovule 1, basal; stigmas 1-4, rarely more, sessile; fruit a dry or fleshy berry.

There are 9 genera and about 1,025 species, confined to the tropics. The largest genera are *Piper* with 600 species and *Peperomia* with 400 species. The family is related to the Saururaceae, with which it is often united; otherwise it stands alone as a distinct type, the systematic position of which is uncertain. The spicate inflorescence, naked flowers, and 1-celled, 1-seeded ovary are distinctive.

The unripe fruit of *Piper nigrum* (Java, etc.) yields black pepper. The ripe fruit of the same plant yields white pepper. Long pepper is the whole spike of *P. longum* of India. The drug cubebs is obtained from *P. Cubeba*. Betel consists of the leaves of *P. Bette*, which in India are mixed with the areca nut and masticated (p. 16). From an extraction of the roots of *P. methysticum* (ava, or kava-kava), mixed with the milk of coconuts, an intoxicating drink is made in the Pacific Islands. Some species of *Peperomia* are eaten as salads; others chewed as betel.

Some genera are in cultivation in America as greenhouse foliage plants: *Peperomia*, 10 or more species; *Piper* (Pepper, Black Pepper, Japanese Pepper).

50. **Chloranthaceae** (from the genus *Chloranthus*, signifying green flowers). **CHLORANTHUS FAMILY**. Fig. 14. Herbs, shrubs or trees: leaves opposite; flowers bisexual or unisexual, regular, very small, subtended by bracts, and mostly borne in spikes; perianth 0; stamens in the bisexual flowers 1-3, united with each other and with the ovary; in the staminate inflorescence inserted on a common axis and forming a spike; carpels 1, with 1 pendent ovule; stigma sessile; fruit drupeaceous.

Three genera and about 35 species occur, in tropical America, East Asia, and the islands of the Pacific Ocean. The family is related to the Piperaceae and Saururaceae. The opposite leaves, the few stamens, which are often unilaterally united with the 1-celled ovary, and the suspended ovule, are peculiar.

The roots of *Chloranthus officinalis* have a camphor-like odor, and are used in the East as a febrifuge.

One species of *Chloranthus* is grown in greenhouses for foliage and berries.

#### Order 24. SALICALES

51. **Salicaceae** (from the genus *Salix*, the classical Latin name). **WILLOW FAMILY**. Fig 15. Shrubs or crees, creeping in the arctics: leaves alternate, simple; flowers dioecious, both sexes in catkins, 1 flower to each scale; perianth 0; disk present, cup-shaped or finger-like; stamens 2-many, separate or united; ovary often pedicelled, 1-celled; placentae 2, parietal; ovules numerous; stigmas 2, often each 2-lobed; fruit a capsule; seeds with a basal tuft of long hairs.

Salicaceae has 2 genera and about 180 species, of which 160 belong to the genus *Salix*; inhabitants of the north temperate and arctic zones, a few in the tropics and in South Africa. The family is not definitely related to any other family, though possibly to the Tamaricaceae. The flowers of both sexes in catkins, the glandular disk, and the dehiscent many-seeded capsule with comose seeds, are distinctive.

The bark of many species has been used for intermittent fevers and for tanning leather. A yellow dye occurs in the bark of *Populus alba* and *P. tremula*, also in *Salix alba*, *S. daphnoides*, and others. The resinous buds of *P. balsamifera*, or tacamahac, furnish American balm of Gilead. The staminate catkins of *S. aegyptiaca* are odoriferous and are used in the East in medicinal waters, as a cordial, and as a sudorific. Willow and poplar wood is soft and light. The twigs of several species of *Salix* are universally used in basket-making.

The two genera are in cultivation in America, as

ornamental plants and for shelter-belts and basket-work and sometimes for timber: *Populus* (Poplar, Aspen, Tacamahac, Balm of Gilead [not the original], Cottonwood, Abele); and *Salix* (Willow, Osier).

#### Order 25. MYRICALES

52. **Myricaceae** (from the genus *Myrica*, the ancient name of the Tamarisk). **SWEET GALE FAMILY**. Fig. 15. Shrubs or trees: leaves alternate, usually simple, resinous: flowers monœcious or diœcious, in catkins or spikes, single for each bract; perianth 0; stamens 4-6, or 16, in the axil of the bract (scale); ovary 1-celled, 1-ovuled; stigmas 2: fruit a drupe, usually slightly horned by union with the bracteoles; seed solitary, orthotropous, basal.

15. SALICACEAE: 1. *Salix*, a, male flower; b, female flower; c, cross-section ovary. 2. *Populus*, a, male flower; b, dehiscent fruit. MYRICACEAE: 3. *Myrica*, a, male flower; b, female flower. JUGLANDACEAE: 4. *Juglans*, a, diagram male flower; b, diagram female flower; c, vertical section female flower. BETULACEAE: 5. *Corylus*, a, diagram male flower; b, diagram female flowers. 6. *Betula*, a, male flowers; b, female flowers; c, diagram male flowers; d, diagram female flowers. 7. *Alnus*, a, male flowers; b, female flowers; c, diagram male flowers; d, diagram female flowers. (s, scale; a, b, and c, bracteoles of the first, second and third orders; p, perianth; g, gland.)

One genus with about 35 species is generally distributed over the more temperate parts of the earth. The Myricaceae are related to the other amentiferous families, e.g., Juglandaceae, Fagaceae and Betulaceae. The indehiscent, 1-seeded fruit, basal seeds, two carpels, absence of perianth, and simple leaves are characteristic of the family.

*Myrica Gale* and other species are used for tanning leather. *M. Gale* has also been used in the preparation of beer. The wax from the drupelets of *M. cerifera* and *M. carolinensis* is used for making candles. The fruit of *M. sapida* and *M. Nagi* is edible. *M. (Comptonia) asplenifolia* has been used as a tonic. A volatile oil is obtained from the fruits of *M. Gale*. The root of *M. cerifera* is emetic and purgative.

*M. Nagi* is cultivated in California for the edible fruit. *M. asplenifolia*, native in the United States, is grown for ornament. Other species are sometimes planted.

## Order 26. JUGLANDALES

53. **Juglandaceæ** (from the genus *Juglans*, a contraction of the Latin *Jovis glans*, the nut of Jupiter). WALNUT FAMILY. Fig. 15. Trees or shrubs, often resinous: leaves alternate, exstipulate, pinnately compound: flowers monœcious, small; the staminate in drooping catkins with single perianth of 4 parts, or rarely 0, one flower for each bract; the pistillate 2-3 together, with perianth of 4 parts adherent to the ovary as are also the bract and bracteole; ovary inferior, 1-celled; ovule 1, basal, orthotropous; stigmas usually 2- or 4-branched: fruit a nut with a fleshy exocarp, or bursting irregularly, or 4-valved, or winged.

In this family are 6 genera and about 35 species of the north temperate zone. The largest genus is *Carya* with 10 species. The family is related to other Amentifera, e.g., Myricaceæ, Fagaceæ, and Betulaceæ. The indehiscent, 1-seeded fruit, basal seeds, 2 carpels, perianth and pinnate leaves are distinctive. Fossil species are known.

The wood of English walnut is highly valued, but that of *Juglans nigra* (black walnut) is one of the most valuable of woods. Hickory wood is prized for its hardness and toughness. The fruits of the English walnut (*J. regia*), butternut (*J. cinerea*), and of species of *Carya* (hickory) are among the most important food-nuts. The leaves and bark of *Carya* and *Juglans* are purgative. Green dyes are obtained from *Carya tomentosa*, and yellow from *C. ovata*, *C. sulcata*, and *C. glabra*. Walnut oil and hickory oil are in the trade.

The cultivated genera in America are *Carya* or *Hicoria* (Hickory, Pecan, Bitternut, Pignut, Mockernut, Shellbark, Kingnut), native and hardy; *Juglans* (Walnut, Butternut, English Walnut), ornamental, fruit, and timber; *Platycarya*, ornamental; *Pterocarya*, ornamental.

## Order 27. FAGALES

54. **Betulaceæ** (from the genus *Betula*, the ancient Latin name of the birch). BIRCH FAMILY. Fig. 15. Trees or shrubs: leaves alternate, simple, mostly pinnately parallel-veined: flowers monœcious, regular, much reduced; the staminate in slender catkins; the pistillate in short spikes, rarely in flexuous catkins or geminate; 3 flowers, rarely by reduction 2 or 1 flower behind each bract; perianth of the staminate flower single, 2-4-lobed or 0; stamens 2-10; perianth of the pistillate flower absent in *Betula* and *Alnus*, in other genera an epigynous crown of several tiny scales; ovary inferior, originally 2-celled and each cell 1-ovuled, but only one cell and 1 seed maturing; stigmas 2: fruit an indehiscent nutlet, often winged; either separating from the bract and bracteoles (*Alnus*, *Betula*), or falling with them, in which case these organs form a protective involucre (*Corylus*), or a winged or bladderly organ concerned in seed-dissemination (*Carpinus*, *Ostrya*); seeds anatropous, exalbuminous.

Six genera and about 75 species inhabit the extra-tropical northern hemisphere; many are arctic, some of which are creeping. Fossil species are known. The family is related to the Fagaceæ and other amentiferous families. The pistillate flowers in spikes, the presence of a perianth in one or the other sex, the cymose group of flowers for each bract, the 2 carpels, and the single integument of the seed are characteristic.

The wood of *Alnus* and *Betula* is prized by wagon-makers, cabinet-makers and turners; charcoal for gunpowder is made from this wood. The twigs of *Betula* are made into brooms. The bark of *Betula papyrifera* strips off in thin plates and is used for making canoes and for writing-paper. The very thin bark-layers of *B. Bhojpatra* of India also furnish writing-paper. Vinegar and beer are made from the sugary sap of *Betula*, which is also considered an efficient antiscorbutic. The bark

of *Alnus* and *Betula* is used in tanning Russia leather, and other kinds. Hazelnuts are the fruit of *Corylus*; filberts of *Corylus Avellana*. Oil of *Betula* has a flavor like wintergreen. The wood of *Ostrya* is very hard and prized for beetles. The wood of all the Betulaceæ is good for firewood.

Several genera are in cultivation in America for ornament or for the fruit (*Corylus*) such as: *Alnus* (Alder); *Betula* (Birch); *Carpinus* (Hornbeam Tree, Blue Beech, Water Beech); *Corylus* (Hazel, Filbert, Cobnut); and *Ostrya* (Hop Hornbeam, Ironwood, Leverwood).

55. **Fagaceæ** (from the genus *Fagus*, the classical name, in allusion to the esculent nuts). BEECH FAMILY. Fig. 16. Trees or shrubs: leaves simple, alternate: flowers monœcious; the staminate in slender catkins, one flower with each bract and a perianth of 4-6 parts; the pistillate solitary or in groups of 3, epigynous, the perianth reduced; ovary mostly 3- or 6-celled; ovules 2 in each cell, suspended, all but one in the ovary aborting; integuments 2; stigmas 3: fruit a 1-seeded nut, which singly, or in a group of 2-3, is surrounded by a special involucre.

The family has 5 genera and about 600 species, all natives of the subtropical and temperate northern hemisphere, except the antarctic genus, *Nothofagus*. The largest genera are *Quercus* with 200 species, and *Pasania* with 100 species. The family is related to the Betulaceæ and other amentiferous families; but the staminate flowers alone in catkins, the indehiscent 1-seeded fruit, the 3 carpels, and the special involucre are distinctive. There has been much debate as to the morphology of the involucre,—whether it is composed of the bracteoles of the little dichasium, or represents sterile scales of the condensed catkin, or is a wholly new outgrowth of the subfloral axis. The latter is a recent view of Engler. This involucre becomes the bur in beech and chestnut, and the cup in the oak.

The wood of white oak, red oak and many other species is very valuable, as is also that of beech and chestnut. The bark of *Quercus Suber* of Spain yields bottle-cork. The bark of *Q. velutina* of America is called quercitron, and is used to dye yellow. The kermes insect, which furnishes a crimson dye, lives on *Q. coccifera* of the Mediterranean. The stings of gall insects produce the commercial oak-galls from which tannic and gallic acid are obtained, and from which ink was made. Official creosote is distilled from the tar of species of *Fagus*. The nut-like fruits of *Castanea*, *Fagus*, *Quercus Ilex*, *Q. Robur*, and *Q. Ægilops* are eaten. The cups of *Q. Ægilops* are sold for dyeing black and for tanning. The bark from many species of this family is used for tannin.

In America several genera are cultivated for ornament, food, and timber: *Castanea inc.* (Chestnut, Chinquapin); *Castanopsis Fagus* (Beech); *Nothofagus*, little known; *Quercus* (Oak, Black Jack).

## Order 28. URTICALES

56. **Ulmaceæ** (from the genus *Ulmus*, the classical name). ELM FAMILY. Fig. 16. Trees or shrubs without milky juice: leaves alternate, usually oblique: flowers bisexual or unisexual, regular, small; perianth simple; parts 4-5, rarely 3-7; stamens of the same number opposite the sepals, rarely twice as many, not elastically incurved; ovary superior, 1-celled, 1-ovuled; the ovule suspended, anatropous; stigmas usually 2: fruit nut-like, drupaceous, or winged.

Thirteen genera and about 140 species are generally distributed in all but the polar regions. The largest genus is *Celtis*, with 60 species. The family is closely related to the Urticaceæ and Moraceæ. Its non-elastic stamens, and suspended anatropous seeds are important distinguishing characters.

The seeds of some species of *Celtis* are edible. The wood is used to make wind instruments, and the like.

Elm wood is of use in the crafts. The mucilaginous bark of slippery elm (*Ulmus fulva*) is used for poultices and coughs. The fragrant wood of *Planera Abelicea* of Crete is false sandalwood.

There are several genera in cultivation in America. Among these are: Aphananthe, ornamental; Celtis (Nettle Tree, Hackberry, Sugarberry), hardy, ornamental; Planera (Water Elm), ornamental; Ulmus (Elm), ornamental, and for timber; Zelkova, ornamental.

57. **Moraceæ** (from the genus *Morus*, the classical name). MULBERRY FAMILY. Fig. 16. Herbs, shrubs, or trees, sometimes climbing: juice milky: leaves alternate: flowers dioecious or monoecious, regular, small, mostly in heads or spikes, or lining the hollow pyriform fleshy axis of the inflorescence (*Ficus*); perianth single, of 4, rarely 2-6, imbricated parts, more or less united and fleshy in the pistillate flower; stamens of the same number and opposite the sepals, usually inflexed in the bud and elastic; ovary superior, sessile or stipitate, 1-celled, 1-ovuled; the ovule suspended, amphitropous, rarely

tropics. The leaves of *Morus indica* are eaten in India; those of *M. rubra* in America. *M. serrata* is cultivated for fodder. The fig is the fleshy receptacle of the inflorescence of *Ficus Carica*. For the structure and pollination of this remarkable plant see Kerner and Oliver's "Natural History of Plants." The leaves of *Morus* are diuretic and anthelmintic. The juice of *Antiaris toxicaria* is used by the Javanese to poison arrows. Hops are used in medicine, also to flavor beer. Hashish, bhang or Cannabis indica is obtained from *Cannabis sativa*, and is much used in the East as a narcotic to chew and smoke like opium. The fibers of *C. sativa* are hemp. The bark of *Broussonetia* furnishes clothing to the South Sea Islanders. The wood of *Maclura aurantiaca* is flexible; the yellow juice of the fruit of this plant was used by the Indians to paint their faces. *Cudrania javanensis* yields a dye. The milky juice of *Ficus elastica* and other species yield commercial rubber. *F. indica* is a banyan tree of India. *F. religiosa* is the sacred fig. The leaves of various species of mulberry are used to feed silkworms. Shellac is obtained from a small hemipterous insect which lives on *F. laccifera* and *F. religiosa* in India.

Several genera are in cultivation in America, the majority in the far South. Among these are: Artocarpus (Bread Fruit, Jack Fruit), cultivated in the West Indies and in botanical gardens; Brosimum (Bread Nut), tropical; Broussonetia (Paper Mulberry), ornamental, semi-hardy; Cannabis (Hemp), grown for fiber or ornament; Cudrania, grown for hedges; Ficus (Fig, India Rubber Plant, Banyan Tree, Creeping Fig, Peepul Tree), grown in warm regions and in the greenhouses; Humulus (Hops), grown for the fruit; Maclura (Osage Orange), for hedges; Morus (Mulberry), for fruit, and leaves for silkworms.

58. **Urticaceæ** (from the genus *Urtica*, the classical Latin name of the plant, signifying to burn). NETTLE FAMILY. Fig. 17. Herbs, shrubs or trees, rarely climbing: leaves alternate or opposite: flowers unisexual, regular; perianth single, rarely 0, usually green, consisting of 4-5, rarely 2-3, separate or united parts, imbricated or valvate; stamens as many, and opposite the segments, inflexed and uncoiling elastically; ovary sessile, or pedicelled, or rarely united with the perianth, 1-celled, 1-ovuled; style 1; stigma feathery: fruit an achene or drupe; seeds basal, orthotropous; embryo straight.

The 41 genera and about 475 species are mainly tropical, a few in North America and fewer in Europe. The largest genus is *Pilea*, with 100 species. The family is very closely related to the Moraceæ and Ulmaceæ, with which it was formerly united. The apetalous anemophilous flowers, with elastic stamens opposite the sepals, and the 1-celled ovary, with a single basal, orthotropous seed, are distinctive. Many of the Urticaceæ are covered with stinging hairs containing formic acid. The common nettles are examples. Cystoliths are common in the leaves.

*Parietaria diffusa* and *P. erecta* contain niter, and have been used as diuretics. Nettles were used by doctors to flog patients in order to produce a counter irritation of the skin, a practice called "urtication." Other species have been used locally as medicine. *Laportea stimularis* has been used as a fish-poison. The bast fibers of many species are useful; e.g., *Urtica dioica*, *U. cannabina*, *Laportea canadensis*, and especially the China grass or ramie (*Bahmeria nivea*). The fibers of this latter have long been used in the Netherlands. The young foliage of many Urticaceæ is used as spinach. The tuberous root of *Pouzolzia tuberosa* is eaten.

The following are in cultivation in America; three of them are ornamental: Pellionia, a greenhouse creeper; Pilea (Artillery Plant), a garden and greenhouse plant; and Urera, a greenhouse shrub. The other genus, Urtica (Nettle), is grown for fiber, and Boehmeria occurs occasionally in cultivation.

16. **FAGACEÆ**: 1. *Quercus*, a, male flowers; b, female flower; c, diagram female flower; d, fruit. 2. *Castanea*, a, diagram female flower; b, involucre and 3 fruits. **ULMACEÆ**: 3. *Ulmus*, a, flower; b, fruit. **MORACEÆ**: 4. *Morus*, a, male flower; b, fruit. 5. *Humulus*, a, female flower; b, vertical section fruit. 6. *Cudrania*, pistil. 7. *Ficus*, vertical section female inflorescence (for explanation of letters see Fig. 15).

basal; stigmas 1-2: fruit an achene or drupe enveloped by the fleshy perianth, or on a fleshy gynophore, or composed of achenes in a fleshy hollow common receptacle.

Moraceæ contains 55 genera and about 950 species, mostly of tropical distribution, 6 species of which are native in the eastern United States. The largest genus is *Ficus* with 600 species. The family is frequently united with the Urticaceæ and differs from that family only in the presence of milky juice, in the two stigmas, and in the usually suspended seed. From the Ulmaceæ it differs in the inflexed elastic stamens.

The fruit of the black mulberry (*Morus nigra*) has been eaten since earliest times. Those of *M. rubra* (red mulberry), and *M. alba* are also used for food. The bread fruit (*Artocarpus incisa*) of the South Sea Islands is now cultivated for food everywhere in the

## Order 29. PROTEALES

**59. Proteaceæ** (from the genus *Protea*, from *Proteus*, a self-transforming sea-god, in allusion to the great diversity of the genus). **PROTEA FAMILY.** Fig. 17. Shrubs or trees, rarely herbs: leaves alternate; flowers bisexual, rarely unisexual, regular or irregular; perianth of one series, parts 4, separate or variously united, or labiate, valvate; stamens 4, opposite the perianth parts, hypogynous or inserted on the perianth; hypogynous stalk (gynophore) usually developed, often bearing a ring of scales, or swellings, or a cup; carpel 1; ovary superior, 1-celled; ovules 1 to several; style slender; stigma slender or enlarged: fruit unsymmetrical, capsular, drupaceous, or nut-like, or a samara or follicle; seeds sometimes winged.

There are 49 genera and about 1,000 species, mostly Australian, but many also in South Africa, and a few in South America. The largest genera are *Grevillea*, with 160 species; and *Hakea*, with 100 species. The family is perhaps distantly related to the *Loranthaceæ*, *Santalaceæ*, and *Urticaceæ*, but the relationship is little understood. The 4 valvate sepals, 4 stamens, and the unsymmetrical, 1-celled ovary, raised on an appendaged gynophore are distinctive. The small flowers are usually aggregated in heads or spikes surrounded by bracts. The *Proteaceæ*, for the most part, inhabit countries in which a very dry windy season alternates with a rainy season, and many of them are white-hairy.

*Grevillea robusta*, *Knightia excelsa*, *Embothrium coccineum*, *Leucospermum conocarpum* (redwood), and *Protea grandiflora* (wagen-boom) are useful for timber. The wood of the last species is used for wagon-wheels. The seeds of several species are eaten. A bitter principle is found in *Leucadendron argenteum* of Africa; a gum resin in *Grevillea robusta* of Australia. A golden dye is obtained from the Australian *Persoonia saccata*. *Gevuina avellana* (Chilean hazelnut) furnishes an edible fruit, as does also *Brabeium stellatifolium* (wild chestnut of South Africa), and *Macadamia ternifolia* (Queensland nut). *Banksia* and *Protea* furnish important bee-plants.

The genera in cultivation in America are mostly the following: *Banksia*; *Gevuina* (Chilean Nut, Chile Hazel), grown in California; *Grevillea* (Silk Oak), in greenhouse and California; *Leucadendron* (Silver Tree of the Cape), grown in California; *Macadamia* (Australian Nut), in southern California; *Protea*, in southern California; *Telopea* (Waratah, Warratau), in California.

## Order 30. SANTALALES

**60. Loranthaceæ** (from the genus *Loranthus*, meaning *thong flower*, significance not clear). **MISTLETOE FAMILY.** Fig. 17. Herbs or subshrubs, parasites or half-parasites, with or without chlorophyll, rarely rooted in the earth: leaves usually opposite, rarely alternate, thick and green, or reduced to scales: flowers bisexual or unisexual, usually regular; receptacle of the pistillate flower cup-shaped, united with the ovary; perianth undifferentiated, usually in 2 series of 2 or 3 parts each, of which the outer may be calyx and the inner corolla; stamens as many as the parts of the perianth and opposite them, free, or united with the perianth; ovary 1-celled, inferior; ovule 1, orthotropous; stigma 1, often sessile: fruit a 1-seeded berry.

The 21 genera and about 600 species are mostly inhabitants of tropical countries, but extend into the temperate zone. One species reaches Newfoundland. *Loranthus*, the largest genus, contains 200 species, and *Phoradendron* contains 80 species. The family is related to the *Santalaceæ* and *Proteaceæ*. The habit, the cup-shaped receptacle, the position and number of the stamens, and the 1-celled, 1-seeded fruit are distinctive. The fruits are often very viscid and easily become fastened to the branches of trees where they

germinate and grow. The inflorescence is often much reduced and inconspicuous.

The viscid substance of the fruit is called birdlime, and is used for catching small birds. Various species have been used locally as medicine. The mistletoe (*Viscum album*) of Europe was worshipped by the Gauls. When gathered from the oak it was considered sacred by the Druids.

*Phoradendron flavescens* (American mistletoe) is gathered and sold in the market.

**61. Santalaceæ** (from the genus *Santalum*, the Latin name for sandalwood). **SANDALWOOD FAMILY.** A family closely related to the *Loranthaceæ*, from which it differs only in the more numerous ovules and the general habit. The *Santalaceæ* are commonly independent plants or root parasites, while the *Loranthaceæ* are usually aerial parasites.

The *Santalaceæ* consists of 26 genera and about 250 species, in the temperate and tropical regions.

**17. URTICACEÆ:** 1. *Urtica*, a, male flower; b, female flower; c, female flower, vertical section. **PROTEACEÆ:** 2. *Banksia*, a, inflorescence; b, flower. 3. *Protea*, flower. 4. a and b, pistils of *Proteaceæ*. **LORANTHACEÆ:** 5. *Phoradendron*, a, inflorescence; b, vertical section inflorescence. **OLACACEÆ:** 6. *Liriosma*, flower. 7. *Liriosma*, floral diagram.

The aromatic and sweet-scented wood of the tree, *Santalum album*, has been used medicinally, and is used in perfumery and cabinet-making. Other species of *Santalum*, also of *Fusanus*, *Acanthosyris*, *Colpoen*, and *Exocarpus* are also used in cabinet work. The sweet flesh of the fruit of some species, the thickened pedicels or oily seeds of others, are edible.

Queer tendril-like brushes on the fruits of the reduced aerial genus *Myzodendron* of South America serve as flying organs and later twine about the support.

*Buckleya* of the southeastern United States is sometimes cultivated; also *Pyrularia*.

**62. Olacaceæ** (from the genus *Olar*, signifying a furrow, application unknown). **OLAX FAMILY.** Fig. 17. Trees or shrubs, sometimes twining or climbing, with alternate, entire leaves: flowers mostly bisexual, regular; perianth single, the divisions (sepals?) 4-5, rarely 6,

valvate; stamens 4-10, often adnate to the perianth or connate; disk present, diverse; carpels 3, rarely 2-5; ovary superior, 1-celled, rarely falsely 3-5-celled; ovule 1; style 1; fruit usually a drupe inclosed in the accrescent and persistent perianth; seed albuminous.

Olacaceæ has 25 genera and about 140 species of tropical distribution, two of which reach southern Florida. *Olax* is the largest genus. The Olacaceæ are related to the Loranthaceæ and Santalaceæ.

18. ARISTOLOCHIACEÆ: 1. *Asarum*, a, flower; b, floral diagram. 2. *Aristolochia*, flower. POLYGONACEÆ: 3. *Fagopyrum*, a, flower; b, floral diagram. 4. *Polygonum*, sheathing stipule. 5. *Rumex*, fruiting calyx. CHENOPODIACEÆ: 6. *Chenopodium*, a, flower; b, fruit. AMARANTACEÆ: 7. *Amarantus*, a, fruit; b, vertical section seed. 8. *Achyranthes*, flower.

The family is of little economic importance. Some species are valuable for their hard timber. The drupes of *Ximenia* are eaten in Senegal. *Olax zeylanica* has a fetid wood, used locally for fevers.

One species, *Ximenia americana* (hog plum) is native in Florida and the tropics, and is of moderate value for the fruit.

#### Order 31. ARISTOLOCHIALES

63. **Aristolochiaceæ** (from the genus *Aristolochia*, in reference to its supposed medicinal properties in connection with child-birth). BIRTHWORT or DUTCHMAN'S PIPE FAMILY. Fig. 18. Herbs or woody plants, the latter mostly twining; leaves alternate, usually broad and entire; flowers bisexual, epigynous, regular or irregular; perianth of one series, the parts mostly 3, connate, often petaloid, very diverse, sometimes regular with the parts nearly separate, sometimes with a long tube which is swollen below, abruptly curved above, and with an abruptly spreading entire border; stamens 6-36, separate and inserted on the ovary, or united with the style; ovary inferior, rarely superior, 4- or 6-, rarely 5-, celled; ovules many; style 1; stigmas 4 or 6; fruit a capsule.

Five genera and about 210 species are known, 180 species of which belong to *Aristolochia*. They are distributed in the warm parts of the earth, but are most numerous in South America. Seven or 8 species are native in northeastern North America. The family is

not definitely related to any other, but is placed provisionally near the Polygonaceæ, not however because related to that family, but because equally simple in structure. Three scale-like organs between the perianth and stamens in *Asarum* are probably true petals. The flowers of most *Aristolochiaceæ* are lurid in color and pollinated by flies. Many are carrion-scented and afford an additional attraction for these insects. The perianth in *Aristolochia* assumes remarkable shapes, some of which have led to the name "Dutchman's pipe."

The rootstock of *Asarum canadense* (Canada snake-root or wild ginger) is aromatically peppery, and used to flavor wines, the breath, and the like. *Aristolochia reticulata*, of Arkansas, and *Aristolochia Serpentaria*, of the eastern United States, furnish the serpentaria of medicine, used as a tonic and as a febrifuge. The latter plant is Virginia snakeroot. The common name arises from the reputed efficacy of these plants and other species of the family as remedies for snake-bites.

The genera in cultivation in America are: *Aristolochia* (Birthwort, Virginia Snakeroot, Dutchman's Pipe, Pelican Flower, Goose Flower), hardy or greenhouse twiners; *Asarum* (Wild Ginger, Canada Snakeroot), low hardy border herbs.

#### Order 32. POLYGONALES

64. **Polygonaceæ** (from the genus *Polygonum*, derived from the Greek meaning *many knees* in reference to the swollen joints of some species). BUCKWHEAT FAMILY. Fig. 18. Herbs, shrubs, or trees, sometimes twining; stem often knotty; leaves alternate, rarely opposite, simple, usually with a sheathing stipular growth (ochrea) at the base; flowers bisexual or unisexual, regular; perianth apparently of one set, though sometimes in 2 whorls, the parts usually 3, 5, or 6, distinct or connate at base, the inner set sometimes much enlarged and modified with hooks, spines, wings, or tubercles; stamens 1-15, usually 6, 8, or 9, usually opposite the perianth parts, mostly separate and hypogynous; ovary superior or nearly so, compressed or 3-angled, of 2-4-carpels, but 1-celled or falsely 3-celled; ovule solitary; styles and stigmas 2-4; fruit a flat, angled, or winged achene; seeds usually not inverted (orthotropous).

Thirty genera and about 700 species occur, mostly in the north temperate zone of both continents. The largest genera are *Polygonum*, 150 species; *Coccoloba*, 125 species; *Eriogonum*, 120 species; and *Rumex* with 100 species. The family is not closely related to any other, but is usually placed near the Chenopodiaceæ because of its simple floral structure and for want of a better place. The stipular sheaths or, when absent, the involucre heads (*Eriogonum*), and 1-celled fruit with a single orthotropous seed, are distinctive.

The foliage of the Polygonaceæ contains an acid, for which reason it is frequently eaten as salads or pot-herbs. Among plants used for this purpose are several species of *Rumex*, petioles of *Rheum Rhaponticum*, and *Oxyria*. The seeds of buckwheat (*Fagopyrum esculentum*) contain much starch and are made into flour. In medicine, rhubarb (*Rheum officinale*), employed as a purge and tonic, has been in use since earliest times, and its origin is lost in antiquity, though probably it is a native of China. Yellow dock (*Rumex crispus*) is a tonic. Smartweed (*Polygonum Hydropiper*) has an acrid juice that will produce a blister. A blue dye is obtained from *P. tinctorium* of China. The roots of *Calligonum Pallasia* are used in Siberia to stay hunger; and the fruits to quench thirst. The astringent drug, bistorta, is from *P. Bistorta*. The leaves of *P. orientale* are smoked like tobacco in China.

Several genera are in cultivation in America for ornament and food. Among these are: *Antigonon* (Mountain Rose, San Miguelito), very showy climbers; *Coccoloba* (Sea Grape, Shore Grape, Pigeon Plum),

trees both of greenhouse and the South, used for timber and edible fruit; *Eriogonum*, garden plants; *Fagopyrum* (Buckwheat), grain; *Muehlenbeckia* (cultivated as *Coccoloba* or Tapeworm Plant), greenhouse; *Polygonum* (Smartweed, Jointweed, Knotweed, Prince's Feather, Kiss-me-over-the-garden-gate, Lady's Thumb, Mountain Fleece, Secalinal), hardy ornamental herbs; *Rheum* (Rhubarb, Pie-plant, Wine Plant), food, medicine, and ornament; *Rumex* (Dock, Sorrel, Sheep Sorrel, Canaigre, Rais Colorado, Herb Patience, Spinage Dock, Curly Dock), ornamental plants, food-plants and weeds.

### Order 33. CENTROSPERMÆ

65. **Chenopodiaceæ** (from the genus *Chenopodium*, which means *goose foot*, from the shape of the leaves). **GOOSEFOOT FAMILY.** Fig. 18. Herbs, shrubs, or rarely small trees, often very fleshy with reduced branching and foliage, and very diverse and remarkable in form: leaves alternate, rarely opposite, often fleshy or reduced to scales: flowers bisexual or unisexual, regular, very small; perianth of one series, the parts 1-5, separate or united, greenish, imbricated, persistent; stamens as many as the perianth parts, or fewer, opposite them, hypogynous or borne on the perianth, often connate; hypogynous disk usually present; ovary superior, 1-celled, 1-ovuled; style and stigmas 1-4; fruit dry, rarely fleshy, usually indehiscent, inclosed in the very diverse perianth which is often hard, or fleshy, or thorny, or hooked; embryo coiled.

This family contains 73 genera and about 550 species, distributed all over the world, but principally confined to saline or alkaline habitats. A few have become weeds in good garden soil. The family is closely related to the *Amarantaceæ*, *Phytolaccaceæ*, *Caryophyllaceæ* and *Portulacaceæ*, all of which have an annular embryo. The fleshy habit, absence of scarious bracts, 1-celled, 1-seeded ovary, and coiled embryo are distinctive. A remarkable family of littoral plants, often with water-storing tissue, spines, queer fruits, and the like.

The most important economic species is the beet (*Beta vulgaris*), the enlarged root of which is used for food and for sugar, the foliage as a pot-herb. Species of *Chenopodium*, *Atriplex*, *Spinacia* and others are eaten as greens. Of these spinach is the most famous. The young shoots of *Salicornia* (glasswort, marsh samphire) are eaten as a pot-herb and are pickled. These shoots are also used for making glass and soaps because of the soda contained. The seeds of *Chenopodium Quinoa* are made into flour in Peru. The foliage of *Chenopodium Botrys* and *Chenopodium ambrosioides* is fragrant-scented. The seeds of *Chenopodium anthelminticum* (wormseed) are a well-known vermifuge. *Chenopodium mexicanum* yields saponin. *Atriplex hortensis* (orach) of Europe and Asia, yields an indigo dye, and the leaves are edible. Soda is obtained by burning many species. *Salsola Kali* var. *tenuifolia* (Russian thistle) is a bad weed.

Several genera are in cultivation in America, largely for food, but some for ornament. Among these are: *Atriplex* (Orach, Sea Purslane), food and ornament; *Beta* (Beet, Mangel-wurzel, Mangel, Chard, Swiss Chard, Spinach Beet), food and ornament; *Chenopodium* (Good King Henry, Mercury, Markery, Feather Geranium, Jerusalem Oak, Wormseed, Mexican Tea), ornament, food, medicine; *Cycloloma* (Cyclone Plant), ornament; *Kochia* (Mock Cypress), ornament; *Spinacia* (Spinach, Spinage), food.

66. **Amarantaceæ** (from the genus *Amarantus*, derived from the Greek, signifying *unfading*; the bracts are scarious and unchanging). **AMARANTH FAMILY.** Fig. 18. Herbs, shrubs, or rarely trees: leaves opposite or alternate, rarely fleshy: flowers bisexual or unisexual, small, regular, usually surrounded by scarious bracts; perianth simple, in one series of 5, rarely 1, 2, 3, or 4,

separate or united parts; stamens opposite the perianth parts, of the same number or fewer, rarely more numerous, hypogynous or perigynous, separate or united, the stamen-tube often with fringed appendages at the top; hypogynous disk usually present; ovary superior, free or slightly united with the perianth, 1-celled, 1 to many-seeded; style 0, or 1, or several; stigmas various: fruit a berry, an achene, or dehiscent by a lid; usually surrounded by the perianth; embryo coiled.

The 40 genera and about 450 species are distributed everywhere except in the arctics; most abundant within the tropics. The family is very closely related to the *Chenopodiaceæ* and *Phytolaccaceæ*, also to the *Caryophyllaceæ* and *Portulacaceæ*. The single perianth, scarious persistent bracts, and 1-seeded fruit are distinctive.

Many species of *Amarantus* are eaten as greens. *Gomphrena arborescens* is a tonic. Many *Amarantaceæ* are weeds in cultivated grounds. Some are important ornamental plants. The garden forms of *Celosia cristata* are remarkable for their fasciated inflorescence.

In cultivation in America are: *Amarantus* (Love-lies-bleeding, Prince's Feather, Joseph's Coat), garden annuals; *Bosea*, ornamental; *Celosia* (Cockscomb), garden annuals; *Gomphrena* (Globe Amaranth, Bachelor's Button), garden annual; *Iresine* or *Achyranthes*, bedding plants; *Telanthera* (*Alternanthera*), bedding plants; *Trichinium* or *Ptilotus*, greenhouse.

67. **Nyctaginaceæ** (from the generic name *Nyctago*, a synonym of *Mirabilis*, meaning *night*, in reference to the crepuscular or nocturnal flowering of the Four-O'clock). **FOUR-O'CLOCK FAMILY.** Fig. 19. Herbs, shrubs, or trees: leaves usually opposite, entire; flowers bisexual, rarely unisexual, surrounded by an involucre of separate or united bracts which incloses 1 or several flowers; corolla absent; perianth parts united, very diverse in consistency, form and color, often petaloid,

19. NYCTAGINACEÆ: 1. *Mirabilis*, a, flower; b, floral diagram, 2. *Neea*, flower. PHYTOLACCACEÆ: 3. *Phytolacca*, a, flower; b, floral diagram; c, vertical section of seed. AIZOACEÆ: 4. *Mollugo*, a, flower; b, vertical section of seed. 5. *Aizoon*, floral diagram. 6. *Mesembryanthemum*, flower. PORTULACACEÆ: 7. *Calandrinia*, flower.

valvate or plicate, persistent after flowering, and often woody or leathery, enveloping the fruit; stamens 1-30, united at the base, unequal, hypogynous; ovary of 1 carpel, 1-celled, 1-ovuled; style 1; stigma 1: fruit an achene.

The family has 18 genera and about 150 species, principally natives of America from Colorado to Chile. A few are scattered in other parts of the world. The largest genus is *Pisonia* with 40 species; *Neea* has 30 species. The family is related to the *Phytolaccaceæ*. The floral bracts, absence of corolla, persistent perianth enveloping the very thin-walled fruit, and the 1-seeded, 1-celled ovary, are distinctive.

The roots of *Borhavia* and of *Mirabilis Jalapa* are purgative, and are sold as a substitute for jalap. The foliage of several species of *Borhavia* is used as vegetables. The natives of the Hawaiian Islands catch birds with the very sticky fruits of the native species. The leaves of *Neea theifera* are used as tea in Brazil, also as a black dye.

In America 3 genera are in common cultivation: *Abronia*, garden annuals; *Bougainvillea*, greenhouse shrubs; *Mirabilis* (Four-o'clock, Marvel of Peru).

68. **Phytolaccaceæ** (from the genus *Phytolacca*, derived from the Greek meaning *plant* and *lac*, in reference to the red juice of the fruit). **POKEWEED FAMILY.** Fig. 19. Herbs, shrubs, or trees: leaves mostly alternate, simple: flowers bisexual, rarely unisexual, regular; perianth of one series, divisions 4-5, separate, persistent, not modified in fruit; stamens of the same number as the parts of the perianth and alternate with them, or more numerous, often connate at base, hypogynous; disk obscure or annular; ovary usually superior, rarely inferior; carpels 1 to many, free, or united into a several-celled ovary; ovules 1 for each carpel; styles as many as the carpels: fruit a berry, utricle, nut, or samara; embryo curved.

The pokeweed family contains 22 genera and about 100 species, mostly of tropical and subtropical America and South Africa. One species reaches the eastern United States. All the genera are small. The family is related to the *Aizoaceæ*; also to the *Caryophyllaceæ*, *Chenopodiaceæ*, *Nyctaginaceæ*, and other families with curved embryos. The several 1-seeded carpels and non-acrescent perianth are usually distinctive.

The red juice of the fruit of *Phytolacca decandra* was used by the American Indians for staining baskets, and the like. The roots of this plant are medicinal (emetic, cathartic), and the young shoots are eaten.

A few genera are in cultivation in America. Among these are *Phytolacca* (Pokeberry, Pokeweed, Scoke, Garget, Pigeonberry, Inkberry), native, hardy, rarely cultivated as a pot-herb; and *Rivina* (Rough Plant), ornamental garden and greenhouse plants.

69. **Aizoaceæ** (from the genus *Aizoon*, derived from the Greek meaning *always alive*, in reference to the persistence of life in desert habitats). **CARPET-WEED or ICE-PLANT FAMILY.** Fig. 19. Erect or prostrate, often fleshy herbs or sub-shrubs, either the stem or the leaves, or both, curiously modified to reduce surface and store water; rarely ordinary herbaceous plants: leaves opposite, alternate or whorled, simple and mostly entire; flowers bisexual, regular, hypogynous or epigynous; perianth of one set of 4-5 separate or united parts; stamens 5, alternating with the perianth parts, or by the splitting up of each becoming very numerous, in which case many of the outer are changed into long, showy, petaloid staminodia, the whole then somewhat resembling the head of an aster; ovary 2-20-celled, superior or inferior; placenta axilal, basal, or parietal; ovules mostly numerous; stigmas 2-20: fruit capsular or nut-like; embryo curved or annular.

Eighteen genera and about 500 species are known, of which 300 belong to the genus *Mesembryanthemum*; mostly inhabitants of the desert or, at least, dry portions of tropical and south-tropical regions. The large

genus, *Mesembryanthemum*, is almost exclusively South African, but reaches the Mediterranean. One species of *Aizoaceæ* (*Sesuvium*) is native in the eastern United States. The family is related through some genera to the *Phytolaccaceæ*; through others to the *Caryophyllaceæ* and *Portulacaceæ*. The annular embryo places the *Aizoaceæ* in this group. The apetalous, often falsely polypetalous, flowers, with several-celled ovary, and curved embryo, are characteristic.

The fruits of *Mesembryanthemum edule* (Hottentot fig) are edible. The leaves of *Mesembryanthemum* are used as a vegetable on the borders of the African desert. *Tetragonia expansa* (New Zealand spinach) is cultivated as a pot-herb. *Mesembryanthemum crystallinum* (ice-plant) of the Mediterranean region, with leaves covered with peculiar vesicular hairs filled with a viscid liquid, which sparkles in the sunlight like frost, is cultivated as a curiosity. Other species are cultivated for their strange appearance.

Many species of *Mesembryanthemum* (Fig. Mari-gold, and Ice-plant) are more or less cultivated in America; also one species of *Tetragonia* (New Zealand Spinach, New Zealand Ice-plant).

70. **Portulacaceæ** (from the genus *Portulaca*, an old Latin name of unknown origin). **PURSLANE FAMILY.** Fig. 19. Herbaceous or suffruticose: leaves often fleshy, sometimes connate: flowers bisexual, usually regular; sepals 2; petals 4-5, rarely more, sometimes connate at the base, fugaceous; stamens in 1 or 2 whorls, hypogynous (except in *Portulaca*), equal in number to the petals and opposite them, or double the number and alternating with them, or fewer, or, by multiplication, very many; ovary 1-celled, with a free-central or basal placenta; ovules 2 to many; style 2-3-parted: fruit a capsule, opening by a valve or lid, rarely indehiscent; embryo curved or annular.

Most of the 17 genera and about 150 species are inhabitants of the warmer, dry or arid regions, for which their fleshy structure and frequently prostrate or caespitose habit are an adaptation. They are most abundant in South America and the Cape of Good Hope; also common in western North America. The *Portulacaceæ* are most closely related to the *Caryophyllaceæ* and *Aizoaceæ*. The 2 sepals, 1-celled ovary with central placenta, several styles, and curved or coiled embryo are distinctive. In the common purslane and a few other species, the capsule opens by a terminal lid, which, separating along a transverse line, falls off and thus allows the seeds to escape. In *Portulaca* the ovary is partly inferior.

Most of the *Portulacaceæ* are mucilaginous; some are slightly bitter and have been used as a mild tonic. The herbage of *Portulaca oleracea* is eaten as a salad or as greens, and is also said to be sedative and an antidote for scurvy. Several species of *Calandrinia*, *Talinum* and *Claytonia*, are used as pot-herbs. The roots of *Claytonia tuberosa* of Siberia are edible, as are also the roots of the western *Lewisia*.

About one-third of the genera are in cultivation in America. *Portulaca grandiflora* (Rose Moss) is ornamental; *P. oleracea* (Purslane or Pusley) is a pot-herb; the *Montias* are also pot-herbs. *Lewisia*, *Talinum*, *Spraguea* and *Claytonia* are mostly ornamental.

71. **Basellaceæ** (from the genus *Basella*, the Malabar name of the plant). **BASELLA FAMILY.** Fig. 20. Climbing, perennial herbs, rarely slightly woody: leaves alternate, broad, often fleshy: flowers bisexual, regular, 2 bracteolate; sepals 2; petals 5, separate or connate, imbricated, persistent; stamens 5, opposite the petals and attached to their base; ovary superior, 1-celled; ovule 1, basal, curved; style and stigma 1-3: fruit indehiscent, inclosed in the corolla; embryo spiral.

There are 5 genera and about 15 species, all except one species being confined to tropical America, mostly in the Andes. *Boussingaultia*, the largest genus, contains 10 species. The family is related to the *Cheno-*

podaceæ with which it has been united; also to the Polygonaceæ and Portulacaceæ. The twining stem, and the two sets of floral envelopes, together with the 1-celled ovary and single seed, are distinctive.

*Basella alba* (red and white spinach) is eaten as a pot-herb. The starchy root of *Ullucus tuberosus* is eaten in Peru. It is used as a substitute for the potato, which it resembles.

The genera apparently in cultivation in America are: Anredera; *Basella* (Malabar Nightshade), grown as ornamental greenhouse plants, or eaten as spinach; and *Boussingaultia* (Madeira Vine, Mignonette Vine), ornamental garden or greenhouse plants.

72. **Caryophyllaceæ** (from the genus *Caryophyllus*, an old botanical name for the clove pink [*Dianthus*], the application of the name obscure). PINK FAMILY. Fig. 20. Herbs, rarely suffrutescent, with opposite entire leaves; flowers bisexual, rarely unisexual, regular; sepals 5, separate or united; petals 5, rarely wanting; stamens twice as many as the petals, rarely fewer, hypogynous or perigynous; carpels 3-5; ovary superior, 1-celled with a free-central or basal placenta; ovules 1 to many; styles 3-5; fruit a capsule, rarely a berry, opening by valves or indehiscent; seed albuminous; embryo strongly curved or coiled.

The pink family consists of 70 genera and from 1,200-1,500 species, distributed over all parts of the earth, though most abundant in the temperate and sub-

night-flying moths. The bracts at the base of the flower in *Dianthus* are distinctive. The petals of chickweed are curiously 2-parted, simulating 10 petals.

The Caryophyllaceæ are of little economic importance. Some were formerly used in medicine, but have fallen into disrepute. The roots of *Saponaria officinalis* contain a saponaceous substance, saponin, and have been used for washing, whence the common name "soapwort." Saponin is a powerful local irritant, and, if applied strong, is said to kill either muscular or nervous tissue. *Spergula arvensis* has been used as a fodder plant. Many members of the family are well-known ornamental plants, of which the most famous is *Dianthus Caryophyllus*, the carnation pink.

Perhaps 20 genera (including Illecebraceæ) are grown, mostly for ornament. Among these are: *Arenaria* (Sandwort); *Cerastium* (Mouse-ear Chickweed); *Dianthus* (Carnation, Clove Pink, China Pink, Plum Pink, Sweet William, Picotee, Grenadine); *Gypsophila* (Baby's Breath); *Lychnis* (Ragged Robin, Maltese Cross, Dusty Miller); *Paronychia* (Whitlow-wort); *Sagina* (Pearl-wort); *Saponaria* (Bouncing Bet, Soapwort, Cow Herb); *Silene* (Catchfly, Campion, Wild Pink); *Spergula* (Spurry); *Stellaria* (Chickweed, Starwort); *Tunica*.

#### Order 34. RANALES

73. **Nymphæaceæ** (from the genus *Nymphæa*, a name intended for the white water-lilies; dedicated by the Greeks to the water nymphs). WATER-LILY FAMILY. Fig. 21. Aquatic herbs; leaves alternate; flowers usually bisexual, regular, the organs, in part at least, spirally arranged; sepals mostly 4, rarely 3, 5, 6, or 12; petals 3-many, usually very numerous, hypogynous, or more or less epigynous, often a distinct transition to the stamens; stamens very numerous (rarely 6), inserted with the petals; carpels rarely 3-4, usually many, rarely distinct, usually cohering in a whorl or sunken in the enlarged receptacle; stigmas radially arranged on a sessile disk (as in poppy) or single; fruit indehiscent or irregularly dehiscent, usually fleshy; seeds several.

*Nymphæaceæ* has 8 genera and about 60 species, distributed in all parts of the world, but more especially in tropical South America. The family is closely related to the other families with spiral structure of the flower, as the Ranunculaceæ, Magnoliaceæ and Dilleniaceæ. There is also a relation to *Podophyllum* of the Berberidaceæ, and to the *Papaveraceæ*. The habit, spiral arrangement of floral parts, when present, the numerous stamens, the usually coherent carpels, and the type of fruit, are characteristic.

The leaves of *Nelumbo* are raised on long petioles, those of *Nymphæa* usually float, those of *Brasenia* are covered with a thick layer of slime, those of *Victoria regia* are 5-8 feet in diameter and floating. The receptacle of *Nelumbo* in fruit is like an inverted top with the ripe 1-seeded carpels loosely rattling in small cavities on the flat surface. The *Nymphæaceæ* in stem-structure and character of the embryo shows a transition to the monocotyledons.

Because of their unique appearance among plants, some species were venerated by the ancients. The lotus of the Egyptians, represented on their monuments and statues of their gods 5,000 years ago, was *Nymphæa cærulea* or *N. Lotus*, though *Nelumbo nucifera* has long passed under that name. (See article on *Nymphæa*.) The rootstocks of the *Nymphæaceæ* contain abundant starch, mucilage and sugar, which render them nutritive. The seeds are edible and the negroes of the Nile used them as millet. The Egyptians still eat the seeds and rootstocks. The seeds and rootstocks of *Euryale ferox* are cultivated and eaten in China.

In the American trade a few genera appear. *Cabomba* (Fish-Grass), with dissected submerged leaves and

20. **BASSELLACEÆ**: 1. *Boussingaultia*, flower calyx removed. **CARYOPHYLLACEÆ**: 2. *Silene*, flower. 3. *Agrostemma* (*Lychnis*), seed. 4. *Arenaria*, flower. 5. *Sagina*, flower. 6. *Spergula*, floral diagram. 7. *Paronychia*, flower.

arctic zone. Many have become weeds in cultivated ground and are now very widely dispersed. The Caryophyllaceæ are related to the Chenopodiaceæ, Amarantaceæ, Phytolaccaceæ, Portulacaceæ, Nyctaginaceæ and Aizoaceæ, all of which have a coiled, curved or annular embryo. Of these, the Phytolaccaceæ probably represent more nearly the ancestral type. By most recent authors (see Pax) the Illecebraceæ (*Paronychia*, *Anychia*, *Scleranthus* and *Herniaria*) are included in the Caryophyllaceæ. The curved embryo, the 1-celled ovary with several styles and central placenta, the 10 stamens, the 5 separate petals and the opposite entire leaves are together distinctive.

The family is very naturally divided into two distinct tribes: **Tribe I. Silenoideæ**.—Sepals united forming a tubular calyx; stamens hypogynous. This includes *Silene*, *Lychnis*, *Dianthus*, *Tunica*, *Saponaria* and *Gypsophila*.

**Tribe II. Alsinoideæ**.—Sepals separate; stamens mostly perigynous. Includes *Spergula*, *Cerastium*, *Stellaria*, *Arenaria*, *Sagina*, *Paronychia*, *Anychia*, *Herniaria* and *Scleranthus*.

In the Silenoideæ, the long-clawed petals often have a scale at the top, the five together forming a tiny crown. Some species of *Silene* and *Lychnis* flower only at night or in cloudy weather, and are pollinated by

white flowers, is grown in aquaria; *Brasenia* (Water Shield) is grown in aquatic gardens, as are also various species of *Nuphar* (Yellow Water-Lily, Spatterdock, Cow Lily); *Nymphaea* (White Pond-Lily); *Nelumbo* (Indian Lotus, so-called Egyptian Lotus, and Water Chinquapin); *Victoria regia*; and the similar *Euryale ferox*. The white water-lilies have latterly been called *Castalia*, but the name *Nymphaea* as applied to them has good historical standing and is retained in this work; *Nuphar* is still held for the yellow pond-lilies.

74. **Trochodendraceæ** (from the genus *Trochodendron*, from the Greek *wheel*, plus *tree*). **TROCHODENDRON FAMILY.** Trees or shrubs: leaves alternate or opposite, with oil-glands: flowers bisexual or unisexual,

many, or 0, often in the form of honeyglands; stamens usually very numerous, hypogynous; carpels 1 to many, usually separate: fruit an achene or follicle, rarely a capsule or a berry; seeds with endosperm.

The 27 genera and about 680 species are distributed mainly in the north temperate and subarctic regions. *Clematis*, *Anemone* and *Delphinium* cross the equator southward. The largest genus is *Ranunculus*. The family is related to the *Magnoliaceæ*, *Annonaceæ*, *Dilleniaceæ*, *Nymphaeaceæ*, and other families with acyclic flowers and numerous carpels. The spiral floral structure, the numerous hypogynous stamens, and the usually separate carpels are the most distinctive characteristics. The *Ranunculaceæ* is probably a very old family, and by some authors is thought to represent more closely than others the stock from which the dicotyledons have sprung.

The floral structure is very interesting and very variable. The petals, when not wanting, are rarely normal. In one series a transition is shown from the staminode-like nectary of *Coptis* to the petal-like nectary of *Ranunculus*; in another series the nectar-bearing petals are spurred or variously irregular, as in *Aconitum*, *Delphinium* and *Aquilegia*. In the last two genera, the flowers also have become extremely irregular. The fruits show an equally great diversity. From the primitive follicular type, they have become modified into achenes with a suspended or erect ovule, into a berry, or, in *Nigella*, even into a several-celled capsule by the fusion of the carpels. The wind-pollinated *Thalictrum* shows great reduction and modification on that account. The stalked carpels of *Coptis* simulate an umbel of separate fruits. Finally the foliage of several species of *Ranunculus* has become very much dissected on account of the aquatic habit, and the plants, therefore, simulate a *Myriophyllum*.

The *Ranunculaceæ* is divided by Prantl into three tribes as follows:

**Tribe I.** Fruit follicular, carpels fleshy, outer seed-coat long, e.g. *Pæonia* and *Hydrastis*.

**Tribe II.** Fruit usually follicular, carpels rarely fleshy, outer seed-coat not longer than the inner, e.g., *Caltha*, *Helleborus*, *Coptis*, *Actæa*, *Aquilegia*, *Delphinium*, etc.

**Tribe III.** Fruit an achene, e.g., *Anemone*, *Clematis*, *Ranunculus*, *Thalictrum*, etc.

The family contains many plants useful to mankind. Many are cultivated for their ornamental flowers. The seeds, leaves and roots contain a bitter acid principle which is very irritating and in many cases poisonous. Because of this, many species of *Anemone*, *Clematis*, and so on, have been used to produce blisters, and beggars are said to have made use of *C. Vitalba* to produce artificial sores and thus excite pity. The roots of *Coptis* (gold-thread) are bright yellow, and have been used both as bitters and for the dye-stuffs contained. *Hydrastis* (golden seal) is a well-known tonic and stomach corrective. *Aconite* is a powerful narcotic drug much used to allay fever. Slow cooking usually dissipates the poisonous properties of the *Ranunculaceæ*, thus enabling the vegetative portion in many cases to be eaten as greens. *Ranunculus Thora* and *R. sceleratus* were named by the Romans "sardonian" because they are said to excite convulsive sardonic laughter.

Two dozen or more genera are in cultivation in America, almost entirely for ornamental purposes. Among these are: *Aconitum* (Aconite, Monkshood, Wolfsbane); *Actæa* (Baneberry, Red and White Cowhose); *Adonis* (Pheasant's Eye, Adonis); *Anemone* (Anemone, Windflower, Patens, Pasque Flower); *Aquilegia* (Columbine); *Caltha* (Marsh Marigold, American Cowslip); *Clematis* (Virgin's Bower); *Coptis* (Gold-thread); *Delphinium* (Larkspur); *Eranthis* (Winter Aconite); *Helleborus* (Christmas Rose); *Hydrastis* (Golden Seal, Orange Root); *Nigella* (Love-in-a-Mist, Devil-in-a-Bush, Fennel Flower); *Pæonia* (Peony, Piney);

21. **NYMPHÆACEÆ:** 1. *Nelumbium*, fruit. 2. *Nymphaea*, flower. 3. *Nuphar*, fruit. **RANUNCULACEÆ:** 4. *Ranunculus*, a, flower; b, fruit. 5. *Aquilegia*, fruit. 6. *Clematis*, fruit. 7. Petals of various genera, a, *Coptis*; b, *Eranthis*; c, *Ranunculus*; d, *Aquilegia*; e, *Aconitum*.

regular, hypogynous or perigynous; sepals and petals wanting; stamens numerous, spirally arranged; carpels separate, sometimes half immersed in the receptacle, 2 to many in one whorl; ovules 1 to many: fruit a follicle, or indehiscent.

Only 3 genera and 6 species are known, all of Eastern Asia. The family is closely related to the *Magnoliaceæ*, in which it has been included by many authors. It has the same spiral structure of the flower, and separate carpels, but the perianth is wanting.

*Trochodendron* is one of the very few angiosperms in which the secondary wood is made up entirely of tracheids with bordered pits, without true vessels, as in the *Coniferæ*.

The family is of little economic value. The wood of some species is used locally. In America, *Cercidiphyllum japonicum* and *Euptelea polyandra* are in cultivation as hardy, ornamental woody plants.

75. **Ranunculaceæ** (from the genus *Ranunculus*, from the Latin signifying a little frog, because many of these plants are aquatic or marsh plants). **BUTTERCUP FAMILY.** Fig. 21. Herbs or shrubs of diverse habit: flowers bisexual rarely unisexual, spirally constructed except often the perianth, regular or irregular; sepals 3 to many, usually 5, separate, often petaloid; petals 3 to

*Ranunculus* (Buttercup, Crowfoot); *Thalictrum* (Meadow Rue); *Trautvetteria* (False Bugbane); *Trollius* (Globe Flower); *Xanthorrhiza* (Shrub Yellow Root).

A considerable industry has recently sprung into existence in which *Hydrastis* is grown for the medicinal value of the roots.

76. **Lardizabalaceæ** (from the genus *Lardizabala*, named in honor of a Spanish naturalist, Lardizabala y Uribe). **LARDIZABALA FAMILY.** Mostly twining plants with palmately compound leaves; flowers polygamous or unisexual, rudiments of the other sex organs present, regular, hypogynous; sepals 6; petaloid, in two whorls, petals none; stamens 6, hypogynous; usually with nectaries between stamens and petals; carpels 3, rarely 6-9 or numerous, separate; ovules many rarely one, parietal; fruiting carpels baccate, indehiscent or dehiscent.

This family has 8 genera and 18 species, inhabitants of the Himalayas, China, Japan, and Chile. The family is related to the Berberidaceæ, with which it was formerly united, and to the Menispermaceæ, from both of which it is distinguished by the several-seeded fruit and by other characters.

The fruits of most species are edible. The stems of *Boquila* and *Lardizabala* are used as cordage.

*Lardizabala*, *Stauntonia*, *Akebia* and *Sargentodoxa* are in the American trade.

77. **Berberidaceæ** (from the genus *Berberis*, derived from Berberys which is the Arabic name of the fruit). **BARBERRY FAMILY.** Fig. 22. Herbs or shrubs with large, compound leaves, or small and simple, or spine-like leaves; flowers bisexual, regular, hypogynous; sepals 3-9 in 1-3 series; petals 4-9 or more, in several whorls, often changed to nectaries; stamens as many as the petals and opposite them, rarely twice as many; anthers peculiar, opening by valves which roll upward; ovary 1-celled with several ovules; style almost 0; stigma mostly peltate; fruit a berry or capsule.

The family Berberidaceæ has 8 genera and about 200 species, distributed through north temperate Europe, Asia and America. *Berberis* extends along the Andes to the Straits of Magellan. Fossil species in the Tertiary are known. The family is related to the Ranunculaceæ, Papaveraceæ and Fumariaceæ. There is also an evident relation to the Magnoliaceæ and Annonaceæ. The cyclic flowers, definite stamens opposite the petals, the solitary carpel, and usually the dehiscence of the anthers are distinctive. In *Podophyllum*, the anthers open longitudinally in the ordinary way, and the stamens are twice the number of the petals. The stamens of *Berberis* are irritable, flying toward the stigma when touched, and then scattering the pollen.

The fruit of the common barberry (*Berberis vulgaris*) contains oxalic acid and is used as a preserve; the yellow inner bark and stems are astringent and yield the yellow "berberine," which is also a purgative. This yellow color formerly induced doctors to administer *Berberis* for jaundice. The fruits of the mahonias of California are also eaten as a preserve. The wood of the Indian and South American species of *Berberis* is used as a dye. The root of *Podophyllum* (mandrake or May apple) is purgative and poisonous; the ripe fruit of this plant is fleshy and edible. Many other species have been used for medicine in various parts of the world. *Berberis vulgaris* is the famous host-plant of the æcidial stage of the wheat rust.

The genera that are in the American trade are mostly grown as unusual herbaceous plants in gardens and are not widely known. Many species of the shrubby and spiny *Berberis*, and also of *Mahonia*, are grown for ornamental purposes. *Akebia*, a well-known woody twiner with palmate leaves and curious purple flowers, is now placed in the Lardizabalaceæ.

78. **Menispermaceæ** (from the genus *Menispermum*, derived from the Greek meaning moonseed). **MOON-**

**SEED FAMILY.** Fig. 22. Woody climbers; leaves alternate; flowers dicecious, regular; sepals usually 6, in 2 series; petals 6, in 2 series; stamens 6, hypogynous, opposite the petals, sometimes monadelphous; carpels usually 3, rarely more, separate, 1-ovuled, much curved in fruit; seed half-inverted; embryo usually curved; fruit compound of sessile or stipitate drupelets.

There are 56 genera and 150 species, distributed mostly in the tropical and subtropical portions of both hemispheres. None are found in Europe. Three species are native in the northeastern United States. The Menispermaceæ are related to the Berberidaceæ, the Annonaceæ and the Magnoliaceæ. The numerical plan of 3, the 2 whorls of sepals and petals, the curved seed, the drupelets, and the absence of oil-glands, are distinctive. Cross-sections of the twining stems often present peculiar patterns due to the unequal growth of the cambium.

Several species are used in medicine. *Jateorhiza palmatus* of tropical Africa has a turnip-shaped root which was much used as a tonic. The roots of species of *Cissampelos* are administered in Brazil in cases of snake-bites. The bark of several species yields a yellow dye. *Anamirta Cocculus* of tropical Asia has extremely poisonous fruits (fish-berries or cocculus) used to intoxicate and poison fish which are thus obtained in abundance, but are sometimes dangerous to eat. The narcotic principle, picrotoxine, is almost as poisonous as strychnine. In England, beer is said sometimes to

22. **BERBERIDACEÆ:** 1. *Berberis*, flower. **MENISPERMACEÆ:** 2. *Menispermum*, fruit. **MAGNOLIACEÆ:** 3. *Magnolia*; a, flower; b, floral diagram; c, fruit. **CALYCANTHACEÆ:** 4. *Calycanthus*; a, flower; b, fruit.

be adulterated with the fruit (called cocculus indicus) of this plant.

Few genera are in cultivation in America for ornamental purposes, mostly in the southern states, and especially Florida: *Cissampelos* (Velvet Leaf or Pareira Brava), tonic and diuretic, in Florida; *Menispermum* (Moonseed Vine, from the curved fruit), hardy, native; *Cocculus carolinus* of the southeastern United States, semi-hardy; *C. triloba*, E. Asia, hardy.

79. **Magnoliaceæ** (from the genus *Magnolia*, which was dedicated to P. Magnol, a professor of Botany at

Montpellier in the 17th century.) **MAGNOLIA FAMILY.** Fig. 22. Woody plants with alternate, entire or lobed leaves, and usually large stipules, each pair of which forms a hood over the young growth above, the outer pair of stipules serving as bud-scales, and each pair leaving a scar which completely encircles the stem: flowers usually bisexual, regular, hypogynous, the parts spirally arranged except sometimes the sepals and petals; sepals 3; petals 6 to many, separate; stamens very numerous; carpels usually many and usually separate; ovary 1-celled, 1- to several-seeded, arranged spirally or in a whorl (*Illicium*) at the top of the receptacle: fruit a follicle, or samara, or indehiscent and fleshy.

Ten genera and about 80 species are distributed principally in the subtropical and temperate portions of Asia and America, but are absent in Africa, Europe and the arctic regions. The Magnoliaceae are most closely related to the Annonaceae and Calycanthaceae. The peculiar stipules, the spiral structure of the hypogynous flower, and the separate carpels are distinctive. In *Magnolia*, the outer seed-coat is fleshy and red; when ripe the seeds fall out but remain suspended by the uncoiled spiral vessels of the raphe and funiculus.

The wood is generally valuable for timber, while all parts, such as leaves and bark, contain a bitter resin, which in some species is fragrantly aromatic. *Michelia Champaca* is cultivated in tropical Asia for its sweet flowers which are carried about as a perfumery. Its aromatic and acrid bark and buds are used in rheumatism. The bark of *Talauma elegans* is used in Java as a stomachic. The seeds of *Magnolia Yulan* have been used from prehistoric times in China as a febrifuge. It is said that the aromatic bark of the tulip tree is a substitute for cascarilla and quinine. *Drimys Winteri* has long been used as a stimulant in Central and South America, and, by importation, in Europe. The fruit of *Illicium verum*, a Chinese shrub, is very pleasantly aromatic, resembling anise, from which, and its remarkable star-like whorled carpels, it is called "star anise." It is much used as a condiment in oriental countries. The bark of *Illicium anisatum* (*I. religiosum*) was formerly burned as incense in the temples of Japan. For a long period the name *Illicium anisatum* was thought to apply to the star anise, but this mistake was rectified in the B.M. 7005. *Liriodendron Tulipifera* furnishes the valuable "whitewood" or "yellow poplar" of commerce. The wood of various species of *Magnolia* is used in cabinet-work.

Several genera are in cultivation in America, all except *Illicium* as ornamental trees and shrubs. Among these are: *Illicium* (Star Anise); *Liriodendron* (Tulip Tree); *Magnolia* (*Magnolia*, White Bay, Beam Tree, Cucumber Tree); and *Schizandra*, a procumbent warty shrub.

**80. Calycanthaceae** (from the genus *Calycanthus*, derived from the Greek, which means a *cup* and *flower*, referring to the peculiar receptacle). **CALYCANTHUS FAMILY.** Fig. 22. Shrubs with opposite leaves and aromatic bark: flowers bisexual, regular, perigynous, spirally constructed; parts of the perianth numerous, petaloid, not clearly differentiated into calyx and corolla; stamens 10-30 (5 in *Meratia*); carpels numerous, separate, inserted on the inner face of the hollow receptacle, each 1-2-ovuled, in fruit forming 1-seeded achenes, which are completely inclosed by the fleshy receptacle; seeds, exalbuminous; cotyledons spirally rolled.

*Calycanthus*, with 4-6 species, is confined to the southern United States and California; *Meratia* has two species in China and Japan. The family is related to the Magnoliaceae and the Annonaceae in the spiral structure of the flowers, but differs in the exalbuminous seed, the perigynous flowers and the opposite leaves. By some authors the family has been placed near the Rosaceae because of the perigynous flowers, but the spiral arrangement is not that of this latter family. The aromatic bark, the magnolia-like flowers, and the peculiar rose-like fruits are distinctive.

The bark of *Calycanthus floridus* is used in America as a tonic under the name Carolina allspice.

All the species are in cultivation in the northern United States as ornamental shrubs.

**81. Annonaceae** (from the genus *Annona*, which is from Menona, its Banda name). **CUSTARD-APPLE FAMILY.** Fig. 23. Trees or shrubs, with simple and entire alternate leaves: flowers usually bisexual, regular, hypogynous; sepals 3; petals usually 6, commonly valvate, rarely imbricated; stamens spirally arranged; numerous; carpels usually numerous and separate (united in *Monodora*), 1- to several-ovuled: fruit berry-like, rarely capsular, often constricted between the seeds.

From 500-600 species in 46 genera are found mostly in the tropical regions of Asia, Africa and America, the majority occurring in the Old World. Only

23. ANNONACEAE: 1. *Asimina*; a, flower; b, floral diagram. 2. *Annona*, fruit. MYRISTICACEAE: 3. *Myristica*; a, male flower; b, female flower; c, seed with arillus. MONIMIACEAE: 4. *Monimia*; a, male flower; b, female flower. LAURACEAE: 5. *Cinnamomum*; a, flower; b, floral diagram. 6. *Benzoin*, female flower.

the genus *Asimina* is extra-tropical in Atlantic North America and in Australia. The family is most closely related to the Magnoliaceae; but also to the Myristicaceae, Menispermaceae, Calycanthaceae and Dilleniaceae. The plan of 3 in calyx and corolla, the numerous spiral stamens, the usually separate carpels, the berry-like fruit and ruminant endosperm are distinctive. There is great structural diversity in the family.

The Annonaceae is rich in useful plants. The Malaysians use the bark of several species for rheumatic pains, and the fruit of others as a stomachic. With the flowers of *Uvaria* they prepare an ointment to ward off fevers. European women in India formerly used the scented flowers of this plant in hair-oil. Many species of *Annona* and *Asimina* produce edible fruit, as for example, the sweet-sop (*Annona squamosa*), the sour-sop (*Annona muricata*), the custard-apple (*Annona reticulata*), and the northern papaw (*Asimina triloba*).

A few genera are in cultivation in America, mostly in Florida and southern California: *Annona*, cultivated

for the fruit; Asimina, ornamental, in the North; Artabotrys, climbing, ornamental, sweet-scented, used for perfume; Duguetia, cultivated for the fruit in Florida.

82. **Myristicaceæ** (from the genus *Myristica*, meaning an *anointing medium*, in reference to the fragrant fruit). NUTMEG FAMILY. Fig. 23. Trees or shrubs: leaves alternate, coriaceous, entire: flowers dioecious, regular, small; perianth of one series, the 3 parts connate, 3-lobed; stamens 3-18, monadelphous; carpel 1, superior; ovary 1-celled; ovule 1; stigma sessile, entire or lobed: fruit a fleshy capsule; seed with a fleshy, lacinate aril.

The family contains 1 genus and about 80 species, of tropical distribution, principally in tropical Asia. The family is most closely related to the Annonaceæ. The dioecious flowers with only one set of floral envelopes, and that consisting of 3 parts, the monadelphous stamens, the 1-celled, 1-ovuled ovary and the aril are distinctive.

All parts of Myristicaceæ contain a fragrant oil, which, however, is most abundant in the fruit. The seeds of *Myristica fragrans*, of the Moluccas, furnish the well-known nutmeg, used as a condiment. The aril of the same fruit is mace. The fruits of other species are also sparingly used as condiments.

*Myristica fragrans* is cultivated and naturalized in the West Indies.

83. **Monimiaceæ** (from the genus *Monimia*, named for the wife of Myrthidates). MONIMIA FAMILY. Fig. 23. Trees or shrubs with aromatic glands: leaves opposite or whorled, rarely alternate: flowers usually bisexual, regular, perigynous, the more or less cup-shaped receptacle conspicuous, variously formed; perianth of 1 or 2 whorls, inconspicuous; stamens numerous, rarely few, scattered over the inner face of the receptacle; anthers often opening by uplifting valves; carpels numerous, all separate, also scattered over the receptacular cup; ovaries 1-ovuled; style and stigma 1 for each carpel: fruit an achene or drupe, borne on the receptacle and sessile or pedicelled, or immersed in the fleshy often urn-shaped receptacle which becomes part of an aggregate accessory fruit and frequently completely incloses the achenes.

Contained in this family are 31 genera and about 150 species, of tropical and subtropical distribution, principally of the South Sea Islands and Australia; some, however, reach South America, Africa, and other countries. The largest genus is *Siparuna*, containing 60 species. The family is related to the Calycanthaceæ, as is plainly evident in the fruit. The usually enlarged receptacle, the peculiar fruit, and the 1-seeded carpels are distinctive.

The Monimiaceæ have stimulating properties. *Peumus* leaves are used to promote digestion, like tea and coffee. The fruits of this plant are edible, as are also those of *Laurelia sempervirens*. The wood of *Atherosperma moschatum* is much sought for ship-building; the bark is a substitute for tea.

*Peumus* (Chilean Boldo) is advertised in California; valuable for its timber, edible fruits, and ornamental qualities.

84. **Lauraceæ** (from the genus *Laurus*, the old Latin name). LAUREL FAMILY. Fig. 23. Trees or shrubs with fetid or aromatic bark: leaves alternate, rarely otherwise, simple, punctate: flowers bisexual or unisexual, regular; parts of the perianth similar, usually 6, in 2 whorls; stamens in 3-4 whorls of 3 each, perigynous or epigynous, some often staminodial and glandular; anthers opening by uplifting valves; ovary superior or very rarely inferior, 1-celled, 1-ovuled; style 1; stigma 2-3-lobed: fruit a berry, drupe, or dry, often seated on a thickened pedicel or inclosed in a hollow receptacle.

The 39 genera and about 900 species inhabit mostly tropical regions, but extend into the temperate regions. Six species are found in the northeastern United States. The largest genera are *Ocotea* with 200 species,

and *Litsea* with 100 species. The family is related to the Monimiaceæ, and stands between that family and the Thymelæaceæ. The undifferentiated perianth, numerous stamens with uplifting valves, and 1-celled, 1-seeded ovary are distinctive.

The Lauraceæ are useful on account of the aromatic oil. The leaves of laurel (*Laurus nobilis*) are used for flavoring and for packing figs. Cinnamon is from the bark of *Cinnamomum zeylanicum*. *Cinnamomum Cassia* yields cassia cinnamon. The bark of the root of *Sassafras varifolium* is the sassafras of commerce. Camphor is obtained by distillation from *Cinnamomum Camphora*. The fruit of *Persea gratissima* is the avocado of South America, eaten by both men and animals. Many fragrant woods are obtained from this family, as, for example: anise wood (*Ocotea cymbarum*), bebeeru wood, greenheart (*Nectandra Rodieri*), or clove-cassia pepper wood (*Dicypellium caryophyllatum*) so named because of the pungency of the dust, Madeira mahogany (*Persea indica*), fetid till (*Ocotea fetens*), sweetwood (*Nectandra exaltata*), and stinkwood (*Ocotea bullata*).

Among the genera in cultivation in this country are: Benzoin (Spice Bush, Benjamin Bush, Wild Allspice, Fever Bush), native, ornamental; *Cinnamomum* or Camphora (Camphor Tree), introduced in Florida and California; *Cinnamomum* (Cinnamon, Cassia Buds), cultivated under glass; *Laurus* (Sweet Bay), ornamental, conservatory; *Persea* (Red Bay, Bull Bay, Avocado), greenhouse and South; Sassafras, native ornamental; and Umbellularia (California Laurel), ornamental, in the South and California.

#### Order 35. RHCEADALES

85. **Papaveraceæ** (from the genus *Papaver*, derivation obscure). POPPY FAMILY. Fig. 24. Annual or perennial herbs, or rarely shrubs, with yellow (*Chelidonium*), white (*Papaver*), or red (*Sanguinaria*), or rarely watery (*Eschscholtzia*) juice: leaves usually alternate, often crenately toothed or lobed or divided: flowers bisexual, regular; sepals 2, rarely 3; petals 4, rarely 6 or more, rarely wanting; stamens numerous in many whorls, hypogynous; carpels 1 to many, connate into a 1-celled ovary, with the parietal placentæ as many as the stigmas; ovules 1 to many; styles as many as the carpels, usually wanting; stigmas distinct, or in a radiate disk, or lobed: fruit capsular or silique; seed albuminous.

The 23 genera and about 80 species are widely distributed in the north temperate zone, but are especially numerous in central and eastern Asia, the Mediterranean region and western North America. One species of poppy is found in the south temperate region in South Africa and Australia. The family is closely related to the Fumariaceæ (which see), with which it is united by many European authors. It is also related to Capparidaceæ and Crucifereæ. There is, on the other hand, an affinity with the Berberidaceæ. The milky juice, numerical plan of 2 or 3 in the perianth, numerous stamens, and 1-celled ovary with parietal placentæ are characteristic.

In *Papaver*, an orbicular disk crowns the ovary on the top of which radiate the numerous stigmatic lines. The capsules open by means of small valves between the placentæ and underneath the disk. The capsule of *Chelidonium* is like a mustard fruit (silique), in being long and slender and the lateral walls springing upward as valves, leaving the placentæ exposed.

Many of the Papaveraceæ are cultivated as ornamental plants. Some poppies are bad weeds in cultivated ground in Europe. *Papaver somniferum*, a native of Asia, furnishes the opium of commerce, which is obtained by incisions made in the capsules. Poppy oil is derived in France from the seeds of *Papaver somniferum*. *Sanguinaria* root is used in medicine as a sedative.

A score of genera are in cultivation in America, all as garden plants. Some of these are: *Bocconia* (Plume Poppy of eastern Asia); *Chelidonium* (Celandine), a weed from Europe; *Dendromecon*, shrubby; *Eschscholtzia* (California Poppy); *Mecynopsis* (Welsh Poppy of western Europe); *Papaver* (Poppy); *Platystemon* (Cream Cups); *Platystigma*; *Sanguinaria* (Bloodroot), native; *Stylophorum* (Celandine Poppy), native.

86. **Fumariaceæ** (from the genus *Fumaria*, which is from the Latin *fumus*, smoke, presumably referring to the nitrous odor of the roots when pulled from the ground). **FUMITORY FAMILY**. Fig. 24. Herbaceous plants with alternate, dissected leaves: flowers bisexual, regular or irregular, hypogynous; sepals 2; petals 4, free or connate, in 2 unlike pairs, outer pair larger, either one or both petals of which are spurred or gibbous, the two inner crested and united over the anthers and stamens; anthers 6, borne on 2 filaments; carpels 2, united; ovary 1-celled, 1- to many-seeded: fruit a silique, vesicular or indehiscent, or transversely jointed; seeds albuminous.

There are 5 genera and 130 species, mostly from the north temperate regions. The family is closely related to the *Papaveraceæ* with which it is often united. The

87. **Cruciferæ** (from the Latin signifying *cross-bearers*, in reference to the cross-like appearance produced by the four petals). **MUSTARD FAMILY**. Fig. 24. Herbs, rarely shrubby: leaves usually alternate, simple, often varying from entire to palmate or pinnatifid within the same genus: flowers bisexual, regular; sepals 4; petals 4, rarely wanting; stamens 6, 4 long and 2 shorter (tetradynamous), rarely fewer, very rarely more, hypogynous; carpels 2, united, ovary superior, 2-, rarely 1-, celled with 2 parietal placentæ at the edges of the septum: fruit a silique (long), or a silicle (short), rarely indehiscent; seeds exalbuminous; the embryo variously curved and folded.

In the family are 208 genera and 1,600 species, distributed throughout the cold and temperate parts of both hemispheres, but especially abundant around the Mediterranean Sea; a few are tropical. The *Cruciferæ* are closely related to the *Capparidaceæ*, *Papaveraceæ*, and *Fumariaceæ*. The 4 sepals, 4 petals, 6 stamens (4 long and 2 short), and the peculiar fruit are distinctive.

The 6 stamens probably represent a reduction from 2 sets of 4 each. In *Lepidium* and other genera, there may be only 2 stamens. The septum of the fruit remains upon the plant when the seeds and valves fall. The siliques are often flattened, either perpendicular or parallel to the partition (in different genera). The embryos in the seed are folded so that the hypocotyl (radicle) and cotyledons lie side by side. Distinct patterns are thus produced which are so constant as to be of great value in the classification within the family. Three principal types are recognized: cotyledons accumbent, when the edges of the cotyledons are applied to the hypocotyl; incumbent, when the back of one cotyledon is applied to the hypocotyl; and conduplicate, when the cotyledons themselves are also folded and enwrap the hypocotyl. In *Leavenworthia*, alone, the embryo is straight.

The flower of *Cruciferæ* is of little value in classification within the family; the important characters are in connection with the fruit and seeds.

Many have become well-known weeds as, for example, charlock (*Brassica arvensis*), shepherd's purse (*Capsella Bursa-pastoris*), pepper grass (*Lepidium*), spring mustard (*Barbarea*), wild radish (*Raphanus Raphanistrum*). Many others are among the well-known old-fashioned ornamental plants of the garden, e.g., rocket (*Hesperis matronalis*), stock or gilliflower (*Matthiola*), wallflower (*Cheiranthus*), honesty (*Lunaria*) with large orbicular flat pods, candytuft (*Iberis*), sweet alyssum (*Alyssum*). Others are used as food, of which *Brassica oleracea*, a very variable species, is the most important, furnishing cabbage, cauliflower, kohlrabi and kale. *Brassica campestris* furnishes the various forms of rutabaga. *Brassica alba* furnishes white mustard, and *Brassica nigra*, black mustard. *Radicula Nasturtium-aquaticum* is water-cress; *Radicula Armoracia* is horse-radish. The rootstocks of *Dentaria* are eaten in America under the name "crinkle root." *Raphanus sativus* is the garden radish; *Lepidium sativum* is garden cress. The various organs of most *Cruciferæ* contain an oily substance which is very pungent to the taste and which gives the peculiar flavor to the various cresses. This oil is abundant in the seeds from which it is extracted (oil of mustard). The foliage of the various maritime *Cruciferæ* have been found a useful article of diet in counteracting scurvy, for which reason the arctic *Cochlearia* is called "scurvy-grass." The leaves of the woad of western Europe (*Isatis tinctoria*) yield a blue dye. *Anastatica Hierochuntica* is the original "rose of Jericho," the branches of which close and open when alternately dried and wetted. (See article on Resurrection Plants.)

88. **Capparidaceæ** (from the genus *Capparis*, the Greek name, from the Arabic *kapar*, capers). **CAPER FAMILY**. Fig. 24. Herbs or rarely shrubs: flowers bisex-

24. **PAPAVERACEÆ**: 1. *Papaver*; a, flower; b and c, fruit. 2. *Chelidonium*, fruit. **FUMARIACEÆ**: 3. *Dicentra*, flower. 4. *Fumaria* flower 1, corolla removed. **CRUCIFERÆ**: 5. Flower; a, perianth removed; b, floral diagram. 6. Fruit; a, *Brassica*; b, *Lepidium*; c, *Lunaria*; d, *Raphanus*. 7. Cross-section seeds of *Cruciferæ*, showing types of embryos; a, accumbent; b, incumbent; c, conduplicate. **CAPPARIDACEÆ**: 8. *Cleome*, flower.

bleeding-heart-like flower, the plan of 2, the 6 anthers on 2 filaments, the 1-celled ovary, and the absence of milky juice are distinctive.

*Fumaria officinalis* and some species of *Corydalis* have been used as medicine, but the family is of little economic importance, except for the few ornamental species.

Following are the genera best known in cultivation: *Adlumia* (Allegheny Vine, Climbing Fumitory), a graceful native garden climber; *Corydalis*, with 1-spurred corolla; *Dicentra* (Bleeding Heart, Squirrel Corn, Dutchman's Breeches), with 2-spurred corolla; and *Fumaria* (Fumitory), with 1-spurred corolla.

ual, more or less irregular; sepals 3-8, usually 4; petals 4-8, rarely 0, hypogynous or perigynous; disk ring-like or scale-like or tubular at the base of the petals; stamens 6, rarely 4 or many; carpels 2 or more; ovary 1- to several-celled, usually raised on an outgrowth (gynophore) of the pedicel-like axis, which may become much elongated in fruit; ovules numerous; style 1 or 0; stigmas 1 to several: fruit a capsule, silique, berry or drupe; embryo usually coiled.

Thirty-four genera and about 350 species occur, mostly of tropical and subtropical distribution. They extend to Australia, the African deserts and into the western and eastern United States. The family is very closely related to the Cruciferae and certain forms are difficult to distinguish from that family. The non-tetradynamous stamens, and commonly 1-celled ovary are distinctive. The gynophore is often very long, slender and conspicuous, and sometimes (Gynandropsis) carries up the stamens along with the pistil. The detailed variation in the flower is very intricate.

Several genera are cultivated as ornamental plants. The acrid oil in the fruit is stimulating, as in the Cruciferae, and for this reason several genera have been used in medicine (Cleome, Polanisia, Capparis, etc). *Capparis spinosa* of the Mediterranean region furnishes the capers of commerce, which are flower-buds preserved in salt and vinegar.

As garden plants, a few genera are in the American trade: Cleome (Bee or Spider Plant), ornamental; Gynandropsis, ornamental; Capparis (Caper Plant), shrubby, grown in this country for ornament as well as for food; and Crataeva, shrubby, grown in southern California.

89. **Resedaceae** (from the genus *Reseda* which is from the Latin, *to calm*, in allusion to supposed quieting properties). MIGNONETTE FAMILY. Herbs or shrubs: leaves usually alternate: flowers mostly bisexual, more or less irregular; calyx persistent, 4-8-parted, irregular; petals 0-8, alternating with the sepals; stamens 3-40, inserted within an irregular fleshy disk; carpels 2-6, free, or united into a 1-celled ovary which is often imperfectly closed at the top; placentae 2-6, parietal; ovules many; styles or sessile stigmas 3-6: fruit usually a dehiscent capsule, rarely a berry, or composed of separate follicles; seeds reniform, without endosperm; embryo curved.

About 45 species and 6 genera occur, mainly distributed about the Mediterranean Sea. This family is allied to the Cruciferae and Capparidaceae, from which it differs principally in general character. The extra-staminal disk, the numerous stamens, the 1-celled ovary or ovaries with parietal placentae, and the usually gaping summit of the ovary are distinctive.

*Reseda luteola* (Dyer's weed) yields a yellow dye which was formerly much used. *R. odorata* (mignonette), a plant cultivated since early times, and whose origin was long considered unknown, although probably Egyptian, is extensively cultivated for the fragrance of its flowers.

90. **Moringaceae** (from the genus *Moringa*, derived from the Malabar name of the plant). MORINGA FAMILY. Trees, with 2-3-pinnate alternate leaves: flowers bisexual, irregular, perigynous; sepals 5, imbricated; petals 5, imbricated, unequal, lower reflexed; stamens 8-10, separate or united at the base, alternate ones shorter or reduced to staminodia; sub-ovarian disk present, lining the cup; ovary borne on a gynophore, 1-celled; placentae 3; ovules numerous; style 1: fruit a silique-like capsule.

There is but one genus, containing 3 species, natives of northeastern Africa and India. The family is distinct, not related closely to any other, perhaps distantly related to the Bignoniaceae, the Capparidaceae, the Violaceae, or the Leguminosae. Provisionally placed by Engler and Prantl between the Poppy group of families and the Rose group.

*Moringa arabica* of Arabia (ben-nut) yields a useful oil which does not become rancid. The root of one species is used in intermittent fevers. A tragacanth-like gum exudes from the bark of *M. oleifera*.

*M. oleifera* (horse-radish tree) is grown sparingly in the southern United States. The fruits and the roots are edible.

#### Order 36. SARRACENIALES

91. **Sarraceniaceae** (from the genus *Sarracenia*, in honor of Dr. Sarracin, an early physician of Quebec, who sent the northern species to Europe). PITCHER-PLANT FAMILY. Fig. 25. Perennial herbs inhabiting bogs: leaves all basal, tubular: scapes 1-flowered; flowers bisexual, regular; sepals 4-5, imbricated; petals 5, hypogynous, or 0; stamens many but not apparently either cyclic or spiral; ovary superior, 3-5, rarely 6-, celled; ovules numerous; style 1; stigmas 1-5: fruit a capsule.

The Sarraceniaceae has 3 genera and 8 species, of which 6 belong to the genus *Sarracenia*; all American. *Heliamphora* is in British Guiana, *Darlingtonia* in California, and *Sarracenia* in Atlantic North America from Newfoundland to Florida. The family is most closely related to the Droseraceae and Nepenthaceae, but also to the Papaveraceae and Nymphaeaceae.

The Sarraceniaceae are far-famed as insectivorous plants. The pitchers are partly filled with a liquid containing a digestive enzyme. Small insects which fall into the liquid, or are attracted by a sugary secretion, and are unable to escape because of various devices, are at length digested and absorbed. Like the sun-

25. SARRACENIACEAE: 1. *Sarracenia*; a, flower; b, leaves. NEPENTHACEAE: 2. *Nepenthes*; a, female flower; b, leaf. DROSERACEAE: 3. *Drosera*; a, flower; b, floral diagram; c, leaf. 4. *Dionaea*, leaf. 5. *Aldrovanda*, leaf.

dews, these plants can inhabit soils poor in nitrates. The remarkable umbrella-shaped style, and fiddle-shaped petals of *Sarracenia* are part of a very interesting mechanism for cross-pollination.

The family is of little economic importance. The rhizome of *Sarracenia purpurea* was used in Canada as a specific against smallpox, but did not prove of value. *Darlingtonia californica* and species of *Sarracenia* are in the trade because of their peculiar habits and structure, and their botanical interest. They are grown mainly in the greenhouse.

92. **Nepenthaceæ** (from the genus *Nepenthes*, derived from the Greek signifying a *magic potion*, probably in reference to the pitchers). **NEPENTHES FAMILY.** Fig. 25. Slightly woody or herbaceous plants: leaves alternate, consisting of a winged basal portion, a slender stalk-like intermediate portion, and a terminal urn-shaped pitcher with a rolling fluted border and a lid, the pitcher containing a watery fluid: flowers diœcious, paniculate, regular; perianth of 4 parts, possibly 2 sepals and 2 petals, imbricated; stamens 4-16, monadelphous; ovary superior, 3-4-celled; ovules numerous in each cell; stigma sessile, discoid: fruit a capsule.

A single genus with about 40 species occurs in the East Indies, Madagascar, the Seychelle Islands, and New Caledonia. Borneo has the greatest number of species. The family is related to the Sarraceniaceæ and Droseraceæ, although formerly considered related to the Aristolochiaceæ. The habit, the undifferentiated perianth, the monadelphous stamens, and the 3-4-celled ovary, are distinctive. A remarkable family of insectivorous plants. Along with the water secreted in the cavity of the pitcher is a pepsin-like substance, by the aid of which insects are digested, the dissolved material being later absorbed. The slender part of the leaf in some species coils and serves as a tendril by means of which the plant climbs.

26. **CRASSULACEÆ:** 1. *Sedum*, flower. **SAXIFRAGACEÆ:** 2. *Saxifraga*, flower. 3. *Ribes*, a, floral diagram; b, flower. 4. *Parnassia*, a, floral diagram; b, flower. **CEPHALOTACEÆ:** 5. *Cephalotus*, leaves.

In American greenhouses, many kinds of *Nepenthes* (Pitcher Plants), some of hybrid origin, are cultivated because of their curious habit.

93. **Droseraceæ** (from the genus *Drosera*, derived from the Greek, meaning *dewy*). **SUNDEW FAMILY.** Fig. 25. Very glandular herbs or sub-shrubs with alternate leaves: flowers bisexual, regular, hypogynous, rarely perigynous; sepals 4-5, imbricated; petals 5, imbricated; stamens in 1 or more whorls of 5; carpels 2-5; ovary superior, 1-3-celled: fruit a capsule with numerous seeds.

The 6 genera and about 100 species, 90 species of which belong to the genus *Drosera*, are widely scattered over the earth. The family is related in floral structure to the Cistaceæ and Violaceæ, and to the Saxifragaceæ.

The Droseraceæ are noted as insectivorous plants. *Drosera* has a rosette of small basal leaves covered with sensitive motile tentacles that secrete a terminal drop of clear sticky fluid, the so-called dew, in which small insects are caught as on sticky fly-paper. A digestive substance is then secreted and the organic matter absorbed. The leaves of *Dionæa* (the famous Venus' fly-trap of Carolina) have a conduplicate ter-

minal lobe which closes violently when a fly alights upon the upper (inner) surface. A marginal fringe prevents the escape of the insect; and it is in time digested. *Aldrovanda* of South Europe has tiny traps similar to those of *Dionæa*, but the whole plant is aquatic, and resembles *Utricularia*.

*Drosophyllum* and *Roridula* are said to be used in Portugal and the Cape for the practical capture of flies in the house. The leaves of some *Droseras* yield a purple dye. The liquids known as *aqua-auri* and *rosoglio* (Italian) contain *Drosera rotundifolia* as an essential ingredient.

*Drosera* and *Dionæa* are in the American trade, mostly grown as greenhouse curiosities.

#### Order 37. ROSALES

94. **Crassulaceæ** (from the genus *Crassula*, diminutive of *crassus*, meaning thick). **ORPINE FAMILY.** Fig. 26. Herbs or sub-shrubs: leaves mostly alternate, commonly fleshy: flowers mostly bisexual, regular; sepals 5, rarely 3-30, imbricated; petals as many, rarely connate; stamens as many or twice as many as the petals, epipetalous or hypogynous, rarely perigynous, separate; carpels as many as the petals, separate with a scale at the base of each; ovules numerous, rarely few or one: fruit a group of follicles, rarely the carpels somewhat united and ovary half-inferior.

Thirteen genera and about 500 species inhabit the drier parts of the earth, but principally South Africa and South Europe. The genus *Sedum* contains 140 species, and *Crassula* 120 species. This is a very definite family, but closely related to the Saxifragaceæ, from which it differs in the regular numerical plan, almost constantly separate ovaries, and predominantly fleshy habit.

The Crassulaceæ are well adapted to a dry climate. The fleshy leaves are provided with water-storage tissue and a thick cuticle, and are often odd in shape and appearance. These leaves lose water very slowly when separated from the plant, and will often remain fresh for weeks. When pinned to the wall, the leaf of *Bryophyllum* sends forth plantlets from the margin, and the stem of live-forever may grow and flower, so efficient is the protection against loss of water afforded by the cuticle. These plants, likewise, will grow for weeks or months in the collector's press.

The herbage contains much tannin and sometimes acid. A refreshing drink has been made from *Sempervivum tectorum* (houseleek). The fleshy leaves of the Crassulaceæ are cooling to wounds and burns. *Sedum Telephium* was formerly cultivated as a pot-herb. Other species have been used for nearly similar purposes.

Several genera are in cultivation in America. Of these, *Sempervivum* is the well-known Houseleek or Old-hen-and-chickens; *Cotyledon* is somewhat similar in growth; *Sedum acre* is Moss Stonecrop; and *Sedum triphyllum* (*S. Telephium*) is Live-forever, or Orpine.

95. **Cephalotaceæ** (from the genus *Cephalotus*, derived from the Greek meaning *headed*, said to refer to the capitate hairs at the base of the flower). **CEPHALOTUS FAMILY.** Fig. 26. Perennial scapose herbs: leaves of 2 kinds in a basal rosette, one lanceolate and ordinary, the other a petioled pitcher with winged sides, fluted mouth and a lid: flowers bisexual, regular, perigynous; perianth of 6 parts, apparently in one series, valvate; stamens 12, in 2 whorls; carpels 6, separate, arranged around the woody apex of the axis; 1-2 basal ovules in each: fruit dry, somewhat inflated.

The family consists of but 1 genus and 1 species (*Cephalotus follicularis*), found in the swamps of King George's Sound, West Australia. This family is related to the Saxifragaceæ, and was formerly united with that family, but differs in the peculiar habit, the wholly separate carpels arranged around the apex of the axis,

and the basal seeds; related also to the Crassulaceæ, but lacks the hypogynous scales and has basal seeds.

This remarkable little insectivorous plant is cultivated in greenhouses as a curiosity.

96. **Saxifragaceæ** (from the genus *Saxifraga*, derived from the Latin signifying to *break rocks*, in allusion to the habit of growing in the clefts of rocks). **SAXIFRAGE FAMILY.** Fig. 26. Herbs, shrubs, or small trees: leaves alternate, rarely opposite; flowers bisexual, usually regular, hypogynous or perigynous, rarely epigynous; sepals 4-5, rarely more or fewer; petals usually of the same number, valvate or imbricated, inserted with the stamens at the edge of a receptacular nectariferous disk; stamens of the same number as the petals and alternate with them, or twice as many and the outer opposite the petals; carpels 2, rarely 5, partly united, rarely separate, superior or half inferior; ovules numerous; styles and stigmas as many as the carpels: fruit a capsule or berry.

There are about 70 genera and some 700 species, widely distributed but more abundant in temperate regions. Many reach the arctic. Some are fossil. *Saxifraga* is the largest genus, with 200 species in the north temperate, arctic and Andean regions. *Ribes* has 50 species. The family is closely related to the Rosaceæ, differing in the more abundant endosperm and constantly few carpels and few stamens; related also to the Crassulaceæ, which has a regular numerical plan and hypogynous scales; and to the Cunoniaceæ and Hamamelidaceæ.

The ovaries of *Ribes*, *Philadelphus*, *Chrysosplenium*, *Deutzia*, *Hydrangea*, and some *Saxifragas*, and a few other genera are almost wholly inferior. *Parnassia* has staminodia in clusters at the base of each petal. The fruit of *Ribes* is a berry. Some *Heucheras* have irregular flowers; also some *Saxifragas*, some *Hydrangeas* and *Tolmieas*. The peripheral flowers of *Hydrangea* often have enlarged corollas and are sterile. Water-glands in the axils of the foliar teeth of some *Saxifragas* secrete a deposit of lime.

The rough leaves of *Deutzia scabra* are used in Japan to polish wood. The fruits of several species of *Ribes* are edible; *R. vulgare* yields the red currant; *R. Grossularia*, the English gooseberry, and also native gooseberries; *R. nigrum*, the black currant. Otherwise the family is of economic importance only for its ornamental species, which are numerous and largely hardy.

Many genera are in cultivation in this country. Among these the following well-known names may be noted: *Deutzia*; *Decumaria*, climbing shrub; Golden Saxifrage (*Chrysosplenium*); *Astilbe*; *Hydrangea*; Mock-orange or *Syringa* (*Philadelphus*); Currants and Gooseberries (*Ribes*); False Mitrewort or False Bishop's-cap or Foam-flower (*Tiarella*); Grass of Parnassus (*Parnassia*); Mitrewort or Bishop's-cap (*Mitella*); Alum Root or Coral Bells (*Heuchera*); Saxifrage and Strawberry Geranium (*Saxifraga*).

97. **Pittosporaceæ** (from the genus *Pittosporum*, the name referring to the viscid coating of the seeds). **PITTIOSPORUM FAMILY.** Trees or shrubs, often climbing: leaves alternate, mostly leathery: flowers bisexual, regular; sepals or divisions of the calyx 5, imbricated; petals 5, imbricated in the bud; claws often connivent or coherent; stamens 5, alternating with the petals, hypogynous, no disk at the base; carpels 2, rarely 3-5; ovary 1- to several-celled; placentæ parietal or axial; style 1; stigmas 1 to several: fruit a capsule or berry; seeds numerous or few, immersed in a pulp or viscid juice.

All the 9 genera and about 90 species are natives of Australia, except the genus *Pittosporum*, which, however, is of the Old World. The largest genus is *Pittosporum* containing 70 species. The relationship of the family is doubtful. Though in the past supposed by different authors to be related to the Celastraceæ,

*Polygalaceæ*, *Caryophyllaceæ*, *Rutaceæ*, *Saxifragaceæ*, *Ericaceæ*, and so on, it is, according to Pax, most closely related to the *Saxifragaceæ*.

The *Pittosporaceæ* all contain resinous aromatic bitter material in organized resin-canals or chambers. These give the fruit a disagreeable flavor. In spite of this disagreeable taste, it is said (Lemaout and Decaine) that, "The natives of Australia, who to appease their hunger are reduced to filling their stomachs with clay mixed with organic detritus, eagerly devour the fleshy fruits of this family."

Most of the genera are in cultivation: *Bellardiera*; *Bursaria*, a spiny shrub; *Hymenosporum*, a shrub with yellow flowers; *Pittosporum* (*Pittosporum*, *Karo*, *Tawhiwhi*, *Tarata*, *Tobira*), evergreen, fragrant shrubs; *Sollya* (Australian Bluebell Creeper).

98. **Cunoniaceæ** (from the genus *Cunonia*, named after John Christian Cuno, an Amsterdam botanist of the 18th century). **CUNONIA FAMILY.** Fig. 27. Trees or shrubs: leaves opposite or whorled, simple, ternate or pinnate: flowers small, densely crowded, usually bisexual, hypogynous; sepals 4-5, rarely 6, usually valvate; petals 4-5, small, usually wanting; stamens twice as many as the sepals, rarely just as many or more nu-

27. **CUNONIACEÆ:** 1. *Cunonia*, a, flower; b, floral diagram. **BRUNIACEÆ:** 2. *Brunia*, a, flower branch; b, flower. **HAMAMELIDACEÆ:** 3. *Hamamelis*, a, flower; b, floral diagram; c, fruit. 4. *Liquidambar*, fruit.

merous, exserted, attached near the edge of an intrastaminal disk; ovary mostly 2-celled, superior; ovules numerous, rarely few; styles 1-2; stigmas 2: fruit usually a capsule, rarely a drupe or nut.

Nineteen genera and 120 species are known, 70 species of which belong to *Weinmannia*; all of South America or the Australian region, except one in South Africa.

The family is closely related to the *Saxifragaceæ*, with which it was formerly united, but because of the uniform floral structure and the position of the leaves, as well as the geographical distribution, it is now treated as distinct.

The wood of some species is useful; otherwise the *Cunoniaceæ* are of little economic importance. *Acrophyllum venosum*, an Australian evergreen shrub, is cultivated in greenhouses.

99. **Bruniaceæ** (from the genus *Brunia*, named in honor of Cornelius Brun, a traveler in the East). **BRUNIA FAMILY.** Fig. 27. Heath-like shrubs: leaves alternate: flowers bisexual, regular, epigynous; sepals 4-5, imbricated; petals 4-5, imbricated; stamens 4-5,

alternating with the petals, free or united with the petals, or with each other, rarely an intrastaminal disk present; ovary inferior, 1-3-celled; ovules 1-2 in each cell; fruit dry, indehiscent, or capsular.

Twelve genera and about 50 species occur, all natives of South Africa. The family is related to various families of the Saxifrage group, as, for instance, the Hamamelidaceæ, but is distinct because of its heath-like habit. The flowers are mostly in dense heads.

The family is of no economic importance. One species of *Audouinia* (*A. capitata*) is said to be sometimes in cultivation as *Diosma capitata*.

100. **Hamamelidaceæ** (from the genus *Hamamelis*, an ancient Greek name applied to some tree). WITCH-HAZEL FAMILY. Fig. 27. Trees or shrubs: leaves simple, alternate: flowers unisexual or bisexual, hypogynous, perigynous or epigynous; sepals 4-5; petals 4-5, or 0; stamens 4-5, rarely more; sub-ovarian disk rare; ovary 2-celled; ovules 1 or several in each cell: fruit a woody, 2-valved capsule, with a separating inner layer of different texture; seeds often winged.

Twenty genera and 50 species are known, widely distributed in subtropical or warm temperate regions of both hemispheres. It is an ancient family more abundant in former ages, related to the Saxifragaceæ, and by some considered related to the Cornaceæ or Araliaceæ. Many fossil species are known. The peculiar fruit is distinctive.

In some genera, as in *Hamamelis*, the seeds are forcibly expelled when the fruit opens, often to a distance of 10 feet or more, much as wet apple seeds may be shot from between the thumb and finger.

The family is of little economic importance. Extract of the bark of *Hamamelis* is used as a liniment (witch-hazel). The twigs are supposed to have supernormal properties, especially in the detection of water in the earth. They are frequently used in rural districts in the attempt to detect underground springs. *Liquidambar styraciflua* (sweet gum), of the southern United States, yields a balsam. The oriental balsam, *Styrax*, is obtained from the eastern *L. orientalis*. This was formerly used in medicine.

Perhaps half the genera are in cultivation, all for ornamental purposes. Of these, *Fothergilla*, *Corylopsis*, *Hamamelis*, and *Liquidambar* are the best known. Most of the species are hardy.

101. **Platanaceæ** (from the genus *Platanus*, the ancient name of the tree, signifying *broad*). PLANE-TREE FAMILY. Fig. 28. Trees with alternate, broad, palmately veined leaves: flowers in dense heads, monoecious, regular, perigynous; sepals usually 3-8, separate, thick, often with bracts at the base; petals of the same number, glabrous; stamens of like number alternating with the petals; connective peltate at the top; extra staminodia often present; carpels several, distinct, 1-seeded: fruit a caryopsis, angled from pressure, and truncate at top, surrounded by long hairs at the base; seed orthotropous.

A single genus and about 6 species are distributed in southern Europe, southern Asia, and in North America. The family is related to the Saxifragaceæ and Hamamelidaceæ. The polypetalous perigynous flower, with as many stamens as petals, the separate carpels, and especially the peculiar inflorescence and leaf, are distinctive. Fossil species are known.

The wood of *Platanus* is similar to maple and of value, but the most important use is for ornament. Two species of *Platanus* (Plane-Tree, Buttonwood, Button Ball, Oriental Plane, Sycamore) are in cultivation in America.

102. **Rosaceæ** (from the genus *Rosa*, the ancient name of the rose). ROSE FAMILY. Fig. 28. Herbs, shrubs, or trees, often thorny, sometimes climbing: leaves alternate, rarely opposite: flowers bisexual, rarely unisexual, usually regular, perigynous; calyx of 4-5 imbricated or valvate sepals; corolla of as many imbricated petals,

or 0; stamens 5 to many, in whorls of 5, borne on the cup of the receptacle at some distance from the carpels; cup lined with a glandular disk; carpels 1 to many, separate and superior or united and inferior; ovaries 1 to several-ovuled; styles as many as the carpels: fruit a follicle, achene, drupe, pome, or hip; seeds usually exalbuminous.

There are about 90 genera and 1,500 species, widely distributed in all parts of the world, most abundant, perhaps, in the temperate regions. The largest genera are *Rubus*, 180-200 species; *Potentilla*, 200 species; and *Rosa*, 100 species. The family is related to the Saxifragaceæ and the Leguminosæ, also to the Calycanthaceæ. The perigynous flower with cup lined by the glandular disk, the numerous cyclic stamens, and

28. **PLATANACEÆ**: 1. *Platanus*, a, flower; b, floral diagram. **ROSACEÆ**: 2. *Fragaria*, a, flower; b, fruit. 3. *Geum*, fruit. 4. *Rosa*, a, floral diagram; b, fruit. 5. *Spiraea*, fruit. 6. *Prunus*, a, flower; b, fruit. 7. *Pyrus*, a, flower; b, fruit. **LEGUMINOSÆ**: 8. *Pisum*, a, flower; b, flower, petals removed; c, fruit. 9. *Desmodium*, fruit. 10. *Cassia*, flower. 11. *Acacia*, flower.

the separate, usually cyclic, carpels, are distinctive. The Ranunculaceæ is similar, but acyclic and hypogynous.

The family is divided into 6 very distinct sub-families, some of which, by certain authors, are considered of family rank, as follows: I. Fruit follicular, e.g., *Spiræa*, *Physocarpus*, *Aruncus*, *Sorbaria*, and so on. II. Ovary compound, inferior: fruit fleshy, e.g., *Pyrus*, *Cratægus*, *Cotoneaster*, *Cydonia*, *Amelanchier*, *Mespilus*, and the like. III. Fruit of achenes or separate drupelets, e.g., *Rubus*, *Fragaria*, *Potentilla*, *Geum*, *Cercocarpus*, *Ulmaria*, *Alchemilla*, *Agrimonia*, *Sanguisorba*, and *Rosa*. IV. Carpels connate, and adnate to the hollow, but dry, receptacle, e.g., *Neurada* and *Griellum*. V. Carpel 1, superior: fruit a drupe: style terminal, e.g., *Prunus*. VI. Same as the last, but

style basal and flowers often irregular, e.g., *Chrysobalanus*.

The fruitlets of *Rubus* have a fleshy ovarian wall and are drupelets. The strawberry has a fleshy receptacle with dry achenes scattered upon it. The rose fruit consists of a hollow, fleshy receptacle bearing achenes on its inner face; that of *Pyrus* is similar, but the receptacle and carpels have grown together into one structure. The peach, cherry, and plum are each the product of one superior carpel.

The following plants are cultivated for their fruits: apple, pear, quince, cherry, plum, apricot, peach, almond, raspberry, blackberry, strawberry, and medlar. These fruits are eaten fresh, preserved in sugar, or fermented into vinegar or cider. Rose fruits are also preserved, and the fruits of mountain ash are used for making a spirituous drink. The petals of *Rosa damascena* and *R. gallica* are macerated with oil of sesame to form attar of roses. The petals themselves yield oil of rose, from which rose-water is made. Many species have been used in medicine; e.g., rose, the seeds of which are vermifugal. Quince seeds contain mucilage and are emollient. The conserve of rose is astringent. Agrimony is nephritic, and is also used for pulmonary catarrh and angina. Alchemilla is astringent and vulnerary. The root of *Fragaria* is diuretic and astringent. Flowers of *Hagenia abyssinica* are a famous remedy for tapeworm. Flowers of *Ulmaria* are used to give a bouquet to wine; also as a sudorific and cordial. The bark of *Prunus serotina* (wild cherry bark) is tonic and pectoral. The bark of *Quillaja Saponaria* (soap-bark tree) of Chile, is a stimulant, diuretic and irritant, contains saponin, and is used for washing delicate fabrics. Gummy exudations from the bark of cherry are sometimes used in medicine. *Sanguisorba* has been used for forage, and as a condiment. The seeds of many species of *Prunus* and others yield oil in quantity.

Fifty or sixty genera are cultivated in America. Among these are: Agrimonia (Agrimony); Alchemilla (Lady's Mantle); Amelanchier (Shadbush, Juneberry, Service-berry); Aronia (Choke-berry); Aruncus; Cercocarpus; Chrysobalanus (Cocoa Plum); Comarum (Marsh Cinquefoil); Cotoneaster; Cratægus (Hawthorn, Scarlet Thorn, Washington Thorn); Eriobotrya (Loquat, Japan Plum); Exochorda (Pearl Bush); Fragaria (Strawberry); Geum (Avens); Gillenia or Portercanthus (American Ipecac, Bowman's Root); Holidiscus or Schizonotus; Kerria (Globe-flower, Japanese Rose); Margyricarpus (Pearl Fruit); Mespilus (Medlar, Mespil); Neviusia (Snow Wreath); Photinia (Toyon, Tollon); Physocarpus (Ninebark); Potentilla (Cinquefoil, Five-finger, Silver-weed); Pyracantha; Pyrus (Pear, Apple, Crab); Quillaja (Soap-bark Tree); Raphiolepis (Indian Hawthorn); Rosa (Rose, Eglantine, Sweetbrier); Rubus (Bramble, Blackberry, Raspberry, Cloud-berry, Baked-apple Berry, Yellow Berry, Salmonberry, Wineberry, Blackcap, Thimbleberry, Dewberry); Sanguisorba (Burret); Sorbaria; Sorbus, (Mountain Ash, Rowan Tree, Dogberry, Service Tree, White Beam-tree); Spiræa (Queen of the Meadows, Meadowsweet, Hardhack, Steeple-bush, Bridal Wreath); Ulmaria (Meadowsweet, Queen-of-the-Prairie, Queen-of-the-Meadows); Waldsteinia (Barren Strawberry, Yellow Strawberry).

103. **Leguminosæ** (from *legume*, the name of the type of fruit characteristic of this family). **PEA FAMILY.** Fig. 28. Herbs, shrubs, or trees, often twining: leaves alternate, compound, rarely simple: flowers regular or irregular, usually bisexual, hypogynous or perigynous, fundamentally polypetalous; sepals 5, more or less connate, often unequal; petals 5, rarely fewer, nearly equal, or unequal, or more commonly papilionaceous (i. e., 1 dorsal standard, 2 lateral cleaver-shaped wings, and 2 ventral, more or less connate, petals forming the keel); stamens 10 or very numerous, rarely 5, included or exserted, often inserted around a glandular disk, mona-

delphous, 9 united and 1 separate, or all separate; carpel 1, rarely 2–15, superior; ovary 1-celled, inequilateral; the single parietal placenta ventral but turned dorsally; ovules 1 to many: fruit a legume, or, by reduction, indehiscent, or follicular, or fleshy, often jointed between the seeds, and sometimes filled with pulp; seeds exalbuminous.

Leguminosæ contains 429 genera and about 7,000 species, distributed over the whole earth, but most abundant in the tropics. This family and the Orchidaceæ are, next to the Compositæ, the largest families of flowering plants. The large genera which contain 100 or more species are: Astragalus, 1,200 species; Acacia, 450 sp.; Cassia, 380 sp.; Mimosa, 300 sp.; Crotonaria, 250 sp.; Indigofera, 250 sp.; Trifolium, 250 sp.; Bauhinia, 150 sp.; Aspalanthus, 150 sp.; Oxytropis, 150 sp.; Desmodium, 150 sp.; Inga, 140 sp.; Tepirosia, 120 sp.; Vicia, 120 sp.; Pithecolobium, 110 sp.; Lupinus, 100 sp.; Psoralea, 100 sp.; Dalea, 100 sp.; Lathyrus, 100 sp.; Rhynchosia, 100 sp.; and Phaseolus, 100 sp. Taken in the broad sense, the family is a very natural one, the nearest relatives being the Chrysobalanus section of the Rosaceæ. The most constant distinguishing character is the leguminous type of fruit. When this occasionally varies, the papilionaceous corolla, or the general Mimosa type of flower, is distinctive. Except in the fruit, the family is very diverse, and the following sub-families have often been treated as distinct families.

Sub-family I. **Mimosæ.**—Flowers regular; corolla valvate; stamens 5–10, or very numerous, exserted: e.g., Pithecolobium, Albizzia, Mimosa, and Acacia.

Sub-family II. **Cæsalpinæ.**—Flowers irregular, not papilionaceous; stamens 10 or fewer, not conspicuously exserted; corolla imbricated: e.g., Copaiba, Tamarindus, Cercis, Bauhinia, Cassia, Gleditsia, Gymnocladus, Cæsalpinia, and the like.

Sub-family III. **Papilionatæ.**—Corolla papilionaceous, imbricated; stamens 5–10, included: e.g., Pisum, Lathyrus, Robinia, Vicia, Phaseolus, and so forth.

The leaves of many Leguminosæ are motile. *Mimosa pudica*, *Cassia nichilans*, and others, are sensitive to touch, the leaflets, and often the leaves, quickly drooping when disturbed. A great number show sleep movement, the leaflets drooping at nightfall. The motile organ is the pulvinus at the base of the leaflet or leaf. The lateral leaflets of *Desmodium gyrans* are rhythmically and spontaneously motile. The pollination of the papilionaceous flowers is complicated and interesting. (See Kerner and Oliver's "Natural History of Plants.") The legumes of *Desmodium* separate into 1-seeded joints which are covered with hooked hairs, and, therefore, bur-like. The roots of the Leguminosæ commonly bear tubercles containing nitrogen-fixing organisms, the product of which is used by the plant.

The economic plants are almost innumerable. The following are the most important:

Plants used for food: *Detarium senegalense* of Senegambia, edible drupe; *Castanospermum australe* (Australian chestnut), *Dolichos Lablab* (black bean), *Phaseolus vulgaris* (bean), *Cicer arietinum* (chick pea), *Pisum sativum* (pea), *Ervum Lens* (lentil) and *Lupinus* spp., all have edible seeds; *Apios tuberosa*, *Psoralea hypogæa*, and *P. esculenta*, edible tubers; *Arachis hypogæa* (peanut), and *Voandzeia subterranea*, subterranean seeds; *Lathyrus tuberosa*, sugary tubers, much used before potatoes were known; and *Cytisus scoparius*, buds used as capers.

Plants used as forage: *Ceratonia Siliqua* (St. John's bread), *Onobrychis sativa* (sainfoin), *Vicia sativa* (vetch), *Medicago sativa* (alfalfa), *Medicago lupulina* (medick), *Trifolium* species (clover), *Glycine hispida* (soy bean), *Vigna Catjang* (cowpea), *Lotus corniculatus*, *Lupinus* spp., *Anihyllis Vulneraria*, *Hedysarum coronarium*, *Ornithopus sativus*, *Pisum sativum*, *Ulex europæus*.

Plants used for medicine: *Acacia Senegal* (gum acacia); *A. Catechu* (catechu), astringent, tonic; *Swartzia tomentosa*, sudorific; *Copaiba Langdorfii* (balsam of Copaiba), of Brazil, for catarrh; *Cassia* sps., Orient, India, etc., leaves purgative; *Tamarindus indica* (tamarind), pulpy pods used; *Sophora tomentosa*, India, seeds arrest choleric vomiting; *Toluifera Balsamum* (balsam of Tolu), South America, bronchial; *Andira* sps., tropical America, emetic, purge, narcotic, vermifuge; *Pterocarpus Draco* (dragon's blood), West Indies, astringent; *P. Marsupium* (gum kino); *Butea frondosa* (eastern kino), Asia; *Mucuna pruriens* (cow-itch or cowage), India, stinging hairs on pod, anthelmintic; *Astragalus gummifer* (gum tragacanth), of the Orient; *Colutea arborescens* (bladder senna), purgative, emetic; *Glycyrrhiza glabra*, (licorice), Europe, emollient; *Genista tinctoria*, purgative; *Cytisus scoparius*, diuretic; *Trigonella Fœnum-græcum* (fenugreek), Old World, food, condiment, horse-remedy, and so on; *Anagris fetida* (stinking wood), purgative and poisonous; *Physostigma venosum* (calabar bean), sedative, contracts the pupil, poisonous; *Astragalus* sps., and *Crotalaria* sps. are loco-weeds, and poisonous to cattle; arrow-poisons are furnished by *Erythrophœum*, *Azafia*, and *Pithecolobium*. Fifteen genera furnish fish-poison.

Dye-stuffs: *Cæsalpinia echinata* yields braziline; *Sophora japonica* yields yellow dye; *Indigofera tinctoria* yields indigo; *Genista tinctoria*, yields a dye; *Hæmatoxylon campechianum* yields logwood and hæmatoxylin. *Pterocarpus santalinum* yields red sandalwood, a brown dye.

Other purposes: Copal varnish from *Hymenæa* sps., *Trachylobium* sps., and *Copaiba* sps. Many species are valuable timber trees. A snuff-perfume is obtained from seeds of *Coumarouna* (tonka bean). Rosewood is from *Dalbergia nigra*, and other species. African rosewood is from *Pterocarpus erinaceus*. Red seeds of *Abrus precatorius* (jequirity) are used for necklaces, as are also those of *Adenanthera Pavonina* (Circassian seeds). Branches of *Cytisus scoparius* (broom) are used for basket-work. *Ulex europæus* (furze) is used as firewood in France. Many species furnish fibers for spinning. Oil is obtained from seeds of peanut and others. Many are ornamental.

About 150 genera are cultivated in America, or are important to American agriculture. Many of the species are among our most valuable ornamental and food-plants. Some of these genera are: *Abrus* (Crab's-eye Vine, Weather Plant); *Acacia* (Wattle, Kangaroo Thorn, Weeping Myall, Australian Blackwood, Mulga, Popinac, Opopanax, Cassie, Huisache, Espino, Cavan, Gum Arabic Tree); *Adenanthera* (Red Sandalwood); *Albizia*; *Alhagi* (Camel's Thorn); *Amphicarpæa* (Hog Peanut); *Amorpha* (Lead Plant, Bastard Indigo); *Anthyllis* (Kidney Vetch, Sand Clover, Woundwort, Jupiter's Beard); *Apios* (Groundnut, Wild Bean); *Arachis* (Peanut, Goober); *Astragalus* (Milk Vetch); *Baptisia* (Wild Indigo); *Bauhinia* (Mountain Ebony); *Cæsalpinia* (Brasilieto, Barbadoes Pride, Barbadoes Flowerfence, Dwarf Poinciana); *Canavalia* (Jack Bean, Chickasaw Lima); *Caragana* (Pea Tree); *Cassia* (Wild Senna, Partridge Pea, Pudding Pipe Tree); *Centrosema* (Butterfly Pea); *Cercis* (Judas Tree, Red Bud); *Chorizema*; *Cicer* (Chick Pea); *Cladrastis* (Yellow-wood); *Chianthus* (Glory Pea, Glory Vine, Parrot's Bill); *Cliatoria* (Butterfly Pea); *Colutea* (Bladder Senna); *Coronilla* (Crown Vetch, Scorpion Senna); *Crotalaria* (Rattle-Box); *Cytisus* (Broom, Genista); *Desmodium* (Tick Trefoil, Telegraph Plant); *Dolichos* (Hyacinth Bean, Taukok, Black Bean), the species still much confused; *Erythrina* (Coral Tree); *Galega* (Goat's Rue); *Genista* (Dyer's Greenwood); *Gleditsia* (Honey Locust, Sweet Locust, Three-thorned Acacia); *Glycine* (Soy Bean); *Glycyrrhiza* (Licorice); *Gymnocladus* (Kentucky Coffee Tree); *Halimodendron* (Salt Tree);

*Hedysarum* (French Honeysuckle); *Hosackia*; *Indigofera* (Indigo); *Kennedya*; *Laburnum* (Golden Chain, Bean Tree, Scotch Laburnum); *Lathyrus* (Sweet Pea, Tangier Scarlet P., Pride of California, Everlasting P., Two-flowered P., Flat P., Perennial P., Lord Anson's P., Marsh P., Sea P., Beach P., Prairie Vetchling, Black P., Black Bitter Vetch, Spring Bitter Vetch); *Lens* (Lentil); *Lespedeza* (Bush Clover, Japan Clover, Hoop-koop); *Leucana* (White Popinac); *Lotus* (Bird's-foot Trefoil, Babies' Slippers, Winged Pea); *Lupinus* (Lupine, Sundial, Deer Cabbage); *Milletia* (Ironwood); *Medicago* (Alfalfa, Lucerne, Black or Hop Medick, Nonesuch, Snails, Tree Alfalfa, Moon Trefoil); *Melilotus* (Sweet Clover); *Mimosa* (Sensitive Plant, Humble Plant); *Mucuna* (Cowitch, Cowage, Velvet Bean, Banana Bean); *Onobrychis* (Sainfoin, Holy Clover); *Ononis* (Rest-Harrow, Goat Root); *Parkinsonia* (Jerusalem Thorn); *Parocheus* (Shamrock Pea, Blue Oxalis); *Petalostemon* (Prairie Clover); *Phaseolus* (Bean, Caracol, Snail-flower, Corkscrew Flower, Scarlet-runner, Dutch Caseknife B., Metcalfe B., Moth B., Gram, Silva B., Civet B., Lima B., Kidney B., Bush B.); *Piscidia* (Fish-poison Tree, Jamaica Dogwood); *Pisum* (Garden Pea, Field P.); *Pithecolobium*; *Prosopis* (Mesquite, Screw Bean, Tornillo); *Poinciana* (Royal Poinciana, Peacock Flower, Flomboyant); *Psoralea* (Scurfy Pea, Pomme Blanche); *Pueraria* (Kudzu Vine); *Robinia* (Locust, False Acacia, Black Locust, Rose Acacia, Clammy Locust); *Schrankia* (Sensitive Brier); *Sophora* (Japan Pagoda Tree); *Spartium* (Spanish Broom); *Sutherlandia* (Bladder Senna); *Swainsona* (Winter Sweet Pea); *Tamarindus* (Tamarind); *Templetonia* (Coral Bush); *Tephrosia* (Goat's Rue, Catgut, Wild Sweet Pea, Hoary P.); *Thermopsis*; *Trifolium* (Clover, Alsike, Cowgrass); *Trigonella* (Fenugreek); *Ulex* (Gorse Whin, Furze); *Vicia* (Vetch, Tare, Broad Bean, Windsor B., English Dwarf B.); *Vigna* (Cowpea, Black Pea, China Bean); *Wistaria* (Chinese Wistaria, Kidney-bean Tree).

#### Order 38. GERANIALES

104. **Geraniaceæ** (from the genus *Geranium*, Crane's-bill, from *geranos*, a crane, in allusion to the cranelike beak of the fruit). GERANIUM FAMILY. Fig. 29. Herbs and shrubs, sometimes fleshy: leaves opposite or alternate, very diverse: flowers bisexual, regular or slightly irregular; sepals 5, imbricated, persistent; petals 5, rarely fewer, imbricated or convolute; stamens usually 10, rarely more, hypogynous or perigynous, the outer set opposite the petals, some frequently antherless, somewhat monadelphous below, often glandular at the base; carpels 5; ovary 5-celled, rarely 2-3-celled, 5-lobed, prolonged into a beak terminatd by the 5 styles; ovules 1 to many in each cell: fruit rarely a capsule, more commonly splitting into 5 beaked sections; seeds with endosperm, straight or curved.

The family has 10 genera and 360 species, widely distributed over the whole globe. The largest genera are *Pelargonium* (South Africa) with 175 species, and *Geranium* with 160 species. Some fossil fruits of Geraniaceæ are known. The Geraniaceæ are related to the Oxalidaceæ, Tropæolaceæ and Balsaminaceæ; also to the Linaceæ and Rutaceæ. The 5 sepals and petals, the 10 stamens, the 5 carpels, and the more or less beaked or lobed fruit with its peculiar dehiscence, are together distinctive.

The flower of *Pelargonium* is slightly irregular, with a dorsal receptacular spur at the base of the calyx. The fruits of all but 40 Geraniaceæ dehisce elastically, throwing the seeds to a distance. The 5 carpels split away at base, coil up violently, and remain attached to the summit of a column which projects from the receptacle. This method of dehiscence, when present, is characteristic of the Geraniaceæ.

The Geraniaceæ are astringent; several contain resin, and others contain free acids. Several species of

III. Desert vegetation.—The giant cactus (*Carnegiea gigantea*); also bushes of *Opuntia fulgida*, and in the foreground the low fine growths of *Bigelovia nana* Twigg.

*Geranium* have been used as remedies for wounds, others for dysentery, and the like; some have been used as stimulants. *Erodium moschatum* is valued because of a very strong odor of musk. The resinous stems of *Monsonia* (South Africa) burn readily, and have been used for torches. The most important economic genus is *Pelargonium*, cultivated for ornament. The foliage of some *Pelargoniums* is glandular and very fragrant ("rose geraniums"). Some species of *Geranium* also are ornamental. The awn-like beak of *Erodium* fruits have been used as hygrometers.

Few genera are in cultivation in America as ornamental plants: *Erodium* (Stork's-bill); *Geranium*, (Crane's-bill); *Pelargonium* (so-called "Geraniums"). Several cultivated genera, formerly included in the *Geraniaceae*, are now placed in separate families, which see, e.g., *Impatiens* (Balsaminaceae), *Tropaeolum* (Tropaeolaceae), *Oxalis* and *Averrhoa* (Oxalidaceae).

105. *Oxalidaceae* (from the genus *Oxalis*, signifying acid, from the sour taste of the foliage). *OXALIS* FAMILY. Herbs, rarely shrubby: leaves usually compound: flowers bisexual, regular; sepals 5, persistent, imbricated; petals 5, convolute or imbricated, rarely united at the base; stamens 10 in 2 whorls, the outer set opposite the petals, filaments coherent below, those of the outer set shorter, one or both sets with external glandular appendages at the base, hypogynous; ovary superior, 5-celled, with a persistent central column (as in *Geraniaceae*); styles separate: fruit an ordinary capsule with each cell dorsally dehiscent, or a berry.

The *Oxalis* family contains 7 genera and about 230 species, of which 220 belong to the genus *Oxalis*. They are mostly of tropical and subtropical distribution. *Oxalis* occurs chiefly in South Africa and South America. The *Oxalidaceae* were formerly united with the *Geraniaceae*, but differ in the fruit, which is a dehiscent capsule or a berry and does not break up into separate carpels.

The species of *Oxalis* are often bulbous or tuberous, or the roots are enlarged as water-storage tissue. The leaflets usually have a sensitive cushion at the base (pulvinus) and show sleep-movements. The flowers of many are dimorphic or trimorphic, i.e., have stamens or styles of 2 or 3 lengths in the same species. The seeds are forcibly ejected through the dorsal suture of the capsule by the elastic separation of the outer layer of the testa.

*Oxalis* contains much oxalic acid, which may be extracted for economic purposes. It is somewhat sedative, and the sour taste has made some species useful as salads. The starchy roots of some South American species are used for cattle-fodder. The fruits of *Averrhoa* are used in the tropics as a substitute for gooseberries, which they resemble in flavor.

Two genera are grown in America: *Averrhoa* (Carambola), 1 species grown for shade and fruit; and *Oxalis*.

106. *Tropaeolaceae* (from the genus *Tropaeolum*, from *tropaion*, a trophy; the leaves are shield-like, and the flowers resemble a helmet). *NASTURTIIUM* FAMILY. Fig. 29. Diffuse or climbing succulent herbs with alternate, peltate or lobed leaves: flowers bisexual, irregular, spurred; sepals 5, imbricated; petals 5, imbricated, the upper two differing in shape from the lower three; stamens 8, separate, somewhat perigynous; ovary superior, 3-celled, 3-lobed, each cell 1-seeded; style 1; stigmas 3: fruit splitting into 1-seeded, indehiscent nutlets or drupelets.

A single genus of about 35 species is found in the mountainous regions from Mexico to Chile. The family was formerly included in the *Geraniaceae*, but is distinguished by its separate stamens, its indehiscent fruitlets, and a very peculiar method of embryo development, in which the suspensor divides into three parts, one part growing into the placenta, another out into the ovarian cavity, and the third producing the embryo on its apex. The spur of the flower is an outgrowth of

the obliquely cup-shaped receptacle at the base of the calyx, as in *Pelargonium*.

The herbage of *Tropaeolum* has an acrid taste like cress, and is often used for salad, hence the common name "nasturtium" or "Indian cress."

In America, several species are grown for their showy flowers. *Tropaeolum majus* is the most widely known species. *T. peregrinum* is the "canary-bird flower."

107. *Linaceae* (from the genus *Linum*, the Latin name for flax, from the old Celtic *lin*, a thread). *FLAX* FAMILY. Fig. 29. Woody or herbaceous plants: leaves alternate or opposite, rarely whorled, simple, entire: flowers bisexual, regular; calyx of 5, persistent, imbricated sepals, rarely 4-parted, with 3-fid lobes; petals 5, rarely 4, convolute, clawed, the claw sometimes crested; stamens 5, alternate with the petals, with sometimes 5 additional staminodia, or 10, 15, or 20, hypogynous, usually united at the often glandular base; ovary 5-, rarely 3- or 4-, celled or falsely 10-celled by the intrusion of the midrib; ovules few; styles as many as the cells of the ovary: fruit a capsule or drupe.

There are 9 genera and about 120 species, of which 90 species belong to *Linum*. The *Linaceae* are related to

29. GERANIACEAE: 1. *Geranium*, a, floral diagram; b, fruit; c, fruit dehiscing. TROPEOLACEAE: 2. *Tropaeolum*, flower. LINACEAE: 3. *Linum*, a, flower; b, floral diagram.

the *Geraniaceae* and *Oxalidaceae*, but also show a relation to the *Silenes* in the *Caryophyllaceae*. The many-stamened genera suggest the *Ternstroemiaceae*. The family is most easily recognized by the simple, regular pattern of the flower, and the numerical plan of 5 (or 4) which is carried through all the floral parts. For this reason, the flax was taken by the older botanists as a pattern flower.

*Linum catharticum* (Europe) was formerly used as a purgative. A fixed oil is extracted from the seeds of the common flax (*Linum usitatissimum*), which is used in medicine as an emollient. The most extensive use of this oil is in painting, its value being due to the property of drying into a hard, waterproof coating. Flaxseed meal, from which the oil has been expressed, is used for fodder and for poulticing. The seed-coats of flax become very mucilaginous when soaked, on which account flaxseed has also been used as an emollient in the treatment of coughs and colds. The cortical bast-fibers of the flax have been used since earliest times in textile industries. As the basis of linen cloth, flax is one of the most useful of cultivated plants. Flax was probably Asiatic in its origin. Many species of *Linum* are ornamental, but are little grown.

Two genera are cultivated in America: *Linum*, with species of annual garden plants; and *Reinwardtia*, with species of conservatory sub-shrubs from India.

108. **Erythroxylaceæ** (from the genus *Erythroxylon*, the name signifying *red wood*; the wood of some species being red). **Coca FAMILY**. Fig. 30. Shrubs and small trees: leaves alternate: flowers bisexual, regular, inconspicuous; sepals 5, persistent, imbricated or valvate; petals 5, convolute or imbricated, with appendages on the inner face, or with projecting callosities; stamens 10, in 2 whorls, more or less connate into a tube, and externally glandular; ovary 3-4-celled, usually but 1 cell developing in fruit; 1-2 ovules in each cell; styles 3-4: fruit drupaceous, 1-2-seeded.

Two genera and about 90 species are known; all tropical, and reaching their greatest development in

30. **ERYTHROXYLACEÆ**: 1. *Erythroxylon*, a, flower of *E. pulchrum*; b, flower, perianth removed, of *E. Coca*. **ZYGOPHYLLACEÆ**: 2. *Zygophyllum*, a, flower; b, floral diagram. **RUTACEÆ**: 3. *Ruta*, a, flower; b, floral diagram; c, leaf.

tropical South America, but extending northward to Mexico and southward in the Old World to Natal. The family is closely related to the *Linacææ* with which it was formerly united, but differs in the more prominent stamen-tube, the appendages on the petals, and the drupaceous non-capsular fruit.

The only important economic plant is the coca plant (*Erythroxylon Coca*), a shrub famous as the source of cocaine. Its origin is unknown, but it was early used by the Peruvians as a stimulant. Coca is now grown to a limited extent in southern Florida and southern California, as well as in most tropical countries.

109. **Zygophyllaceæ** (from the genus *Zygophyllum*, derived from the Greek signifying a *yoke* and *leaf*; the leaflets are in pairs). **CALTROP FAMILY**. Fig. 30. Herbs, shrubs, or trees: leaves opposite, rarely alternate, mostly pinnately compound: flowers bisexual, regular, rarely irregular; sepals 4-5, persistent, imbricated or rarely valvate; petals 4-5, rarely 0, imbricated, rarely valvate; disk present, diverse, rarely wanting; stamens usually 8 or 10, hypogynous, the outer opposite the petals, usually scaled at the base of the filaments; ovary superior, 4-5-celled, rarely falsely many-celled; ovules 2 to several in each cell; style and stigma 1: fruit a capsule or separating into fruitlets.

Twenty-one genera and about 150 species occur as natives of the warmer parts of the world, especially the drier desert regions. They are especially abundant in North Africa and the Mediterranean region. This family is very closely related to the *Rutaceæ*, from which it differs in the absence of glandular dots and oil, and in the presence of stipules. The fruits are usually more or less lobed and sometimes winged or covered with prickles.

The hard, faintly aromatic wood (*lignumvitæ*) of *Guaiacum officinale* is used for cabinet work and for pulleys. The wood of this plant yields a resin used as a diaphoretic and purge. The flower-buds of one species of *Zygophyllum* are used in place of capers.

The Arabs use *Z. simplex* to remove freckles. The fetid smell of this plant is so strong that even camels are said to reject it. Soda is obtained from species of *Nitraria*, which inhabit alkaline soil.

*Guaiacum officinale* is sometimes grown in southern Florida and southern California for ornament. *Zygophyllum* may be in cultivation.

110. **Rutaceæ** (from the genus *Ruta*, the ancient name). **RUE FAMILY**. Fig. 30. Herbs, shrubs, trees: leaves usually alternate, simple or variously cut or compound, usually with pellucid dots: flowers bisexual, usually regular; sepals 4-5, often coherent, imbricated; petals 4-5, imbricated or valvate, usually separate; stamens 8-10, rarely 15, inserted at the base of a thick disk, usually distinct; ovary superior, 2-5-lobed, 2-5-celled; each cell 1 to many-ovuled, raised on a prolongation of the receptacle, a glandular disk at its base; styles usually connate: fruit a capsule opening by valves, or fleshy and indehiscent, or separating into fruitlets, rarely winged.

*Rutaceæ* contains over 100 genera and about 900 species, mostly of tropical countries but extending into temperate parts of Europe and America. *Fagara*, with more than 130 species, is the largest genus. The *Rutaceæ* are related to many of the *Geranium* group, especially to *Simarubaceæ*, *Zygophyllaceæ*, and *Meliaceæ*. The transparent dots in the leaves, the numerical plan, and especially the lobed ovary raised on the disk or stalk, are together distinctive. The disk is often much developed and very diversely constructed. The outer stamens are usually opposite the petals, not alternate with them as might be expected. In some cases the carpels are entirely free below and united only by the styles or stigmas. The seeds, except in the berry fruits, are only 1 or 2. The great development of oil-glands containing a fragrant oil is one of the most characteristic features of the family. These glands are produced on all parts of the plant, even on the floral parts and surface of the fruits. The orange and lemon are examples of *Rutaceæ* with berry fruits, and they are widely cultivated and perplexingly variable.

The volatile oil of the *Rutaceæ* has been used to some extent for medicine and also for perfumery. Extract of rue has been used as a vermifuge. The Romans used rue as a condiment. Some species of rue are so pungent as to produce a poisoning of the skin similar to that produced by poison ivy. The volatile oil is so copious in *Dictamnus* as to ignite readily. Several species of *Barosma* (buchu) are tonic and diuretic. The genus *Citrus* is the most useful. It includes the orange, the bitter orange, the citron, the lemon, the lime, the grape-fruit, the kid-glove orange or tangerine, and the bergamot from the rind of which bergamot oil is manufactured, used in perfumery. The bark of the prickly shrub, *Zanthoxylum*, is sometimes used as a tonic. The seeds of some species of *Zanthoxylum* are used to poison fish.

In cultivation in America or worthy of trial are 20 to 30 genera, used mostly for ornament and fruit. Among these are: *Adenandra* (Breath of Heaven); *Ægle* (Bael Fruit, Bengal Quince); *Atalantia*; *Balsamocitrus* (African Bael-Fruit); *Calodendron* (Cape Chestnut); *Casimiroa* (White Sapota); *Citrus* (Orange, Lemon); *Dictamnus* (Dittany, Gas Plant, Burning Bush); *Fagara* (Prickly Ash); *Feronia* (Wood Apple); *Murraya* (Orange Jessamine, Satinwood); *Phellodendron* (Chinese Cork Tree); *Poncirus* (Trifoliate Orange); *Ptelea* (Hop Tree); *Ruta* (Rue); *Triphasia* (Bergamot Lime, Lime Berry); *Zanthoxylum* (Prickly Ash, Chinese or Japanese Pepperwood, Toothache Tree).

111. **Simarubaceæ** (from the genus *Simaruba*, which is the Caribbean name of *Simaruba officinalis*). **QUASIA FAMILY**. Fig. 31. Shrubs or trees: leaves alternate or rarely opposite, pinnate, rarely simple, dotless: flowers unisexual, regular; sepals 3-5, more or less connate, imbricated or valvate; petals 3-5, rarely 0, free or connate, variously arranged in the bud; disk prominent, very diverse, rarely 0; stamens usually twice the petals, filaments naked or with a scale; carpels 2-5, free, or

connate at the base or by the styles, or completely united into a 2-5-celled, superior ovary; each cell 1-, rarely several-, ovuled; carpels in fruit drupe-like, rarely forming a berry or samaras.

About 28 genera and 140 species are generally distributed in the tropics, but extend into the temperate regions. The center of distribution is in tropical America. Some fossil species are known. The family is closely related to the Rutaceæ, but differs in the absence of foliage-glands and in the presence of scales on the filaments. It is also closely related to the Zygophyllaceæ.

Most of the Simarubaceæ contain a bitter principle, also, sometimes, a resinous matter and an oil which is of value as a tonic. *Quassia amara* of tropical America furnishes the quassia wood, famous as a bitter tonic. *Picrasma excelsa*, of Jamaica, also furnishes quassia of equal quality. Branches of quassia and the pulverized bitter wood of species of *Simaruba* are used in tropical America to drive away insects. The seeds of *Simaruba Cedron* are used for the same purpose. Various species are used for snake-bites. The leaves and sap of species of *Picramnia* furnish a beautiful violet dye.

Very few are in cultivation in America: *Picrasma*, a semi-hardy shrub; and *Ailanthus* (Tree of Heaven), a well-known tree.

112. **Burseraceæ** (from the genus *Bursera*, named in memory of Joachim Burser, a botanist in Naples). BURSERIA FAMILY. Fig. 31. Trees or shrubs, often very large, with usually alternate compound leaves: flowers bisexual, regular, usually small and very numerous; sepals 3-5, more or less connate, imbricated or often valvate; petals 3-5, usually separate, imbricated or val-

31. SIMARUBACEÆ: 1. *Ailanthus*, a, flower, section; b, flower, looking in; c, fruit. BURSERACEÆ: 2. *Bursera*, a, flower; b, floral diagram. MELIACEÆ: 3. *Swietenia*, flower. 4. *Cedrela*, flower. 5. *Melia*, floral diagram. MALPIGHIACEÆ: 6. *Camarea*, flower. 7. *Malpighia*, floral diagram.

vate; stamens usually twice as many as the petals, hypogynous, sometimes unequal, separate, the outer opposite the petals; disk present, annular or cup-shaped, rarely 0, sometimes adnate to the calyx; ovary superior, 2-5-celled; ovules usually 2 in each cell; style 1 or 0; fruit drupe-like with 2-5 stones or with a bony endocarp or a capsule with the epicarp opening and exposing the connate bony pits; seeds exalbuminous.

The 16 genera and about 270 species are widely distributed in tropical regions. One species of *Bursera* reaches Florida. The family is related to the Rutaceæ and Simarubaceæ, from which it differs in the presence of resin-chambers in the bark. It is also very closely related to the Anacardiaceæ.

The family is very rich in resin and, therefore, is of considerable economic importance. These resins are frequently aromatic or fragrant; hence many have been used as incense. The resin myrrh is obtained from species of *Commiphora* of Arabia and Africa. Mecca balsam is from the same genus. *Olibanum incense* is derived from trees of the genus *Boswellia*, of India. Frankincense is either this *olibanum* or the resin from *Boswellia Carteri*. A substitute for dammar and copal has been obtained from the *Burseraceæ*.

Few species of the *Burseraceæ* are in cultivation in America: *Bursera Simaruba*, as an ornamental greenhouse tree; and *Garuga pinnata*, which is grown in Florida and California for the gooseberry-like fruit.

113. **Meliaceæ** (from the genus *Melia*, the Greek name of the somewhat similar manna-ash). MAHOGANY FAMILY. Fig. 31. Trees or shrubs: leaves usually alternate, pinnate or rarely simple; flowers bisexual, rarely unisexual, paniced; sepals 4-5, usually partly connate, imbricated; petals 4-5, rarely 3-8, separate, or connate or adnate to the stamens; stamens 8-10, rarely 5, or numerous, hypogynous, filaments usually connate into a tube which is entire or lacerate, rarely free; disk present; ovary superior, 2-5-celled, rarely 1- or many-celled, each cell 2-, rarely several-, ovuled; style and stigma 1: fruit a drupe, berry, or capsule.

There are 42 genera and about 600 species, all confined to the tropics. They enter the United States only in southern Florida. Some fossil species are known. The family is related to the Rutaceæ, but lacks the resin and oil-glands. It is closely related to all of the disk-bearing families, but is distinguished by the peculiar stamen-tube with teeth and fringe.

There is the greatest diversity in the arrangement of the anthers on the staminal tube and the dentation or fringing of the latter. Very commonly there are 2 stipule-like teeth just below the anthers. The seeds are sometimes winged (in mahogany). The leaves are rarely transparent-dotted (*Flindersia*).

*Melia Azedarach*, an Asiatic tree, is bitter, and has been used in medicine as a purgative and vermifuge. Other species of *Meliaceæ* are purgative and emetic, or are used for heartburn, and the like. Some have the odor of garlic. The bark of the Asiatic *Walsura piscidia* is used to stupefy fish. The pulp of the fruit of *Aglaia edulis* is said to be delicious. The bitter bark of mahogany has been used in place of quinine. The most celebrated member of the family is *Swietenia Mahogani* of the West Indies and Peru, which furnishes the mahogany timber of commerce. The wood of the West Indian *Cedrela odorata* is fragrant, and is the so-called cigar-box cedar, from which these boxes are made. The sawdust of the South African sneezewood (*Pteroxylon obliquum*) causes sneezing, hence the popular name.

Five or more genera are in cultivation in America, all confined to southern California and southern Florida, except *Melia*, which is common throughout the southern states, and *Cedrela sinensis*, hardy in Mass. Among these are *Cedrela* (West Indian Cedar); *Melia* (Pride of India, China-berry Tree, Texas Umbrella Tree); *Pteroxylon* (Sneezewood); *Swietenia* (Mahogany).

114. **Malpighiaceæ** (from the genus *Malpighia*, in honor of Marcello Malpighi, once professor of medicine at Pisa). MALPIGHIA FAMILY. Fig. 31. Trees or shrubs, most often climbing: leaves usually opposite, often with petiolar glands and jointed petioles: flowers commonly bisexual, usually obliquely irregular; sepals 5, mostly separate, some or all with large glands; petals 5, fringed or toothed, slender-clawed; stamens 10, in part staminodial, rarely fewer, the outer opposite the petals, hypogynous or nearly so, usually connate below; anthers very diverse and odd; ovary superior, 2-3-celled and lobed, rarely 5-celled, the cells 1-ovuled; styles 2-3, rarely connate: fruit commonly separating into 2-3 nut-like portions which are entire, or pectinately winged, or naked, rarely a single nut or drupe; seeds

exalbuminous; embryo variously curved or spiral, rarely straight.

This family has 55 genera and about 650 species, generally distributed in the tropics, but reaching to Texas and California in North America, and Port Natal in Africa. They are most abundant in the tropical forests of South America. The family is closely related to the Zygophyllaceæ, Sapindaceæ, and Erythroxylaceæ, as shown by the lobed and winged fruit, or clawed petals. The glandular calyx, clawed petals, the outer stamens opposite the petals, peculiar anthers, queer fruit, and curved embryo are together distinctive.

The family is of little economic importance. Various coloring matters and astringent tannins are contained in the bark, for which reason some of the Malpighiaceæ have been used for dysentery and intermittent fever. Some are used as a remedy for snake-bites. The fruits of certain Malpighiaceæ are sour, juicy and refreshing.

Few species are in cultivation in North America, all in California, Florida or the West Indies. *Galphimia* and *Stigmaphyllon* are ornamental; *Malpighia glabra* is the Barbadoes cherry, cultivated in the West Indies for the cherry-like fruit.

**115. Tremandraceæ** (from the genus *Tremandra*, which is from the Latin *tremble* and the Greek *male*, probably in allusion to the anthers). **TREMANDRA FAMILY.** Fig. 32. Shrubs or sub-shrubs, with opposite, whorled or alternate leaves: flowers bisexual, regular; sepals 4-5, rarely 3, valvate; petals of the same number as the sepals and alternating with them, colored, entire, separate induplicate-valvate; stamens 8 or 10, rarely 6, hypogynous, in 1 or 2 whorls; anthers opening by a transverse terminal valve, or more or less prolonged into a beak with terminal pores; ovary superior, 2-celled; style 1; stigma 1: fruit a capsule; seeds 1 or 2 in each cavity.

In this family are 3 genera and about 23 species, of which 20 belong to the genus *Tetratheca*. All are native of south and west Australia. The family is very similar to the Polygalaceæ, and separated from that

32. TREMANDRACEÆ: 1. *Platytheca*, floral diagram. POLYGALACEÆ: 2. *Polygala*, a, flower; b, flower, vertical section; c, floral diagram. EUPHORBIACEÆ: 3. *Euphorbia*, a, involucre and flowers; b, involucre, vertical section; c, floral diagram. 4. *Croton*, a, flower; b, floral diagram, male flower; c, floral diagram, female flower.

family only by the regular flowers. *Platytheca* is remarkable in having the four anther cells all in one plane.

Two genera are in the American trade, both tender heath-like plants: *Platytheca*, and *Tetratheca*.

**116. Polygalaceæ** (from the genus *Polygala*, an old Greek name applied later to this genus by botanists because of the supposed stimulative action of the plant on the lactation of cattle). **MILKWORT FAMILY.** Fig. 32.

Herbs, shrubs, or small trees, sometimes climbing or twining; leaves mostly alternate: flowers bisexual, irregular; sepals 5, imbricated, separate or somewhat coherent, the 2 inner largest and often winged or petaloid; petals rarely 5, commonly 3, at least the 2 upper, and sometimes all more or less coherent with each other and with the stamen-tube, inner petal concave and often with a fringed crest (keel); stamens 8, rarely fewer, in 2 whorls, hypogynous, usually adherent to the keel petal and coherent into a tube which is slit down and open behind; anthers usually opening by terminal pores or slits; ovary superior usually 2-celled; ovule usually 1 in each cell; style 1, dilated above; stigmas 1-4: fruit usually a capsule, rarely a drupe or samara; seeds pendulous, albuminous.

Polygalaceæ has 10 genera and about 500 species, 450 of which belong to the genus *Polygala*; widely distributed over the earth, but absent in New Zealand, Polynesia, arctic North America and arctic Asia. The family is not closely related to any other. The peculiar perianth and stamens, and the 2-celled ovary, are together very distinctive. The floral parts, though simulating those of the Leguminosæ, are not homologous.

A bitter principle gives the Polygalaceæ tonic and astringent properties. Some species are emetic. The root of *Polygala Senega* (North America), so-called "Senega or Seneca snakeroot," is used as an emetic and cathartic, but more especially as an expectorant. This and many other species of *Polygala* are reputed antidotes for snake-bites, hence the name "snakeroot."

Only the genus *Polygala* is in cultivation in N. America, of which 9 or 10 species are grown for ornamental purposes. Some are shrubs and 1 is an evergreen trailer.

**117. Euphorbiaceæ** (from the genus *Euphorbia*, named in honor of Euphorbus, physician to King Juba). **SPURGE FAMILY.** Fig. 32. Herbs, shrubs or trees, of greatly varying habit, sometimes fleshy and cactus-like, often with milky juice: leaves mostly alternate: flowers monœcious or dicecious, regular or irregular; both calyx and corolla present, or the latter absent, or both absent, or both much reduced, valvate or imbricated; the parts free, rarely united; intrastaminal disk usually present in the staminate flowers, often changed to glands; stamens as many as the sepals, or twice as many, or reduced to 1, separate or monadelphous; hypogynous disk in the pistillate flowers annular or cup-shaped or in the form of glands; ovary superior, usually 3-celled, rarely 1-, 2-, or 4-celled; style and stigma various; ovules 1-2 in each cavity, side by side, suspended, anatropous; micropyle external, covered with a caruncle: fruit splitting into three portions, leaving a central column, rarely indehiscent and berry-like, or drupaceous; seeds albuminous.

The 208 genera and about 4,000 species are widely distributed, mainly in the tropics, but extend into temperate regions. The largest genera are *Euphorbia* with about 700 species, *Croton* with 500-600 species, and *Phyllanthus* with 400 species. The family is related to the Geraniales, as shown by the fruit. The only constant characters of this great polymorphic family are the collateral anatropous ovules with micropyle external, the caruncle, the usually persistent axis of the fruit, and the albuminous seeds. In *Euphorbia*, some sessile staminate flowers and a pedicelled pistillate flower are inclosed in a common involucre which bears various horn-like, or gland-like, or petaloid appendages. The variation in the inflorescence and floral structure throughout the family is very intricate.

The family is of great economic importance. Only the most important plants can be mentioned here. The following are used in medicine: The juice of *Euphorbia Esula*, *E. Cyparissias*, *E. Lathyris*, *E. helioscopia*, and others, is purgative, as is also that of *Mercurialis*. *Croton Tiglium* yields the purgative croton oil. *Ricinus communis* yields castor oil. *Jatropha Curcas* (physic nut) is purgative. *Euphorbia Hyberna*, *Jatropha*

*officinalis*, *Croton*, and *Stillingia sylvatica* (queen's root) are used for syphilis. *Euphorbia corollata* and *E. Ipecacuanha* are emetic. *E. thymifolia* is used as a vermifuge in India. *Croton Eluteria* yields cascarilla bark, a tonic. The hairs of the capsule of *Mallotus philippinensis* are in the trade as kamala. The juice of *E. cotinifolia* is used by the Caribbeans to poison arrows; that of *Excoecaria Agallocha* (blinding tree) is so acrid as to blind the eye into which it may chance to fall. The juice of *E. balsamifera*, of the Canaries, is cooked and eaten as jelly. The seeds of *Aleurites triloba* are called "almonds," and eaten; as are also those of *Conceveiba guyanensis*. The fruit of *E. disticha* is edible. *E. Emblica* has fleshy, sweet fruit. The most useful as food are the tuberous roots of the sweet manioc (*Manihot palmata* var. *Aipi*), eaten cooked or raw; and of the bitter manioc (*M. utilissima*), which is poisonous when raw, but when cooked is very widely used for food in the tropics. This root is the source of cassava bread, and tapioca. Phosphorescent juice is obtained from *E. phosphorea* of Brazil. The fruit of *Hura crepitans* (sand-box) opens with a report like a pistol. It is cooked in oil to prevent dehiscence, and used as a sand-box. India rubber is obtained from the juice of *Hevea guyanensis*, and other species. *Omphalea triandra* yields a blackening juice used as ink. Soap is made from the seminal oil of *Jatropha Curcas*. Oil from the seeds of *Aleurites cordata* (Japanese oil tree) is used for lighting. Turnsole (*Crotophora tinctoria*), of the Mediterranean, yields a dye used to color Dutch cheese. Other Euphorbiaceæ yield dyes. *Sapium sebiferum* (Chinese tallow tree) yields a fat used for burning, and other purposes.

Twenty to 30 genera are in cultivation in N. America for various purposes. Among these are: *Acalypha*, ornamental; *Aleurites* (Candlenut, Candleberry Tree), California; *Codiaeum* (Croton), ornamental; *Euphorbia* (Spurge, Snow-on-the-Mountain, Scarlet Plume, Poinsettia, Mexican Fire Plant, Hypocrite Plant, Painted Leaf, Fire-on-the-Mountain, Crown of Thorns, Medusa's Head, Caper Spurge, Mole Plant), greenhouse, garden, ornamental; *Hevea* (South American Rubber Tree), botanical gardens and Florida; *Jatropha* (French Physic Nut), South; *Manihot* (Ceara Rubber Tree, Cassava, Manioc Plant), South, food and ornamental; *Pedilanthus* (Bird Cactus, Jew Bush), greenhouse; *Phyllanthus* (Snow-bush, Emblie Myrobolan, Otaheite Gooseberry), greenhouse, garden; *Putranjiva* (Indian Amulet Plant), South; *Ricinus* (Castor-Oil Plant, Palma Christi), garden, ornamental; *Stillingia* (Queen's Root, Queen's Delight); *Sapium* (Tallow Tree), South.

#### Order 39. SAPINDALES

118. **Buxaceæ** (from the genus *Buxus*, the ancient name of the box). **BUXUS FAMILY.** Herbs, shrubs or trees: leaves opposite or alternate: flowers monœcious, inconspicuous; hypogynous disk wanting; corolla absent; calyx 4-parted, or in the pistillate flower 4-12-parted or 0, imbricated; stamens 4, opposite the lobes of the calyx, or numerous; ovary superior, 3-celled, rarely 2-4-celled; ovules 2, collateral, rarely 1, suspended, micropyle turned toward the axis; styles 2-3: fruit capsular and opening elastically, or fleshy; seeds with endosperm, with or without a caruncle.

About 6 genera and 30 species inhabit the tropics and subtropics. One species is native in the southeastern United States. The largest genus is *Buxus* with 19 species. Fossil species are known. The family is related to the Euphorbiaceæ, with which it is united by some authors, and to the Celastraceæ and Empetraceæ. The absence of milky juice, the calycoid perianth, the 3-celled ovary with collateral suspended albuminous seeds, and the axially directed micropyle are together characteristic.

The wood of the box (*Buxus sempervirens*) of Europe is close-grained and homogeneous; used for engraving and for the manufacture of musical instruments. A decoction of the wood was formerly used in medicine for fevers. Its leaves and seeds are purgative. Oil from the seeds of *Simmondsia* is used as a hair-tonic.

Four or more genera are in cultivation in America. These are: *Buxus* (Box) ornamental; *Pachysandra*

33. EMPETRACEÆ: 1. *Empetrum*, a, flower; b, floral diagram. CORIARIAEÆ: 2. *Coriaria*, a, flower; b, floral diagram. ANACARDIAEÆ: 3. *Rhus*, a, flower; b, floral diagram. 4. *Anacardium*, fruit. CYRILLACEÆ: 5. *Cyrilla*, flower.

(Mountain Spurge), garden, ornamental; *Sarcococca*, greenhouse, ornamental; and *Simmondsia*, California, for oil.

119. **Empetraceæ** (from the genus *Empetrum*, an ancient name signifying upon a rock). **CROWBERRY FAMILY.** Fig. 33. Small ericoid shrubs: leaves alternate, deeply furrowed beneath: flowers polygamous or dioecious, small, regular, hypogynous; disk wanting; sepals 2-3, imbricated; petals 2-3, or 0; stamens of the same number as the petals and alternate with them; ovary superior, 2-9-celled, each cell 1-ovuled; style-branches 2-9, often fringed or toothed: fruit drupaceous; seed ascending, anatropous, albuminous; micropyle turned toward the outside.

In the north temperate and arctic regions, and in the Andes, are found 3 genera and about 5 species. The family is related to the Buxaceæ, and more distantly to the Euphorbiaceæ and Celastraceæ. The habit, the reduced or absent corolla, the few stamens, the 1-seeded ovary, the external micropyle, and the absence of the disk and aril are together distinctive.

The acid berries of *Empetrum* are eaten in north Europe and Kamtschatka, and also used to prepare a drink. The fruit of *Corema album* has been used as a fever remedy. An acid drink is prepared from it in Portugal.

In North America, 2 genera are in cultivation: *Ceratiola*, not hardy; and *Empetrum* (Crowberry), grown in rock-gardens.

120. **Coriariaceæ** (from the genus *Coriaria*, derived from the Latin meaning a hide, used for tanning). **CORIARIA FAMILY.** Fig. 33. Shrubs with opposite or whorled, entire leaves: flowers bisexual, or unisexual, regular; sepals 5, imbricated; petals 5, smaller, but enlarging in fruit, fleshy, keeled within and pressed between the carpels; stamens 10, hypogynous; carpels 5-10, superior, separate: fruitlets indehiscent, 1-seeded, dry.

This family consists of a single genus containing 8 species, widely distributed in warm-temperate zones. *Coriariaceæ* is not closely related to any other family;

perhaps most closely to the Empetraceæ. Some authors place it near the Sapindaceæ or Phytolaccaceæ, or Rutaceæ. It represents an ancient group. Fossil species are known.

*Coriaria myrtifolia* (myrtle-leaved sumach) of the West Mediterranean region, contains much tannin and is used by curriers; its leaves and fruits are poisonous. The fruit of *C. ruscifolia* of New Zealand contains a vinous juice, which is drunk as a beverage, but its seeds are poisonous. *C. ruscifolia* also yields a black color used by shoemakers.

Two species are grown for ornamental purposes in eastern North America. They are semi-hardy.

121. **Limnanthaceæ** (from the genus *Limnanthus*, the name signifying marsh flower). **LIMNANTHUS FAMILY.** Herbs with alternate leaves: flowers bisexual, regular; sepals 3 or 5, valvate; petals 3 or 5, convolute, separate; stamens twice as many as the petals, the outer opposite the petals, often glandular at base; ovary superior, 3- or 5-lobed, 3- or 5-celled; ovules 1 in each cell, ascending, micropyle directed downward and outward; stigmas 3 or 5: fruit dry, separating into segments.

This is a small family of 2 genera and 5 species, all of North America. The family was formerly united with the Geraniaceæ, to which the floral structure bears a superficial resemblance. It is also related to the Anacardiaceæ and Sapindaceæ. It may be said to possess the general floral structure and lobed ovary of the Geraniaceæ, but the seed position of the two families last named.

*Limnanthus Douglasii*, of California, is grown for ornamental purposes.

122. **Anacardiaceæ** (from the genus *Anacardium*, the name meaning heart-like, in reference to the shape of the nut). **CASHEW FAMILY.** Fig. 33. Trees or shrubs with resinous bark, and alternate, simple or compound leaves: flowers bisexual or unisexual, regular, small, and numerous, epigynous, perigynous or hypogynous; sepals 3-5; petals 3-5, mostly imbricated, or 0; stamens 5 or 10, rarely many, inserted with the petals at the edge or base of an annular, intra-staminal disk; ovary 1-, rarely 2-6-, celled, with 1 ovule in each cell; styles 1-6: fruit a drupe or nut, rarely dehiscent; seeds usually exalbuminous.

There are 58 genera and about 400 species, most abundant in the tropical zone of both hemispheres, but represented by the genus *Rhus* as far north as Europe and the United States. *Rhus* is the largest genus, containing 120 species. The family is related to the Sapindaceæ, but contains resin, and has an intra-staminal disk. It is also related to the Burseraceæ and Simarubaceæ.

The disk in some genera becomes elongated into a stalk on which the ovary is raised. The drupe is sometimes edible (*Mangifera*). In *Anacardium*, the nut-like fruit is situated on top of a fleshy edible receptacle. Sometimes the nut is surrounded by the edible receptacle. In *Cotinus*, the pedicles become plumose and the whole much-branched inflorescence breaks off, and blows about, distributing the seeds. In *Swin-tonia*, the calyx or the corolla becomes enlarged and persistent and serves as a parachute in seed-dissemination. *Rhus Toxicodendron* (poison ivy) and *R. Vernix* (poison sumach, poison elder, poison dogwood) contain in all their parts an oily, extremely irritating substance, which often produces a very painful vesicular eruption that may last for several days.

The Anacardiaceæ is a family of considerable economic importance. Because of the resinous juice, it yields medicinal substances and varnishes. It also yields important edible fruits. *Pistacia vera* of Syria furnishes the pistachio nut; *Pistacia Terebinthus* of the Mediterranean yields Cyprus turpentine, formerly medicinal. The leaves of *Rhus Coriaria* of the Mediterranean are used for tanning fine leather. *Rhus succedanea* of Japan yields vegetable wax, which coats the seed

within the capsule. *Melanorrhœa usitata* yields a celebrated black varnish of Burmah. *Mangifera indica* of the East Indies is the mango tree, the fruit of which is large, juicy, sugary-acid and agreeable. *Anacardium occidentale* of tropical America is the cashew. This plant yields edible nuts and an edible receptacle. From it vinegar is made, also a peppery oil used as a condiment; and the trunk yields a valuable acacia-like gum. The seeds of *Semecarpus* (marking-nut tree) give an indelible black dye used in marking linen. *Spondias purpurea* is the so-called Spanish plum of the West Indies. The fruit of *Spondias dulcis* of the Pacific Islands is also frequently eaten. Other species furnish the hog plum of the West Indies. The mastic, a fragrant gum-resin of the pharmacist, is obtained from *Pistacia Lentiscus* of the Orient.

Eight to 12 genera are in cultivation in N. America, but with the exception of *Rhus* and *Cotinus*, mostly in the southern states, especially in southern Florida and southern California. Among these are: *Anacardium* (Cashew Tree); *Cotinus* (Smoke-bush); *Cyrtocarpa*, fruit edible; *Mangifera* (Mango); *Pistacia* (Pistachio Nut); *Rhus* (Sumach, Poison Ivy, Poison Oak, Poison Elder, Poison Dogwood), 15 species; *Schinus* (California Pepper Tree, Peruvian Mastic); *Semecarpus* (Marking-nut Tree).

123. **Cyrillaceæ** (from the genus *Cyrilla*, named in honor of Dominico Cyrillo, a professor of medicine at Naples). **CYRILLA FAMILY.** Fig. 33. Shrubs with alternate, entire leaves: flowers bisexual, regular, small; sepals 5, often enlarged in fruit, imbricated; petals 5, imbricated, slightly connate at base or separate; stamens 5 or 10, hypogynous, the inner sometimes wanting, filaments dilated; ovary superior, 2-4-celled; ovules 1, rarely, 2-4 in each cell; style short; stigmas 2: fruit a fleshy or dry capsule, or nearly dry drupe with wings; seeds albuminous.

The 3 genera and only 5 species are all American, ranging from Virginia to Brazil. The relationship of the Cyrillaceæ is doubtfully understood. It is probably closely related to the Aquifoliaceæ, although some have placed it with the Ericaceæ. The small polypetalous flowers, the few stamens, the several-celled, few-seeded ovary, the dry fruit and the non-arillate seeds are important characteristics.

*Cyrilla racemiflora* (leatherwood, black ti-ti) of the southeastern United States is occasionally cultivated for ornamental purposes.

124. **Aquifoliaceæ** (from *Aquifolium*, Tournefort's name for the genus *Ilex*, application obscure). **HOLLY FAMILY.** Fig. 34. Trees or shrubs, with alternate or opposite, simple, often evergreen leaves: flowers bisexual, rarely unisexual, very small, axillary, solitary or fascicled, rarely cymose; sepals 3-6, more or less connate; petals 4-5, nearly separate, imbricated; stamens 4-5, alternating with the petals, and sometimes adhering to them, hypogynous disk wanting; ovary superior, 3 to many-celled, each cell 1-2-ovuled; stigma subsessile, lobed: fruit berry-like; seeds albuminous.

Three genera are known and about 280 species, of which 275 belong to the genus *Ilex*. These are widely distributed, but rare in Europe, the center of distribution being in Central and South America. Ten species are found wild in the northeastern United States. The Aquifoliaceæ are related to the Celastraceæ and the Anacardiaceæ, from which they are distinguished by the absence of the hypogynous disk and by the general appearance.

*Ilex Aquifolium* of Europe is used there for hedges and for indoor decoration. *I. opaca* is used for indoor decoration in this country. The leaves of both are thick, glossy, evergreen and spiny-toothed. *I. paraguariensis* furnishes maté, which is the tea of South America. It was early cultivated by the Jesuits (1609-1768), and is even yet one of the most important cultivated plants of South America. Other species of *Ilex*

have been used in various parts of the world for medicine because of their astringent qualities and bitter principle.

Many species of *Ilex* (Holly, Dahoon, Cassena, Yaupon, Winterberry, Black Alder), and one of *Nemopanthes* (Mountain Holly) are grown as cultivated plants in America, all for ornamental purposes.

125. **Celastraceæ** (from the genus *Celastrus*, an ancient Greek name). STAFF-TREE FAMILY. Fig. 34. Shrubs or trees, often climbing; leaves alternate or rarely opposite, simple, not lobed; flowers bisexual or unisexual, small and greenish, regular; sepals 4-5, imbricated; petals 4-5, imbricated; stamens 4-5, alternate with the petals, rarely 10; disk present, lining the bottom of the calyx, sometimes adnate to the ovary; ovary superior, 2-celled, buried in the disk, or distinct and disk small; 1-2 ovules in each cell; style 1, short; stigmas 2-5-lobed; fruit a drupe, or samara, or a capsule; seeds albuminous, usually with a pulpy aril.

Thirty-eight genera and about 375 species are distributed in all parts of the world except the arctic zone. They are especially numerous in the tropics. *Euonymus*, *Maytenus*, and *Celastrus* are the largest genera. The Celastraceæ are in some respects related to the Cyrillaceæ, in others to the Aquifoliaceæ and Rhamnaceæ. The small greenish flowers, the stamens alternating with the petals, the ovary sunken in the disk, and the aril are in general distinctive. There are exceptions to all these characters.

The capsule of *Celastrus* and *Euonymus* frequently remains on the plant through late fall and early winter. It splits into from 3-5 valves, which become reflexed and expose the aril of the seeds. The contrast in color between aril and pericarp is often very striking and ornamental. The Celastraceæ are mostly pollinated by ants and flies which run over the disk for the honey.

The Celastraceæ are of but slight economic importance. Some have been used for their emetic and purgative properties. *Catha edulis* of East Africa has been long cultivated by the Arabs under the name *khat*; the leaves produce an agreeable excitement and it is considered a very valuable remedy for plague. The drupes of an *Elæodendron* are said to be eaten in South Africa. The wood of some Celastraceæ is much valued for carving.

In North America 6 or more genera of Celastraceæ are grown for ornamental purposes; *Elæodendron* in warm-houses and in southern parts; *Euonymus*, hardy North; *Gymnosporia* and *Maytenus* grown in southern regions; *Pachistima*, hardy; and *Celastrus*, a hardy vine.

126. **Stackhousiaceæ** (from the genus *Stackhousia*, named in honor of John Stackhouse, a British botanist). STACKHOUSIA FAMILY. Fig. 34. Herbs with rather thick, alternate leaves; flowers bisexual, regular, in spikes, racemes or fascicles; sepals 5, imbricated; petals 5, more or less, perigynous, long-clawed, the claws separate below, connate above; disk thin, clothing the inside of the cup-shaped receptacle; stamens 5, perigynous, alternating with the petals, often unequal; ovary superior, 2-5-lobed, 2-5-celled, each cell 1-ovuled; styles 2-5, free or connate; fruit of 2-5 separate, globose, angular, reticulated or winged, indehiscent portions which separate from a central persistent column; seeds albuminous.

This is a very small family of 2 genera and 14 species; natives of Australia and adjacent islands. It is probably related to the Celastraceæ more closely than to any other family.

One species of *Stackhousia* is grown for ornamental purposes in California.

127. **Staphyleaceæ** (from the genus *Staphylea*, derived from the Greek meaning *a cluster*, probably in reference to the flower-cluster). BLADDERNUT FAMILY. Fig. 34. Trees or shrubs; leaves opposite or alternate, pinnately compound, stipulate; flowers bisexual, regular; sepals 5, imbricated; petals 5, imbricated; stamens 5, alternating with the petals, inserted outside the large, cup-shaped disk; ovary usually 3-celled; styles 3, sepa-

rate or connate; fruit a capsule, often deeply lobed, sometimes indehiscent and berry-like; seeds usually many in each cell, albuminous, sometimes with an aril.

This family contains 5 or 6 genera and about 22 species, in the north temperate zone, extending rarely to northern South America and to the Malay region. Fossil species are known. The family is closely related to the Sapindaceæ, in which it was formerly included, and from which it is separated by the abundant endosperm, the intra-staminal disk, the more numerous seeds, the straight embryo, and various anatomical differences. The fruits of the bladdernut are an inch long, membranous and bladderly; the seeds become loosened and the fruit then is interesting to children as rattle-boxes.

The family is of little economic importance. Three genera are cultivated in North America for ornamental purposes. These are: *Euscaphis*, *Staphylea* (Bladdernut), and *Turpinia*.

128. **Aceraceæ** (from the genus *Acer*, the classical name of the maples, from the Celtic meaning *hard*).

34. AQUIFOLIACEÆ: 1. *Ilex*, a, flower; b, floral diagram. CELASTRACEÆ: 2. *Euonymus*, a, flower; b, floral diagram. STACKHOUSIACEÆ: 3. *Stackhousia*, flower. STAPHYLEACEÆ: 4. *Staphylea*, a, flower; b, fruit.

MAPLE FAMILY. Fig. 35. Trees or shrubs; leaves opposite, exstipulate, simple or compound; flowers mostly unisexual, often bisexual ones intermixed, regular; sepals 4-5, separate or somewhat connate, imbricated; petals 4-5, or 0, imbricated; disk either extra-staminal or intrastaminal, usually flat, and sometimes lobed or divided; stamens 4-10, mostly 8, separate, inserted at the edge of the disk; ovary superior 2-celled, 2-lobed, much flattened contrary to the partition; style 1; stigmas 2: fruit splitting into two portions, each a samara; seeds 2 in each cell, exalbuminous.

There are 2 genera and about 110 species; all but 1 belong to the genus *Acer*. They are mostly natives of mountainous or upland countries of the northern hemisphere. Some fossil species have been discovered. The Aceraceæ are closely related to the Sapindaceæ, with which they were formerly united, and from which they differ in the opposite, usually palmate leaves, the peculiar fruit, and regular flowers. In position, the disk shows a transition between the Sapindaceæ and other families. The family is easily recognized by the opposite, exstipulate leaves, and peculiar fruit.

The wood of *Acer saccharum* (sugar maple, hard maple) is of great value for timber. Bird's-eye maple and curly maple are forms of this species in which the growth of the cambium is irregular. The manufacture of sugar from the sap of the sugar maple is an important industry in the northern states in early spring. The sycamore of England is *Acer pseudo-platanus*; that of America is a species of *Platanus*. The juice of *Acer platanoides* (Norway maple), and probably of others, is milky.

Forty or more species of *Acer* (maple) are in cultivation in N. America for ornamental purposes. *Acer Negundo* (box elder) is exceptional in having compound leaves.

**129. Hippocastanaceæ** (from the genus *Hippocastanum*, the old generic name of the genus *Æsculus*, derived from the Greek meaning horse and chestnut). HORSE-CHESTNUT FAMILY. Fig. 35. Trees or shrubs: leaves opposite, exstipulate, palmately 3-9-foliolate: flowers, some bisexual, some staminate, irregular; sepals 5, separate or connate, imbricated; petals 4-5, unequal, clawed; stamens 5-8, separate; disk present, extra-staminal, often inequilateral; ovary 3-celled; ovules 2 in each cell; style and stigma 1; fruit usually 1-celled and 1-seeded, capsular, 3-valved; seeds very large, exalbuminous.

There are 2 genera and 22 species of general distribution in the north temperate zone. The family is closely related to the Sapindaceæ, with which it is often united, and from which it differs only in its larger flowers, palmately compound leaves and large seeds. The Hippocastanaceæ, Sapindaceæ, Melianthaceæ,

35. ACERACEÆ: 1. *Acer*, a, flower; b, fruit. HIPPOCASTANACEÆ: 2. *Æsculus*, a, flower; b, floral diagram; c, fruit. SAPINDACEÆ: 3. *Sapindus*, flower. 4. *Koeleruteria*, vertical section fruit.

and some Aceraceæ are almost the only plants with extra-staminal disks.

The horse-chestnut (*Æsculus Hippocastanum*) is a well-known shade tree, said to have been introduced into Europe by Clusius in 1575. The seeds, rich in starch, have been used for fodder. They have also been used to form the principal part of a certain kind of snuff, and the oil contained has been used to a slight extent in medicine. The roots of *Æsculus* contain saponin and have been used, like soapberry, for washing.

Several species of *Æsculus* are in cultivation in N. America. *Æ. glabra* and *Æ. octandra*, natives of the central United States, are called buckeyes.

**130. Sapindaceæ** (from the genus *Sapindus*, a contraction of the Latin *sapo-indicus*, Indian soap). SOAP-BERRY FAMILY. Fig. 35. Trees or shrubs, rarely herbs, often climbing: leaves usually alternate, mostly compound, sometimes ternately, sometimes pinnately decompound; flowers unisexual or polygamous, regular or irregular (i.e. obliquely unsymmetrical), small; sepals 4-5, imbricated or rarely valvate; petals 4-5, small or wanting, usually with scales or hairs at the base inside; disk well developed, situated between the petals and the stamens (extrastaminal); stamens usually 10 in 2 whorls, more or less united at the base; ovary superior, mostly 3-celled and deeply 3-lobed; ovules typically 1 in each cell; style 1; fruit very diverse, a firm or bladdery capsule, a berry, nut, or winged fruit; seeds without endosperm.

The 118 genera and about 1,000 species are of trop-

ical distribution. Only one species reaches northward as far as Kansas. The family is closely related to the Staphyleaceæ, Hippocastanaceæ, and Aceraceæ, which see for differences; and more distantly to the Celastraceæ. The small flowers, usually appendaged petals, 10 stamens, extra-staminal disk, and 3-celled, few-seeded fruit are usually distinctive.

The climbing Sapindaceæ often have very peculiar stems in which many separate cambium rings have taken part. This renders the cross-section very peculiar, making it appear sometimes as a bundle of woody ropes tied together, with bark between them.

The Sapindaceæ are of considerable economic importance. The fruits of many are used locally for food, sometimes the flesh of the fruit, sometimes the aril being of importance. The seeds of *Sapindus* and other genera are often roasted and eaten as food. Oil is obtained from the seeds of others. Some are used locally for medicine. The seeds and other parts of many species are very poisonous, the fruits of species of *Sapindus* being used to poison fish. The juice of *Paullinia pinnata* (cururu) is used by savages in Guiana to poison their arrows. The Lechcheuquana bee collects honey from *Serjania lethalis* which, when eaten even in small quantities, produces raving madness or even death. The bark and berries of many species (e.g., the soap tree, *Sapindus*) contain saponin which reacts like soap, on which account they are used for washing. Yellow and black dyes, used as cosmetics, are obtained from certain species. The very hard wood of certain Sapindaceæ is much prized for timber. The hard, spherical, black seeds of *Sapindus Saponaria* are strung as beads.

There are 15 or more genera of true Sapindaceæ grown in America. *Koeleruteria* (Varnish Tree) is hardy and ornamental. *Cardiospermum* (Balloon Vine) is a tender annual with queer fruit. *Xanthoceras* is a hardy ornamental tree. *Paullinia* is a greenhouse climbing shrub. The following are grown only in the southern states or California: *Greyia*; *Melicocca* (Spanish Lime); *Blighia* (Akee Tree); *Dodonaea*; *Ungnadia* (Mexican or Spanish Buckeye); *Sapindus* (Soapberry).

The following cultivated genera are now referred to other families: *Melanthus* (Melianthaceæ); *Æsculus* (Hippocastanaceæ); *Acer* (Aceraceæ); *Ptæroxylon* (Meliaceæ); *Staphylea* (Staphyleaceæ); *Euscaphis* (Staphyleaceæ); *Turpinia* (Staphyleaceæ).

**131. Melianthaceæ** (from the genus *Melanthus*, derived from the Greek meaning honey and flower). MELANTHUS FAMILY. Shrubs or trees: leaves alternate, entire or pinnate; flowers bisexual, irregular, soon inverted; sepals 5, imbricated; petals 4-5; stamens 4-5, or 10, free or slightly connate at the base, alternating with the petals; disk present, extrastaminal, crescent-shaped, or annular with 10 projections; carpels 4-5; ovary 4-5-celled; ovules 1 to many in each cell; style 1; stigma 4-5-lobed: fruit a capsule; seeds albuminous, sometimes arillate.

All the 3 genera and 17 species are natives of Africa. The Melianthaceæ were formerly united with the Sapindaceæ, with which they agree in the extra-staminal disk, but they differ in the vertically bisymmetrical, not obliquely bisymmetrical, flowers, and more abundant endosperm.

In southern California, species of *Melanthus* are grown for ornament.

**132. Balsaminaceæ** (from *Balsamina*, the old name of the genus *Impatiens*, probably derived from *balassan*, the Arabic name of these plants). BALSAM FAMILY. Fig. 36. Herbs, very rarely epiphytic: leaves various: flowers bisexual, irregular, spurred, nodding; sepals 3-5, irregular, imbricated often petaloid, the posterior very large and sack-like, and gradually prolonged backward into a honey-spur; petals 5, alternate with the sepals, separate, or united so as to appear as 3, lower petals much the larger; stamens 5, hypogynous, closely

covering the ovary like a hood; anthers coherent; ovary superior, 5-celled; ovules 3 to many in each cell; stigmas sessile: fruit a 5-valved capsule, the valves of which coil up elastically and forcibly distribute the seeds, or sometimes a 5-celled drupe-like structure.

Contained in this family are 2 genera and about 220 species, of which all but 1 belong to the genus *Impatiens*; widely distributed, but most abundant in the tropics of the Old World, wanting in South America. The family is closely related to the Geraniaceæ, with which it was formerly united, but is distinguished by the 5 peculiar hypogynous stamens. The honey-spur in this family is an outgrowth of the sepals, and not of the receptacle as in *Pelargonium* and *Tropæolum*. There are extra-floral nectaries on the foliage of some species, which attract protective ants.

The sap of several species of *Impatiens* has been used as a dye to color red or yellow: that of *I. biflora* (North America) staining yellow; that of *I. Balsamina* (India) staining red, and used to color the skin and fingernails. The tubers of *I. tinctoria* of Abyssinia are used for dyeing the feet and hands red or black. Some species have been used as medicine. Many are ornamental.

There are several species of *Impatiens* in the North American trade: *I. aurea* and *I. biflora* are the east American touch-me-nots or jewel-weeds; *I. Balsamina* is the garden balsam; the other species are greenhouse plants.

#### Order 40. RHAMNALES

133. **Rhamnaceæ** from the genus *Rhamnus*, the old Greek name). BUCKTHORN FAMILY. Fig. 36. Trees or shrubs, rarely herbs, sometimes spiny or climbing: leaves simple, mostly alternate: flowers bisexual or unisexual, regular, perigynous, small, greenish, mostly axillary; sepals 5, rarely 4, valvate; petals 5, or 4, alternate with the sepals; stamens of the same number as the petals and opposite them; an intrastaminal disk lining the cup-shaped receptacle; ovary 2-4-celled, superior or inferior; cells 1-, rarely 2-, ovuled; styles 2-4, more or less connate: fruit drupaceous, or winged, or capsular.

Rhamnaceæ has 46 genera and about 550 species very generally distributed over the earth. *Rhamnus* is the largest genus (70 species), and the most widely distributed. The family is represented by 6 native species in northeastern North America. It is most closely related to the Vitaceæ and Celastraceæ, differing from the former in the simple entire leaves and strongly perigynous flowers, and from the latter in the stamens being opposite the petals.

The family is not of great economic importance. The berries and bark of *Rhamnus cathartica* (buckthorn) contain a bitter principle which is purgative. The fruits of some species of *Rhamnus* yield yellow or green dyes of some importance. *R. dahurica* and *R. tinctoria* give Chinese green. The bark of *R. cathartica* and *R. Frangula* (Europe) is used to dye yellow. *R. Purshiana* (California) is the cascara sagrada of medicine, a strong purgative. The fruits of *Zizyphus* *Lotus* are pulpy and agreeable, and were much prized by the ancients. The fruits of several species of *Zizyphus* are eaten in various parts of the Old World. The spiny branches of *Paliurus Spina-Christi* or *Zizyphus Spina-Christi* are thought to have been those from which the crown of thorns was made.

Nine or more genera are in cultivation in N. America for ornamental purposes. These are: *Ceanothus* (New Jersey Tea); *Berchemia* (Supple Jack); *Gouania*; *Hovenia*; *Paliurus*; *Pomaderris*; *Reynosia*; *Rhamnus* (Buckthorn); *Zizyphus* (Jujube).

134. **Vitaceæ** (from the genus *Vitis*, the classical name). GRAPE FAMILY. Fig. 36. Mostly climbing shrubs with tendrils, seldom upright shrubs or small trees: leaves alternate or opposite, very diverse: flowers bisexual, or unisexual, small, numerous, regular; sepals 4-5,

rarely 3-7, minute or obsolete; petals 4-5, rarely 3-7, valvate, separate (gamopetalous in *Leea*); stamens 4-5, rarely 3-7, opposite the petals, somewhat perigynous; disk evident; annular or of separate lobes; ovary superior, 2-, rarely 3-6-, celled, with 2, or rarely 1, ovule in each cell; style 1 or 0; stigma capitate or peltate: fruit a berry; seeds albuminous.

The 11 genera and about 450 species are mostly of tropical and subtropical distribution. Fourteen species reach the northeastern United States. The largest genus is *Cissus* with 250 species. Some fossil forms are known. The Vitaceæ are closely related to the Rhamnaceæ. The climbing habit, the few stamens opposite the petals, the 2-carpelled berry, and the capitate stigma are distinctive.

The petals in *Vitis* remain connate at the tip as in the bud, but separate from each other at the base, and fall off as a cap. The tendrils of the Vitaceæ are borne at the nodes and opposite the leaves. There has been much discussion as to whether the tendrils are apical or

36 BALSAMINACEÆ: 1. *Impatiens*, a, flower; b, fruit. RHAMNACEÆ: 2. *Rhamnus*, a, flower; b, floral diagram. VITACEÆ: 3. *Vitis*, flower. TILIACEÆ: 4. *Tilia*, a, flower; b, floral diagram; c, fruit.

lateral, i.e., whether the plant is sympodial or monopodial. The tips of the tendrils are in some species expanded into disk-like holdfasts. The species of *Cissus* are mainly desert plants. They are often cactus-like, with fleshy, angled, jointed, or terete stems; or have tubers or tuberous bases.

The most important economic plant in the family is the grape (*Vitis*), which has been cultivated since early times. *V. vinifera* is the wine grape of Europe and southern California, and has given rise to our greenhouse grapes; not hardy. *V. Labrusca* is one of the parents of most of our hardy grapes. *V. vulpina* and *V. cordifolia* are frost or fox grapes. Several species of *Vitis* are grown for ornamental purposes only. Raisins are the dried fruit of certain species of *Vitis*, mostly *V. vinifera*. Virginia creeper or woodbine (*Parthenocissus* [*Ampelopsis*] *quinquefolia*) and Boston ivy or Japanese ivy (*P. tricuspidata*) are ornamental.

A few genera are in cultivation in America: *Ampelopsis*; *Parthenocissus* or *Psedera*; *Cissus* (Kangaroo Vine); and *Vitis*.

#### Order 41. MALVALES

135. **Elæocarpaceæ** (from the genus *Elæocarpus*, derived from the Greek meaning *olive-fruit*). ELÆOCARPUS FAMILY. Trees or shrubs, with entire alternate or opposite leaves without slime-cells: flowers usually bisexual, regular, hypogynous; involucre 0; sepals 4-5, separate or connate, valvate; petals 4-5, or 0, separate, rarely connate, usually valvate, often incised; stamens many; anthers opening by terminal pores; hypogynous.

nous intra-staminal disk present; ovary superior, 2- to many-celled, rarely 1-celled; ovules many in each cell; style 1; stigmas 1 to several; fruit capsular or drupaceous.

Seven genera and about 120 species are distributed in the tropics of both hemispheres. *Elaeocarpus* contains 60 species and *Sloanea* 44 species. The family is closely related to the Tiliaceæ, with which it is often united and from which it is distinguished by anatomical characteristics, and usually also by the often hairy and firm, or incised, petals, or by the absence of petals.

A vegetable ivory used in carving is obtained from the large stone of the drupe of *Elaeocarpus sphaericus* of India. Those of *E. tuberculatus* (India and Java) are worn as amulets. The seeds of *Sloanea dentata* of Guiana are eaten like chestnuts. The bark of *Crinodendron Patagua* of Chile is used for tanning. The wood of *Aristotelia Maqui* of Chile is variously used. Its leaves are medicinal and its berries are edible.

Two genera are cultivated in North America: *Aristotelia*, California; *Elaeocarpus*, not hardy.

**136. Tiliaceæ** (from the genus *Tilia*, the ancient Latin name of the Linden). LINDEN or BASSWOOD FAMILY. Fig. 36. Trees, shrubs, or herbs: leaves mostly alternate, entire or variously lobed: flowers bisexual, regular; sepals 5, rarely 3 or 4, free or connate, usually valvate; petals as many as the sepals, convolute or imbricated, or valvate, rarely wanting or modified; stamens 10 or more, hypogynous, usually very numerous, filaments separate, or connate only at the base, or in 5-10 fascicles, some may be staminodia; anthers 4-celled, opening by slits or pores; ovary superior, 2-10-celled; ovules 1 to several in each cell; style 1; stigma rayed: fruit a capsule, or indehiscent and nut-like, or a drupe, rarely a berry, or separating into drupelets; seeds usually albuminous.

Most of the 35 genera and 270 species are tropical. The most important extra-tropical genus is *Tilia* (linden, basswood), which is widely distributed. Fossil species are known. The Tiliaceæ are related to the Malvaceæ and Sterculiaceæ, from which they are distinguished by the nearly distinct stamens, and 4-celled anthers. The stamens are sometimes borne, along with the ovary, on a long stipe-like projection of the receptacle, sometimes cover the whole surface of a discoid receptacle, and sometimes are enveloped by the petals.

The Tiliaceæ, like the Malvaceæ, are mucilaginous. For this reason, many have been used more or less in medicine. The genus *Tilia* and other arborescent genera furnish very valuable timber; that of *Grewia asiatica* is flexible and used for bow-making. In the tropics the foliage of *Corchorus olitorius* is used as a pot-herb. The fruits of species of *Grewia* are used in India as a sherbet because of their agreeable juice. Some members of the family yield cordage. The beautiful seeds of many species are made into necklaces by the Indians.

In North America 6 or more genera are in cultivation. They are all warmhouse plants, or are grown in southern California, except the *Tilias* (Basswood, Lime, Linden), of which many species are grown in America. The *Tilias* furnish some of our best-known hardy, ornamental trees. Other genera are: *Entelea*, *Luehea*, *Grewia* (with some half-hardy species), and *Sparmannia*.

**137. Malvaceæ** (from the genus *Mallow*, altered from the Greek, in allusion to the mucilaginous emollient qualities). MALLOW FAMILY. Fig. 37. Herbs, shrubs or trees, with alternate, simple, usually palmately veined leaves: flowers bisexual, regular; sepals 5, often united, valvate, frequently bracteolate at the base; petals 5, convolute, often adnate to the stamens; stamens very numerous, hypogynous, the filaments united into a tube (monadelphous), anthers 1-celled, pollen spiny; ovary superior, 2 to many-celled, rarely 1-celled; ovules in each cell 1 to many; styles and stigmas usually as many as the carpels: fruit a capsule or separating into drupelets, very rarely fleshy.

The Mallows include 39 genera and from 800 to 900 species, distributed over the whole earth, except in the arctic zone, but most abundant in tropical America. The Malvaceæ are closely related to the

37. MALVACEÆ: 1. *Malva*, a, flower; b, floral diagram; c, fruit; d, cross-section fruit. 2. *Hibiscus*, flower. BOMBACEÆ: 3. *Adansonia*, flower. STERCULIACEÆ: 4. *Theobroma*, flower. DILLENIACEÆ: 5. *Dillenia*, flower.

Sterculiaceæ and Tiliaceæ. From the former they are distinguished by their 1-celled anthers and rough pollen, and from the latter by their monadelphous stamens as well as the 1-celled anthers. The hollyhock-like flower is characteristic.

The foliage, stems, and seeds of most Malvaceæ contain abundant mucilage for which, in some countries, they have been used as medicine. Pungent and poisonous properties are apparently wanting. *Althæa officinalis* (marsh mallow of Europe), *Malva sylvestris* and *M. rotundifolia*, both of Europe, have been used as emollients. *Hibiscus Sabdariffa* and *H. digitatus* (white and red ketmies of tropical Africa) have acid juice and are used in the preparation of refreshing drinks. The capsule of *H. (Abelmoschus) esculentus* (okra or gumbo) of the tropics is eaten in soup, or cooked and seasoned. The seeds of *H. Abelmoschus* of India, now widely cultivated in the tropics, are used for perfumery. *H. Rosa-sinensis* (Chinese hibiscus or shoeblack plant) contains a coloring matter in the flower with which the Chinese blacken shoes and eyebrows. *Althæa cannabina* of southern Europe has fibers which may be used in place of hemp. The fibers of *Urena lobata*, *Abutilon indicum*, *Sida*, *Hibiscus cannabinus*, *H. tiliaceus*, and others, are also used. The most useful genus is *Gossypium* (cotton) of Egypt, India, and tropical America, the abundant, long, woolly hairs on the seeds of which furnish the cotton of commerce. Cotton seed yields an oil which is used for fuel, cattle-food, soap, artificial butter, and many other purposes. Several mallows are weedy plants.

Many of the genera in cultivation in N. America are among the most important old-fashioned cultivated garden plants. Among these are: *Abutilon* (Indian Mallow, Velvet Leaf); *Althæa* (Marsh Mallow, Hollyhock); *Callirhoë* (Poppy Mallow); *Gossypium* (Cotton); *Hibiscus* (Bladder Ketmia, Roselle, Jamaica Sorrel, Okra, Gumbo, Rose of Sharon, Mountain Mahoe, Shoeblack Plant); *Malope*; *Malvastrum*; *Pavonia*; *Sida*; *Sphæralcea*.

138. **Bombacaceæ** (from the genus *Bombax*, from the Latin meaning *silk* or *cotton*). **BOMBAX FAMILY.** Fig. 37. Trees: leaves mostly alternate, entire or digitate, often with slime-cells and stellate hairs: flowers bisexual, regular or slightly irregular; involucre often present; sepals 5, separate or connate, valvate; petals 5, twisted in the bud; stamens 5 to many, separate or monadelphous; anther cells 1-2 or more; pollen smooth; staminodia often present; ovary superior, 2-5-celled; ovules 2 to many; style 1; stigmas 1-5: fruit dry or fleshy, dehiscent or indehiscent.

There are 20 genera and about 100 species, of tropical distribution, mostly in America. The family is closely related to the *Malvaceæ* and often united with that family. It is distinguished most easily by the smooth pollen and the often several-celled anthers.

Many *Bombacaceæ* are very large trees. The trunk of the baobab tree, or monkey's bread tree (*Adansonia digitata*) of tropical Africa is often 100 feet in circumference. The wool produced in the fruit is of little value. The fruit of *Durio zibethinus* contains a cream-like substance and is eaten. The seeds of the green fruit of *Matisia cordata* of the Andes is edible. The sour cucumber tree or cream of tartar tree is *Adansonia Gregorii*. The fruit contains tartaric acid.

Five or 6 genera are in cultivation in this country in the South and in greenhouses: *Adansonia* (Boabab Tree, Monkey's Bread); *Bombax* (Silk Cotton Tree); *Chorisia* (Floss-silk Tree); *Eriodendron*; *Pachira*.

139. **Sterculiaceæ** (from the genus *Sterculia*, derivation obscure). **STERCULIA FAMILY.** Fig. 37. Trees, shrubs, or herbs, sometimes vines: leaves alternate, simple or digitate: flowers bisexual or unisexual, usually regular; sepals 3-5, somewhat united, valvate; petals wanting or reduced; stamens very remarkable and wonderfully diverse, in 2 whorls, those opposite the sepals reduced to staminodia or wanting, the 1 to many others united into a tube, the anthers frequently alternating with sterile teeth, or variously arranged on the back of the tube; ovary superior, 4-5-celled; ovules several; styles 4-5, distinct or connate: fruit dry, rarely fleshy, or splitting into separate berries.

The 48 genera and about 750 species are almost entirely confined to the tropics. The family is related to the *Malvaceæ* in the monadelphous stamens, but differs in the 2-celled anthers; also related to the *Bombacaceæ* and *Tiliaceæ*. The valvate sepals, reduced petals, 4-5-celled ovary, and especially the peculiar stamens, are distinctive.

The *Sterculiaceæ*, like the *Malvaceæ*, contain abundant mucilage. They also contain a bitter principle which renders them emetic and stimulant. The seeds of *Theobroma Cacao*, native of central and northern South America, furnishes cocoa, chocolate, and cocoa-butter. *Cola acuminata* of Africa furnishes the cola nut, now very popular as an ingredient in a mildly stimulating drink. It is said to form the main constituent of the drink called "coco-cola."

There are about 12 genera in cultivation in America, all either in tropical agriculture or in greenhouse culture: *Rulingia*, *Reevesia*, and *Pterospermum* in southern California; *Sterculia* (Japanese Varnish Tree, Chinese Parasol Tree, Flame Tree), *Fremontia* and *Guazuma* in the South; *Theobroma* and *Cola* in the West Indies; *Abroma*, *Dombeya*, and *Mahernia* (Honey Bell) mostly in the greenhouse. All are grown for ornamental purposes except *Theobroma* and *Cola*.

## Order 42. PARIETALES

140. **Dilleniaceæ** (from the genus *Dillenia*, in honor of John James Dillenius, a professor of botany at Oxford). **DILLENIA FAMILY.** Fig. 37. Trees or shrubs, often climbing: leaves alternate, very rarely opposite: flowers bisexual, regular, hypogynous; sepals 5, rarely more or fewer, imbricated, persistent; petals 5 or fewer, imbricated, deciduous; stamens numerous, often very numerous, free or united in groups, anthers opening by slits or pores; carpels several, usually distinct, but often united; ovules numerous: fruit a follicle, or a berry or a capsule, or inclosed in a fleshy calyx, which simulates a berry; seed albuminous, usually with an aril.

Nearly all the 11 genera and about 200 species are tropical, distributed chiefly in Australia, India, and tropical America, rarely in Africa. Of these *Dillenia*, *Hibbertia* and *Tetracera* are the largest genera. The family is related to the *Ranunculaceæ* and *Magnoliaceæ* on the one hand, and to the *Theaceæ* on the other. Its closest affinity is with the latter family. The woody habit, polypetalous flowers, very numerous stamens, usually separate carpels, albuminous seeds with arils, and straight embryo, are characteristic.

The *Dilleniaceæ* are astringent, for which reason some are used medicinally; the fruits of some are eaten because acid, others are used as tonics. Davilla of Brazil has been used for wounds; *Curatella* for ulcers; *Tetracera aspera* of Guiana as a sudorific and diuretic, also for syphilis, intermittent fevers and scurvy. The astringent bark of a species of *Dillenia* is said to have been used in Asia for ulcerated sores. The acid and inedible fruit of *Dillenia speciosa* serves to season dishes; and a syrup of the juice of the unripe fruit allays coughs, assists expectoration and is said to cure angina; the bark is also used for tanning. Many species of *Dillenia* furnish timber in the Indo region. The rough, silicious leaves of many of the tribe *Tetracera*, especially *Curatella americana*, have been used in Brazil to polish wood in place of sandpaper. Some of the climbing species furnish drinking-water by incisions in the stem.

The flowers of many species are very beautiful, but few forms are in cultivation. In this country the only one apparently is *Dillenia indica*, a large magnolia-like tree with flowers 9 inches in diameter, grown in southern California and in Florida.

By recent authors (Gilg, in Engler and Prantl), *Actinidia*, a genus of vines from eastern Asia, has been placed in this family, although formerly included in the *Theaceæ*. A few species of *Actinidia* are in the American trade.

141. **Ochnaceæ** (from the genus *Ochna*, which is from *ochne*, the Greek name of a wild pear tree; the

38. **OCHNACEÆ:** 1. *Ochna*, fruit. **TERNSTROMIACEÆ:** 2. *Gordonia*, flower. 3. *Thea*, floral diagram.

resemblance is probably in the foliage). **OCHNA FAMILY.** Fig. 38. Shrubs or trees, with alternate, simple or pinnate, coriaceous leaves: flowers bisexual, regular; sepals 4-5, imbricated, rarely 10; petals 5, rarely 3-4, or 10, usually convolute; stamens 1-3 times the number of the petals, sometimes with 1-3 series of staminodia, hypogynous, separate; anthers usually opening by terminal pores; an hypogynous stipe usually present (gynophore); ovary 4-5-celled, often deeply lobed; ovules 1 to many in each cell; style and stigmas 1-5:

fruit coriaceous and indehiscent, or fleshy, or a capsule, or composed of the 1-seeded drupe-like lobes of the ovary which are whorled on the enlarged fleshy receptacle (Ochna).

The family has 17 genera and 100 or more species, distributed in the tropical regions of both hemispheres, most abundant perhaps in Brazil, but also abundant in Africa. The family is not closely related to any other but seems to stand between the Ranunculaceae group and the Hypericaceae group of families. The many sepals, petals and stamens, the gynophore, and usually the lobed ovary, are distinctive.

The wood of some species of Ochnaceae has been used locally for timber, and, because of the pronounced astringent properties of some species, they have been used locally for fly-bites, ulcers, and so on.

*Ochna multiflora*, of Upper Guiana, is cultivated in America. This is grown occasionally in greenhouses because of the peculiar fruit, for an account of which see the article on Ochna.

142. **Ternstroemiaceae** (or **Theaceae**) (from the genus *Ternstroemia*, in honor of Ternstroem, a Swedish naturalist and traveler who died in 1745). **TEA FAMILY**. Fig. 38. Large or small trees, with alternate, entire, leathery leaves: flowers solitary or scattered, usually bisexual, regular; sepals 5-7, imbricated, persistent; petals 5, rarely 4 or more, nearly or quite separate; stamens very many, rarely 15 or fewer, usually hypogynous, separate or united at the base, or in 5 fascicles, usually adnate to the corolla below; ovary superior, 2-10-celled; ovules 1 to many in each cavity; styles as many as the cells of

(transferred to the Stachyuraceae). The very numerous stamens, the type of ovary and the curved embryo are distinctive. The numerous stamens have probably been produced by the splitting up of one set of 5, as in the Hypericaceae.

Various glucosides and alkaloids are found in the foliage, on account of which *Gordonia* has been used for tanning leather, and other species have been used in medicine. The most important species is *Thea chinensis* (tea). The bitter taste of tea is largely due to a glucoside, and the stimulating properties to an alkaloid, theine.

Exclusive of *Actinidia* and *Stachyurus*, 8 or 10 genera are in cultivation in N. America. *Stuartia* and *Gordonia* (Loblolly Bay) are hardy. *Visnea*, *Ternstroemia* and *Cleyera* are grown in Florida. *Eurya* and *Schima* are Camellia-like warmhouse shrubs. *Camellia* (*Thea*) is a famous genus of old-fashioned greenhouse shrubs.

143. **Guttiferae** (from the Latin signifying *drop-bearing*, in allusion to the resinous exudation). **GARCINIA FAMILY**. Fig. 39. Trees or shrubs, with opposite or whorled, rarely alternate leaves: flowers regular, usually some bisexual and others unisexual on the same plant, rarely all bisexual; styles usually united and stigmas sometimes shield-shaped,—otherwise as in the Hypericaceae, to which family it is closely related, and with which the Guttiferae is united by many authors.

Thirty-five genera and about 370 species inhabit the tropical regions of both hemispheres. *Clusia* (America), with 80 species, and *Garcinia* (Old World), with 150 species, are the largest genera. Many species are tropical trees of majestic size and handsome form, useful for timber. The *Clusias* are mostly epiphytic shrubs with aerial roots and evergreen leaves.

The Guttiferae yield a yellow or greenish resinous juice when incisions are made. Gamboge is an intensely yellow resinous pigment extracted from *Garcinia Morella* (Ceylon). It is also a powerful purgative. The blackish bitter juice of *Clusia rosea* (West Indies) is also a purgative. The juice of species of *Clusia* (West Indies) may be used as a varnish. The resin of *C. flava* (hog-gum) is a wound remedy. Wounded swine smear themselves with the gum by rubbing against the plant, hence the name. The pulpy fruit of *Garcinia Mangostana* ("mangosteen" of the Moluccas), and *Mammea americana* (West Indies) are delicious to many people.

There are 3 or 4 genera in cultivation in warm America: *Garcinia* including the Mangosteen, cultivated in the West Indies, and the Gamboge Tree cultivated in the West Indies and Florida; *Calophyllum*, cultivated in southern Florida and southern California; *Mammea americana* (Mammee Apple or St. Domingo Apricot), cultivated in southern Florida and southern California.

144. **Hypericaceae** (from the genus *Hypericum*, an ancient Greek name of unknown origin). **ST. JOHN'S-WORT FAMILY**. Fig. 39. Herbaceous or woody plants: leaves opposite or whorled, often pellucid punctate or black-punctate; flowers bisexual, regular, cymose; sepals 4-5, more or less connate, the outer smaller, rarely 4, with the 2 outer much larger; petals as many as the sepals, sessile or clawed; claw naked or with a honey-furrow or -pit; stamens many, hypogynous, usually in 3-5 bundles the members of which are often more or less united, rarely monadelphous; ovary superior 3-5, rarely 1-, celled; placentae usually parietal; ovules numerous; styles 1-5, usually 3-5; fruit a capsule, rarely fleshy.

About 8 genera and 260 species are known, of which 200 are in the genus *Hypericum*, of the tropical and temperate regions throughout the world, but especially abundant in the north temperate zone. The family is very closely related to the Guttiferae, with which it is united by Engler and Prantl under the latter name; also related to the Ternstroemiaceae (Theaceae). The fascicles of stamens probably represent individual stamens, each of which has become divided into many.

39. **HYPERICACEAE**: 1. *Hypericum*, species, a, flower; b, flower, petals removed; c, fruit. 2. *Visnea*, floral diagram. **GUTTIFERAE**: 3. *Garcinia*, a, flower; b, flower, perianth removed. **TAMARICACEAE**: 4. *Tamarix*, a, flower; b, flower, perianth removed; c, floral diagram.

the ovary, or united into one: fruit a capsule or indehiscent, dry or drupaceous; embryo more or less curved.

In this family are 16 genera and 174 species of tropical and subtropical distribution. *Stuartia* reaches Virginia and Kentucky, and *Gordonia* reaches Virginia. This family is related to the Hypericaceae and Guttiferae, also to the Dilleniaceae. From it are now usually excluded several genera which were formerly included. Of importance to us in this connection are *Actinidia* (transferred to the Dilleniaceae), and *Stachyurus*

The opposite pellucid-dotted leaves, fascicled stamens, and 3-5-celled ovary with separate styles are characteristic.

The balsamic exudations from the bark and wood, especially of the shrubby species, were formerly used to some extent in medicine as an astringent.

The genera in cultivation in America for ornamental purposes are: *Ascyrum* (St. Andrew's Cross, St. Peter's-wort), and *Hypericum* (St. John's-wort). Some of the species are herbaceous and some are shrubby. Some of the *Hypericums* are very showy.

145. **Tamaricaceæ** (from the genus *Tamarix*, said to have been named from the river Tamaris, now Tambro, on the border of the Pyrenees). **TAMARISK FAMILY.** Fig. 39. Shrubs or small trees, with alternate, mostly needle-like or scale-like, ericoid leaves: flowers bisexual, regular; sepals 4-5; petals 5, imbricated, withering and drying persistent; stamens equal to and alternate with the petals or double the number, inserted on a more or less evident disk; ovary superior, 1-celled, with 3-4 parietal placentæ, or placenta basal; ovules 2 to many; styles 3-4, or stigmas sessile; seeds densely bearded at distal end, rarely winged: fruit a capsule, sometimes becoming falsely and incompletely several-celled.

The 5 genera and about 90-100 species are mainly distributed in the Mediterranean region and in central Asia. The family is related to the Frankeniaceæ and Elatinaceæ; possibly also to the Salicaceæ. The ericoid habit, withering-persistent petals, definite stamens, 1-celled ovary and bearded seeds are distinctive. By means of small leaves, sunken stomata, water-storing tissue, and other contrivances, the Tamaricaceæ are adapted for life in the dry saline regions in which they live. Foliage-glands excrete an excess of absorbed mineral matter, and this very hygroscopic excretion accumulates on the surface of the plant.

The Tamaricaceæ contain much tannin, resin and oils, which render them bitter and astringent. The bark of *Myricaria germanica* has been used for jaundice; the galls of some species are used because astringent. *Tamarix mannifera*, "which grows on Mount Sinai and elsewhere in Arabia, secretes, as the result of the puncture of a cynips, a saccharine matter, supposed by some to be the manna which fed the Hebrews in the desert." (See also *Fracinus Ornus*.)

None of the genera in cultivation in N. America is very hardy: *Tamarix* (Tamarisk); *Myricaria*, all grown for the queer, fluffy foliage, and small, abundant flowers.

146. **Fouquieriaceæ** (from the genus *Fouquieria*, named in honor of Pierre E. Fouquier, professor of medicine at Paris). **CANDLEWOOD FAMILY.** Similar to the Tamaricaceæ and formerly united with that family, but differing in the gamopetalous corolla, the ligule-bearing, hairy stamens, partially united styles, median ovules instead of basal, and leaves without crystal glands or epidermal glands.

The single genus and about 4 species are natives of Mexico and the southwestern United States.

*F. splendens* is the ocotilla, coach-whip cactus, vine cactus, or Jacob's staff of the Southwest, a spiny cactus-like shrub used by the Mexicans to make impenetrable hedges. A useful wax is obtained from the cortex of this species. The cortex is also used medicinally. This species is in cultivation in the larger rockeries of California.

147. **Cistaceæ** (from the genus *Cistus*, derived from the Greek, meaning a *box* or *capsule*, on account of the shape of the capsule). **ROCK-ROSE FAMILY.** Fig. 40. Herbs or shrubs: leaves mostly opposite: flowers bisexual, regular; sepals 3 or more, in  $\frac{2}{3}$  phyllotaxy; petals 5, rarely 3 or 0, quickly falling; convolutions of corolla and calyx in opposite directions; stamens numerous, hypogynous; ovary superior, 1-celled, with 3-10 parietal placentæ, or falsely 5-10-celled by ingrowing partitions; ovules 2 to many, orthotropous; style 1; stigmas 1-3: fruit a capsule.

In North America and around the Mediterranean Sea, 4 genera and about 70 species are distributed; also a few species in eastern Asia and in South America. The family is most closely related to the Violaceæ and the Bixaceæ, and more distantly to the Hypericaceæ. The quickly falling convolute petals, many

40. **CISTACEÆ:** 1. *Helianthemum*, flower. 2. *Cistus*, floral diagram. **BIXACEÆ:** 3. *Bixa*, floral diagram. **VIOLACEÆ:** 4. *Viola*, a, flower; b, flower, perianth removed; c, fruit; d, floral diagram. **PASSIFLORACEÆ:** 5. a, flower; b, cross-section of ovary.

hypogynous stamens, 1-celled, many-seeded ovary, parietal placentæ and copious endosperm are distinctive features.

In the dry region about the Mediterranean, the shrubby forms, especially *Cistus ladaniferus* and *C. monspeliensis* take part in forming extensive "maquis," or impenetrable evergreen thickets, where they alone form great stretches of vegetation. The Cistaceæ prefer dry, sunny, sandy or alkaline soil. In America, *Hudsonia* forms carpets on the sand-dunes which are often strikingly beautiful when in flower. The family includes also *Lechea* (pinweed), and *Helianthemum* (rock-rose).

In North America several species of *Cistus*, all shrubs, and of *Helianthemum*, are grown for ornamental purposes, although they have no marked importance in this country.

148. **Bixaceæ** (from the genus *Bixa*, a name of South American origin). **BIXA FAMILY.** Fig. 40. Trees or shrubs: leaves alternate, simple or compound: flowers unisexual or bisexual, regular; sepals 4-5, imbricated; petals 4-5, large and colored, imbricated and twisted in the bud; stamens numerous; anthers opening by slits, or rarely by pores (*Bixa*), hypogynous; carpels 1 to several, united; ovary 1-celled, with 1 to several parietal placentæ, or falsely 3-celled; seeds many, with endosperm: fruit fleshy or dry, indehiscent or valvular, in *Bixa* large and bristly-prickly all over.

All the 4 genera and 19 species (excluding the Flacourtiaceæ and other small families often here included) are tropical, from Mexico to Brazil and in Africa, Madagascar and Australia. *Bixa* is now widely distributed through the tropics. The Bixaceæ are related to the Violaceæ and Cistaceæ, as well as to the Tiliaceæ. The numerous stamens, compound but 1-celled ovary with many placentæ are all important distinguishing characters.

*Bixa Orellana* furnishes the coloring matter known as "anatto," extracted from the pulp around the seeds,

which is much used to give butte, a rich yellow color and is also used in dyeing silks. The Caribbeans formerly tattooed themselves with this dye in order, it is said, to prevent mosquito-bites. The wood is very soft and serves only for tinder; the roots are aromatic and have been used to color and flavor soups. *Maximiliana* *Gossypium* furnishes a substitute for gum tragacanth in farther India.

*Bixa Oreilana* is in cultivation in the West Indies, where it is grown for the fruit. Several other genera in the American trade, which were formerly included in the Bixaceæ, are now placed by Warburg in the Flacourtiaceæ.

149. **Violaceæ** (from the genus *Viola*, the ancient Latin name). VIOLET FAMILY. Fig. 40. Herbs, shrubs or small trees, rarely climbing; leaves usually alternate; flowers bisexual, regular or irregular; sepals 5, separate or nearly so; petals 5, 1 often spurred; stamens 5, hypogynous or slightly perigynous, closely connivent around the style, similar or dissimilar (2 spurred); ovary 1-celled; placenta 2-5, usually 3, parietal; ovules many; style 1: fruit a firm capsule with placenta on the middle of the valves, rarely a berry and indehiscent.

Violaceæ has 15 genera and about 300 species, of which about 200 belong to the genus *Viola*. These genera are grouped in three tribes: the Violeæ, with irregular flowers, found chiefly in Europe, Siberia and North America, although the woody species are mainly natives of tropical America; the Paypayroleæ and Rinoreæ, with regular flowers, are principally found in South America, Africa and Australia. The family is closely related to the Cistaceæ. The tendency to irregular flowers, the peculiar stamens, the 1-celled ovary with usually 3 parietal placenta, and the anatropous ovules, are distinctive.

In the genus *Viola* and some other genera, a finger-like curved nectar-secreting horn projects backward from the connective of each of the two lower anthers into the spur of the lower petal. In many species of *Viola*, almost all the seeds are produced by small apetalous cleistogamous flowers on short pedicels near the ground in midsummer, after the normal flowering period is over. These are very fertile, and quite diverse in structure, and, therefore, useful in classification. Cleistogamous flowers are also produced in the genus *Hybanthus*. The capsules of most Violaceæ open elastically when ripe, the valves springing back and at the same time folding on the midrib so that the seeds are forcibly ejected as one would shoot a wet apple seed from between the fingers.

The Violaceæ have been used to a certain extent in medicine, their virtues being due to an alkaloid having emetic and laxative properties. *Hybanthus ipecacuanha* ("white ipecacuanha" of commerce) furnishes a substitute for ipecac. Various species of *Viola* and other genera have been used in many countries for skin diseases, as emetics, laxatives, and the like. Several species are ornamental.

Three genera are in the American trade: *Cornistylis* or *Calyptrion*, a species of greenhouse woody climbers; *Hybanthus* or *Solea*, of the garden; and *Viola* (Common Pansy, Horned Pansy, Sweet English Violets, Wild Violets).

150. **Flacourtiaceæ** (from the genus *Flacourtia*, named in honor of E. de Flacourt, a governor of Madagascar). FLACOURTIA FAMILY. Trees or shrubs, rarely climbing; leaves usually alternate and in 2 ranks; flowers bisexual, rarely unisexual, regular; sepals 2-6, commonly 4-5, imbricated, rarely otherwise; petals 0, or equal to the sepals, or many, imbricated or convolute; stamens numerous, hypogynous or perigynous; receptacle enlarged and variously modified, often surmounted by a diversely formed disk; ovary superior or nearly so, 1-celled; placenta parietal; ovules numerous; styles and stigmas 1 to several: fruit dry or fleshy, dehiscent or indehiscent.

There are 70 genera and more than 500 species of tropical distribution. The family is related to the Violaceæ, Passifloraceæ, and other families with similar parietal placentation, but is most closely related to the Bixaceæ with which it has often been united, and from which it differs mainly in the absence of slime-cells. In general, the peculiar ovary, the numerous stamens, the regular flower, and the enlarged receptacle are characteristic.

The sour fruit of several species is eaten, or preserved, in the tropics. The seeds of *Pangium edule* are roasted and used for baking. The leaves of *Casearia esculenta* are eaten in India. The wood is little used. The bark of *Neumannia theiformis* is used like ipecac in Madagascar. Chaulmugra oil is obtained probably from *Gynocardia odorata* of farther India. A peculiar resin is secured from species of *Lætia* of Cuba. Coccois oil, used in perfumery, is obtained from the Polynesian genus *Myroxylon*. The fixed oil of species of *Pangium* is used in cooking.

Probably 5 or 6 genera are in cultivation in the warmer parts of North America: *Aberia* (Kei Apple); *Azara*; *Carriera*; *Flacourtia* (Rambutan, Governor's Plum); *Idesia*, hardy in Mass.; *Oncoba*; *Xylosma*.

151. **Stachyuraceæ** (from the genus *Stachyurus*, signifying *spike-tail*, in reference to the form of inflorescence). STACHYURUS FAMILY. Shrubs or small trees with alternate leaves; flowers bisexual or polygamous, regular; sepals 4, imbricated; petals 4, imbricated; stamens 8, separate; carpels 4; ovary superior, 1-celled, or falsely 4-celled by the intrusion of the large parietal placenta; style and stigma 1; ovules many: fruit berry-like, pericarp leathery.

Only one genus and 4 species occur in Japan, China, and the Himalayas. The family is closely related to the Ternstroemiaceæ with which it was formerly united and from which it differs in the fewer stamens, 1-celled ovary and entire stigma. Useful apparently only as ornamental plants.

Two species are occasionally cultivated in America.

152. **Passifloraceæ** (from the genus *Passiflora*; early travelers thought they had found emblems of the crucifixion in the flower, for a detailed account of which see article on *Passiflora*). PASSION-FLOWER FAMILY. Fig. 40. Herbaceous or woody plants, usually climbing by axillary tendrils; leaves alternate, simple or compound; flowers bisexual, or unisexual, usually involucre, perigynous; calyx and corolla sometimes similar; sepals 4-5, imbricated, often petaloid; petals 4-5, rarely 0, imbricated, often smaller than the sepals, sometimes fringed; a crown (outgrowth of receptacle) of many filaments between the petals and stamens, sometimes tubular or scale-like; stamens 4-5, usually opposite the petals, inserted on the edge of the cup-shaped receptacle, or at the base of the corona, or at the base of the pistil at the summit of a long gynophore, separate or connate; ovary superior, raised on a more or less distinct stalk (gynophore), 1-celled with 3-5 parietal placenta; ovules numerous; styles 3-5: fruit a berry or capsule.

This family contains 18 genera and about 350 species, inhabitants principally of the tropical regions, especially of the New World. Two hundred and fifty species belong to the genus *Passiflora*, which extends as far north as southern Pennsylvania. The family is not closely related to other families, but finds its nearest affinities in the Loasaceæ, Turneraceæ and Begoniaceæ. The remarkable floral structure is distinctive.

The pulpy aril of the seeds of *Passiflora* is used in tropical America in the preparation of cooling drinks. The flowers and fruit of *P. rubra* are narcotic. The roots of *P. quadrangularis* are very poisonous and sometimes used in small doses as a vermifuge. Many *Passifloras* are cultivated in the tropics as fruit plants.

Many are in cultivation in America, namely *Passiflora* and *Tacsonia* (Granadilla, Jamaica Honeysuckle,

Water Lemon, May-Pop), some for the beautiful and odd flowers, some, especially in the South, for the fruit.

153. **Caricaceæ** (from the genus *Carica*, erroneously supposed to be a native of Caria; or from the Latin meaning a kind of dry fig). **PAWPAW FAMILY**. Fig. 41. Peculiar trees with straight, rarely branched, palm-like trunks, very abundant milky juice, and a terminal crown of very large, alternate, palmately-lobed, rarely entire, leaves; flowers unisexual, small, nearly regular; sepals 5; petals 5, in the staminate flowers connate, in the pistillate nearly separate; stamens about 10, inserted on the corolla; ovary superior, 1- or 5-celled, many-seeded; styles 5; fruit a large melon-like berry.

This is a small family of 2 genera and 27 species, confined to tropical and subtropical America; most abundant in the Andes. The **Caricaceæ** is united with the **Passifloraceæ** by some authors, but is similar only in

beyond the ovary); sepals 4-5, imbricated; petals 4-5, flat or cucullate; stamens 4-5, alternating with the petals, or more commonly very numerous through doubling, the outer often converted into staminodia which resemble the petals; ovary usually inferior, and 1-celled, with 3 parietal placentæ; ovules numerous: fruit a capsule, rarely indehiscent, often spirally constructed.

There are 13 genera and about 120 species confined to America from the Great Plains to Chile; most abundant in South America. This is a distinct family distantly related to the **Passifloraceæ** and the **Begoniaceæ**. The very peculiar hairs constitute a good recognition character. On *Mentzelia* there are three types of hairs: (1) Chinese pagoda-like, broad at the base; (2) tuberculate stem and harpoon-like top; (3) smooth stem and harpoon top. The flowers with many staminodia are often large and cactus-like. Very queer, grotesque, complex scales are produced in the flowers of certain genera (e. g., *Loasa*) through the union of several staminodia.

*Mentzelia hispida* is a strong purgative, and is used by the Mexicans for syphilis.

A few genera are in cultivation in North America. Of these, *Loasa* is like a nettle, and the sting is very painful, but the flowers are queer and interesting. *Mentzelia* comprises a number of garden annuals or biennials often with large showy flowers.

155. **Begoniaceæ** (from the genus *Begonia*, named in honor of Michael Begon, a French promoter of botany). **BEGONIA FAMILY**. Fig. 41. Herbs, rarely shrubby, hairs usually scale-like or branched: leaves alternate, usually oblique: flowers monœcious, regular, epigynous, cymose, the staminate opening first; perianth of the staminate flowers of 2 valvate sepals and 2 petals, all petaloid; perianth of the pistillate flowers of 2 to many similar petaloid parts; stamens numerous, separate or nearly so; ovary inferior, 2-3-celled, usually sharply angled and winged; ovules numerous; styles 3, more or less branched and bearing very peculiar crescent-shaped, kidney-shaped, or, more often, spiral, velvety stigmas, rarely straight: fruit a capsule, rarely a berry.

The *Begonia* family has 4 genera and about 500 species, most of which belong to the genus *Begonia*. They are widely distributed throughout the tropics, but perhaps most abundant in South America along the Andes to Mexico, and in the eastern Himalayas south-eastward to the Malay Peninsula. The **Begoniaceæ** constitute a distinct group remotely related to the **Cactaceæ**, **Loasaceæ**, **Passifloraceæ** and **Cucurbitaceæ**.

The family is of little economic importance except for ornamental purposes. Many species contain oxalic acid and are eaten as salad, and as a remedy for scurvy. The roots of some are astringent; others have a purgative root, used in certain tropics for syphilis and scrofula. The **Begoniaceæ** is one of the most important ornamental families.

Very many species and hybrids of *Begonia* are grown for greenhouse and bedding purposes, both for the flowers and the foliage.

#### Order 43. OPUNTIALES

156. **Cactaceæ** (from the old Linnæan genus *Cactus*, a name used by the ancients to denote any spiny plant). **CACTUS FAMILY**. Fig. 41. Fleshy plants with watery or milky juice, a great reduction or complete absence of foliage, and very thick, rather sparingly branched, rarely unbranched stems, which are cylindrical, globular, flattened, or fluted, and often constricted or jointed: leaves alternate, flat and leaf-like in *Pereskia*, scale-like or absent in other genera, usually bearing bundles of spines in the axils, which are trichomes, and which are of two kinds, long and stout, or minute and needle-like: flowers bisexual, mostly regular, perigynous or epigynous; sepals and petals rarely 8-10, usually very many, similar; stamens many, inserted spirally or in groups

41. **CARICACEÆ**: 1. *Carica*, one form of flower opened. **LOASACEÆ**: 2. *Loasa*, a flower; b, c, and d, types of foliage hairs. **BEGONIACEÆ**: 4. *Begonia*, a, male flower; b, female flower; c, cross-section ovary. **CACTACEÆ**: 5. *Pilocereus*, flower. 6. *Opuntia*, flower

the fruit. It is also related to the **Cucurbitaceæ** by the fruit. The peculiar habit and abundant milky juice are very distinctive.

The large melon-like fruits of *Carica Papaya* are now cultivated and eaten throughout the tropics; those of other species are also eaten. The milky juice of *C. Papaya* contains a pepsin-like substance which will curdle milk. This substance will separate the fibers of meat, and hence the leaves and fruit are cooked with too fresh tough meat to make it tender. The juice has also been used as a remedy for dyspepsia.

*Carica Papaya* (South American pawpaw) is commonly grown in greenhouses; and it, as well as two other species, are grown in southern California and Florida in the open.

154. **Loasaceæ** (from the genus *Loasa*, the meaning unknown). **LOASA FAMILY**. Fig. 41. Erect or climbing herbs, rarely shrubby, with very peculiar and characteristic hairs, some hooked, some stinging: leaves opposite or alternate, very diverse: flowers bisexual, regular, mostly perigynous (i.e., receptacle usually extended

on inside of the receptacle; ovary inferior, 1-celled, with 3 to many parietal placentæ; ovules numerous; style 1; stigmas as many as the placentæ: fruit a berry; embryo straight or curved.

The Cacti are almost entirely confined to the dry regions of tropical and subtropical America. Mexico is the center of this distribution, but the Cactaceæ extend from New York to Patagonia. A species of *Rhipsalis* has lately been found indigenous in West Africa. The family is related to the Begoniaceæ, Loasaceæ, and Passifloraceæ. The peculiar habit, perianth of many similar parts, many stamens, and inferior 1-celled ovary are distinctive. The Cactaceæ is divided into three groups: (1) *Cereus* group, with receptacle extended in a tube beyond the ovary (perigynous), and no hooked spines; (2) *Opuntia* group, tube of the receptacle wanting, hooked spines usually present; (3) *Pereskia* group, with foliaceous leaves, panicked flowers, and no hooked spines.

The seeds of *Rhipsalis*, an epiphytic genus, are often viscid so as to adhere to tree trunks and the like. The ovaries of some Cactaceæ are imbedded in the tissue of the stem. In this family, the thick stem is a water-storing organ. The flattened or fluted condition of the stem of most species is probably an adaptation which allows these stems to swell when water is abundant and contract when it is scarce without danger of rupturing the cuticle. The variation in size and form among cacti is very great. The largest species is *Carnegiea gigantea* of Mexico, candelabra-like, 60 feet high.

The fruit of *Opuntia Ficus-indica*, now naturalized in the Mediterranean region, is there eaten under the name of Indian fig. *Opuntia Tuna* of tropical America is the prickly pear, an edible fruit. *Opuntia vulgaris* of the eastern United States is also eaten under the name of prickly pear or Indian fig. Fruits of *Cereus triangularis*, *C. giganteus*, and *C. Thurberi* are much prized. The stem and flowers of *C. grandiflorus* are used in medicine, producing an action on the heart. Vermifugal properties are found in many Cactaceæ. An alcoholic drink is made by the Mexicans from the sap of species of *Cereus*. The cochineal insect, a scale insect yielding the well-known dye, cochineal, lives upon species of *Opuntia*, *Pereskia*, and *Nopalea*, in tropical America.

The total number of genera of Cactaceæ which have been described up to the present time is about 70, although Dr. Karl Schumann, who monographed the family in 1899, recognized but 21. Of the many genera described, most are good and will probably stand. A rational and uniform treatment of the family will doubtless show that there are no less than 75 tenable genera. The total number of names published is something over 3,800. This includes many species that have been transferred from one genus to another. The number of species recognized by Schumann is something less than 700. Many of these species of Schumann, however, are known to be aggregates, and it is not unlikely that there are about 1,200 species in the family.

The number of genera treated in this work is 35. They are in cultivation in America as odd plants for desert gardens, and as greenhouse curiosities. Many have beautiful showy flowers, those of *Cereus grandiflorus* (night-blooming cereus) being nearly one foot across, and opening only in the night.

The reader will find the cacti described in this Cyclopedia under the following names: *Acanthocereus*; *Anhalonium*=*Ariocarpus*; *Aporocactus*; *Ariocarpus*; *Bergerocactus*; *Cactus*; *Carnegiea*; *Cephalocereus*; *Cereus*; *Disocactus*; *Echinocactus*; *Echinocereus*; *Echinopsis*; *Epiphyllum*=*Zygocactus*; *Escontria*; *Hariota*; *Harrisia*; *Heliocereus*; *Hylocereus*; *Lemaireocereus*; *Leptocereus*; *Leuchtenbergia*; *Lophophora*; *Mamillaria*; *Melocactus*=*Cactus*; *Myrtillocactus*; *Nopalea*;

*Opuntia*; *Pachycereus*; *Pelecypora*; *Pereskia*; *Peresklopsis*; *Phyllocactus*=*Epiphyllum*; *Pilocereus*=*Cephalocereus*; *Rathbunia*; *Selenicereus*; *Schlumbergera*; *Wilcoxia*; *Wittia*; *Zygocactus*.

#### Order 44. MYRTIFLORÆ

157. **Thymelæaceæ** (from the generic name *Thymelæa*, a Greek name meaning *thyme* + *olive* or *oil*). **MEZEREUM FAMILY.** Fig. 42. Shrubs or trees, rarely herbs: leaves alternate or opposite, simple, entire: flowers bisexual or unisexual, regular, receptacle developed into a long tube which bears appendages in the throat; perianth undifferentiated, often petaloid, parts 4-5, imbricated, perigynous; stamens as many as the sepals and alternate with them, or twice as many, or

42. **THYMELÆACEÆ:** 1. *Daphne*, flower. **ELEAGNACEÆ:** 2. *Elæagnus*, a, male flower; b, bisexual flower; c, floral diagram; 2a and 2b, halves from surface of leaf. **LYTHRACEÆ:** 3. *Lythrum*, a, flower; b, trimorphic flowers of *L. Salicaria*; c, floral diagram. **PUNICEÆ:** 4. *Punica*, a, flower; b, fruit, upper story; c, fruit, lower story.

reduced to 2, perigynous; ovary superior, 1-celled, rarely 2-celled; ovule solitary, pendulous; style 1 or 0, stigma 1: fruit indehiscent, a nut, drupe, or berry; rarely a capsule.

About 37 genera and 425 species are widely distributed over the earth. One species is native in north-western North America. The largest genera are *Gnidia* with 80-90 species, and *Pimelea* with 75 species. The family stands between the Myrtifloræ and the Cactales, and also somewhat suggests the Passifloraceæ. The single perianth, the tubular receptacle, perigynous, definite stamens, the appendages in the tube of the receptacle, and the superior 1-celled, 1-ovuled ovary are distinctive.

*Gnidia carinata* of South Africa and *Daphne Mezereum* (mezereon) of Europe have been used as a purge; as has also the spurge flax (*Daphne Gnidium*) of South Europe, the caustic juice of which is used in a blistering ointment. A blistering principle is obtained from the bark of *Funifera utilis* of Brazil; also from *Dirca palustris*. The roots of *Thymelæa tinctoria* yield a yellow dye. Paper is made from the cauline fibers of

several species, e.g., *Daphne cannabina* of India, *Dirca palustris* of the United States, *Gnidia* of Madagascar, and *Lagetta* of Jamaica. Cord is made from *Lagetta funifera* and *L. linearia* of South America. The wood of *Aquilaria Agallocha* of India is aromatic, called aloewood. One *Pimelea* yields a balsam. Lace-bark is the product of *Lagetta linearia*.

Six or more genera are in cultivation in this country for ornament. Among these are: *Daphne* (Mezereon), greenhouse and garden; *Dirca* (Leatherwood, Moosewood), native, hardy; and *Pimelea* (Rice Flower), greenhouse.

158. **Elæagnaceæ** (from the genus *Elæagnus*, derived from the Greek name of the olive combined with that of the Chaste tree). **OLEASTER FAMILY.** Fig. 42. Trees and shrubs, covered with silvery and brown, petate or stellate scales: leaves alternate or opposite, simple, entire: flowers bisexual or unisexual, regular, perigynous; receptacle developed into a long tube beyond the ovary, more or less persistent, and inclosing the fruit; perianth of 1 series; parts 4, rarely 2 or 6, valvate; stamens of the same number or double the number, inserted in the tube; perigynous disk prominent, lobed; ovary superior, 1-celled, 1-ovuled; style 1; stigma 1: real fruit dry, indehiscent, but appearing drupe-like because of the fleshy investing receptacle.

Three genera and about 30 species are found, of which about 25 belong to *Elæagnus*; mostly steppe or rock plants, chiefly of south Asia, Europe and North America. The family is closely related to the *Thymelæaceæ*, which see for further relationship. The peculiar scales, the perigynous flowers, the 1-celled, 1-seeded ovary, and the fleshy but free receptacle are distinctive.

The acid fruits of *Elæagnus angustifolia* of Persia are eaten; also those of *E. latifolia* of India, and the seeds of *Shepherdia argentea* of North America.

There are 3 genera in cultivation in America, principally as hardy ornamental plants with silvery foliage: *Elæagnus* (Oleaster, Goumi); *Hippophaë* (Sea Buckthorn, Swallow Thorn); *Shepherdia* (Buffalo Berry).

159. **Lythraceæ** (from the genus *Lythrum*, derived from the Greek meaning blood, in reference to the purple flowers). **LOOSESTRIFE FAMILY.** Fig. 42. Herbs, shrubs, or trees: leaves usually opposite or whorled: flowers bisexual, usually regular, perigynous; receptacle ("calyx-tube") tubular, ribbed, free from the ovary, bearing the 4 or 8 valvate sepals on its margin; petals of the same number as the sepals, or 0, and inserted with them, imbricated; stamens usually twice as many as the petals, rarely more (up to 200), or fewer (to 1); outer set alternate with the petals, and inserted some distance below them; ovary superior, 2-6-celled, many-ovuled: fruit a capsule, rarely indehiscent.

There are 22 genera and about 450 species known; generally distributed, but more abundant in the tropics, especially in America. The largest genus is *Cuphea* with about 160 species. The family is closely related to the *Onagraceæ*, but differs in the superior ovary; it is also related to the *Melastomaceæ*, but the stamens are normal.

*Lythrum Salicaria* has been used as an astringent; *Heimia* and *Cuphea* have been used as purgatives and emetics. *Lawsonia inermis* of Egypt is the famous henna, the perfume of the flower of which is renowned throughout the East; with an orange-red dye obtained from the leaves of this plant, women of the orient dye hair and nails. *Pemphis acidula* is used as a pot-herb in Asia. The flowers of *Woodfordia floribunda* yield the red dye of India called dhak. *Lagerstromia* furnishes very valuable timber.

In cultivation in N. America are several genera: *Cuphea*, species of garden annuals; *Decodon* (Swamp Loosestrife), native, but used for water-gardens; *Lythrum* (Loosestrife); *Lawsonia* (Henna), cultivated in southern Florida and southern California; *Lagerstromia indica* (Crape Myrtle) cultivated in the South.

160. **Punicaceæ** (from the genus *Punica*, derived from the Latin in reference to Carthage, near which city the plant is said to have grown; or from the Latin meaning scarlet, in reference to the flowers). **POMEGRANATE FAMILY.** Fig. 42. Shrubs or commonly small trees: leaves mostly opposite: flowers bisexual, usually perigynous; receptacle campanulate or tubular, thickened above the ovary; sepals 5-8, fleshy, valvate; petals 5-7, imbricated, inserted with the sepals on the edge of the receptacle; stamens very numerous, clothing the tube of the receptacle; carpels in 1-2 (rarely 3) superimposed series, 3 in the lower and usually 5-7 in the upper; ovary more or less inferior, with as many cells as carpels; placenta of the lower series axile, of the upper parietal, the cells many-ovuled; style and stigma 1: fruit a berry, the pulpy central mass of which is formed from the fleshy outer seed-coats.

This is a family of only 1 genus and 2 species, natives of the Mediterranean region and eastward to the Himalayas. It was formerly united with the *Lythraceæ*, but the peculiar ovary is unique. *Punica Granatum* is the famous pomegranate, cultivated for its fruit since the earliest times, and now widely spread over the tropics. This species is cultivated in the southern states and in greenhouses. It has escaped in Florida.

161. **Lecythidaceæ** (from the genus *Lecythis*, derived from the Greek meaning an oil-jar, in reference to the fruit). **LECYTHIA FAMILY.** Fig. 43. Trees: leaves alternate, large and striking: flowers bisexual, regular, perigynous or epigynous; sepals 4-6, rarely fewer, valvate; petals 4-6, imbricated, rarely more or fewer; stamens very numerous, somewhat monadelphous, many antherless; intra-staminal disk often present; ovary inferior, 2-6-celled, several ovules in each cell: fruit a hard-shelled berry or a capsule dehiscing by a lid.

The family has 18 genera and about 225 species, with a somewhat isolated distribution in various parts of the tropics, e.g., North Brazil, west coast of Africa, Malay Peninsula, Mozambique, and Samoa. The family was formerly united with the *Myrtaceæ* but is dissimilar in some important details of vascular structure, and in the absence of volatile oils.

The most important economic plant is the Brazil-nut or para-nut (*Bertholletia excelsa*) of northern South America, the oily seeds of which are an important article of food. The seeds are in a box-like capsule, the lid of which falls off. The oily seeds of several other species are eaten, e.g., the monkey-pot tree (*Lecythis*). The fruits and roots of a number of species of *Barringtonia* are used in Java and China to stupefy fish. The flowers of *Grias cauliflora* of the West Indies are used for tea. A cooling drink is made from the fruit of *Couroupita guianensis* of the West Indies.

The Brazil-nut or nigger-toe is sparingly planted in southern California, Florida and the West Indies.

162. **Rhizophoraceæ** (from the genus *Rhizophora*, root-bearing, because of the numerous aerial roots). **MANGROVE FAMILY.** Fig. 43. Trees or shrubs: leaves usually opposite, coriaceous: flowers bisexual, epigynous or perigynous; sepals 3-14, more or less connate, valvate; petals of the same number, small, often lacerate; stamens 2-4 times as many, often in pairs opposite the petals; ovary inferior, usually 2-5-celled: fruit somewhat juicy, crowned with the calyx, rarely dehiscent, usually a berry, rarely a drupe.

The 15 genera and about 50 species are distributed throughout the tropics. The family is related to the *Combretaceæ* and *Lythraceæ*; more distantly to the other families of the myrtaceous group.

This is a small family of remarkable plants, mostly inhabiting mud-flats along the coast in the tropics. The stem soon perishes at the base and then the plant is supported by its numerous prop-roots alone. The mud is so soft that otherwise the plants could probably not remain erect. The genus *Rhizophora* is almost unique in the vegetable kingdom because the seeds germi-

nate on the plant. The hypocotyl may reach the length of 3 feet, although usually less; it is club-shaped and heaviest at the apex, so that when the seedling eventually falls from the tree, it sticks in the mud vertically, with the hypocotyl down, ready to grow.

The Rhizophoraceæ are of little economic importance. Land is held in place and protected from the waves by the mangrove. The fruits of *Anisophyllum* are plum-like but poor. The mangrove grows wild on the Florida, Texas, and Mississippi coast, and has been offered for sale in California.

163. **Combretaceæ** (from the genus *Combretum*, a name given to this plant by Pliny). **COMBRETUM FAMILY.** Fig. 43. Trees or shrubs, erect or climbing; leaves

shade. *Poivrea* is a red-flowered shrub grown in southern Florida. One species of *Combretum* is a warmhouse climbing shrub. *Quisqualis*, or rangoon creeper, is a peculiar climbing shrub grown in the warmhouse. It is at first erect, later climbing.

164. **Myrtaceæ** (from the genus *Myrtus* derived from the classical name myrtle, which probably meant perfume). **MYRTLE FAMILY.** Fig. 43. Usually shrubby or arborescent aromatically fragrant plants; leaves usually opposite, thick, entire and pellucid-dotted; flowers bisexual, regular, rarely perigynous; sepals mostly 4-5, imbricated; petals 4-5, imbricated; stamens very numerous by splitting, often in fascicles which are opposite the petals; ovary inferior, 1- to many-celled; fruit usually a berry, rarely a drupe or nut; seeds 1- to many.

The 72 genera and 2,750 species are confined almost entirely to the tropics, but with two great centers of distribution, one in tropical America and the other in Australia. *Eugenia* contains 625 species, and *Eucalyptus* more than 130 species. This is a large family related to the Melastomaceæ, Onagraceæ, and Lythraceæ. The very numerous stamens, derived by the splitting of the few original stamens, and the oil-glands are distinctive. The petals of *Eucalyptus* remain firmly grown together, and, when the flower opens, they separate along a transverse line and are thrown off as a lid.

The Myrtaceæ are rich in volatile oils; also in tannin, acids, sugars, mucilage, and fixed oils. Cloves are the flower-buds of *Jambosa caryophyllus*. The fruit of *Pimenta officinalis* is thought to combine the flavors of the nutmeg, cinnamon, and clove, and is therefore termed allspice. *Psidium Guajava* is a tree cultivated in the tropics for the much-prized fruits. Oil of myrica is obtained from the leaves of *Pimenta acris* of the West Indies and is used in making bay rum. Oil of cajuput, a fragrant oil used in medicine, is secured from the leaves and twigs of the East Indian *Melaleuca Leucadendron*. The leaves of the European myrtle (*Myrtus communis*) yield a distilled preparation known as eau-d'ange, used as a toilet article. Other edible fruits are rose apples (*Jambosa malaccensis* and *J. vulgaris*) of the East Indies and Pacific Ocean. Jambos berries are obtained from *Jambosa vulgaris*, which is extensively cultivated in the tropics. Oil of eucalyptus is an important aromatic oil obtained from the foliage of various species of that genus. The wood of *Eucalyptus* is hard, firm and elastic, and is much prized in wood-carving. Many other species of this family are in use locally for food, condiments, medicine, timber, and so on.

About 20 genera are in cultivation in North America, mostly in the South or Southwest. Among these are the Bottle-brush (*Callistemon*), Cajaput Tree (*Melaleuca*), *Eucalyptus* or Australian Blue-gum, Rose Apple or Jambos (*Jambosa*), Cayenne Cherry (*Eugenia*), Myrtle (*Myrtus*), Guava (*Psidium*), Allspice, Pimento (*Pimenta*), Brisbane Box (*Tristania*), Turpentine Tree (*Syncarpia*), and Downy Myrtle (*Rhodomyrtus*).

165. **Melastomaceæ** (from the genus *Melastoma*, derived from the Greek *black-mouth*, because the berries of some of the species when eaten stain the mouth black). **MELASTOMA FAMILY.** Fig. 43. Herbs, shrubs or trees; erect, climbing or epiphytic; branches often 4-sided; leaves opposite or whorled, simple, mostly entire, usually palmately nerved throughout with transverse nervelets; flowers bisexual, regular or slightly irregular; often perigynous; sepals 3-6, mostly 5, valvate, imbricated or united into a calyptra-like hood; petals commonly 5, convolute; stamens usually twice as many as the petals, rarely just as many; anthers mostly opening by terminal pores, inflexed in the bud, often curved; connective very peculiar and diverse, with various appendages; often one anther cell wanting, the other mounted on the end of the lever-like, versatile, curved connective; ovary usually 4-5-celled, more or

43. **LECYNTHIDACEÆ:** 1. *Lecythis*, flower. **RHIZOPHORACEÆ:** 2. *Rhizophora*, a, flower; b, germinating fruit. **COMBRETACEÆ:** 3. *Combretum*, a, flower; b, floral diagram. **MYRTACEÆ:** 4. *Jambosa*, a, flower; b, vertical section flower-bud. 5. *Eucalyptus*, a, flower-bud and lid; b, vertical section flower-bud. **MELASTOMACEÆ:** 6. *Melastoma*, a, flower; b, floral diagram.

alternate or opposite, simple or coriaceous; flowers bisexual or unisexual, regular, usually perigynous; receptacle enveloping the ovary and often projecting into a slender tube; sepals 4-5, valvate, connate; petals 4-5, or 0; stamens 4-5, alternating with the petals, or twice or thrice as many; ovary 1-celled, inferior, 2-4-ovuled; fruit a drupe, or dry and winged, rarely dehiscent.

In this family are 15 genera and about 280 species, mostly confined to the tropics of both hemispheres. The family is related to the Cornaceæ and the Rhizophoraceæ, as well as more distantly to the Onagraceæ.

The trees are valuable for their hard, close wood; the tannin-containing bark and galls are used locally for tanning leather. The seeds known as myrobalans (*Terminalia Chebula* and *T. Catappa*) are much eaten in India. A useful oil is obtained from these seeds. Black and yellow dyes are furnished by several species.

Four to 6 genera are in cultivation in the Southern States and the West Indies. *Terminalia Catappa* (tropical almond, myrobalan) is grown for nuts and

less inferior; ovules numerous in each cell; style and stigma 1: fruit a berry, drupe or capsule, or dry and indehiscent, usually inclosed in the calyx.

Most of the 148 genera and about 2,800 species, are found in tropical America, where the species are very abundant and form a characteristic component of the vegetation; represented in the eastern United States by 4 species of *Rhexia* (deer-grass, meadow beauty). Melastomaceæ is a very distinct, striking and peculiar tropical family related to the Myrtaceæ and the Lythraceæ, recognized by the venation of the leaves, and the unusual stamens. The so-called "cauliflower" species, with the flowers borne directly on the tree-trunks, are pollinated by butterflies in the deep tropical forests. Some Melastomaceæ are myrmecophilous, i.e., furnish habitations or food for ants, which in turn protect the plant.

The fruits of several species are eaten. The berries and bark of some yield coloring matter of some importance. A yellow dye is obtained from the leaves of *Mecycylon* of the East Indies and Africa; red and black dyes are secured from the berries of *Tamonea* (tropical America), *Melastoma* (East Indies), and so on. The leaves of *Tamonea theezans* are used by the Peruvians in place of tea. Some, because of astringent properties, are locally used as medicine. The most important use of the Melastomaceæ is ornamental. The large, showy, queer flowers and striking foliage render them popular greenhouse plants in the North.

Some 20 genera are cultivated in N. America, mostly as warmhouse decorative plants, or for summer bedding. Few, if any, have popular names.

166. **Onagraceæ** (from the genus *Onagra*, now a part of *Oenothera*, derived from the Greek, *a wild ass*, in reference to a fancied resemblance between the ears of that animal and the leaves of these plants). EVENING PRIMROSE FAMILY. Fig. 44. Mostly herbs, rarely shrubs: leaves opposite or alternate: flowers bisexual, regular, perigynous or epigynous; sepals 4, rarely 2-3, separate or united, valvate; petals 4, or rarely 2 or 0, mostly clawed, convolute; stamens of the same number as the petals or twice as many, outer alternate with the petals; ovary 2-4-celled, inferior; ovules numerous; style 1; stigmas 1-4: fruit a capsule, rarely a berry or nut.

The 36 genera and 470 species are mostly natives of the temperate portion of the New World (western United States and Mexico), but are also abundant in South America. *Epilobium*, containing 160 species, is widely distributed in the cooler regions of both hemispheres. This is a distinct family, recognized by the numerical plan of 2 or 4, the usually perigynous flowers, and the inferior ovary with many ovules. It is related to Lythraceæ, Melastomaceæ, Myrtaceæ, and other families of this group.

*Fuchsia* is shrubby or even arborescent, and its fruit is a berry. The tubular receptacle is prolonged beyond the ovary in most genera, but not in *Jussieua*, *Ludwigia*, and *Epilobium*. The seeds of *Epilobium* are comose, and are distributed, parachute-like, by the wind. The flowers of a number of species of *Oenothera* open only at night or in dark weather, and are pollinated by night-flying moths; hence the name evening primrose.

The wood of several species of *Fuchsia* furnishes ink and a black dye. *Jussieua pilosa* yields a yellow dye. The berries of many *Fuchsias* are eaten, and preserved with sugar. The young shoots of *Epilobium latifolium* are eaten as greens. The roots of *Oenothera biennis* have been improved in Europe and furnish "rhapontic" roots, which are eaten like celery. The coma of the seeds of *Epilobium* has been used in Lapland to make lamp-wicks and has been spun into cloth, but without great success. Many genera are cultivated for ornamental purposes because of the showy flowers.

About a dozen genera are cultivated in N. America,

among which are the following: *Circæa* (Enchanter's Nightshade); *Epilobium* (Willow Herb, Fire Weed); *Fuchsia*; *Ludwigia* (Water-purslane, Seed-box or Rattle-box); *Clarkia*; *Oenothera* (Evening Primrose, Sundrops); and *Godetia*. These are mostly grown in the open as annuals or as hardy perennials, except *Fuchsia*, which is a greenhouse plant but often bedded out in summer.

167. **Hydrocaryaceæ** (from the Greek signifying, *water-walnut*). WATER CHESTNUT FAMILY. Herbaceous, aquatic plants mostly floating: stems slender, clothed with cypose, pinnatifid roots: leaves alternate, crowded at the summit of the stem, floating, rhomboid, petioled; petioles forming thick, hollow floats: flowers bisexual, regular, slightly perigynous, axillary; sepals 4; petals 4; stamens 4, all sets alternating; ovary surrounded by an erect, corona-like disk, half-inferior, 2-celled; cells 1-ovuled; style and stigma 1: fruit a woody 1-celled, 1-seeded nut bearing on the surface the four divergent woody horn-like sepals and capped by the woody disk.

A single genus and 3 species occur, distributed in the Mediterranean region and eastward to eastern Asia. This is an ancient family, more common in the tertiary. The family is related to the Onagraceæ, with which it is frequently united, and to the Haloragidaceæ, and is somewhat intermediate between these two families. The fruit, disk, and habit are peculiar.

The starchy seeds have a chestnut-like flavor and are eaten raw or cooked, for which reason the plants are often cultivated. The fruits are regularly sold

44. ONAGRACEÆ: 1. *Oenothera*, a, flower; b, floral diagram. 2. *Epilobium*, a, flower; b, dehiscent fruit; c, seed. 3. *Circæa*, floral diagram. HALORAGIDACEÆ: 4. *Myriophyllum*, a, portion of flowering plant; b, female flower; c, male flower, petals removed.

in the markets of India; those of *Trapa natans* var. *verbanensis* are used as beads.

*Trapa natans* (Water Chestnut, Water Caltrops) and *T. bispinosa* (Singhara Nut) are grown in this country as aquarium plants. See article on *Trapa*.

168. **Haloragidaceæ** (from the genus *Haloragis*, meaning *sea + a berry*). WATER MILFOIL FAMILY. Fig. 44. Herbs, aquatic or terrestrial, of very diverse appearance: leaves opposite or alternate, often in the same genus, pectinate (aquatic) to very large and

divided: flowers bisexual or unisexual, regular; sepals 4; petals 4 or 0; stamens 8, the outer opposite the petals, or 4, rarely fewer; ovary inferior, 1-4-celled, each cell 1-ovuled: fruit nut-like, often crowned by the calyx.

Eight genera and about 100 species are known, of general distribution. These are most abundant in the southern hemisphere of the Old World. They are represented in South America and elsewhere by the queer *Gunnera* and in the eastern United States by *Hippuris*, *Myriophyllum* and *Proserpinaca*. The family is closely related to the *Onagraceæ*, but differs in having but 1 ovule in each cell of the ovary.

The aquatic forms are *Utricularia*-like and floating, with slender stems and either finely pectinate leaves with filiform divisions (*Myriophyllum*) or linear and entire leaves (*Hippuris*). *Gunnera* of South America has broad kidney-shaped leaves varying from small to gigantically large. The leaves of this genus in Costa Rica are said to be so large as to give shelter to three men on horseback.

The fruits of *Gunnera macrophylla* are used as a stimulant in Java. The giant leaves, six feet broad, of *Gunnera chilensis* are used in Chile for tanning skins.

Two species of *Gunnera* are almost, or quite, hardy in the mid-eastern United States, and are grown for luxuriant lawn foliage. Several species of the aquatic *Myriophyllum* are in cultivation, one of which is parrot's feather (*M. proserpinacoides*).

#### Order 45. UMBELLIFLORÆ

169 **Araliaceæ** (from the genus *Aralia*, the meaning of which is unknown). GINSENG FAMILY. Fig. 45. Herbs, shrubs, or trees, often prickly or climbing: stems solid, pithy: leaves usually alternate, simple, or pinnately or ternately compound: flowers bisexual or unisexual, small, regular, epigynous, commonly in umbels; sepals minute, often almost wanting; petals 5, rarely more, valvate or imbricated, sometimes cohering at the apex

and deciduous as a cap; stamens usually 5, alternate with the petals, and inserted at the edge of an epigynous disk, rarely twice or thrice as many; ovary inferior, 2-15-celled; cells 1-ovuled; styles as many as the carpels: fruit a berry, rarely splitting into segments.

Fifty-one genera and about 400 species are distributed in tropical and temperate regions of both hemispheres. The two great centers of distribution are tropical America and the Malay Peninsula. The family is very closely related to the *Umbelliferae*, but differs in the berry-like fruit with more numerous carpels.

The leaves of the English ivy (*Hedera Helix*) were used in medicine in olden times. The roots of ginseng (*Panax Ginseng* and *Panax quinquefolium*) are much prized in China where they are carried about on the person as a charm against disease. These roots are now extensively and profitably cultivated in America for the Chinese trade. The roots of *Aralia nudicaulis* (American sarsaparilla) are considered a tonic. Chinese rice-paper is made from the pith of *Tetrapanax papyriferum* simply by cutting the pith spirally into thin sheets. Many *Araliaceæ* are grown as ornamental plants.

Many genera are cultivated in America. Among these are: *Acanthopanax*; *Aralia* (including *Spikenard*, *Hercules' Club* or *Devil's Walking-club*, *Wild Sarsaparilla*, *Bristly Sarsaparilla*, *Chinese Angelica Tree*); *Dizygotheca*; *Fatsia*; *Oreopanax*; *Polyscias*; *Pseudopanax*; *Hedera* (English Ivy); and *Panax* (*Ginseng*).

170. **Umbelliferae** (from the predominating type of flower cluster). PARSLEY FAMILY. Fig. 45. Herbs or rarely shrubs: stems often hollow: leaves alternate, rarely simple, usually ternately or pinnately compound: flowers minute, bisexual, regular or the outer irregular, epigynous, borne in simple or compound umbels; sepals minute or wanting; petals 5, valvate and incurved in the bud; stamens 5, alternating with the petals, inserted around an epigynous disk; ovary 2-celled, inferior, each cell 1-seeded; styles 2: fruit very special, consisting of 2 dry, ribbed or winged, 1-seeded, indehiscent carpels (mericarps), which separate at the base but remain attached at the top to a very slender and flexuous Y-shaped stalk (carpophore) from which they dangle; between or under the ribs are oil-tubes.

About 231 genera and 1,500 species are very commonly found in all boreal temperate and subtropical lands, but are rare in the tropics except in the mountains. The *Umbelliferae* is a distinct family, closely related to the *Araliaceæ*, and more distantly to the *Cornaceæ*. The umbels, the inferior ovary and the peculiar fruit are distinctive.

The leaves are exceedingly diverse in size, shape and extent to which compounded. Those of *Eryngium* are sword-shaped, or yucca-like, often spiny; those of *Hydrocotyle* are simple and often peltate. *Azorella* of the Andes and New Zealand is turf-like or cushion-like, a xerophytic adaptation. Some species of *Angelica* are immense herbs many feet high with enormous leaves. The flowers, in general, are uniform in structure and appearance, the greatest diversity being in the fruit.

Economic plants are abundant in the *Umbelliferae*; between 40 and 50 have been listed by some authors. Various alkaloids and other compounds, some very poisonous, together with many kinds of resins, produced in the foliage, roots or seeds, form the basis of their economic importance. Plants used for food are celery (*Apium graveolens*), carrot (*Daucus Carota*), and parsley (*Petroselinum sativum*). Those used for flavoring are caraway (*Carum Carui*), anise (*Pimpinella Anisum*), sweet Cicely (*Osmorhiza* or *Scandix*), chervil (*Anthriscus Cerefolium*), dill (*Anethum graveolens*), fennel (*Feniculum vulgare*), lovage (*Levisticum officinale*). Very poisonous plants are poison hemlock (*Conium maculatum*), fool's parsley (*Aethusa Cynapium*) and others. The following drugs are obtained from this family: coriander (*Coriandrum sativum*), ammoniac resin (from *Dorema Ammon-*

45. **ARALIACEÆ**: 1. *Aralia*, a. flower; b. floral diagram. 2. *Hedera*, portion of inflorescence. **UMBELLIFERÆ**: 3. *Cicuta*, inflorescence. 4. *Foeniculum*, a. flower; b. dehiscent fruit. 5. *Artedia*, fruit. 6. *Apium*, fruit. 7. a, b, and c, fruits of *Umbelliferae*, cross-section.

*iocum*), galbanum (a resin from species of *Ferula*). From various species of *Ferula* is obtained the vile-smelling gum-resin *asafetida*, used in medicine, which the Persians are said to praise as a delicious condiment.

There are 40–50 genera in cultivation in America, mostly hardy. Some are grown for food, others for ornament: Sea Holly (*Eryngium*); Sanicle, or locally Black Snakeroot (*Sanicula*); Carrot (*Daucus*); Coriander (*Coriandrum*); Cumin (*Cuminum*); Celery (*Apium*); Caraway (*Carum*); Gout-weed (*Ægopodium*); Sweet Cicely (*Osmorhiza*); Myrrh (not of medicine) or European Sweet Cicely (*Myrrhis* or, more properly, *Scandix*); Fennel (*Foeniculum*); Lovage (*Levisticum*); Angelica (*Angelica*); Cow-parsnip (*Heracleum*). Poison hemlock (*Conium*) is a roadside weed.

171. **Cornaceæ** (from the genus *Cornus*, derived from the Latin *horn*, referring to the hardness of the wood). **DOGWOOD FAMILY.** Trees or shrubs, rarely herbs: leaves opposite or alternate, entire, exstipulate; flowers bisexual, rarely unisexual, regular, epigynous; sepals 4, minute or absent; petals 4, usually valvate; stamens commonly of same number as petals and alternate with them, separate; epigynous disk usually present; ovary inferior, 2-celled, rarely 1–10-celled; ovules in each cell 1, rarely 2: fruit a drupe or berry.

The 15 genera and about 120 species, of which 45 species belong to the genus *Cornus*, are distributed in the temperate portions of the northern hemisphere, principally in North America and Asia; some, however, occur in South Africa and New Zealand. The relationships of the family are doubtful. *Cornus* is related to the *Caprifoliaceæ*, but some other genera suggest the *Araliaceæ*. The woody or sub-ligneous habit, 4-merous, polypetalous, epigynous flowers and the berry-like fruit with one seed in each cell are distinctive.

Many species of *Cornus* have capitate flowers surrounded by a large petaloid involucre (e.g., *Cornus mas*, *C. florida*, *C. canadensis*). *C. canadensis* and *C. suecica* are herbaceous dogwoods. *Helwingia rusciflora*, of China and Japan, is a most remarkable plant with flowers borne at the center of the leaf-blade attached to the midrib on the upper side.

The acid fruits of *C. mas* are edible, and are used as a sherbet in the East. Those of *C. capitata* of the Himalayas have a flavor like strawberries and are eaten. Many *Cornaceæ* are ornamental woody plants.

Several genera are in cultivation here, of which may be mentioned: *Cornus* (Dogwood, Osier Dogwood); *Aucuba*, from Japan; *Garrya* from southern United States; *Griselinia* from New Zealand; *Nyssa* (Sour Gum, Pepperidge, Tupelo) from the eastern United States. *Garrya*, *Nyssa* and others have been separated by some into other families.

#### Sub-class II. *Metachlamydeæ*, or *Sympetalæ*

##### Order 46. **ERICALES**

172. **Clethraceæ** (from the genus *Clethra*, the ancient Greek name of Alder). **PEPPERBUSH, or WHITE ALDER FAMILY.** Fig. 46. Tall shrubs or low trees: leaves alternate: flowers bisexual, regular, hypogynous; disk absent; calyx 5-parted, persistent; corolla saucer-shaped, of 5 separate petals; stamens 10, hypogynous; anthers opening by terminal pores, at first inverted, later erect; ovary superior, 3-celled; style 1; stigmas 3; ovules numerous: fruit a capsule.

A single genus and about 30 species are distributed in the tropical and subtropical regions of both hemispheres; mostly American. Two species reach the eastern United States. The family is closely related to the *Pyrolaceæ* and *Ericaceæ*. The polypetalous corolla, temporarily inverted anthers and the 3-celled ovary are important characteristics. There is one fossil species known.

A few species of *Clethra* are grown in North America

for ornamental purposes. *C. alnifolia* is the native white alder or sweet pepperbush.

173. **Pyrolaceæ** (from the genus *Pyrola*, diminutive of *Pyrus*; possibly a resemblance in the foliage). **SHIN-LEAF FAMILY.** Fig. 46. Very low perennial herbs:

46. **CLETHRACEÆ:** 1. *Clethra*, a, flower; b, cross-section ovary. **PYROLACEÆ:** 2. *Pyrola*, a, flower; b, floral diagram. **ERICA-CEÆ:** 3. *Andromeda*, flower. 4. *Kalmia*, flower. 5. *Rhododendron*, flower. 6. *Erica*, stamen. 7. *Vaccinium*, a, flower; b, stamen.

leaves alternate, basal or scattered, thick and evergreen in most species: flowers bisexual, regular, with or without a hypogynous disk; calyx 5-parted, persistent; corolla waxy, saucer-shaped, of 5 separate petals; stamens 10, hypogynous; anthers opening by terminal pores, inverted; ovary superior, 5-celled, many-ovuled; style and stigma 1: fruit a capsule.

There are 3 genera and 20 species distributed in the boreal and temperate parts of Europe, Asia and America. The polypetalous flowers, inverted anthers and 5 carpels are characteristic. The family is closely related to the *Ericaceæ* and *Clethraceæ*.

Two species of *Chimaphila* (*Pipsissewa*, Prince's Pine), one species of *Moneses* (*One-flowered Pyrola*), and a few species of *Pyrola* (*Shinleaf*) are offered in the American trade for ornamental purposes. Otherwise the family is of no economic importance.

174. **Monotropaceæ** (from the genus *Monotropa*, meaning *one turn*, in reference to the nodding flower). **INDIAN-PIPE FAMILY.** Low, saprophytic herbs, without chlorophyll, white, yellowish, brownish, or blood-red in color: leaves alternate, reduced to scales: flowers 1 to several, bisexual, regular, a lobed, hypogynous disk sometimes present; calyx 5-parted, rarely 0; corolla of 4–5, separate, gibbous petals, these rarely coherent; stamens 8–10, hypogynous; anthers opening by slits, 1–2-celled, often appendaged; ovary 4–5-celled, superior, many-ovuled; style and stigma 1: fruit a capsule.

The Indian-pipe family contains 8 genera and about 12 species, all North American except 1 Himalayan species and 1 found in both Europe and America; most abundant in the West. The family is closely related to the *Ericaceæ*, *Pyrolaceæ* and *Clethraceæ*, from which it differs mainly in method of nutrition.

*Sarcodes sanguinea*, the Sierran snow plant, is bright red in color.

The Monotropaceæ are not known to be in cultivation.

175 **Ericaceæ** (from the genus *Erica*, the ancient name of the heath, from *erico*, to break). **HEATH FAMILY.** Fig. 46. Shrubs or sub-shrubs: leaves alternate, often evergreen; flowers bisexual, regular or slightly irregular; calyx 4-5-fid, persistent; corolla gamopetalous, rarely polypetalous, often urceolate, 4-5-lobed, convolute or imbricated; stamens alternate with the petals, of the same number or double the number, inserted at the base of a hypogynous disk, not epipetalous; anthers sometimes appendaged, opening by terminal pores, rarely by longitudinal slits; ovary superior or inferior, 4-5-celled or falsely 10-celled, many ovuled; style and stigma 1: fruit a capsule, rarely a berry or drupe.

The 67 genera and about 1,400 species are very generally distributed. *Erica*, the largest genus, with 420 species, is confined to the Old World. The family is closely related to the Pyrolaceæ and Clethraceæ; also to the Epacridaceæ and Diapensiaceæ. The northern Ericaceæ are largely evergreen and variously adapted

ing on hilltops). **EPACRIS FAMILY.** Shrubs or small trees: leaves alternate, usually stiff, small, and heath-like: flowers bisexual, regular, hypogynous; disk present; calyx of 4-5 sepals bracted at the base; corolla gamopetalous, 4-5-lobed; stamens 4-5, hypogynous or epipetalous; anthers opening by longitudinal slits; carpels 4-5; ovary superior, 1-10-celled; ovules solitary or many; style and stigma 1: fruit a drupe or capsule.

The 21 genera and about 300 species are almost exclusively confined to Australia and New Zealand. One species is found in South America. The family is closely related to the Ericaceæ, but has one whorl of stamens. The genus *Styphelia* contains 172 species. *S. sapida* furnishes edible berries.

A few species of *Epacris* are grown as ornamental plants in the greenhouses of North America.

177. **Diapensiaceæ** (from the genus *Diapensia*, the derivation of which is obscure). **DIAPENSIA FAMILY.** Fig. 47. Low shrubs: leaves alternate, evergreen, reniform or imbricated or moss-like: flowers bisexual, regular, hypogynous; disk absent; calyx of 3-5 sepals; corolla with 5 separate petals, or gamopetalous; lobes imbricated; stamens 5, epipetalous or hypogynous, alternating with the corolla lobes, often also alternating with 5 staminodia; anthers opening by a longitudinal slit; ovary superior, 3-celled; ovules very numerous; style 1; stigmas 1-3: fruit a capsule.

Diapensiaceæ has 6 genera and about 10 species of circumpolar distribution, extending southward to Carolina and the Himalayas. The family is related to the Ericaceæ, and to the Epacridaceæ. The 3 carpels and 5 stamens are important distinguishing characteristics.

Four or more genera are in cultivation in America; of these, *Galax aphylla* (Galax) of North Carolina has reniform leaves; *Pyxidantha barbata* (Pyxie, Flowering Moss, or Pine-barren Beauty) of southern New Jersey has subulate leaves; *Shortia*, of North Carolina and Japan, and *Schizocodon soldanelloides* (Fringed Galax) of Japan both have orbicular leaves.

#### Order 47. PRIMULEALES

178. **Myrsinaceæ** (from the genus *Myrsine*, the Greek name of Myrrh). **MYRSINE FAMILY.** Trees or shrubs: leaves usually alternate, coriaceous, glandular-dotted: flowers bisexual or unisexual, regular, often very glandular; calyx 4-5-parted, persistent; corolla gamopetalous, rarely of separate petals, 4-5-lobed; stamens 5, opposite the lobes of the corolla, mostly epipetalous, separate or monadelphous; alternating staminodia often present; ovary superior or inferior, 1-celled, placenta basal or free-central; ovules few or numerous; style and stigma 1: fruit a few-seeded berry or drupe.

Widely distributed in the tropics are 32 genera and about 550 species. Two species reach Florida. The family is related to the Primulaceæ, but is woody, glandular, and has indehiscent fruits; also related to the Sapotaceæ.

The leaves of *Jacquinia* are used in America to stupefy fish; the fruits of this genus are poisonous. The fruits of some species of *Ardisia* are edible. Bread is made in San Domingo from the crushed seed of *Theophrasta Jussieu*.

About a half-dozen genera are in cultivation in this country, but are little known. *Jacquinia* and *Myrsine* are grown in southern Florida and southern California; *Ardisia* is a genus of greenhouse shrubs. The species ascribed in the trade to *Theophrasta* on further study have been referred to other genera.

179. **Primulaceæ** (from the genus *Primula*, from Latin *primus* (first), in reference to the early flowering of some European species). **PRIMROSE FAMILY.** Fig. 47. Herbs: leaves mostly opposite or whorled, often dotted or mealy: flowers bisexual, regular, rarely slightly irregular; calyx not bracteate, mostly 5-parted; corolla

47. **DIAPENSIACEÆ:** 1. *Diapensia*, a, flower; b, floral diagram. **PRIMULACEÆ:** 2. *Primula*, a, flower b, floral diagram. **PLUMBAGINACEÆ:** 3. *Armeria*, flower. 4. *Statice*, calyx. 5. *Plumbago*, floral diagram.

in foliage to a xerophytic habitat. *Ledum* is polypetalous. *Rhododendron* has a funnel-form corolla; *Kalmia*, a cup-shaped corolla with elastic stamens in pockets. The anthers of *Epigæa* dehisce longitudinally.

*Arctostaphylos Uva-Ursi* (bearberry) of Europe and America is medicinal. The volatile oil of wintergreen is obtained from the leaves, and stems, of the North American *Gaultheria procumbens*. A very poisonous substance is found in some species of *Rhododendron*, *Lyonia* and *Leucothoe*; and possibly the poisonous quality of *Kalmia* and *Rhododendron* honey is due to this. Species of *Gaylussacia* (North America) yield huckleberries; species of *Vaccinium* yield blueberries. The fruits of *V. Myrtillus* (Europe) are bilberries. The European heaths furnish commercial honey. Cranberries are the fruit of *V. macrocarpon* and *V. Oxycoccus*. Many species of Ericaceæ are ornamental.

Forty to 50 genera are in cultivation in N. America. Among these are the Strawberry Tree or Madrona (*Arbutus*); Bearberry (*Arctostaphylos*); Heather (*Calluna*); Heath (*Erica*); Trailing *Arbutus* or Mayflower (*Epigæa*); Labrador Tea (*Ledum*); Sourwood or Sorrel Tree (*Oxydendrum*); *Azalea*, *Rhodora*, *Rhododendron* or Pinxter Flower (*Rhododendron*); Laurel (*Kalmia*); Blueberry and Cranberry (*Vaccinium*); Huckleberry (*Gaylussacia*); also *Menziesia*, *Chamaedaphne*, *Cassiope*, *Andromeda*, and others.

176. **Epacridaceæ** (from the genus *Epacris*, derived from the Greek meaning on the top; many species grow-

gamopetalous, 5-lobed, rarely of separate petals; stamens 5, epipetalous, opposite the corolla lobes, often alternating with staminodia; ovary superior, rarely half-inferior, 1-celled, many-ovuled; placenta free-central; style and stigma 1; fruit a capsule opening by valves or by a transverse lid.

The family has 28 genera and about 320 species of more or less cosmopolitan distribution, but most abundant in north temperate regions. It is most closely related to the Myrsinaceæ and Plumbaginaceæ. The herbaceous habit, dehiscent fruit, and many seeds are important distinguishing characteristics. The flowers of this family often have styles and stamens of different lengths in the same species (heteromorphic), e. g., *Primula*. The free-central placentation is characteristic of this and related families.

Rhizomes of *Primula* were formerly used for diseases of the bladder. Primrose wine is made from the flowers of *Primula officinalis* and *P. vulgaris*. Rhizomes of *Cyclamen* are purgative and emetic. In some countries these rhizomes are used to stupefy fish; roasted they become good food for pigs (sowbread of Europe). Other species have been used in medicine. Many are ornamental plants.

Twelve to 18 genera are in cultivation in North America. Among these are the following well-known names: *Cyclamen*; *Dodecatheon* (Shooting-star); *Androsace* (Rock Jasmine); *Anagallis* (Pimpernel, Poor Man's Weather-glass); *Hottonia* (Featherfoil, Water-Violet, Water-Yarrow) with aquatic inflated stems and fine leaves; *Lysimachia* (Loosestrife, Moneywort, Creeping Charlie); *Primula* (Primrose); *Soldanella*; *Stieronema* (Loosestrife); *Trientalis* (Star Flower).

**180. Plumbaginaceæ** (from the genus *Plumbago*, from *plumbum*, lead; perhaps in reference to the lead-like stain given by the roots to the fingers). **LEADWORT FAMILY.** Fig. 47. Herbs or shrubs: leaves alternate, linear or lanceolate; flowers bisexual, regular; calyx bracteate, 5-fid, usually scarious, and plicate, angled or winged, sometimes colored, persistent; corolla gamopetalous, or of 5 nearly separate petals, mostly convolute; stamens 5, epipetalous, opposite the lobes of the corolla; ovary superior, 1-celled; ovule 1, basal; styles 5; fruit a capsule or utricle, invested by the calyx.

The ten genera and about 250 species, of almost cosmopolitan distribution, are found usually inhabiting seacoasts and alkaline regions; they are most abundant in the Mediterranean region, and in Central Asia. The family is closely related to the Primulaceæ, but has only one seed.

A fatty substance in the root of certain *Plumbagos* gives a lead-colored stain to the fingers and paper. These roots were formerly used for toothache, ulcers, and the like. Beggars are said still to use them to produce sores. The roots of *Statice latifolia* of Russia contain tannin and have been used for tanning.

There are 5 or 6 genera in cultivation in North America; *Acantholimon* from Armenia, hardy; *Armeria* (Sea Pink, Thrift) of Europe and Asia, hardy; *Ceratostigma* of China, hardy; *Plumbago* (Leadwort), of Asia, Africa, Australia, mostly of the greenhouse; *Statice* (Sea Lavender), of Europe, Asia, North America, hardy. Some species of this family are used for dry bouquets.

#### Order 48. EBENALES

**181. Sapotaceæ** (from the old generic name *Sapota*, derived from a native name of *Achras Sapota*). **SAPOTILLA FAMILY.** Fig. 48. Trees or shrubs; juice milky; leaves alternate, entire, coriaceous; flowers usually bisexual, axillary, regular; calyx mostly of separate sepals in two whorls of 2, 3, or 4, or in one whorl of 5; corolla gamopetalous; lobes as many as the sepals, or twice as many, in one or two series, imbricated, sometimes with appendages which simulate extra corolla-lobes; stamens as many as the lobes of the corolla and opposite them,

sometimes with intermediate staminodia, or twice as many, epipetalous; ovary superior, 4- to many-celled; ovules 1 in each cell, basal; style and stigma 1; fruit a berry.

There are 31 genera and about 400 species, of tropical distribution, rarely reaching the warm temperate zone. One species extends to Virginia and two to Illinois. This is a distinct family, distantly related to the Myrsinaceæ, Ebenaceæ, and Styracaceæ.

The fruits of *Lucuma mammosa* (marmalade plum), and *Achras Sapota* (sapodilla), are very agreeable. Fruits of *Illipe* and *Mimusops*, both Asiatic, are edible. The oil from the seeds of the oriental *Illipe butyracea* and of other species is galam butter, and shea butter. It is used for food and soap. The wood of many species is very hard and valuable—so-called ironwoods. Several species of *Palaquium* of the East Indies yield gutta percha, as do other species of the family. Gum chicle is obtained from *Achras Sapota*. Star-Apple is *Chrysophyllum Cainilo*. West Indian medlar is *Mimusops Elengi*.

Six to 10 genera are in cultivation in North America, mostly in the warmer parts: *Mimusops*, *Lucuma* (Mar-

48. SAPOTACEÆ: 1. *Lucuma*, flower. 2. *Sideroxylon*, floral diagram. EBENACEÆ: 3. *Diospyros*, a, female flower; b, floral diagram, female flower. STYRACACEÆ: 4. *Styrax*, a, flower; b, cross-section ovary; c, fruit. SYMPLOCACEÆ: 5. *Symplocos*, a, flower; b, cross-section fruit.

malade Plum) and *Sideroxylon* are grown in southern California and Florida; *Dichopsis* or *Palaquium* (wrongly called *Isonandra*), the commercial gutta percha tree, is cultivated in the South. *Bumelia* and *Chrysophyllum* are ornamental, the former hardy to Massachusetts.

**182. Ebenaceæ** (from the Latin *ebenus*, meaning *ebony*). **EBONY FAMILY.** Fig. 48. Trees or shrubs; leaves alternate, coriaceous, entire; flowers rarely bisexual, usually dioecious, regular; calyx 3-6-parted, persistent; corolla 3-6-lobed, hypogynous, gamopetalous, urceolate, coriaceous, mostly imbricated and twisted; stamens short, usually double the number of the corolla-lobes, rarely as many or more numerous, hypogynous or epipetalous, separate or united in pairs; ovary superior, 2-16-celled, with 1-2 suspended ovules in each cell; styles and stigmas 2-8; fruit berry-like, rarely sub-dehiscent.

In this family are 5 genera and about 280 species, of which 180 belong to the genus *Diospyros*; they are inhabitants of tropical and subtropical regions, principally of the eastern hemisphere. The greatest development of the family is in the East Indies and Malay Archipelago. One species of *Diospyros* occurs in the eastern United States, from Rhode Island southward. The family is related to the Styracaceæ, Sym-

plocaceæ and Sapotaceæ. The superior several-celled ovary, unisexual flowers and absence of milky juice are important distinctive characters.

The wood of many species, especially of the genus *Diospyros*, furnishes the ebony of commerce. The fruit of *Diospyros Lotus* is known as date plum in Asia. The fruit of the persimmon (*Diospyros virginiana*) is also edible. The bark of persimmon is sometimes used in medicine.

Three or 4 genera are in cultivation in North America for ornamental purposes. Maba, from Natal, and Royena, from South Africa, are not hardy. *Diospyros* (Common Persimmon and Kaki), hardy or tender, depending on the species, is grown for ornament or fruit.

183. **Styracaceæ** (from the genus *Styrax*, the ancient Greek name of the storax tree). **STORAX FAMILY.** Fig. 48. Shrubs or small trees: leaves alternate, simple: flowers bisexual, regular; calyx 4-5-cleft; corolla mostly 4-5-lobed, the lobes almost separate, imbricated or valvate; stamens in one series, hypogynous or epipetalous, twice as many as the lobes of the corolla, rarely just as many, separate or more or less united; ovary superior, rarely half-inferior, 1-celled at the top, 3-5-celled at the bottom; 1, rarely several, ovules in each cell; style 1; stigmas 1-5: fruit a capsular drupe.

Six genera and about 100 species are distributed in the warmer regions of South and Central America, southeastern United States, eastern Asia, and the Mediterranean region. The family is very closely related to the Symplocaceæ; also to the Ebenaceæ and Sapotaceæ. The superior, imperfectly several-celled ovary, bisexual flowers and absence of milky juice are distinctive. Fossil species are known.

*Styrax Benzoin* of the East Indies yields the fragrant resin known as benzoin. It is a pathological product of the tree. Some Brazilian species of *Styrax* and some species of *Pamphilia* also yield a fragrant resin which is burned as incense in the churches. The storax of the ancients was obtained from *Liquidambar orientalis* (family Hamamelidaceæ).

Two or 3 genera are in cultivation in America: *Halesia* (Silver Bell, Snowdrop Tree), of eastern United States, is hardy; *Styrax* (Storax) of China, Japan, and America, is semi-hardy. *Pterostyrax* of Japan is by some referred to *Halesia*.

184. **Symplocaceæ** (from the genus *Symplocos*, derived from the Greek, meaning *connected*, referring to the stamens). **SYMPLOCOS FAMILY.** Fig. 48. Trees or shrubs: leaves alternate, simple: flowers bisexual, or less commonly unisexual, regular; calyx 5-lobed, gamosepalous, imbricated; corolla-lobes 5 or 10, in 1 or 2 series, gamopetalous, imbricated; stamens 15 to many in 1-3 or many series, separate, or slightly united with each other and the corolla, hypogynous or epipetalous; ovary inferior or half-inferior, 2-5-celled, with about 2 ovules in each cell; style 1; stigmas 1-5: fruit drupaceous.

Only one genus and about 275 species are found in tropical lands; they are most abundant in the Malay region and East India. A few species in Japan, and one in North America, extend the family into the temperate zone. *Symplocos tinctoria* reaches Delaware. The family is related to the Styracaceæ, and is often united with it. The inferior, completely several-celled ovary, and numerous stamens, are important characteristics. Fossil species are known.

The bark of *Symplocos racemosa* is used as a medicine in the East Indies under the name lotus bark. The leaves of *S. spicata* and the roots of *S. tinctoria* are used in the preparation of yellow dye-stuffs. *S. crataegoides* is a hardy ornamental shrub from Japan.

#### Order 49. CONTORTÆ

185. **Oleaceæ** (from the genus *Olea*, derived from the Greek meaning, originally, *olive tree*, and later *oil*,

i. e., olive oil). **OLIVE FAMILY.** Fig. 49. Trees or shrubs: leaves opposite, simple or pinnate: flowers bisexual or unisexual, regular, small and numerous; calyx 4-lobed, rarely 4-15-lobed, valvate; corolla 4-lobed, rarely 6-12-lobed, gamopetalous, rarely polypetalous, or 0, hypogynous, valvate; stamens 2, rarely 3-5, epipetalous, alternate with the corolla-lobes; ovary superior, 2-celled; ovules usually 2 in each cell; style 1 or 0; stigmas 1-2: fruit a drupe, berry, capsule, or samara.

Oleaceæ has 20 genera and more than 400 species, of temperate and tropical lands; these are especially abundant in the East Indies and East Asia. About 10 species are native in northeastern North America. Fossil species are known. The family is related to the Loganiaceæ; possibly also to the Celastraceæ and

49. **OLEACEÆ:** 1. *Olea*, a, flower; b, floral diagram. 2. *Fraxinus*, fruit. **LOGANIACEÆ:** 3. *Logania*, flower. **GENTIANACEÆ:** 4. *Gentiana*, a, flower; b, floral diagram. **APOCYNACEÆ:** 5. *Apocynum*, a, flower; b, floral diagram; c, fruit. 6. *Vinca*, pistil.

**Rubiaceæ.** The numerical plan of 4, the 2 stamens and the superior ovary are important distinctive characteristics.

The most useful plant is the olive (*Olea europæa*) of the Orient, long cultivated in the Mediterranean region. The oil expressed from the fruit is used as food, and for other purposes. The unripe fruits, preserved in brine, are the olives of commerce. The bark of the fringe tree and privet contains medicinal principles of minor importance, as do also the leaves of the lilac. A saccharine exudation from the bark of *Fraxinus Ornus* of Sicily, induced by the puncture of a cicada, is manna (See, also, *Tamarix mannifera*). The wood of olive and ash are valuable. The flowers of *Osmanthus fragrans* have been used to scent tea in China.

A dozen genera are in cultivation in North America: *Chionanthus* (Fringe Tree), hardy; *Forsythia* (Golden Bell), hardy; *Fontanesia*, hardy; *Fraxinus* (Ash), hardy; *Jasminum* (Jasmine, Jessamine), of the greenhouse and the South; *Ligustrum* (Privet), hardy; *Olea* (Olive),

not hardy; *Osmanthus* (Fragrant Olive and Devil-wood), not hardy; *Phillyrea*, not hardy; *Schrebera*, not hardy; and *Syringa* (Lilac), hardy.

186. **Loganiaceæ** (from the genus *Logania*, named in honor of J. Logan, a botanist). **LOGANIA FAMILY.** Fig. 49. Herbs, shrubs, or trees: leaves opposite, simple; flowers usually bisexual, regular; calyx 4-5-lobed or parted; corolla 4-5-, or 10-lobed, imbricated or convolute; stamens epipetalous, of the same number as the lobes of the corolla and usually alternate with them, rarely reduced to 1; ovary superior, usually 2-celled, rarely 1-or 4-celled; ovules usually numerous; styles 1; stigmas 1-2: fruit a capsule, rarely a berry or drupe.

The family contains 32 genera and about 360 species, of tropical distribution. A few genera only reach the temperate zone, 4 species of which are native in northeastern North America. Fossil species are known. The family is related to the Apocynaceæ, Gentianaceæ, Solanaceæ, Rubiaceæ, and Scrophulariaceæ. The opposite stipulate leaves, and 2-celled superior ovary, are important distinctive characters.

The seeds and bark of *Strychnos nux-vomica* contain a very poisonous alkaloid, strychnine, used as a nerve tonic. Curare, with which the Indians of South America poisoned their arrows, is probably obtained from the bark of *S. toxifer*. Other species of *Strychnos* are used in Java to poison arrows. The root of *Spigelia* (pink-root), an American plant, has been used as a vermifuge. It is also poisonous. *Strychnos Ignatia* yields the poisonous ignatius bean of India. The nut of *S. potatorum* is the clearing nut of India, which is used to purify foul water, by rubbing it on the inside of the vessel. The roots of yellow jasmine (*Gelsemium sempervirens*) of the southeastern United States are used as a nerve tonic.

Three or 4 genera are in the North American trade, all ornamental: *Buddleia*, semi-hardy; *Gelsemium* (Yellow Jessamine), woody vine, semi-hardy; *Spigelia* (Pink-Root), herbaceous, hardy.

187. **Gentianaceæ** (from the genus *Gentiana*, named in honor of King Gentius of Illyria, who, according to Pliny, first discovered the medicinal properties of these plants). **GENTIAN FAMILY.** Fig. 49. Herbs, rarely shrubs or small trees: leaves opposite, rarely alternate or whorled, exstipulate: flowers bisexual, regular; calyx 4-5-parted, persistent; corolla 4-8-lobed, gamopetalous, hypogynous, convolute or induplicate, rarely valvate; stamens of the same number as the corolla-lobes and alternate with them, epipetalous; hypogynous disk usually present; ovary superior, 1-celled, with 2 parietal placentæ, rarely 2-celled; ovules numerous: fruit a capsule.

The 63 genera and about 750 species are almost cosmopolitan in distribution. Three hundred species belong to the genus *Gentiana*, distributed mostly in the mountains of the north temperate zone, in the arctic zone and in the Andes; they are wanting in Africa. Fossil species of *Menyanthes* are known. The family is closely related to the Loganiaceæ. The commonly 1-celled ovary, exstipulate leaves and the presence of a bitter principle are important characters.

The general occurrence of a bitter principle renders the majority of Gentianaceæ valuable as tonics, and appetizers. Most of the drug, gentian, is obtained from *Gentiana lutea* of Europe. *G. punctata*, *G. purpurea*, and *G. Pannonica* are also used. *Erythraea Centaureium* (centaury) furnishes a medicinal bitter principle. *Tachia guianensis* is used as bitters in South America, under the name quassia. The bitter principle of *Menyanthes* is used as a medicine, and also as a substitute for hops in flavoring beer. The Gentianaceæ are used medicinally in all parts of the globe.

Several genera are in cultivation in North America: *Erythraea*; *Eustoma*; *Fraseria*; *Gentiana* (Gentian); *Menyanthes* (Buckbean); *Sabbatia*; and *Swertia*. *Nymphoides* (*Limnanthemum*) (Floating Heart, Water

Snowflake) is a genus of peculiar aquatic plants. *Villarsia* is a close relative of *Nymphoides*.

188. **Apocynaceæ** (from the genus *Apocynum*, the ancient name of the dogbane, from the Greek). **DOGBANE FAMILY.** Fig. 49. Herbs, shrubs or trees with milky juice, often climbing: leaves opposite or whorled, rarely alternate, entire, exstipulate: flowers bisexual, regular; calyx 4-5-parted; corolla 4-5-lobed, hypogynous, gamopetalous, usually with appendages or folds in the throat, convolute or valvate; stamens 4-5, epipetalous, alternating with the corolla lobes; anthers usually sagittate and acute; pollen granular; hypogynous disk usually present and variously lobed; ovaries usually 2, rarely more or less united; mostly superior, each 1-celled, many-seeded, style 1, usually bearing a fleshy ring below the solitary stigma: fruit follicular with comose seeds, or indehiscent, or berry-like, or of nutlets, sometimes winged or prickly.

One hundred and thirty genera and about 1,000 species occur, mostly in tropical countries in both hemispheres. Five or 6 species reach northeastern North America. The family is related to the Asclepiadaceæ and Gentianaceæ. The milky juice, sagittate anthers, absence of corona, styler ring, and usually separate ovaries but connate styles and stigmas, are important characteristics.

Many species of *Landolphia* yield commercial caoutchouc, as do also other genera, such as *Urceola* and *Willoughbya*. Some are very poisonous, e.g., *Tanghinia* of Madagascar; also *Cerbera* and *Acocanthera*. *Tanghinia*, the ordeal tree of Madagascar, "is the most poisonous of plants; a seed no larger than an almond suffices to kill twenty people." Death has followed the use of oleander wood as meat-skewers. An infusion of its leaves is an insecticide; of its bark, a rat-poison. Some are heart-poisons, for example *Strophanthus* and *Aspidosperma* (quebracho bark). The bark of *Alstonia* is a tonic. *Allamanda cathartica* is purgative. Several species furnish edible fruits tasting like citron. *Wrightia tinctoria* furnishes an indigo; *W. tomentosa*, a yellow dye.

About 20 to 25 genera are in cultivation in N. America as ornamental plants, mostly in the South or in the greenhouse. Among these are: *Allamanda*; *Carissa* (Caraunda, Christ's Thorn); *Amsonia*; *Apocynum* (Dogbane); *Nerium* (Oleander); *Tabernaemontana* (Crape Jasmine, Nero's Crown); *Trachelospermum* (Star Jasmine); and *Vinca* (Periwinkle).

189. **Asclepiadaceæ** (from the genus *Asclepias*, dedicated to Æsculapius). **MILKWEED FAMILY.** Fig. 50. Herbs or shrubs, sometimes fleshy, often climbing, generally with milky juice: leaves opposite, rarely otherwise, exstipulate: flowers bisexual, regular, very frequently in umbels; calyx 5-parted, imbricated; corolla 5-parted or lobed, gamopetalous, hypogynous; a crown present, which is either an outgrowth of the corolla, or of the stamens, or of both; stamens 5, mostly hypogynous, alternating with the lobes of the corolla, usually monadelphous, sometimes united with the styles; pollen usually agglutinated into pollinia, which are attached to glandular appendages of the stigma; disk absent; ovaries 2, superior, each 1-celled, many-seeded; styles 2; stigmas united: fruit of two follicles; seeds usually comose.

There are 217 genera and about 1,900 species, principally of the tropics, but many reach the temperate zone. The family is distinct, and closely related only to the Apocynaceæ. The Asclepiadaceæ is one of the most extraordinary of families. Most species have a milky juice. Many in South Africa are fleshy, cactus-like plants. Some are epiphytes with variously modified foliage. One genus of epiphytes bears foliar pitchers that catch and hold rain-water. Some species are like a bundle of leafless whip-lashes; others have remarkable tuberous bases to store water. The floral crown is most diverse; and the details of insect-pollination, especially the behavior of the pollinia, is very compli-

cated. The union of the two carpels by the stigma only is unique.

Pleurisy root (*Asclepias tuberosa*) was formerly used extensively for lung and catarrhal disorders. Condurango, from the bark of *Marsdenia Condurango*, is a stomach tonic. The milky juice of many is medicinal; some are emetics (*Vincetoxicum*, *Gomphocarpus*, *Secamone*); others are purgative (*Solenostemma*,

gamopetalous, hypogynous, convolute; stamens 5, slightly epipetalous, alternating with the corolla-lobes; hypogynous disk present, usually lobed; ovary superior, 2-celled, rarely more or fewer celled; each cell 1-2-ovuled, micropyle directed downward and outward; styles 1-2; stigmas 1-2: fruit a capsule or a berry, very rarely breaking into 4 1-seeded nutlets.

Convolvulaceæ has 40 genera with about 1,000 species, of which 300 species belong to the genus *Ipomœa* and 160 species to the genus *Convolvulus*. They are distributed in all regions except the arctics; but are especially numerous in tropical Asia and tropical America. The family is related to the Solanaceæ and Boraginaceæ, but also to the Polemoniaceæ and Hydrophyllaceæ. The absence of a circinate inflorescence, the plaited corolla, the direction in which the micropyle is turned and the few-seeded fruit are important distinguishing characteristics. The genus *Cuscuta* is parasitic and chlorophyllless, receiving its nutriment by means of haustoria from the plant upon which it twines.

Because of the substances contained in the milky juice, many species are medicinal. The following are purges: jalap (*Exogonium Purga*), of Mexico; turbith (*Operculina Turpethum*), of the East Indies; and scammony (*Convolvulus Scammonia*), of the orient. The fleshy roots of *Ipomœa Batatas* (sweet potato) are edible; also those of *Convolvulus Sepium*. *Ipomœa Pes-capræ* is used in India to bind the sands along the coast. *Convolvulus scoparius* of the Canaries furnishes the fragrant oil of rhodium, used to adulterate oil of rose, and sold also to rat-catchers as a lure for rats. *Cuscuta Epilinum*, and several other species, are bad pests in cultivated fields.

Several genera are in cultivation in N. America: *Argyrea*, tender twiners; *Breweria*, trailing, grown in Florida; *Convolvulus* (Bindweed, California Rose, Rutland Beauty), mostly twining; *Ipomœa* (Morning-glory, Moonflower, Cypress Vine, Indian Pink, Man-of-the-Earth, Blue Dawn Flower, Sweet Potato, Jalap), mostly twining; *Jacquemontia*, garden twiners; *Lettosmia*, twiners, grown in Florida.

191. **Polemoniaceæ** (from the genus *Polemonium*, an ancient name of doubtful application). **POLEMONIUM FAMILY.** Fig. 50. Herbs, rarely woody; leaves alternate, or the lower sometimes opposite, simple or pinnate; flowers bisexual, regular, or nearly so; calyx 5-cleft; corolla 5-lobed, gamopetalous, hypogynous, convolute; stamens 5, epipetalous, alternate with the corolla-lobes; hypogynous disk present; ovary superior, 3-, rarely 2- or 5-, celled; ovules in each cell many, rarely 1; style 1, 3-fid, rarely 5-fid; stigmas 3, rarely 5: fruit a capsule.

About 8 genera and 200 species are known; these are almost entirely American and principally North American. Nearly 100 species belong to the genus *Gilia*. The family is closely related to the Convolvulaceæ, and difficult to separate from that family. The 3 many-ovuled cells of the ovary are important. The disk of *Cobæa* is large and 5-lobed. The terminal leaflet of this plant is a branched tendril.

Many Polemoniaceæ are grown as ornamental plants. *Polemonium cæruleum* (Jacob's ladder, or Greek valerian) is used in some countries as a remedy for various ailments.

About 6 to 8 genera are cultivated in this country as ornamental plants: *Cantua*, a shrub in the greenhouse; *Cobæa*, a climbing herb, mostly in the greenhouse; *Gilia*, many species, for bedding; *Læselia* in the cool-house; *Phlox* (*Phlox*, Ground or Moss Pink), for bedding; *Polemonium*, for bedding.

192. **Hydrophyllaceæ** (from the genus *Hydrophyllum*, meaning water-leaf). **WATER-LEAF FAMILY.** Fig. 50. Annual or perennial herbs: leaves mostly alternate, often lobed: flowers bisexual, regular, mostly in circinate raceme-like clusters; calyx 5-cleft; corolla 5-lobed, often

50. ASCLEPIADACEÆ: 1. *Asclepias*, a, flower; b, flower, vertical section; c, stamens; d, pistil and pollinia; e, pollinia and gland; f, floral diagram. CONVOLVULACEÆ: 2. *Convolvulus*, floral diagram. POLEMONIACEÆ: 3. *Phlox*, flower. 4. *Polemonium*, floral diagram. HYDROPHYLLACEÆ: 5. *Hydrophyllum*, flower. 6. *Phacelia*, a, and b, ovary of two species.

*Cynanchum*); others are sudorifics (*Hemidesmus*). The acrid juice of *Gonolobus* is used to poison arrows; that of *Periploca* to poison wolves, hence the name wolfbane and dogbane. The milk of *Gynmema lactiferum*, the cow-plant of Ceylon, is edible; also that of the Cape, *Oxystelma esculentum*. Some Indian species yield good bast fibers. *Marsdenia tinctoria* yields a dye. Several species yield caoutchouc. The oschur or modar (*Calotropis procera*) is probably the sodom apple of the Bible. The herbage of several species is cooked and eaten. The acid stem of *Sarcostemma* is eaten as a salad. In East Africa, *Cynanchum sarcostemmoides* is used to poison fish. Many Asclepiadaceæ are ornamental plants.

About 20 genera are in cultivation in N. America, mostly in the tropical horticulture of Florida and California. More generally cultivated and better known are: *Asclepias* (Milkweed); *Cynanchum* (Mosquito Plant, Cruel Plant); *Hoya* (Wax-plant); and *Periploca* (Silk Vine).

#### Order 50. TUBIFLORÆ

190. **Convolvulaceæ** (from the genus *Convolvulus*, signifying to entwine). **MORNING-GLORY FAMILY.** Fig. 50. Herbs, shrubs or small trees, twining or erect, turf-forming shrubs, thorny shrubs, "switch plants," or yellow, leafless, twining parasites, often with milky juice: leaves alternate: flowers bisexual, regular; peduncles very often bi-bracteate; calyx 5-parted, persistent; corolla more or less 5-lobed, usually plaited,

with scales in the throat, gamopetalous, hypogynous, imbricated; stamens 5, alternating with the corallolobes, slightly epipetalous; hypogynous disk present; ovary superior, 1-celled, rarely incompletely 2-celled; ovules 2 to several; style 1; stigmas 2; fruit a capsule.

The 17 genera and about 170 species are found most abundantly in temperate North America, less commonly southward to Patagonia. A very few are found in south and east Africa, India, Japan, and the Hawaiian Islands. The family is most closely related to the Boraginaceæ, but has a 1-celled ovary; more distantly related to the Convolvulaceæ and Polemoniaceæ.

*Eriodictyon glutinosum* (yerba santa) of California has lately come into use as an expectorant in throat and lung trouble. *Hydrophyllum canadense* has long had a reputation as a remedy for snake-bites, poison-ivy poisoning, erysipelas, and other skin troubles.

About a half dozen genera are in cultivation in N. America as ornamental plants. They are used principally for outdoor bedding. *Emmenanthe* (California Yellow or Golden Bells); *Hesperochiron*; *Hydrophyllum* (Waterleaf); *Nemophila*; and *Phacelia*.

**193. Boraginaceæ** (from the genus *Borago*, an ancient name having reference to the roughness of the foliage). BORAGE FAMILY. Fig. 51. Herbs, rarely shrubs or trees; leaves usually alternate, very frequently rough-hairy; flowers bisexual, regular, rarely irregular; inflorescence usually cinate; calyx 4-5-cleft, persistent; corolla 4-5-lobed, gamopetalous, hypogynous, imbricated, often with scales or folds in the throat; stamens 5, epipetalous, alternating with the corallolobes; hypogynous disk usually present; carpels 2; ovary superior, 4-celled, either entire and style terminal, or 2-lobed, or more commonly deeply 4-lobed with the style basal between the lobes; each cell 1-ovuled; style 1; stigmas usually 2; fruit rarely a berry, usually of 4 1-seeded nutlets, with the surface variously smooth, polished, wrinkled, barbed, winged, or crested.

There are 85 genera and about 1,500 species widely distributed in the temperate and tropical zones, most abundant in the Mediterranean region and in western North America. The largest genera are *Cordia* with 230 species, and *Heliotropium* with 220 species. The family is most closely related to the Hydrophyllaceæ; also related to the Verbenaceæ and Labiata. The cinate inflorescence, and 2-carpeled, 4-celled ovary with 1 seed in each cell, are distinctive characteristics. The fruit of the Boraginaceæ is most diverse, and very important in classification within the family.

Many species, native in Europe, were formerly used for medicine; for example, comfrey (*Symphytum officinale*), borage (*Borago officinalis*), hound's-tongue (*Cynoglossum officinale*), lungwort (*Pulmonaria officinalis*), viper's bugloss (*Echium vulgare*), bugloss (*Anchusa officinalis*), gromwell (*Lithospermum officinale*), and heliotrope (*Heliotropium europæum*). *Tournefortia umbellata* was used in Mexico as a febrifuge. The roots of alkanet (*Alkanna tinctoria*) of South Europe and Asia contain a red dye of commercial importance. The roots of some species of *Anchusa*, *Onosma*, *Lithospermum* and *Arnebia* also contain a red pigment. The wood of some species of *Cordia* is of value, as are also its bast fibers. The wood of several species of *Ehretia* is valuable, and the fruit is edible.

About 30 genera are in cultivation in N. America, mostly as hardy ornamental border plants. Among these are: *Arnebia* (Prophet's Flower, Arabian Primrose); *Anchusa* (Alkanet, not the real); *Borago* (Borage), used as a pot-herb or bee-plant; *Cerinthe* (Honeywort); *Cynoglossum* (Hound's-tongue); *Echium* (Viper's Bugloss); *Lithospermum* (Gromwell, Puccoon, Indian Paint); *Myosotidium* (Giant Forget-me-not); *Myosotis* (Forget-me-not); *Mertensia* (Virginian Cowslip, Virginian Lungwort); *Omphalodes* (Navelwort, Creeping Forget-me-not); *Onosma* (Golden Drops); *Onosmodium*

(False Gromwell); *Pulmonaria* (Lungwort, Bethlehem Sage); and *Symphytum* (Comfrey).

**194. Verbenaceæ** (from the genus *Verbena*, the Latin name for any sacred herb; application obscure). VERVAIN FAMILY. Fig. 51. Herbs, shrubs, or trees; leaves opposite, rarely whorled or alternate, simple or compound; flowers bisexual, rarely regular, usually oblique or 2-lipped; calyx 4-5-, rarely 6-8-, toothed; corolla 4-5-lobed gamopetalous, hypogynous, lobes imbricated; stamens 4, didynamous, rarely 5 or 2, epipetalous, hypogynous; disk present; ovary superior, of 2, rarely of 4 or 5, carpels, 2-5-celled, but by false partitions 4-10-celled, entire or 2-4-lobed; ovule usually solitary in each cell; style 1; stigma usually 1; fruit a drupe or berry, often separating into drupelets.

Verbenaceæ has 67 genera and about 750 species, mainly of tropical and subtropical distribution. Eleven species reach the northeastern United States. *Lippia* is the largest genus with 100 species; *Clerodendron* has 90 species, and *Verbena* 80 species. The family is closely related to the Labiata and not clearly distinct from that family. The predominatingly terminal style, and not deeply lobed ovary are the only differentiating characters.

Many species have been used in medicine: *Verbena hastata* as bitters; species of *Lippia* as tonics; *Ægiphila salutaris* as a purge and remedy for snake-bites. Species of *Clerodendron* have very sweet-scented flowers. They

51. BORAGINACEÆ: 1. *Borago*, pistil. 2. *Symphytum*, flower. 3. *Cynoglossum*, fruit. 4. *Omphalodes*, fruit. VERBENACEÆ: 5. *Verbena*, flower. 6. *Lantana*, floral diagram. LABIATÆ: 7. *Mentha*, flower. 8. *Thymus*, pistil. 9. *Salvia*, flower. 10. *Lamium*, floral diagram. NOLANACEÆ: 11. *Nolana*, a, flower; b and c, pistils of different species.

are used as purges, diuretics, and for liver, stomach, and lung complaints. *Lippia citriodora* yields a fragrant substance used in flavoring cream, and other foods. Several species have been used as tea in America. *Duranta Ellisia* and species of *Lantana* have edible fruit. *Verbena officinalis* of Europe is a tonic, but more famous for its use in witchcraft. It was celebrated among the Romans and Druids of Gaul and used by them in religious ceremonies. The very valuable teak-

wood is obtained from *Tectona grandis* of farther India and the East Indies. The white mangrove trees of Brazil belong to various species of the tribe Avicenniæ.

A score of genera are in cultivation in North America. Among these are: *Amsonia*, a greenhouse shrub; *Calli-carpa*, greenhouse or hardy shrubs; *Caryopteris*, a shrub, not hardy; *Clerodendron* (Turk's Turban), greenhouse or hardy; *Duranta* (Golden Dewdrop), cultivated in the South; *Lantana*, greenhouse or bedding herbs or shrubs; *Lippia* (Lemon Verbena), greenhouse or hardy shrubs or herbs; *Petræa* (Purple Wreath), greenhouse climber; *Verbena*, bedding or greenhouse herbs; *Vitex* (Chaste Tree, Hemp Tree, Monk's Pepper Tree), semi-hardy shrubs or trees.

195. **Labiata** (the name refers to the 2-lipped [bilabiate] character of the corolla of most species). MINT FAMILY. Fig. 51. Herbs or shrubs, commonly with a four-angled stem, and usually containing a fragrant oil: leaves opposite or whorled: flowers bisexual, very rarely unisexual, irregular, rarely regular, usually bilabiate; calyx 5-toothed or cleft, regular or 2-lipped; corolla 5-lobed, rarely 4-lobed, gamopetalous and hypogynous, 1 lip sometimes obsolete, the lobes imbricated; stamens 4, didynamous, or only 2, epipetalous; hypogynous disk well developed, thick, entire or lobed; ovary superior, of 2 carpels, deeply 4-lobed, 4-celled, each cell 1-ovuled; style basal or sub-basal; stigmas 2: fruit of 4 1-seeded nutlets; the ectocarp rarely fleshy.

One hundred and fifty-seven genera and about 2,800 species are distributed over the whole earth, but are especially abundant in the Mediterranean region and the orient; they are also abundant in the mountains of the subtropics. The larger genera are *Salvia*, 500 species; *Hyptis*, 300 species; *Stachys*, 180–200 species; *Scutellaria*, 180 species; *Nepeta*, 150 species; *Satureia*, 130 species; and *Teucrium*, 100 species. The family is related to the Verbenaceæ and to the Boraginaceæ, also to the Scrophulariaceæ and Acanthaceæ. The 4-angled stem, fragrant oil, 4-lobed ovary, the solitary ovules, and the basal style are distinctive. This is a difficult family for the student. The characters for separating the genera reside mostly in the calyx, corolla and stamens. The nutlets are less important in classification than in the Boraginaceæ.

Owing to the volatile oil and bitter principles, the Labiata are of more than usual economic importance: *Scutellaria lateriflora* (skullcap), tonic, nervine; *Salvia officinalis* (garden sage), tonic, also used as a condiment; *Marrubium vulgare* (hoarhound), tonic, antelmintic, and expectorant; *Hedeoma pulegioides* (American pennyroyal), carminative and stimulant; *Mentha spicata* (spearmint) and *Mentha piperita* (peppermint), carminative; *Mentha Pulegium* (European pennyroyal), carminative; mints are also used as condiments. The following oils are from Labiata: Oil of thyme (*Thymus Serpyllum*); rosemary (*Rosmarinus officinalis*); Lavender (*Lavandula officinalis*); spike (*Lavandula Spica*); origanum (*Origanum Majorana*). Catnip (*Nepeta Cataria*) is a family sudorific. Mother-wort (*Leonurus Cardiacus*) is a family stimulant and bitters. The leaves of lavender and patchouli (*Pogostemon Patchouli*) are used to keep insects from woollens, furs, and the like. Many other species have been used locally for various purposes.

Fifty or more genera are in cultivation in North America. Most of these are garden annuals or hardy perennials cultivated for the flavor or odor, for ornamental purposes, or for medicine. Among these are: *Acanthomintha* (Thorny Mint); *Ajuga* (Bugle Weed); *Cedronella* (Balm of Gilead); *Coleus*; *Collinsonia* (Horse-balm, Horse-weed, Stonewort); *Cunila* (Maryland Ditany); *Hedeoma* (American Pennyroyal); *Hyssopus* (Hyssop), hardy shrub; *Lamium* (Dead Nettle); *Lavandula* (Lavender); *Leonotis* (Lion's Ear, Lion's Tail); *Lophanthus* (Giant Hyssop); *Marrubium* (Hore-

hound); *Melissa* (Balm); *Mentha* (Mint, Spearmint, Peppermint, Japanese Mint, Bergamot Mint, Black Mint, White Mint, European Pennyroyal); *Micromeria* (*Yerba Buena*); *Moluccella* (Shell Flower, Molucca Balm); *Monarda* (Horsemint, Oswego Tea, Bee-balm, Fragrant Balm, Wild Bergamot); *Nepeta* (Catnip, Ground Ivy, Gill-run-over-the-ground); *Ocimum* (Basil); *Origanum* (Marjoram); *Phlomis* (Jerusalem Sage); *Physostegia* (False Dragonhead, Obedient Plant); *Plectranthus* (Cockle-spur Flower); *Pogostemon* (Patchouli Plant); *Prunella* or *Brunella* (Self-heal, Heal-all); *Pycnanthemum* (Mountain Mint); *Rosmarinus* (Rosemary, Old Man); *Salvia* (Sage, Clary, Scarlet Sage); *Satureia* (Savory); *Scutellaria* (Skull-cap); *Stachys* (Woundwort, Choro-gi, Chinese or Japanese Artichoke, Knot-root, Betony); *Teucrium* (Germander); *Thymus* (Thyme, Mother-of-Thyme); *Trichostema* (Blue Curls, Bastard Pennyroyal, Ramero); *Westringia* (Victorian Rosemary).

196. **Nolanaceæ** (from the genus *Nolana*, derived from *nola*, a little bell, in reference to the corolla). NOLANA FAMILY. Fig. 51. Herbs or small shrubs: leaves alternate, or opposite: flowers bisexual, regular; calyx 5-cleft; corolla 5-lobed, gamopetalous, hypogynous, plicate in the bud; stamens 5, slightly epipetalous, alternating with the lobes of the corolla; hypogynous disk well developed, often lobed; ovary superior, typically of 5 carpels, radially lobed, or both radially and transversely lobed, lobes 5–30, in fruit forming 5–30 nutlets which are each 1–7-seeded, or sometimes both radially and transversely lobed.

There occur 3 genera and 50 species, confined to the west coast of South America. Many species are maritime. The family is related to the Convolvulaceæ, also to the Boraginaceæ and Solanaceæ. The plicate corolla and very peculiarly lobed ovary derived from 5 carpels are distinctive.

A few species of *Nolana*, all prostrate plants, are cultivated in this country for ornamental purposes.

197. **Solanaceæ** (from the genus *Solanum*, the significance unknown). NIGHTSHADE FAMILY. Fig. 52. Herbs, erect or climbing shrubs, or small trees: leaves usually alternate: flowers bisexual, rarely unisexual, regular, rarely irregular; calyx 5-cleft; corolla 5-lobed, gamopetalous, hypogynous, usually plicate in the bud, the folds twisted to right or left, rarely the tips of the folds valvate or imbricated; stamens 5, epipetalous, alternating with the corolla-lobes; hypogynous disk present; ovary superior, 2-celled, rarely falsely 1-, or more, celled; ovules in each cell 1 to many; style 1; stigmas 1–2: fruit a berry or capsule.

About 70 genera and 1,600 species, 900 of which belong to *Solanum*, are distributed in the tropical and warm temperate regions, the greatest number being in Central and South America. The family is related to the Scrophulariaceæ, Convolvulaceæ and Nolanaceæ. The regular, plaited corolla, and usually numerous seeds are important distinguishing characteristics. *Datura* has a prickly fruit. The calyx of *Physalis* is accrescent and inflated, surrounds the fruit, and is often colored.

Many Solanaceæ contain narcotic or poisonous alkaloids and are used in medicine. Belladonna (alkaloid atropine) is obtained from the roots of *Atropa Belladonna*; it was formerly used by women to dilate the pupils of the eye, hence the specific name. The leaves and flowers of *Datura Stramonium* (Jimson weed) constitute the stramonium of medicine (alkaloid daturine). Stramonium seeds were formerly used by magicians to produce fantastic visions, and by thieves to stupefy their victims. Henbane (alkaloid hyoscyamine) consists of the leaves and tops of *Hyoscyamus niger* and is narcotic. Mandragora is similar in effect to belladonna. It was used by sorcerers to produce hallucinations in their victims. *Scopolia carniolica* and *Solanum carolinense* (horse-nettle) have been used in medicine. The remedy, pichi, con-

sists of the dried twigs of *Fabiana imbricata* of Chile. European bittersweet (*S. Dulcamara*) has been used as medicine; it is poisonous. Black nightshade (*S. nigrum*) and others are poisonous. Tobacco is the dried leaves of *Nicotiana Tabacum*. Winter cherry (*Physalis Alkekengi*) is diuretic. Chilli is a name for the fruits of *Capsicum annuum* of South America. Cayenne pepper is the fruit of various species of *Capsicum*. Tomato, or love apple, is the fruit of *Lycopersicum esculentum* (= *Solanum Lycopersicum*). Species of nightshade, when cooked, are eaten as greens. Eggplant is the fruit of *S. Melongena* of Asia. Potatoes are the tubers of *S. tuberosum* of Peru and Chile.

About 30 genera are cultivated in North America as ornamental plants or for food. Among these are: *Atropa* (Belladonna); *Capsicum* (Red or Cayenne Pepper); *Cestrum*; *Cyphomandra* (Tree Tomato); *Datura* (Angel's Trumpet, Datura); *Hyoscyamus* (Henbane); *Lycium* (Matrimony Vine, Box Thorn); *Lycopersicum* (Tomato), [Engler and Prantl unite this with *Solanum*]; *Mandragora* (Mandrake of history); *Nicotiana* (*Nicotina*, Tobacco); *Nicandra* (Apple of Peru); *Nierembergia* (Cup-flower, White Cup); *Petunia*; *Physalis* (Ground Cherry, Strawberry Tomato, Alkekengi, Bladder Cherry, Cape Gooseberry, Chinese Lantern Plant); *Salpiglossis*; *Schizanthus* (Butterfly Flower, Poor man's Orchid); *Streptosolen*; *Solandra*; and *Solanum* (Nightshade, Potato, Pepino, Melon Pear, Melon Shrub, Eggplant, Guinea Squash, Aubergine, Jerusalem Cherry, Potato Vine, Bittersweet).

198. **Scrophulariaceæ** (from the genus *Scrophularia*, a reputed remedy for scrofula). FIGWORT FAMILY. Fig. 52. Herbs, shrubs, or small trees: leaves alternate, opposite or whorled; flowers bisexual, regular or commonly irregular, often bilabiate, in which case the throat is often closed by a palate; calyx 5-cleft; corolla 5-lobed, gamopetalous, hypogynous, rarely spurred at the base, imbricated; fertile stamens rarely 5, usually 4 and didynamous, rarely 2; sterile often present as stamodia; epipetalous; hypogynous disk annular or unilateral; ovary superior, 2-celled; ovules many; style 1; stigmas 1-2: fruit generally a capsule, rarely a berry.

Scrophulariaceæ is a family of 179 genera and about 2,500 species, distributed very generally over the whole earth. A few are aquatic and have finely divided leaves. Some are half-parasites on the roots of other plants. A few are total parasites without chlorophyll. The largest genera are *Verbascum* containing 160 species, *Calceolaria* with 134 species, *Veronica* with 200 species, and *Pedicularis* with 250 species. The family is related to the Solanaceæ, to the Orobanchaceæ and Gesneriaceæ. The non-plicate imbricated usually irregular corolla, reduced number of stamens, and 2-celled, many-ovuled ovary, are distinctive characters.

The economic uses of the Scrophulariaceæ are medicinal and ornamental. *Veronica officinalis* has been used as a tonic and an astringent. *Veronica Beccabunga* has been used for scurvy. *Scrophularia nodosa* was a remedy for fevers. *Antirrhinum* was used as a diuretic. *Euphrasia officinalis* was used in ophthalmia, and hence the name "eye-bright." *Gratiola officinalis* (poor man's herb) is a violent purgative. *Digitalis purpurea* is the most valuable medicinal plant in the family. It is poisonous, and a well-known diuretic and sedative-narcotic. The tropical *Scoparia dulcis* is a febrifuge. *Veronica virginica* (Culver's root), *Verbascum Thapsus*, *Linaria vulgaris*, and *Chelone glabra* have also been used in medicine. The snapdragon and foxglove are well-known garden plants of this family.

Because of the showy flowers, 30 to 40 genera are in cultivation in N. America for ornamental purposes. Among these are: *Antirrhinum* (Snapdragon), garden and greenhouse; *Calceolaria*, greenhouse plants, mostly from South America; *Castilleja* (Painted Cup), garden plants; *Chelone* (Turtlehead), hardy garden

plants; *Collinsia*, garden annuals; *Digitalis* (Foxglove), hardy garden plants; *Erinus*, hardy; *Gerardia*, hardy; *Gratiola*, hardy; *Halleria* (African Honey-suckle), cultivated in the southern borders; *Linaria* (Butter-and-Eggs, Kenilworth Ivy, Mother-of-Thousands, Toad-flax), hardy and greenhouse; *Mimulus* (Monkey Flower, Musk Plant), garden annuals or hardy; *Paulownia*, semi-hardy tree; *Pedicularis* (Lousewort, Wood Betony), hardy; *Pentstemon* (Beard Tongue, Pentstemon), hardy; *Phygelia* (Cape Fuchsia), mostly greenhouse; *Rhodochiton* (Purple Bells), vine, garden annual; *Russelia*, greenhouse; *Scrophularia* (Figwort), hardy; *Tetranema* (Mexican Foxglove), greenhouse; *Torenia*, garden; *Verbascum* (Mullein), hardy; *Veronica* (Speedwell, Culver's Root, Fluellen, Ground Hele, Angel's Eyes, Bird's Eyes), garden, mostly hardy or annual.

199. **Bignoniaceæ** (from the genus *Bignonia*, named for the Abbe Jean Paul Bignon, court librarian at Paris,

52. SOLANACEÆ: 1. *Solanum*, a, flower; b, floral diagram. 2. *Nicotiana*, flower. SCROPHULARIACEÆ: 3. *Verbascum*, flower. 4. *Antirrhinum*, a, flower; b, floral diagram. 5. *Scrophularia*, flower. BIGNONIACEÆ: 6. *Campsis*, a, flower; b, floral diagram; c, fruit and seeds. PEDALIACEÆ: 7. *Sesamum*, floral diagram.

and a friend of the botanist Tournefort). BIGNONIA FAMILY. Fig. 52. Woody plants, rarely herbs, usually climbing or twining in the tropical forests: leaves opposite, rarely alternate, usually compound; flowers bisexual, more or less irregular, scarcely bilabiate; calyx 5-cleft, rarely bilabiate or spathe-like, sometimes with appendages; corolla 5-lobed, gamopetalous, hypogynous, imbricated; stamens 4, didynamous, or only 2, the others staminodial, epipetalous; anthers various; hypogynous disk present; ovary superior, 2-celled, rarely 1-celled; many-ovuled; style 1; stigmas 2: fruit a woody capsule; seeds usually winged and very compressed; endosperm 0.

The family contains 100 genera and from 500-600 species, principally natives of the tropics; these are most abundant in America. Three species reach the northeastern United States, from New Jersey and Ohio southward. The largest genus is *Tabebuia* with

80 species. The family is related to the Scrophulariaceae; but the peculiar fruit with winged seeds and the absence of endosperm are distinctive. The climbing species may or may not have foliar tendrils. These, when present, terminate in adherent disks. The woody, tropical, climbing Bignoniaceae are famed for the peculiar cambium growth which produces secondary thickening of such a nature as to give to the cross-section very odd and very diverse patterns, some of which are almost geometrical in their regularity. The wood in these patterns may be either divided into four wedges at right angles to each other, or four wedges may be superimposed on a smaller circle of wood, or the wedges may be divided toward the periphery into peculiar finger-like portions, or there may be concentric rings of wood.

Catalpa and Tecoma have been used in medicine but are not officinal. Caraboa (*Jacaranda Copaia*) contains an aromatic resin of the odor of coumarin. Many are ornamental plants with large, handsome flowers.

About 20 genera are in cultivation in North America, all as ornamental plants. Among these are: Bignonia (Trumpet Flower, Cross Vine, Quarter Vine), mostly greenhouse climbers; Catalpa, semi-hardy or hardy trees; Chilopsis (Desert Willow, Flowering Willow, Mimbrés) cultivated in the South; Crescentia (Calabash Tree), cultivated South. Others are Campsis (Trumpet Creeper, T. Vine, T. Honeysuckle); Tecoma (Yellow Elder); Pandorea (Wonga-Wonga Vine; Bower Plant of Australia); Tecomaria (Cape Honeysuckle, climbing or erect shrubs or trees, cultivated mostly in the South, only one of which is fully hardy North).

200. **Pedaliaceae** (from the genus *Pedaliu*m, signifying a rudder, in reference to the winged angles of the fruit). **PEDALIUM FAMILY.** Fig. 52. Herbs, rarely shrubs, covered with peculiar slime-secreting glands: leaves opposite, or alternate above: flowers bisexual, irregular; calyx 5-cleft; corolla 5-lobed, gamopetalous, more or less curved but indistinctly if at all 2-lipped; stamens 4, didynamous, often with an extra staminodium, subepipetalous; hypogynous disk inequilateral; ovary superior or rarely inferior, 2-4-celled or falsely 1-celled; style 1; stigmas 2-4: fruit a capsule, or a hard indehiscent structure which is often covered with stiff or hooked spines or wings; seeds 1 to several, attached to central placenta.

In this family are 14 genera and about 50 species, of tropical and subtropical regions of Africa, Arabia, farther India, Ceylon, Australia, and East Indies. They are mostly strand or xerophytic plants. The family is most closely related to the Scrophulariaceae, and to the Martyniaceae, with which latter family it is often united. The peculiar slime-glands, the queer fruit, and the axial seeds are important characters.

The seeds of *Sesamum indicum* yield an oil called benne oil or oil of sesame, which is used as food after the manner of olive oil. The oil is also used as a cosmetic and as a medicine. This plant has been cultivated for ages in the orient, and is now cultivated in other lands, the oil being used in the manufacture of soap. *Harpagophytum procumbens* is the famous grapple-plant of South Africa, the fruits of which are difficult to separate from wool and clothing. The fruits of several species of *Uncarina* are almost as bad. A mucilaginous medicinal drink is made from the leaves of *Pedaliu*m *Murex* in India. These leaves are also used to thicken milk, to which they give a rich appearance.

The genera in cultivation in N. America are: *Ceratotheca*, ornamental greenhouse plants, and grown in Florida, with indistinctly hooked capsules; *Sesamum*, grown for oil, medicine, or ornament, outdoor annual, capsule not hooked.

201. **Martyniaceae** (from the genus *Martynia*, in honor of Prof. John Martyn of Cambridge, England).

**MARTYNIA FAMILY.** Fig. 53. Annual or perennial, glandular-hairy herbs: leaves opposite, or alternate: flowers bisexual, irregular, but not bilabiate; calyx 5-cleft; corolla 5-lobed, gamopetalous, hypogynous; stamens 4, didynamous, rarely 2, the others staminodial, epipetalous, alternating with the corolla-lobes; hypogynous disk present, regular; ovary superior, of 2 carpels but

53. **MARTYNIACEAE:** 1. *Martynia*, a, flower; b, floral diagram; c, fruit. **GESNERIACEAE:** 2. *Gesneria*, flower. 3. *Achimenes*, floral diagram. **LENTIBULARIACEAE:** 4. *Utricularia*, a, part of leaf with bladder; b, flower; c, floral diagram. **GLOBULARIACEAE:** 5. *Globularia*, flower. 6. *Cockburnia*, vertical section ovary.

1-celled; placenta parietal; ovules several; style 1; stigmas 2: fruit a more or less long, curved, beaked capsule, with a fleshy pericarp, becoming falsely 4-celled.

About 3 genera and 10 species inhabit tropical and subtropical America. One species reaches southern Indiana. The family is closely related to the Pedaliaceae, with which it has generally been united. The horned fruit, 1-celled ovary, parietal placenta and less slimy pubescence, are distinctive characters.

The turnip-like root of *Craniolaria annua*, known in South America as escorzonera, is cooked with sugar or eaten as a vegetable. The fruits of *Martynia* (or *Proboscidea*) *louisiana* (*M. proboscidea*) are sometimes used as pickles.

One genus is in cultivation in this country, namely *Martynia* (Unicorn Plant, Proboscis Flower), of which 3 or 4 species are grown. The *Craniolarias* of the trade seem to be *Martynias*.

202. **Gesneriaceae** (from the genus *Gesneria*, named after the early botanist Conrad Gesner of Zurich). **GESNERIA FAMILY.** Fig. 53. Herbs, rarely shrubs or small trees, sometimes climbing: leaves usually opposite or whorled, simple: flowers bisexual, irregular, often bilabiate; calyx 5-parted; corolla 5-lobed, gamopetalous, hypogynous, often gibbous below, imbricated; stamens rarely 5, usually 4 and didynamous, rarely 2, the sterile usually present as staminodia, epipetalous; hypogynous disk present, diverse; ovary superior or inferior, of 2 carpels but 1-celled with 2 parietal placenta, often falsely 2-4-celled; ovules numerous; style 1; stigmas 1-2: fruit fleshy with pulpy placenta, or capsular, or silique-like with twisted valves.

Eighty-four genera and about 500 species are widely distributed in the tropics and subtropics of both hemispheres. The largest genera are *Cyrtandra* containing 180 species and *Rottlera* with about 100 species. The family is related to the *Scrophulariaceae*, *Orobanchaceae* and *Bignoniaceae*. The 1-celled ovary without winged seeds, and the non-parasitic habit are distinctive.

The only economic plants in the family are the ornamental, of which there are many. The flowers throughout the family are uncommonly large and showy.

Twenty or more genera are in cultivation in N. America. Among these are the following, all of greenhouse culture: *Agalmyla*, climbers; *Episcia*; *Gesneria*; *Isoloma* (*Kohleria*); *Nagelia* (*Smithiantha*); *Saintpaulia* (*Usambara Violet*; *African Violet*); *Sinningia*, including the *Gloxinias*; *Streptocarpus* (*Cape Primrose*); *Trichosporum* (or *Æschynanthus*), trailing or drooping.

203. **Lentibulariaceae** (from the old generic name *Lentibularia*, said to mean *lens*, + *a small pipe*, significance obscure). **BLADDERWORT FAMILY.** Fig. 53. Aquatic or marsh herbs, or epiphytes: leaves alternate, rarely whorled, very diverse; sometimes finely dissected, or peltate, or oval, or lanceolate; sometimes of two very distinct kinds; usually with very small scattered bladder-like lobes consisting of a complicated trap-like mechanism for catching tiny swimming organisms, or with the whole upper surface of the undivided leaf very glutinous so that insects stick fast to it; either all basal or all cauline, or both: flowers bisexual, irregular; calyx 2-5-cleft, persistent; corolla 5-lobed, more or less 2-lipped and with a spur or sack at the base; upper lip 2-lobed; lower 3-lobed, often with a palate in the throat; stamens 2, epipetalous; ovary superior, of 2 carpels but 1-celled; placenta free-central; style 1; stigmas 2; fruit a capsule.

Belonging to this family are 5 genera and about 300 species, of which at least 200 belong to *Utricularia*; they are distributed in all parts of the globe but are more numerous in the tropics. One fossil species is known. The family is related to the *Scrophulariaceae*. The irregular corolla, 2 stamens, and 1-celled ovary with central placenta, are important characters. This is a most interesting family of insectivorous plants; with the exception of *Pinguicula*, they are adapted to catch organisms that swim in the water of ponds, or, in case of the epiphytes, in the rain-water in the cracks and crevices of the host plant.

*Utricularias* were formerly used locally as medicine. The secretion of the leaves of *Pinguicula* contains a pepsin-like digestive ferment. The Lapps use these leaves to curdle the reindeer milk, hence the common name, butterwort. Danish peasant girls are said to use the juice as a hair-pomade. Another account says, "Pinguicula leaves, whether fresh or dry, are used by the Lapps to thicken fresh still-warm milk, which neither curdles nor gives cream thereafter, but forms a delicious compact tenacious mass, a small portion of which will act similarly on another quantity of fresh milk."

Two genera are in cultivation in N. America for their peculiar habit and curious orchid-like flowers, which are often very showy: *Pinguicula* (*Butterwort*); and *Utricularia* (*Bladderwort*), mostly epiphytic.

204. **Globulariaceae** (from the genus *Globularia*, so named because the flowers are borne in heads). **GLOBULARIA FAMILY.** Fig. 54. Shrubs or herbs: leaves alternate, simple: flowers bisexual, bilabiate, borne in involucrate heads on a chaffy receptacle; calyx mostly 5-parted, bilabiate or regular; corolla 5-lobed, gamopetalous, hypogynous, upper lip sometimes obsolete; the lobes imbricated; stamens 4, didynamous, epipetalous; anthers exserted, by constriction often falsely 4-celled; hypogynous disk usually reduced to a gland on one side; ovary superior, 1-celled; ovule solitary; style

1; stigmas 1-2; fruit a nutlet inclosed in the persistent calyx.

The 3 genera and 20 species are confined to the Mediterranean region. Seventeen species belong to the genus *Globularia*. The family is related to the *Scrophulariaceae*, but is distinguished by the solitary ovule and 1-celled ovary. *Globularias* are easily mistaken for *Scabiosas*, because of the involucrate heads and exserted stamens.

Some species are locally used as remedies.

A few species of *Globularia* are in cultivation in this country; two are hardy, and a third is a greenhouse plant.

205. **Acanthaceae** (from the genus *Acanthus*, derived from the Greek, *a spine*; some of the plants are spiny). **ACANTHUS FAMILY.** Fig. 54. Herbs, or rarely shrubs or trees: leaves opposite, rarely whorled; flowers bisexual, irregular, usually bilabiate; calyx 5-cleft; corolla 5-lobed, gamopetalous, hypogynous, the lobes imbricated; stamens usually 4, didynamous, rarely 2, sometimes a staminodium present, epipetalous; hypogynous disk present, mostly small; ovary superior, 2-celled, each cell 2-4-, rarely many-, ovuled; style 1; stigmas 1-2, one lobe often small or wanting; fruit a capsule; seeds exalbuminous, aided in distribution by peculiar outgrowths of the funiculus.

*Acanthaceae* has 173 genera and about 1,500 species, of tropical distribution. Few species extend into the Mediterranean region and into the United States. Six species are found in the northeastern United States. Two hundred species belong to the genus *Ruellia*, and 250 to *Justicia*. The family is related to the *Bignoniaceae*, and to the *Scrophulariaceae*, as well as to the other

54. **ACANTHACEAE:** 1. *Ruellia*, flower. 2. *Justicia*, opened fruit. **MYOPORACEAE:** 3. *Myoporium*, a, flower; b, vertical section ovary. **PHRYMACEAE:** 4. *Phryma*, a, flower; b, fruiting calyx. **PLANTAGINACEAE:** 5. *Plantago*, a, flower; b, vertical section ovary; c, fruit.

families of this group. The 2-celled ovary with 2-4 ovules and the queer outgrowths of the funiculus are distinctive.

Many species are used in the tropics for medicine; for example, *Asteracantha longifolia*, a purge and sudorific; *Justicia Gendarussa*, astringent, used in India for rheumatism, and the leaves sprinkled in clothing to keep insects away; *Justicia pectoralis*, used for lung troubles. The young flowers of *Blepharis edulis* and *Asystasia gangetica* are eaten as vegetables. *Ruellia ciliosa* of the United States has recently been sold spuriously as *Spigelia* (pink root).

Twenty to 30 genera are in cultivation in N. America, except in a few cases, as ornamental greenhouse plants. Among these are: *Acanthus* (*Bear's Breech*), hardy

herbs; Adhatoda, shrubs; Aphelandra, shrubs; Crossandra, shrub; Fittonia, herbs; Graptophyllum (Caricature Plant), shrubs; Jacobinia, herbs; Justicia, referred to other genera; Peristrophe; Ruellia, herbs or shrubs; Strobilanthes, often used also for bedding

206. **Myoporaceæ** (from the genus *Myoporum*, signifying to *shut a pore*, in reference to the spots in the leaves which are closed by a membrane). **MYOPORUM FAMILY.** Fig. 54. Shrubs or trees: leaves alternate, rarely opposite, usually glandular or woolly; flowers bisexual, regular or irregular; calyx 5-cleft, persistent; corolla 5-lobed, gamopetalous, hypogynous; stamens 4, didynamous, the fifth a staminodium, epipetalous; ovary superior, 2-celled or falsely 3-10-celled; usually 1-2, rarely 8, ovules in each cell; style 1; stigmas 1-2: fruit drupaceous.

There are 5 genera and about 90 species, of which 57 belong to Pholidia and 25 to Myoporum. They are mainly natives of Australia, but scattered species occur in the West Indies, Japan, China, Hawaiian Islands, and elsewhere. The family is related to the Scrophulariaceæ and to the Verbenaceæ. The few ovules, the presence of oil-glands and the pendulous seeds are distinctive.

*Myoporum platycarpum* is the sandal-tree or sugar-tree or dogwood of Australia. From it, a kind of manna is secreted; also a resin that is used like sealing-wax.

Two species of Myoporum are grown as ornamental plants in this country.

55. RUBIACEÆ: 1. *Galium*, a, flower; b, fruit. 2. *Houstonia*, flower. 3. *Bouvardia*, floral diagram. CAPRIFOLIACEÆ: 4. *Lonicera*, flower. VALERIANACEÆ: 5. *Valeriana*, flower.

207. **Phrymaceæ** (from the genus *Phryma*, a name of unknown derivation). **LOPSEED FAMILY.** Fig. 54. Perennial herbs: leaves opposite, simple; flowers bisexual, bilabiate; calyx 5-cleft, 2-lipped; corolla 5-lobed, 2-lipped, gamopetalous, hypogynous; stamens 4, didynamous, included, epipetalous; ovary superior, 1-celled; ovule 1, sub-basal, straight (orthotropous); style 1; stigmas 2: fruit dry, indehiscent, inclosed in the abruptly reflexed calyx, the teeth of which are hooked.

A single genus and species occurs in the eastern United States and East Asia. The family is related to the Verbenaceæ and was formerly united with that family; but the peculiar, 1-seeded fruit, with a straight orthotropous seed is distinctive.

*Phryma leptostachya* (lopseed) has been in the trade as an ornamental garden plant.

#### Order 51. PLANTAGINALES

208. **Plantaginaceæ** (from the genus *Plantago*, the Latin name of the plant). **PLANTAIN FAMILY.** Fig. 54. Annual or perennial herbs: leaves alternate or opposite; flowers bisexual, or rarely unisexual, regular; calyx 4-cleft; corolla 4-lobed, gamopetalous, hypogynous, scarious, imbricated; stamens 4, epipetalous or hypogynous, exerted, alternate with the corolla-lobes; ovary superior, 1-2-celled, rarely 4-celled; ovules 1 to many in each cell; style and stigma 1: fruit a circumscissile cap-

sule, or an indehiscent nutlet, invested by the persistent calyx; seeds usually peltate.

Three genera and about 200 species, of which all but 3 belong to the genus *Plantago*, are distributed over the whole earth. The centers of distribution are the Mediterranean region and the Andes. This is a very distinct gamopetalous family of doubtful relationship, possibly allied to the Labiate.

Many European species were formerly used in medicine; the seeds as mucilaginous emollients in inflammatory ophthalmia, and the like; the leaves as bitters. The seeds are used in India to stiffen muslins. *Plantago lanceolata*, *P. Coronopus* and *P. major* are eaten as greens. The seeds of several species are sold for feeding birds. *P. lanceolata* is used for early pasturage.

The family is not cultivated in N. America, except possibly for bird-seed, pasturage, or pond-border planting.

#### Order 52. RUBIALES

209. **Rubiaceæ** (from the genus *Rubia*, signifying red, from the color of the roots of some species). **MADDER FAMILY.** Fig. 55. Trees, shrubs or herbs: leaves opposite or whorled, simple, usually entire; flowers bisexual, rarely unisexual, regular, rarely slightly irregular; calyx 2-6-cleft, or 0; corolla gamopetalous, 4-6-lobed, mostly valvate; stamens 4-6, epipetalous; ovary inferior, 1 to many-, commonly 2-, celled; ovules 1 to many in each cell; style 1; stigma 1, capitate or several-branched: fruit a capsule, berry, or drupe.

Rubiaceæ is a family of 343 genera and about 4,500 species, mainly tropical; about 34 species reach the northeastern United States. The family is closely related to the Caprifoliaceæ, but usually has stipules or whorled leaves; it is also related to the Cornaceæ, Valerianaceæ, Compositæ, and the like.

A number of tropical Rubiaceæ are myrmecophilous, i. e., provide a dwelling-place for protective ants. The whorled leaves of some species have probably been developed from stipules.

This is an important economic family. *Coffea arabica* (Abyssinia coffee) is generally cultivated in the tropics and used elsewhere as a beverage. *Cinchona Ledgeriana* and *C. succirubra* of the Andes furnish quinine. *Uragoga* (*Caphelis*) *Ipecacuanha* of Brazil is the source of the emetic ipecac. *Cephalanthus* of North America, and several species of *Galium* have been used in medicine. *Rubia tinctoria* (Mediterranean) furnishes the red dye, madder. Roots of *Asperula* and some species of *Galium* yield red dyes. *Morinda citrifolia* (tropics) yields a yellow dye, morindin. *Orouparia Gambir* (Malay) yields the dye known as catechu, gambir, or terra japonica. The foliage of *Asperula odorata* has the fragrance of sweet grass, and is used for a similar purpose, and for flavoring wines. *Galium triflorum* has a similar odor. *Galium verum*, the yellow bedstraw (Europe) contains a milk-curdling ferment, hence the name, "galium;" also formerly given to women to increase lactation. Berries of *Mitchella* contain a saponin-like substance. The fruits of *Vangueria edulis* and several other species of Rubiaceæ are edible. The wood of many species is valuable.

Forty to 50 genera and a great many species are in cultivation in N. America, mostly in the greenhouse and in tropical horticulture. Among these are Indian Mulberry (*Morinda*); Cape Jasmine (*Gardenia*); Bluets (*Houstonia*); Manettia Vine (*Manettia*); Madder (*Rubia*); Buttonbush (*Cephalanthus*, hardy); Bedstraw or Cleavers (*Galium*); Coffee (*Coffea*); *Cinchona* (*Cinchona*); and Partridge Berry (*Mitchella*).

210. **Caprifoliaceæ** (from the old genus *Caprifolium*, meaning a goat-leaf, possibly in reference to the climbing habit). **HONEYSUCKLE FAMILY.** Fig. 55. Shrubs, very rarely herbs: leaves opposite, simple or pinnate; flowers bisexual, regular or irregular; calyx 4-5-toothed,

or 4-5-fid; corolla gamopetalous, 4-5-lobed, tubular or rotate; stamens of the same number as the corolla-lobes and alternate with them, epipetalous; ovary inferior, 1-5-celled; each cell 1 to many-ovuled; style 1 or obsolete; stigmas 1-5; fruit a berry or capsula.

The 11 genera and about 350 species are distributed principally in the north temperate zone. The tropical species are mostly confined to the mountains. A few species of *Sambucus* and *Viburnum* occur in the southern hemisphere. The family is very closely related to the Rubiaceæ but the leaves are exstipulate; also to the Cornaceæ and Valerianaceæ. Some fossil species have been found.

Many species of Honeysuckle exhale a sweet odor after sunset. The berries of *Lonicera Caprifolium* are said to be diuretic; those of *L. Xylosteum* are laxative. The berries of the European elder (*Sambucus nigra*), and of the American elder (*S. canadensis*) are cooked and eaten and are also made into wine. The dried flowers of elder were formerly used in cases of fever. The roots of the North American *Triosteum perfoliatum* furnish a kind of ipecac. Other species are locally used in medicine. Many are ornamental.

Eight or 10 genera are in cultivation in N. America: *Viburnum* (Sheepberry, Hobble-bush, Wayfaring Tree, Arrowwood, High Cranberry, Snowball Bush); *Sambucus* (Elder); *Triosteum* (Feverwort, Horse Gentian, Wild Ipecac); *Symphoricarpos* (Snowberry, Coral Berry); *Abelia*; *Diervilla* (Weigela, Bush Honeysuckle); *Linnaea* (Twin-flower); *Lonicera* (Bush Honeysuckle); *Honeysuckles*, *Woodbine*, *Trumpet Honeysuckle*.

**211. Valerianaceæ** (from the genus *Valeriana*, a word of uncertain origin). **VALERIAN FAMILY.** Fig. 55. Annual or perennial herbs, often strongly scented; leaves basal and cauline, the latter opposite, simple or pinnate; flowers bisexual or unisexual, regular or irregular, epigynous; calyx of 1-3 minute, but often accrescent, sepals; corolla 5-, rarely 3-4, lobed, gamopetalous, often produced into a spur at the base; lobes imbricated; stamens 1-4, rarely 5, epipetalous, exserted; ovary inferior, 3-celled, only 1 cell maturing; seed 1; style 1; stigmas 3; fruit dry, indehiscent, 1-seeded.

Eight genera and about 280 species are known, mostly in the north temperate regions of the Old World, especially in the region just north of the Mediterranean, and in South America, where the genus *Valeriana* is mostly distributed. The family is related to the Dipsacaceæ and the Caprifoliaceæ, and more remotely to the Compositæ. The epigynous, gamopetalous flower, separate stamens, 3 carpels and 1-seeded fruit are distinctive.

*Valeriana officinalis* is a powerful nerve sedative with a peculiar odor. Many other Valerianaceæ are used as local remedies for the same purpose. The foliage of various species of *Valerianella* (lamb's lettuce, corn salad) is eaten as a salad, less commonly as a pot-herb.

In this country few genera are in cultivation: *Patrinia* as a pot-herb; *Centranthus* (Red Valerian, Jupiter's Beard) and *Valeriana* (Valerian) as ornamental plants; and *Valerianella* (Corn Salad, Fetticus) for food.

**212. Dipsacaceæ** (from the genus *Dipsacus*, derived from the Greek *to thirst*, in allusion to the water-holding leaf-bases). **TEASEL FAMILY.** Fig. 56. Annual or perennial herbs; leaves opposite, rarely whorled; flowers small, bisexual, mostly irregular, epigynous, in dense involucrate heads; each flower also surrounded by a cup-shaped, more or less scarious, involucre, which is a metamorphosed bracteole; calyx of setaceous segments or crown-like, or plumose, or various; corolla 4-5-lobed, gamopetalous, usually irregular; lobes imbricated; stamens 4, rarely 2-3, mostly epipetalous; ovary inferior, 1-celled, 1-ovuled; style 1; stigmas 2; fruit an achene.

The family has 10 genera and about 150 species, all natives of warm-temperate regions of the Old World, and mostly of the eastern Mediterranean region. The

family is related to the Valerianaceæ, and more distantly to the Compositæ. The gamopetalous corolla, 2 carpels, involucrate heads and involucrate flowers are distinctive.

*Dipsacus* and *Scabiosa* have been used in medicine. The spiny hooked bracts of *Dipsacus ferox* (fuller's teasel of southwestern Asia) have been used to full cloth, whence the common name; and the plant was once cultivated extensively for this purpose. The connate leaf-bases of *Dipsacus sylvestris* hold several ounces of rain-water until evaporated. This contrivance

56. **DIPSACACEÆ**: 1. *Dipsacus*, a, flower; b, fruiting head. 2. *Scabiosa*, fruit. **CUCURBITACEÆ**: 3. *Cucurbita*, a, male flower; b, female flower; c, cross-section fruit. **CAMPANULACEÆ**: 4. *Campanula*, flower. 5. *Lobelia*, a, flower; b, floral diagram.

may be of benefit in preventing the ascent of harmful insects.

Four genera are in cultivation in North America: *Cephalaria*, *Morina*, and *Scabiosa* as ornamental plants; *Dipsacus ferox* (*D. fullonum*), locally cultivated in New York state for fulling cloth.

#### Order 53. CAMPANULALES

**213. Cucurbitaceæ** (from the genus *Cucurbita*, the classical name for the gourd). **GOURD FAMILY.** Fig. 56. Herbs, rarely shrubs, climbing, usually with branched tendrils; leaves alternate, more or less rounded; veins palmate; flowers usually unisexual, perigynous, regular; stamens 5, rarely separate, usually connate in 2 pairs and 1 free stamen (thus apparently, stamens 3), or monadelphous, inserted at the summit of the ovary; anthers 2-celled, the cells often queerly curved and contorted; carpels usually 3, rarely more or fewer; ovary inferior, mostly 3-celled, many-ovuled; fruit a dry berry with thick rind and spongy center (Pepo), or juicy with hard rind, very exceptionally dehiscent.

There are 87 genera and about 650 species, widely distributed over the earth but most abundant in the tropics; they are wanting in the cold regions. Several are wild in the eastern United States. The family is related to the Campanulaceæ, possibly also to the Passi-

floraceæ. The tendrils are usually borne singly at the nodes and are thought to be modified axillary branches. The fruits are exceedingly diverse and odd. Some are the largest fruits of the vegetable kingdom, others are very tiny. The gourds are very diverse in shape and color,—club-shaped, globular, or flattened from above, or curiously curved.

The family is of considerable economic importance. The fruits of many are edible; e.g., *Cucurbita Pepo* (pumpkin, summer crookneck squash), *C. maxima* (squash), *C. moschata* (winter crookneck squash), *Cucumis Melo* (muskmelon and other melons), *C. sativa* (cucumber), *Citrullus vulgaris* (watermelon). The gourds are cultivated as curiosities and for the fruit to be used as household utensils, e.g., bottle-gourds and calabash (*Lagenaria*). The leaves, stems, or roots of very many species contain bitter, subresinous substances which render them drastic purgatives. The roots of *Bryonia alba* (bryony) of Europe are highly purgative. The fruits of colocynth (*Citrullus Colocynthis*) of the orient and North Africa furnish a purgative known to the ancients. The fruit of Luffa of India and Arabia is purgative when ripe but edible when green. The outer portion of the fruit of Luffa is very fibrous and reticulated, and, when cleaned, serves as a sponge or dish-cloth in the Antilles (luffa-sponge or Egyptian bath-sponge). The small gourd of *Benincasa hispida* (wax gourd or Chinese watermelon) of tropical Asia is considered an emblem of fertility in India and is presented to newly married couples. *Acanthosicyos* of the South African desert is remarkably erect and spiny, but the small fruit is considered a delicacy. *Elaterium* is a drug obtained from the juice of *Ecballium Elaterium*.

The most remarkable fruit is the squirting cucumber (*Ecballium Elaterium*) of the Mediterranean region. The prickly fruit, about 2 inches long, becomes very turgid and finally explodes with a considerable report. The basal end is blown out like a cork from a bottle, and the pulpy interior, containing the seeds, is projected to a considerable distance.

Twenty to 30 genera are in cultivation in N. America. Among these are the various melons, squashes, gourds, and the like, mentioned above; also Bryony, Wax Gourd, Balsam Pear or Balsam Apple (*Momordica*), Dish-cloth Gourd, Squirting Cucumber, Curuba (*Sicana*), and Snake Gourd (*Trichosanthes*).

**214. Campanulaceæ** (from the genus *Campanula*, a diminutive of *campana*, a little bell). **BELLFLOWER FAMILY.** Fig. 56. Herbs, shrubs, or trees, mostly with milky juice; leaves usually alternate, exstipulate, rarely lobed or divided; flowers bisexual, rarely unisexual, regular or irregular, often bilabiate and split down the back, usually epigynous; calyx of usually 5, separate, valvate sepals; corolla usually 5-lobed, gamopetalous, very rarely polypetalous; stamens as many as the lobes of the corolla, often slightly epipetalous, separate or united; ovary usually inferior, 2-5-celled or 6-10-celled, rarely 1-celled; ovules many; style 1; stigmas 1 to several: fruit a capsule, rarely a berry.

Campanulaceæ has 59 genera and about 1,500 species, occurring in all parts of the world but mostly in the temperate regions. A large part are alpine. Arborescent forms occur in the Hawaiian Islands. The family is rather distantly related to the Compositæ, Dipsacaceæ, Caprifoliaceæ. Formerly the Lobeliaceæ were separated as a distinct family, but the only differences are in the irregular flowers and syngenesious or monadelphous stamens, both of which show abundant transitions. When united, the family constitutes a very distinct group. The gamopetalous epigynous flower, the many ovules and the frequently united stamens are distinctive. The stamens are sometimes united by their filaments with the anthers free (monadelphous), or by the anthers with the filaments free (syngenesious), or by both filaments and anthers.

*Lobelia inflata* (lobelia, Indian tobacco) of North America is poisonous. The foliage furnishes the medicinal lobelia. *L. syphilitica* was used for syphilis by the Indians, but is of no value. The roots of this latter plant and of the cardinal flower (*L. cardinalis*) are more or less poisonous. The berries and fleshy roots of some Campanulaceæ have been used as food.

In cultivation in N. America are some 20 genera. Among these are: Shepherd's Scabious, or Sheep's-bit (*Jasione*); Chinese or Japanese Bellflower or Balloon Flower (*Platycodon*); Venus's Looking-glass (*Specularia*); Horned Rampion (*Phyteuma*); Giant Bellflower (*Ostrowskia*); Lobelia and the Cardinal Flower (*Lobelia*); and the Bellflowers or Bluebells (*Campanula*).

57. **COMPOSITÆ:** 1. Vernonia, fruit. 2. Eupatorium, head. 3. Erigeron, disk flower. 4. Ambrosia, fruiting involucre. 5. Xanthium, fruiting involucre. 6. Coreopsis, head. 7. Dahlia, ray flower. 8. Bidens, fruit. 9. Cosmos, disk flower, corolla removed. 10. Helenium, disk flower, vertical section. 11. Mutisia, head. 12. Senecio, floral diagram. 13. Cichorium, a, head; b, fruit. 14. Lactuca, fruit. 15. Hieracium, ray flower.

**215. Compositæ** (name having reference to the aggregation of the flowers into heads or false flowers, i.e., composite flowers). **COMPOSITE FAMILY.** Fig. 57. Herbs, shrubs, or rarely trees, sometimes twining, often with milky juice; leaves alternate, opposite or whorled, very diverse in shape, size and texture; flowers bisexual or unisexual, regular or irregular, epigynous; subtended by a bract called chaff; aggregated into 1- to many-flowered involucre heads; calyx (pappus) reduced to hairs, scales, awns, or a border, or wanting; corolla gamopetalous, normally regular, 4-5-lobed; the lobes valvate; in one tribe bilabiate; often enlarged and split down one side, and flattened out (ligulate or ray flowers); stamens usually 4-5, epipetalous, syngenesious, alternating with the corolla lobes; carpels 2, rarely 1-celled, 1-ovuled, inferior; style 1; stigmas 2, rarely 1; fruit an achene, often crowned by the persistent pappus; seed exalbuminous.

This is the largest family of flowering plants, consisting of more than 800 genera and 10,000 to 12,000 species, distributed over all parts of the earth, each tribe usually having a definite center of distribution. The largest genera are: *Senecio*, 1,200 species; *Centaurea*, 470; *Vernonia*, 450; *Hieracium*, 400; *Helichrysum*, 300; *Baccharis*, 275; *Cousinia*, 210; *Artemisia*, 200; *Crepis*, 170; *Erigeron*, 150; *Chrysanthemum*, 140; *Saussurea*, 125; *Gnaphalium*, 120; *Circium*, 120; *Scorzonera*, 100; *Anthemis*, 100. The *Compositæ*, taken in the broad sense, is a well-defined family not closely related to any other large families. Its affinities are with the *Campanulaceæ*, *Dipsacaceæ*, and *Valerianaceæ*. In general, the involucre heads, epigynous gamopetalous flowers, syngenesious stamens, 1-seeded dry fruits and exalbuminous seeds are distinctive. In some genera the heads have no ray flowers (discoid), in others they have a marginal row, and in still others all the flowers are ligulate. Except in the last case, the ray flowers are without stamens, and frequently without a pistil (neutral). The style-branches are very diverse, and are important in the characterization of tribes. They are often provided with sweeping hairs which push the pollen from the introrse anthers up out of the anther tube as the style elongates. The anthers are caudate in two tribes, and in some genera the filaments contract abruptly when stimulated by touch. In *Ambrosia* and *Xanthium*, the anthers are separate, and the bracts of the 1-2-flowered pistillate involucre are fused, woody, indehiscent, and covered with spines or hooks.

The family is divided by Hoffman into 13 tribes, several of which are by some authors considered separate families.

Sub-family I. Disk flowers not ligulate; no milky sap. Consists of twelve tribes, separated on a basis of style-branches, anther-tails, chaff on the receptacle, and so on, as follows: Ironweed Tribe, Boneset T., Aster T., Elecampane T., Sunflower T., Sneezeweed T., Chamomile T., Senecio T., Pot Marigold T., Arctotis T., Thistle T., Mutisia T.

Sub-family II. All flowers ligulate; juice milky. One tribe,—the Dandelion or Lettuce Tribe.

Medicinal Plants: The *Compositæ* are rich in ethereal oils, fatty oils, resins and bitter principles, and therefore many species are used in medicine. Among others of less importance, the following may be noted: *Artemisia Absinthium* (wormwood), tonic, febrifuge, anthelmintic; *A. Cina* which furnishes santonina from which santonin is extracted, anthelmintic, stimulant; *A. vulgaris* (mugwort) has been used as an emmenagogue and for epilepsy; *Anthemis nobilis* (Roman chamomile), tonic, nerve, emmenagogue; *Matricaria Chamomilla* (German chamomile), with similar properties; *Tanacetum vulgare* (tansy), tonic, anthelmintic, emmenagogue, diuretic; *Arnica montana* (arnica, leopard's bane), skin stimulant, diuretic; *Inula Helenium* (elecampane), skin stimulant; *Eupatorium perfoliatum* (boneset, thoroughwort), tonic, diaphoretic, laxative; many *Eupatoriums* of the tropics, famed remedies for snake-bites; *Tussilago Farfara* (coltsfoot), sedative; *Arctium Lappa* and *A. minus* (burdock), diaphoretic, alterative, used for rheumatism; *Calendula officinalis* (marigold), diaphoretic, alterative; *Lactuca sativa* (lettuce), the thickened juice a narcotic, a substitute for opium; *L. virosa* (wild lettuce), furnishing lactucarium or lettuce opium, a poisonous anodyne, hypnotic, and sedative; *Taraxacum officinale* (dandelion), tonic, but injurious to digestion; species of *Grindelia*, tonic, sedative, used for asthma and rheumatism; *Erigeron canadense* (heabane), used for diarrhea and uterine hemorrhage; *Anacyclus Pyrrholum* (pellitory), skin irritant; *Achillea Millefolium* (yarrow), an old remedy, styptic, tonic, sudorific, antispasmodic. *Brauneria* (Echinacea), *Prenanthes*, *Xanthium*, *Helenium*, *Spilanthes*, *Baccharis*, and

*Chrysanthemum Leucanthemum* have been used locally to some extent. The pollen of ragweed (*Ambrosia artemisiifolia*), less commonly of species of *Solidago* and other *Compositæ*, is said to be the cause of autumnal hay-fever.

The following are used for food, as salads or cooked in various ways: Young foliage of *Circium* (thistles), *Cynara Cardunculus* (cardoon), *Taraxacum officinale* (dandelion), *Cichorium Intybus* (chicory), *Lactuca sativa* (lettuce), *Cichorium Endivia* (endive, succory), *Pacourina edulis*, and *Scolymus hispanicus*, (Spanish oyster plant); young flower heads of *Cynara Scolymus* (globe artichoke); roots of *Tragopogon porrifolius* (vegetable oyster, salsify), *Scorzonera hispanica* (*Scorzonera*, black salsify), *Helianthus tuberosus* (Jerusalem artichoke). Roots of chicory, roasted, are a substitute for coffee.

The following yield dyes: *Carthamus tinctorius*, (safflower) yields the red dye, carthamine; *Serratula tinctoria* (dyer's savory) yields a yellow dye.

The powdered heads of species of *Chrysanthemum* furnish insect powder. An oil is obtained from the seeds of *Guzotia abyssinica* (niger seeds) of India and Abyssinia, used for food, painting, and burning. Seeds of *Madia sativa* furnish an oil similar to olive oil, edible, illuminating, and lubricating. The seeds of *Helianthus annuus* also furnish a commercial oil.

Many *Compositæ* are ornamental. The species of *Helichrysum*, *Anaphalis*, and related genera, have papery involucre, and furnish well-known everlasting.

More than one hundred and fifty genera are in cultivation in N. America, or are important weeds. Many of our most important and most showy ornamental plants belong to the *Compositæ*. Among these genera are: *Achillea* (Milfoil, Yarrow, Sneezewort); *Ageratum*; *Anaphalis* (Everlasting, Moonshine); *Antennaria* (Everlasting, Cat's-ear, Pussy's Toes, Ladies' Tobacco); *Anthemis* (Chamomile, Mayweed, Golden Marguerite); *Arctium* (Burdock); *Arnica* (Mountain Tobacco, Mountain Snuff); *Artemisia* (Wormwood, Tarragon, Estragon, Southernwood, Roman Wormwood, Old Man and Old Woman, Sage Brush); *Aster* (*Aster*, Starwort, Michaelmas Daisy); *Bidens* (Bur Marigold, Beggar's Ticks, Pitchfork Bur); *Boltonia* (False Chamomile); *Brachycome* (Swan River Daisy); *Brickellia* (Tassel Flower); *Bupthalmum*; *Calendula* (Marigold); *Callistephus* (China Aster); *Cnicus* or *Carbenia* (Blessed Thistle); *Carthamus* (Safflower, False Saffron); *Centaurea* (Centauray, Dusty Miller, Bachelor's Button, Cornflower, Knapweed, Bluebottle, Bluet, Ragged Sailor, Sweet Sultan, Basket Flower, Hardheads); *Chenactis*; *Chrysanthemum* (Feverfew, Golden Feather, Turfing Daisy, Marguerite, Paris Daisy, Costmary, Mint Geranium, Giant Daisy, Ox-eye Daisy, White-weed); *Cichorium* (Chicory, Succory); *Cineraria*; *Circium* or *Cnicus* (Common Thistles); *Coreopsis* (Tickseed, Golden Wave); *Cosmos*; *Cynara* (Artichoke, Cardoon); *Dahlia*; *Doronicum* (Leopard's-Bane); *Echinacea* or *Brauneria* (Purple Coneflower); *Echinops* (Globe Thistle); *Emilia* (Tassel Flower); *Erigeron* (Fleabane, Poor Robin's Plantain); *Eupatorium* (Boneset, Joe-Pye Weed, Thoroughwort, White Snakeroot); *Felicia* (Blue Daisy, Blue Marguerite); *Gaillardia*; *Gazania* (Peacock Gazania); *Grindelia* (Gum Plant); *Gynura* (Velvet Plant); *Helenium* (Sneezeweed); *Helianthus* (Sunflower, Indian Potato, Jerusalem Artichoke); *Helichrysum*; *Heliopsis*; *Helipterum*; *Hidalgoa* (Treasure Vine); *Hieracium* (Hawkweed, Rattlesnake Weed, Devil's Paint-brush); *Inula* (Elecampane); *Krigia* (Dwarf Dandelion); *Lactuca* (Lettuce); *Leontopodium* (Edelweiss); *Leptosyne*; *Liatris* (Blazing Star, Button Snakeroot); *Lonas* (African Daisy); *Madia* (Tarweed); *Matricaria*; *Mikania* (Climbing Hempweed, Climbing Boneset); *Onopordon* (Scotch Thistle); *Parthenium* (American Feverfew, Prairie Dock); *Pentachæta*; *Petasites* (Winter Heliotrope, Sweet Coltsfoot); *Pteris*; *Podolepis*; *Polymnia* (Leaf-cup); *Prenanthes* (Rattle

snake Root); *Rudbeckia* (Black-eyed Susan, Yellow Daisy, Coneflower, Golden Glow); *Santolina* (Lavender Cotton); *Scolymus* (Golden Thistle, Spanish Oyster Plant); *Scorzonera* (Black Salsify); *Senecio* (Groundsel, Canada Plant, Ragwort, German Ivy, Leopard Plant, Dusty Miller); *Silphium* (Rosin-Weed, Compass Plant, Prairie Dock, Cup Plant); *Solidago* (Goldenrod); *Spil-*

*anthes* (Para Cress); *Stokesia* (Stoke's Aster); *Tagetes* (French Marigold, African Marigold); *Tanacetum* (Tansy); *Taraxacum* (Dandelion); *Thelysperma*; *Townsendia*; *Tragopogon* (Salsify, Goat's Beard, Vegetable Oyster, Oyster Plant); *Trilisa* (Vanilla Plant); *Tussilago* (Coltsfoot); *Verbesina* (Crownbeard); *Vernonia* (Ironweed); *Zinnia* (*Zinnia*, Youth-and-Old-Age).

IV. Upland vegetation.—Trees on a wind-swept plateau.

## KEY TO THE FAMILIES AND GENERA

In one of the editions of the *Cyclopedia of American Horticulture*, a key to the families and genera contained therein was placed in the introductory part to Vol. I. This key is now modified and adapted to the present work. The original key was prepared by Wilhelm Miller, Associate Editor of that *Cyclopedia*. The main part of Dr. Miller's introduction to that key is here reprinted, with adaptations, as explaining the purpose of a key and the way in which it is constituted.

The key has now been extensively revised, but the original form and method are still retained.

### *The purposes of the key.*

The following key attempts to supply what is probably the greatest deficiency in cyclopedic works on horticulture:

(1) It helps the gardener to determine the name of any plant cultivated in America, including the wild flowers and other plants native to the United States and Canada that are commonly or even frequently offered for sale.

(2) It helps the student towards a scientific knowledge of the plant world, since it gives a condensed and orderly catalogue of that part of the vegetable kingdom which is of interest to gardeners, farmers and foresters.

No merely alphabetical work can accomplish either of these results. For example, suppose the person has a flower that is known to be an *Iris*, but of what species of *Iris* is not clear to him; and that he wishes to find the name. If he were to consult the best works in which the species of *Iris* are arranged alphabetically, it might require hours to read the pages of description, comparing the items with the specimen, and the chances are that in the end he would not be sure of a determination, since related species are not compared and contrasted.

It was to provide a short-cut to such information that every large genus or group of plants described in the *Cyclopedia of American Horticulture* was classified according to shape, color, size, season, height or other characters of interest to the gardener. These short-cuts, or "keys," have long been in common use with students of botany, and are a feature of all floras, but they have not been sufficiently employed in writings on horticultural subjects.

No valid objection can be made to keys, synopses or other classified arrangements, since they do three things more clearly and briefly than any other device: (1) They help one to find out the name of a plant. (2) They show the difference between the given species and other species of the same genus. (3) They show the relation of each species to every other, i. e., some of the points of likeness and unlikeness.

But classified schemes alone have one serious limitation: They are not so convenient for ready reference if one knows one's plant and merely wishes to find out the native country or how to spell the name. The *Cyclopedia of American Horticulture* met this need by numbering the species and providing an alphabetical list or index in each large genus. It therefore met the needs by presenting both systems—the classified and the alphabetical—one for taxonomic study, the other for convenience.

All this supposes that one knows the genus to which the plant belongs,—whether it is an *Iris*, *Pæonia* or *Rhododendron*. But he may not know the genus: the key will aid him to determine it. The key leads to the family and the genus; having the genus, he can run down the species in the *Cyclopedia* itself, for the genera are to be found in alphabetical order. This key, therefore, deals only with families and genera,

since the species are described and distinguished elsewhere. It ties the whole work together and makes it an organism, instead of a series of detached articles on *Iris*, *Rosa*, *Solanum*, and other genera. In other words, the key is not merely supplementary: it is structural and even fundamental.

### *The preparation of the key.*

It must be confessed, however, that the preparation of the key was undertaken with serious misgivings. During the preparation of the *Cyclopedia of American Horticulture*, the Editor was often importuned for something of the kind, by students, botanists, and others who made increasing use of the volumes as issued. In response to these urgent appeals, it was necessary to point out three objections: (1) Such a key would necessarily be highly technical. (2) It would have to use a scheme of arrangement that may pass with another generation. (3) The labor and expense would be great.

In response to this demand the following key has been prepared. It is based on the system of Bentham and Hooker as set forth in their "*Genera Plantarum*," a work published in parts from 1862 to 1883. The system of Bentham and Hooker is not now the latest, but it is the only one that was in general use at the time the first *Cyclopedia* was begun. The system of Engler and Prantl in "*Die Natürlichen Pflanzenfamilien*" is now well known; this no doubt presents the best system for the present generation, but in its turn it is likely to be superseded. In Engler and Prantl's system the plants are arranged, as far as possible, in the order in which the various families probably have made their appearance on the earth's surface, or at all events in accordance with the evolution from simple to complex. Perhaps the new system is better adapted for showing relationship or likeness, while the old system is well adapted for bringing out differences. This furnishes an additional reason for the use of the older system on the present occasion, as most of those who use this part of the *Cyclopedia* will probably be in search of differences.

In the present revision, the Bentham and Hooker key-plan has been retained. The authors of the main groups in the new *Cyclopedia* have made revisions and adaptations to meet the changes and requirements of their own work. New conceptions of the limitations of families and genera have naturally found expression in the revision. It is not designed to insert in the key all the genera that are mentioned in a minor or incidental way, for to include them all would unnecessarily encumber and complicate the lists and tend to make them unworkable; but it is intended to include all the genera that afford species prominently in the trade in the United States and Canada. When it has seemed to be desirable to omit genera from the key, the relatively unimportant native groups have often been left out, for they may be readily traced in the current botanies.

The way to use a key is explained in the prefatory part to this volume (page xii).

### The general plan.

The key is divided into two main parts: a key to the families (page 80), and a key to the genera (page 86). When the student has determined the family to which the plant belongs, the further tracing of it is to be made in the key to the genera; when the genus has been found, he turns to its alphabetic place in one of the volumes and there runs down the plant to its species.

The families are arranged in accordance with the following framework (for another and fuller outline of the vegetable kingdom, see pages 2-4).

	Families
Division 1. Flowering Plants or Phanerogams.....	1-209
Subdivision 1. Dicotyledons or Exogens.....	1-181
Class 1. Angiosperms.....	1-176
Subclass 1. Polypetales.....	1-101
Series 1. Thalamifloræ.....	1-39
Cohort 1. Ranales.....	1-12
Cohort 2. Parietales.....	13-22
Cohort 3. Polygalales.....	23-25
Cohort 4. Caryophyllales.....	26-29
Cohort 5. Guttiferales.....	30-34
Cohort 6. Malvales.....	35-39
Series 2. Discifloræ.....	40-69
Cohort 1. Geraniales.....	40-53
Cohort 2. Olacales.....	54-56
Cohort 3. Celastrales.....	57-60
Cohort 4. Sapindales.....	61-69
Series 3. Calycifloræ.....	70-101
Cohort 1. Rosales.....	70-79
Cohort 2. Myrtales.....	80-88
Cohort 3. Passiflorales.....	89-93
Cohort 4. Ficoidales.....	94-95
Cohort 5. Umbellales.....	96-101
Subclass 2. Gamopetales.....	102-144
Series 1. Inferæ.....	102-107
Cohort 1. Rubiales.....	102-103
Cohort 2. Asterales.....	104-106
Cohort 3. Campanales.....	107
Series 2. Heteromæræ.....	108-120
Cohort 1. Ericales.....	108-113
Cohort 2. Primulales.....	114-116
Cohort 3. Ebenales.....	117-120
Series 3. Bicarpellatæ.....	121-144
Cohort 1. Gentianales.....	121-125
Cohort 2. Polemoniales.....	126-131
Cohort 3. Personales.....	132-138
Cohort 4. Lamiales.....	139-144
Subclass 3. Apetalæ or Monochlamydeæ.....	145-176
Series 1. Curvembryæ.....	145-149
Series 2. Multiovulatæ Terrestres.....	150-151
Series 3. Micrembryæ.....	152-156
Series 4. Daphneæ.....	157-160
Series 5. Achlamydosporæ.....	161-162
Series 6. Unisuales.....	163-174
Series 7. Anomalous Families.....	175-176
Class 2. Gymnosperms.....	177-181
Subdivision 2. Monocotyledons or Endogens.....	182-209
Series 1. Microspermæ.....	182-183
Series 2. Epigynæ.....	184-193
Series 3. Coronariæ.....	194-196
Series 4. Calycinæ.....	197-198
Series 5. Nudifloræ.....	199-203
Series 6. Apocarpæ.....	204-207
Series 7. Glumacæ.....	208-209
Division 2. Pteridophyta.....	210-223

## PART I.—KEY TO THE FAMILIES

(See page 86 for Part II.)

**Division 1. FLOWERING PLANTS OR PHANEROGAMS OR SPERMATOPHYTES:** those producing real flowers and seeds (pages 80 to 86).

**Subdivision 1. DICOTYLEDONS.** Sts. formed of bark, wood and pith, the wood forming a zone between the other two, and increasing when the st. continues from year to year by the annual addition of a new layer to the outside next to the bark: lvs. usually netted-veined: embryo with a pair of opposite cotyledons, or, in Subdivision 2, often 3 or more in a whorl: parts of the fl. mostly in 4's or 5's (pages 80-84).

**Class 1. ANGIOSPERMS.** Pistil consisting of a closed ovary, which contains the ovules: cotyledons 2.

**Subclass 1. POLYPETALES.** Calyx and corolla both present, the latter of separate petals. (See exceptions listed under Subclass 2, Gamopetales, page 82.)

**Series 1. THALAMIFLORE.** Calyx mostly inserted under the ovary; petals often in 2 or more series, sometimes 1 series; stamens

$\infty$  or definite, inserted on the often small or raised or stipitate receptacle, which is not developed into a glandular disk; ovary very generally free.

**Cohort 1. RANALES.** Stamens  $\infty$ , or if definite then the perianth in 3- $\infty$  series; carpels 1 or more, usually distinct, rarely united. (See exceptions in Saxifragaceæ; also hypogynous Leguminosæ.)

- A. Sepals 5, or fewer, or 0; petals in about 1 series.
- B. Seeds not arillate; sepals deciduous, usually colored: herbs or shrubs. . . . . 1. **RANUNCULACEÆ**.
- BB. Seeds not arillate: calyx and corolla wanting; ovary of 2 carpels but 1-celled. . . . . 7. **EUCOMMIACEÆ**.
- BBB. Seeds arillate: sepals persistent, herbaceous: shrubs or trees. . . . . 2. **DILLENIACEÆ**.
- AA. Sepals or petals in 2- $\infty$  series, rarely wanting.
- B. Plants not aquatic.
- C. Perianth wanting; stamens numerous; fls. polygamous, dioecious, or perfect.
- D. Lvs. pinnately veined, alternate. 5. **TROCHODENDRA-CEÆ**.
- DD. Lvs. palmately veined, opposite. 6. **CERCIDIPHYLLACEÆ**.
- CC. Perianth present.
- D. Petals and stamens mostly  $\infty$ : ovules 1- $\infty$ .
- E. Torus tubular, inclosing carpels: endosperm 0: lvs. opposite: shrubs. . . . . 3. **CALYCANTHACEÆ**.
- EE. Torus short or long, bearing carpels outside: endosperm copious: lvs. alternate: woody. . . . . 4. **MAGNOLIACEÆ**.
- DD. Petals 5: stamens 10: carpels 5-10: ovule solitary: lvs. opposite. (See No. 68, **CORIARIACEÆ**.)
- DDD. Petals and stamens mostly multiples of 3 or 2.
- E. Stamens and carpels usually numerous: ovules 1- $\infty$ : sepals 3; petals 6; fls. bisexual: shrubs or trees. . . . . 8. **ANNONACEÆ**.
- EE. Stamens usually 6: ovule solitary: carpels 3; sepals and petals usually 6: fls. dioecious: mostly woody or herbaceous vines. . . . . 9. **MENISPERMACEÆ**.
- EEE. Stamens 4, 6, or 9; anthers opening by 2 lids rarely birimose: carpel 1: ovules 2- $\infty$ : fls. bisexual: herbs or shrubs. . . . . 10. **BERBERIDACEÆ**.
- EEEE. Stamens usually 6; anthers birimose: carpels mostly 3: ovules many: fls. unisexual: vines or erect, woody. . . . . 11. **LARDIZABALACEÆ**.
- BB. Plants aquatic. . . . . 12. **NYMPHÆACEÆ**.

**Cohort 2. PARIETALES.** Stamens definite or  $\infty$ : ovary 1-celled, or several-celled by spurious partitions; carpels several; placentæ parietal. (See Actæa in Ranunculaceæ, also Berberidaceæ.)

- A. Embryo minute, near the base of the fleshy endosperm.
- B. Pitcher plants. . . . . 13. **SARRACENIACEÆ**.
- BB. Not pitcher plants.
- C. Petals all alike, or nearly so. . . . . 14. **PAPAVERACEÆ**.
- CC. Petals in 2 series, the inner unlike the outer. . . . . 15. **FUMARIACEÆ**.
- AA. Embryo curved; endosperm 0.
- B. Stamens 6, tetradynamous, rarely 4. . . . . 16. **CRUCIFERÆ**.
- BB. Stamens  $\infty$ , or, if few, not tetradynamous. . . . . 17. **CAPPARIDACEÆ**.
- BBB. Stamens usually  $\infty$ , not covered in aestivation by the small petals: ovary often open above. . . . . 18. **RESEDACEÆ**.
- AAA. Embryo not curved, rather large; endosperm fleshy.
- B. Radicle remote from hilum: ovule generally orthotropous. . . . . 19. **CISTACEÆ**.
- BB. Radicle very near hilum: ovule anatropous, or amphitropous.
- C. Anthers dehisce introrsely: mostly herbs. . . . . 20. **VIOLACEÆ**.
- CC. Anthers dehisce extrorsely or at apex: insectivorous plants with capitate glandular tentacles on lvs. (See No. 76, **DROSERACEÆ**.)
- CCC. Anthers dehisce by apical cracks or pores: woody.
- D. Slime-cells present; receptacle not enlarged. . . . . 21. **BIXACEÆ**.
- DD. Slime-cells absent; receptacle enlarged. . . . . 22. **FLACOURTIACEÆ**.
- CCCC. Anthers versatile, dehiscing by longitudinal fissures: woody. (See No. 34, **STACHYURACEÆ**.)

**Cohort 3. POLYGALAEAE.** Stamens as many or twice as many as petals; carpels usually 2; ovary usually perfectly or imperfectly 2-celled, usually compressed.

- A. Fls. regular or slightly oblique.
- B. Stamens 5, as many as sepals or petals: woody.....23. *PITTOSPORACEAE*.
- BB. Stamens twice as many as sepals or petals, which are usually 4 or 5, rarely 3: woody.....24. *TREMANDRACEAE*.
- AA. Fls. irregular; herbaceous or woody.....25. *POLYGALACEAE*.

**Cohort 4. CARYOPHYLLALES.** Stamens definite, rarely  $\infty$ ; ovary 1-celled or imperfectly septate; placenta central, rarely parietal; embryo curved, or coiled, rarely straight.

- A. Sepals of same number as petals: placenta 1, central: herbs.....26. *CARYOPHYLLACEAE*.
- AA. Sepals fewer than petals: placenta 1, central: herbs.....27. *PORTULACACEAE*.
- AAA. Sepals of same number as petals: placenta several; mostly woody.
- B. Corolla polypetalous; stamens without scale, glabrous; fls. spicate or racemose.....28. *TAMARICACEAE*.
- BB. Corolla gamopetalous; stamens with scale, hairy; fls. thyrsoid-paniculate.....29. *FOQUIERACEAE*.

**Cohort 5. GUTTIFERALES.** Stamens usually  $\infty$ ; sepals imbricated; ovary septate; placenta on the inner angles of the cells, i.e., axile. (See also, as exceptions with disk absent, the *Linaceae*, *Erythroxylaceae*, *Malpighiaceae*, *Geraniaceae*, *Tropaeolaceae*, *Limnanthaceae*, *Oxalidaceae*, *Balsaminaceae*, *Ochnaceae*, *Rutaceae*, *Anacardiaceae* and *Sapindaceae*, all belonging to the *Disciflorae*. (See also *Nigella* of the *Ranunculaceae*.)

- A. Lvs. opposite or whorled, herbaceous: fls. cymose or paniced, bisexual.....30. *HYPERICACEAE*.
- AA. Lvs. opposite or whorled, coriaceous: fls. cymose or paniced.
- B. Receptacle not enlarged; fls. unisexual.....31. *GUTTIFERAE*.
- BB. Receptacle enlarged, barrel-shaped between pistil and corolla, bearing the stamens; fls. bisexual.....32. *EUCRYPHIACEAE*.
- AAA. Lvs. alternate, coriaceous: fls. mostly racemose.
- B. Cells of ovary 2-10: stamens numerous.....33. *TERNSTROMIACEAE*.
- BB. Cells of ovary 1: stamens 8.....34. *STACHYURACEAE*.

**Cohort 6. MALVALES.** Stamens usually  $\infty$  or monadelphous; sepals valvate; ovary septate; placenta axile.

- A. Anthers 1-celled; pollen rough: herbs or woody.....35. *MALVACEAE*.
- AA. Anthers 1- to several-celled; pollen smooth: woody plants.....36. *BOMBACACEAE*.
- AAA. Anthers 2-celled: fls. with staminodia and queer stamen-tube: woody plants.....37. *STERCULIACEAE*.
- AAAA. Anthers 2-celled; stamens nearly free; no staminodia: ovule often pendulous with raphe toward axis.
- B. Petals ordinary: herbs or woody.....38. *TILIACEAE*.
- BB. Petals firm, often hairy or incised: woody plants.....39. *ELEOCARPACEAE*.

**Anomalous Group.** Stamens  $\infty$ ; sepals valvate; carpel 1; ovary 1-celled: fls. regular: lvs. compound: herbs or woody..... (Mimosae, incl. in *Leguminosae*.)

**Series 2. DISCIFLOREAE.** Calyx usually inserted under the ovary; petals in 1 series: stamens usually definite, inserted within or upon or around the receptacle, which is usually expanded as a disk within the calyx: ovary usually free, or imbedded in the disk. (See *Flacourtiaceae* and *Trapaceae*.)

**Cohort 1. GERANIALES.** Disk usually a ring between stamens, or adnate to staminal tube, or reduced to glands alternating with the petals, rarely 0: ovary commonly lobed, rarely entire or subapocarpous; ovules 1-2 in each cell, pendulous; raphe toward axis. (See *Stackhouseiaceae*.)

- A. Ovary more or less lobed or grooved.
- B. Anthers elongated; disk enlarged in fr.....51. *OCHNACEAE*.
- BB. Anthers normal.
- C. Calyx-lobes 5, all or mostly with 2 glands outside: woody.....42. *MALPIGHIACEAE*.
- CC. Calyx-lobes not biglandular.
- D. Foliage glandular-dotted: carpels sometimes separate.....49. *RUTACEAE*.
- DD. Foliage not glandular-dotted.
- E. Lvs. usually opposite, compound.....43. *ZYGOPHYLLACEAE*.
- EE. Lvs. alternate.
- F. Disk well developed, irregular; petals often irregular; ovary usually open above: herbs, rarely shrubs. (See No. 18, *Resedaceae*.)

FF. Disk well developed, regular: petals regular: ovary closed: woody plants.....50. *SIMARUBACEAE*.

- FFF. Disk indistinct, otherwise as in the last: herbaceous.
- G. Ovule solitary: stamens 6-10.
- H. Fr. dehiscent: stamens connate at base; fls. regular or irregular.....44. *GERANIACEAE*.
- HH. Fr. indehiscent: stamens free; fls. irregular: ovule pendulous.....45. *TROPEOLACEAE*.
- HHH. Fr. indehiscent: stamens free: fls. regular: ovule ascending.....46. *LIMNANTHACEAE*.
- GG. Ovules several: fr. dehiscent.
- H. Stamens 10: fls. regular.....47. *OXALIDACEAE*.
- HH. Stamens 5: fls. irregular.....48. *BALSAMINACEAE*.

- AA. Ovary entire.
- B. Stamens monadelphous, at least below: woody plants.
- C. Stamen-tube stipitate; disk vari-ous.....53. *MELIACEAE*.
- CC. Stamen-tube sessile; disk 0.
- D. Petals not appendaged: fr. capsular.....40. *LINACEAE*.
- DD. Petals appendaged: fr. drupaceous.....41. *ERYTHROXYLACEAE*.
- BB. Stamens free.
- C. Ovules several or many.
- D. Mostly herbaceous plants. (See No. 17, *Capparidaceae*.)
- DD. Woody plants. (See No. 22, *Flacourtiaceae*.)
- CC. Ovules 1-2.....52. *BURSERACEAE*.

**Cohort 2. OLACALES.** Disk cup-shaped or ring-shaped, free, or bearing the stamens and petals on its edge: ovary 1- $\infty$ -celled, entire; ovule solitary, pendulous; raphe away from axis.

- A. Petals or corolla-lobes usually valvate: woody.....54. *OLACACEAE*.
- AA. Petals or corolla-lobes imbricate or convolute.
- B. Fr. drupaceous, slightly fleshy, 3-18-stoned; stones 1-seeded: fls. not racemose: woody.....55. *AQUIFOLIACEAE*.
- BB. Fr. crustaceous or spongy, 2-4-celled, 1-4-seeded: fls. racemose: woody.....56. *CYRILLACEAE*.

**Cohort 3. CELASTRALES.** Disk tumid or adnate to the calyx or covering its base: stamens inserted around the disk or affixed to its margin: ovary usually entire; ovules usually 2 in each cell, erect: raphe turned toward axis: lvs. simple or rarely compound.

- A. Calyx valvate; petals small, concave; stamens opposite the petals: woody.....59. *RHAMNACEAE*.
- AA. Calyx imbricate.
- B. Stamens alternate with the petals, the latter imbricate.
- C. Petals spreading: calyx small: woody.....57. *CELASTRACEAE*.
- CC. Petals erect, often connate: calyx-tube hemispherical: herbs.....58. *STACKHOUSEIACEAE*.
- BB. Stamens opposite the petals, the latter valvate, dropping off early: woody, rarely herbaceous.....60. *VITACEAE*. (Incl. *Leeaceae*.)

**Cohort 4. SAPINDALES.** Disk various; stamens variously inserted on the disk: ovary entire, or more often lobed, or subapocarpous; ovules commonly 1-2 in each cell, ascending, with raphe toward axis, or reversed, or solitary and pendulous from an ascending funicle, rarely  $\infty$  and horizontal: lvs. pinnate, rarely simple (No. 62), or (No. 65) digitate.

- A. Carpels 2: fr. a samara.....62. *ACERACEAE*.
- AA. Carpels 2-3: fr. a drupe, 1-seeded.....61. *SABIACEAE*.
- AAA. Carpels 3-5: fr. rarely samaroid in *Sapindaceae*.
- B. Bark containing resin: disk intrastaminal.....67. *ANACARDIACEAE*.
- BB. Bark not resinous, or, if so, disk extrastaminal.
- C. Endosperm abundant; embryo straight.
- D. Disk intrastaminal; carpels 3.....63. *STAPHYLEACEAE*.
- DD. Disk extrastaminal; carpels 4-5.....64. *MELIANTHACEAE*.
- CC. Endosperm sparse or wanting; embryo curved: disk extrastaminal. (See *Sapindaceae*, No. 66.)
- D. Lvs. opposite, palmately compound.....65. *HIPPOCASTANACEAE*.
- DD. Lvs. alternate, variously compound, or simple.....66. *SAPINDACEAE*.

**Anomalous Families.** Disk 0: sepals and petals 5: stamens 10; carpels 5-10, distinct: ovule solitary, pendulous; raphe away from axis. Approaches Thalamifloræ.....68. CORIARIACEÆ.

Disk investing calyx-tube: stamens 10, of which 5 have no anthers: ovary 1-celled, with 3-parietal placentæ; ovules  $\infty$ . Approaches Calycifloræ.....69. MORINGACEÆ.

**Series 3. CALYCIPIORÆ.** Petals in 1 series: stamens  $\infty$  or definite, inserted with the petals and sepals on the edge of the cup-shaped receptacle (hypanthium), or on a disk lining the latter: ovary often adnate to this receptacle; and therefore inferior. (See also Calycanthaceæ.)

**Cohort 1. ROSALES.** Carpels superior solitary or free or united only at base, sometimes to the apex and then rarely inferior: styles distinct, rarely united in a column and easily separated (styles connate in some Bruniaceæ and Saxifragaceæ). (See also Tropæolaceæ and Capparidaceæ.)

- A. Endosperm rare.
  - B. Fr. a legume, when rarely otherwise the corolla is either papilionaceous or the stamens are very numerous and exserted: lvs. usually compound with pulvini.....70. LEGUMINOSÆ.
  - BB. Fr. not a legume, either a follicle, drupe, pome, achene or aggregate: lvs. simple or compound without pulvini.....71. ROSACEÆ.
- AA. Endosperm moderate or copious.
  - B. Plants insectivorous.
    - C. Lvs. bearing many tentacles tipped with capitate viscid glands: herbs.....76. DROSERACEÆ.
    - CC. Lvs. bearing pitchers.....74. CEPHALOTACEÆ.
  - BB. Plants not insectivorous.
    - C. Carpels 5, rarely 3 or more, separate, with a scale at the base of each, superior: ovules many: often fleshy plants: herbs.....75. CRASSULACEÆ.
    - CC. Carpels 2 to several, rarely separate, no scale at the base: plants not conspicuously fleshy.
      - D. Ovary usually 2-celled, usually superior; ovules  $\infty$ , usually axile: fr. a caps. or berry or follicle.
        - E. Lvs. opposite, stipulate.....73. CUNONIACEÆ.
        - EE. Lvs. alternate, or opposite and exstipulate.....72. SAXIFRAGACEÆ.
      - DD. Ovary 2-celled, inferior or rarely superior; ovules 1- $\infty$ , pendulous or axile: fr. a woody 2-valved caps., with a separating inner layer of different texture.....77. HAMAMELIDACEÆ.
      - DDD. Ovary 1-4-celled, usually inferior; ovules 1 to several, pendulous: fr. indehiscent or cocci irregularly and tardily dehiscent.
        - E. Plants heath-like: stamens and petals 5.....78. BRUNIACEÆ.
        - EE. Plants ordinary: stamens often many.....79. HALORAGIDACEÆ.

**Cohort 2. MYRTALES.** Ovary syncarpous, inferior or inclosed in a cup-shaped receptacle, usually divided into cells; style undivided; ovules 2- $\infty$  in the cells.

- A. Ovules pendulous from apex of cells: woody.
  - B. Ovary 2-6-celled.....80. RHIZOPHORACEÆ.
  - BB. Ovary 1-celled.....81. COMBRETACEÆ.
- AA. Ovules affixed to the inner angles of the cells or to basilar placentæ, ascending, horizontal or pendulous.
  - B. Stamens  $\infty$ , rarely definite: woody.
    - C. Oil-glands in foliage; sieve-tubes in pith-rays.....82. MYRTACEÆ.
    - CC. Oil-glands absent; no sieve-tubes in pith-rays.....83. LECYTHIDACEÆ.
  - BB. Stamens definite, rarely  $\infty$ .
    - C. Calyx-lobes usually imbricate or open; anthers curved, usually opening by pores at the apex; connective usually appendaged or thickened.....84. MELASTOMACEÆ.
    - CC. Calyx-lobes usually valvate; anthers normal, not appendaged, opening longitudinally.
      - D. Ovary superior; petals corrugated.....85. LYTHRACEÆ.
      - DD. Ovary inferior or half-inferior.
        - E. Carpels in stries, superimposed: petals corrugated.....86. PUNICACEÆ.
        - EE. Carpels in 1 whorl: petals convolute.....87. ONAGRACEÆ.

EEE. Carpels in 1 whorl: petals imbricate; a dentate or wavy cup-shaped disk under ovary: water-plants.....88. TRAPACEÆ.

**Cohort 3. PASSIFLORALES.** Ovary syncarpous, inferior, semi-inferior, or inclosed in the hollow receptacle, rarely exserted, 1-celled with parietal placentation, or divided into cells; ovules 1- $\infty$ ; styles united or distinct from the base.

- A. Crown inserted on calyx-tube or within petals, single, double or multiple.....90. PASSIFLORACEÆ.
- AA. Crown 0.
  - B. Fls. bisexual (see Caricaceæ); petals unlike the sepals: foliage-hairs stinging or rigid or queerly constructed.....89. LOASACEÆ.
  - BB. Fls. unisexual.
    - C. Stamens 5 or 10: perianth of the 2 sexes unlike.....91. CARICACEÆ.
    - CC. Stamens usually 3: perianth of both sexes similar.....92. CUCURBITACEÆ.
    - CCC. Stamens  $\infty$ : perianth of the 2 sexes often unlike.....93. BEGONIACEÆ.

**Cohort 4. FICOIDALES.** Ovary syncarpous, inferior or superior, divided into cells with sub-basilar placentation, or rarely 1-celled with parietal placentæ; ovules 1- $\infty$ ; styles distinct or united to near apex; embryo curved or excentric.

- A. Calyx-lobes, petals and stamens usually  $\infty$ : ovary 1-celled.....94. CACTACEÆ.
- AA. Calyx-lobes usually 4-5: ovary 2- $\infty$ -celled.....95. AIZOACEÆ.

**Cohort 5. UMBELLALES.** Ovary syncarpous, inferior, crowned by the disk, divided into cells, or 1-carpelled; styles distinct or united part way; ovules solitary and pendulous in the cells.

- A. Fr. separating into 2 dry indehiscent carpels.....96. UMBELLIFERÆ.
- AA. Fr. usually drupaceous, the stones distinct but not separating naturally.
  - B. Lvs. compound, or simple, and palmately veined.....97. ARALIACEÆ.
  - BB. Lvs. simple, pinnately veined.
    - C. Ovules 2 in each cell: ovary 1-celled: raphe toward axis: fls. in catkins: lvs. opposite.....98. GARRYACEÆ.
    - CC. Ovule 1 in each cell.
      - D. Raphe toward axis: ovary 1-celled: fls. in heads: lvs. alternate.....99. NYSSACEÆ.
      - DD. Raphe lateral: ovary 1-2-celled; fls. in cymes: lvs. alternate....100. ALANGIACEÆ.
      - DDD. Raphe exterior: ovary 1-5-celled: fls. in heads or cymes: lvs. opposite or alternate.....101. CORNACEÆ.

**Subclass 2. GAMOPETALÆ.** Calyx and corolla both present, the petals usually more or less united; stipules present only in the Rubiaceæ and Loganiaceæ, rarely in the Caprifoliaceæ; corolla polypetalous in some Ericaceæ, in Monotropaceæ, Pyrolaceæ, Clethraceæ, some Styrraceæ and Oleaceæ; also in Galax, Staticæ, Lysimachia; corolla gamopetalous in some Fouquieriaceæ, Stackhousiaceæ, Leguminosæ, Fumariaceæ, Polygalaceæ, and Oxalidaceæ of the Polypetalæ.

**Series 1. INFERÆ.** Ovary inferior (see Ericaceæ); stamens as many as lobes of the corolla, rarely fewer.

**Cohort 1. RUBIALES.** Stamens affixed to the corolla: ovary 2- $\infty$ -celled; cells 1- $\infty$ -ovuled: lvs. opposite or whorled.

- A. Fls. regular or irregular: stipules usually absent.....102. CAPRIFOLIACEÆ.
- AA. Fls. regular: stipules present, interior intrapetalous, various in form, sometimes like the lvs. and disposed in the same whorl with them.....103. RUBIACEÆ.

**Cohort 2. ASTERALES.** Stamens affixed to corolla: ovary of the 2-merous pistil 1-celled, 1-ovuled.

- A. Anthers free: lvs. opposite or whorled.
  - B. Endosperm 0.....104. VALERIANACEÆ.
  - BB. Endosperm present.....105. DIPSACACEÆ.
- AA. Anthers united in a ring around the style except in a few genera: lvs. alternate or opposite.....106. COMPOSITEÆ.

**Cohort 3. CAMPANALES.** Stamens usually free from the corolla: ovary 2-6-celled; the cells usually  $\infty$ -ovuled: lvs. usually alternate.

107. CAMPANULACEÆ.  
(Incl. Lobeliaceæ.)

**Series 2. HETEROMERÆ.** Ovary usually superior: stamens free from the corolla, or opposite the lobes or twice as many, or  $\infty$ , or, if borne on the corollan, the alternate with its lobes and equal in number to them; carpels more than 2.

**Cohort 1. ERICALES.** Stamens twice as many as the corolla-lobes, or as many and opposite them: ovary 2- $\infty$ -celled; ovules numerous (except in Epacridaceae): fr. fleshy or berry-like.

- A. Anthers dehisce by an apical crack or pore, often produced into a tube; stamens usually 8 or 10 (5 in some Ericaceae).
- B. Chlorophyllous plants: polypetalous. 108. MONOTROPACEAE.
- BB. Chlorophyll-bearing plants.
  - C. Anthers inverted, at least at first; polypetalous.
    - D. Ovary 3-celled: shrubs. 109. CLETHRACEAE.
    - DD. Ovary 5-celled: low or acaulescent plants. 110. PYROLACEAE.
  - CC. Anthers erect; rarely polypetalous (Ledum). 111. ERICACEAE.
- AA. Anthers dehisce by longitudinal fissures (see also Epigaea); stamens 5.
  - B. Plants shrubs or trees: carpels 4-5. 112. EPACRIDACEAE.
  - BB. Plants low or acaulescent: carpels 3. 113. DIAPENSACEAE.

**Cohort 2. PRIMULALES.** Stamens as many as the corolla-lobes and opposite them; ovary 1-celled; placenta free-central or basal.

- A. Ovary 1-ovuled. 114. PLUMBAGINACEAE.
- AA. Ovary 2 to many-ovuled.
  - B. Fr. capsular: herbs. 115. PRIMULACEAE.
  - BB. Fr. indehiscent: trees or shrubs. 116. MYRSINACEAE.

**Cohort 3. EBENALES.** Stamens as many as lobes of the corolla and opposite them or twice as many, or  $\infty$ ; ovary 2- $\infty$ -celled; seeds usually few and rather large: woody.

- A. Fls. usually bisexual; stamens usually borne on the corolla.
  - B. Stamens 15- $\infty$ : ovary inferior, 2-5-celled. 117. SYMPLOCACEAE.
- BB. Stamens 5-10: ovary superior.
  - C. Ovary 1-celled at top. 118. STYRACACEAE.
  - CC. Ovary 4- $\infty$ -celled. 119. SAPOTACEAE.
- AA. Fls. dioecious; stamens usually free from corolla. 120. EBENACEAE.

**Series 3. BICARPELLATE.** Ovary usually superior: stamens alternate with corolla-lobes, as many as them or fewer: carpels 2, or rarely 1 or 3.

**Cohort 1. GENTIANALES.** Corolla regular: stamens alternate with corolla-lobes and equal to them in number, or, if fewer, usually alternate with carpels: lvs. usually opposite.

- A. Stamens 2, alternate with the carpels, rarely 4; stigma terminal; ovary 2-celled; ovules affixed to septum: rarely herbaceous. 121. OLEACEAE.
- AA. Stamens and corolla-lobes usually 5, sometimes 4, rarely  $\infty$ .
  - B. Ovary usually compound, with 2 or 3 (rarely 4 or 5) cells or placentae.
  - C. Caps. mostly 2-celled: lvs. connected by transverse lines or stipules. 122. LOGANIACEAE.
  - CC. Caps. mostly 1-celled, with parietal placenta: lvs. not connected as above. 123. GENTIANACEAE.
- BB. Ovaries 2, usually becoming follicles.
  - C. Anthers permanently attached to a large stigmatic body; pollen mostly in waxy masses. 124. ASCLEPIADACEAE.
  - CC. Anthers distinct or merely connivent; pollen ordinary. 125. APOCYNACEAE.

**Cohort 2. POLEMONIALES.** Corolla regular: stamens as many as lobes of corolla: lvs. usually alternate: ovary 1- $\infty$ -ovuled.

- A. Pistil 3-merous; corolla-lobes convolute. 126. POLEMONIACEAE.
- AA. Pistil not 3-merous.
  - B. Corolla-lobes imbricated or rarely convolute.
    - C. Style usually deeply 2-cut, or even split into 2 distinct styles: caps. 1-celled, 2-valved, with 2 parietal or introflexed placenta, or sometimes 2-celled. 127. HYDROPHYLLACEAE.
  - CC. Style usually entire or shortly 2-cut, rarely otherwise; ovary 4-ovuled, usually 4-lobed and maturing as 4 separate or separable nutlets; or not lobed, 3-4-celled, and separating when ripe into 2 or 4 nutlets. 128. BORAGINACEAE.
- BB. Corolla-limb more or less plicate or rarely imbricate.
  - C. Ovary 2-celled (sometimes 3- or spuriously 4-celled, becoming a globular 4-6-seeded caps.: seeds basal. 129. CONVULVULACEAE.

- CC. Ovary 2-celled (rarely 3-5-celled), with numerous ovules on expanded axillary placenta, becoming a pod or berry. 130. SOLANACEAE.
- CCC. Ovary 5-30-celled, 5-30-lobed, often transversely as well as longitudinally so. 131. NOLANACEAE.

**Cohort 3. PERSONALES.** Corolla usually irregular or oblique: posterior stamen differing from the others, abortive or even absent: carpels  $\infty$ -ovuled, or with 2 ovules, one above the other.

- A. Seeds usually with endosperm: ovary perfectly 2-celled; placenta central. 132. SCROPHULARIACEAE.
- AA. Seeds without endosperm. [CEAE.]
  - B. Plants insectivorous, often aquatic: ovary 1-celled, globose, with a free-central or basal placenta. 133. LENTIBULARIACEAE.
- BB. Plants not insectivorous; not aquatic. [CEAE.]
  - C. Seeds winged: ovary 2-, rarely 1-, celled: trees or climbing shrubs. 134. BIGNONIACEAE.
- CC. Seeds not winged.
  - D. Ovary 1-celled or falsely 2-4-celled.
    - E. Fr. straight or spiral. 135. GESNERIACEAE.
    - EE. Fr. falcate-rostrate. 136. MARTYNIACEAE.
  - DD. Ovary 2-4-celled.
    - E. Plant very mucilaginous: no hooks among seeds: fr. often hooked or spiny. 137. PEDALIACEAE.
    - EE. Plants not conspicuously mucilaginous: hooks in caps. aiding in seed-dissemination. 138. ACANTHACEAE.

**Cohort 4. LAMIALES.** Corolla usually irregular or oblique: posterior stamen smaller than the others, usually abortive or quite deficient: carpels with 2 ovules placed side by side, or else 1-ovuled

- A. Fr. not divided into 4 nutlets: ovary not 4-lobed.
  - B. Ovary 1-celled, 1-ovuled.
    - C. Fls. in heads: plant often heath-like. 139. GLOBULARIACEAE.
    - CC. Fls. in slender interrupted spikes. 140. PHRYMACEAE.
  - BB. Ovary 2-10-celled.
    - C. Cells with 2-10 ovules: trees or shrubs. 141. MYOPORACEAE.
    - CC. Cells with 1 ovule: herbs or shrubs. 142. VERBENACEAE.
- AA. Fr. divided into 4 nutlets: ovary 4-lobed. 143. LABIATEAE.

**Anomalous Family.** Remarkable for its scarious 4-lobed corolla: stamens few; ovary 1-4-celled: fr. a circumscissile caps., or rarely indehiscent; seeds peltate. 144. PLANTAGINACEAE.

**Subclass 3. APETALE OR MONOCHLAMYDEAE.** Corolla wanting or undifferentiated from the calyx (except in some Euphorbiaceae and one genus of Phytolaccaceae), and sometimes also the calyx wanting; perianth simple, the lobes or segms. in 1 or 2 series, similar among themselves and usually calyx-like, sometimes minute or wanting. (See also Ranunculaceae, Flacourtiaceae, Menispermaceae, Trochodendraceae, Rosaceae, Lythraceae, Onagraceae, Hamamelidaceae, Rutaceae, Aceraceae, Rhamnaceae, Eucornaceae, Cornaceae, and Caryophyllaceae with corolla sometimes absent.)

**Series 1. CURVEMBRYEAE.** Embryo curved, excentric, lateral or peripheral, rarely straightish, subcentral and narrow (Polygonaceae); ovule solitary in the ovary or in each carpel or in the Amarantaceae more than 2 ovules erect in the center of the cell: fls. bisexual or, in a few genera, unisexual or polygamous; petals very rarely present; stamens as many as the perianth-segms. or fewer, rarely more.

- A. Fr. the hardened or membranous closed base of the corolla-like perianth with a utricle inclosed. 145. NYCTAGINACEAE.
- AA. Fr. a utricle; ovule not orthotropous; embryo annular or spiral: perianth mostly persistent, small 4-5-lobed, or parted, or 0.
  - B. Perianth herbaceous, or scarious at the margin, persistent; stamens perigynous; style branched or styles 2-3: stipules scarious. (Illecebreaceae, incl. in Caryophyllaceae).
  - BB. Perianth dry, chaff-like, not herbaceous, subtended by a bract and 2 bractlets; stamens hypogynous or perigynous; filaments connate at base; style simple or 2-3-fid: stipules 0. 146. AMARANTACEAE.
- BBB. Perianth-lobes or segms. membranous or herbaceous; stamens hypogynous or perigynous, nearly always free; style simple or 2-3-lobed, or styles 2-5: stipules none. 147. CHENOPODIACEAE.

- AAA. Fr. composed of 1 to several carpels, which are crowded or connate in a ring, each with a style, baccate, coriaceous or samaroid; ovule not orthotropous; embryo coiled; stamens hypogynous; perianth herbaceous or coriaceous, rarely membranous.....148. **PHYTOLACCACEÆ.**
- AAAA. Fr. an achene, triangular or lens-shaped; style branched or styles 2-3; ovule orthotropous; embryo straight; perianth herbaceous, membranous or colored, rarely adherent to base of ovary; usually a stipular sheath at each lf.-node.....149. **POLYGONACEÆ.**

**Series 2. MULTIOVULATÆ TERRESTRES.** Terrestrial herbs or shrubs, often climbers: ovary syncarpous; ovules in each cell or on each placenta numerous.

- A. Fls. dioecious; ovary superior; lvs. bearing tendrils and pitchers.....150. **NEPENTHACEÆ.**
- AA. Fls. bisexual; ovary inferior: lvs. without tendrils and pitchers.....151. **ARISTOLOCHIA-  
[CEÆ.]**

**Series 3. MICREMBRYEÆ.** Ovary syncarpous, monocarpous or apocarpous; ovules solitary for each carpel, rarely 2 or few; endosperm copious, fleshy or mealy; embryo minute.

- A. Perianth 0.  
B. Lvs. alternate: carpels 3-4; ovules 2 to several; stamens 3-6.....152. **SAURURACEÆ.**
- BB. Lvs. alternate, rarely opposite or whorled; carpel 1; ovule 1, basal; stamens 2-8.....153. **PIPERACEÆ.**
- BBB. Lvs. opposite: carpel 1; ovule 1, pendent; stamens 1-3.....154. **CHLORANTHACEÆ.**
- AA. Perianth calyx-like.  
B. Carpel solitary: perianth of 3 parts, connate.....155. **MYRISTICACEÆ.**
- BB. Carpels several, together with the stamens scattered over the face of the cup-shaped receptacle.....156. **MONIMIACEÆ.**

**Series 4. DAPHNEÆ.** Ovary monocarpous, 1-celled, rarely syncarpous with 2-4 cells; ovules solitary, or twin and side by side in the ovary or in each cell, rarely a few pairs superposed.

- A. Radicle superior; ovule solitary, pendulous.  
B. Anthers dehiscing by uplifting valves, rarely laterally dehiscent; perianth-tube short, lobes 6 or 4, in 2 series, usually imbricated; ovary 1-celled; woody.....157. **LAURACEÆ.**
- BB. Anthers normal: perianth-tube long; lobes 4-5, imbricated; ovary 1-2-celled; woody.....158. **THYMELÆACEÆ.**
- AA. Radicle inferior.  
B. Perianth-tube cylindraceous; lobes 4, valvate; stamens as many and opposite them: ovule erect or pendulous, or geminate, rarely  $\infty$ .....159. **PROTEACEÆ.**
- BB. Perianth-tube medium, constricted above the ovary, persistent at base, deciduous above; lobes 2 or 4; stamens twice as many as the lobes; silvery-scaly plants; woody.....160. **ELÆAGNACEÆ.**

**Series 5. ACHLAMYDOSPOREÆ.** Ovary 1-celled; cells 1-3-ovuled; cells and ovules often inconspicuous before anthesis; endosperm of seed without a coat, either free in the pericarp or attached to its walls; plants often parasitic.

- A. Ovule 1, not easily distinguishable from ovary.....161. **LORANTHACEÆ.**
- AA. Ovules 1-3, pendulous from summit of free-central placenta.....162. **SANTALACEÆ.**

**Series 6. UNISEXUALEÆ.** Fls. unisexual; ovary syncarpous or monocarpous; ovule solitary or in pairs side by side in the ovary or in each cell; trees or shrubs, rarely herbs.

- A. Ovary 1-celled.  
B. Ovule solitary; stamens 2 to many.  
C. Fls. of both sexes in globose long-peduncled pendent heads, crowded very densely on a central receptacle; radicle inferior; woody.....163. **PLATANACEÆ.**
- CC. Fls. not as above; radicle superior.  
D. Male perianth free from the bract; stamens as many as its lobes and opposite them, or by abortion fewer, rarely numerous.  
E. Stamens uncoiling elastically.  
F. Ovule suspended, anatropous.....164. **MORACEÆ.**
- FF. Ovule basal, orthotropous.....165. **URTICACEÆ.**

- EE. Stamens not elastic: ovule suspended, anatropous.....166. **ULMACEÆ.**
- DD. Male perianth wanting, sometimes grown to the bract in Juglandaceæ; stamens  $\infty$ , often 2 in Myricaceæ.  
E. Lvs. pinnate: male fls. in catkins; woody.....167. **JUGLANDACEÆ.**
- EE. Lvs. simple: male infl. spicate, subamentaceous; woody.  
F. Carpel 1; placenta parietal: ovule amphitropous.....168. **LEITNERIACEÆ.**
- FF. Carpels 2; placenta basal: ovule orthotropous.....169. **MYRICACEÆ.**
- BB. Ovules 2; stamen 1: equisetum-like plants; woody.....170. **CASUARINACEÆ.**
- AA. Ovary 2-3-celled, rarely more-celled.  
B. Endosperm usually copious; fr. usually separating into 2-valved berries, sometimes fleshy and indehiscent, or various: infl. various.  
C. Hypogynous disk present; micropyle externally directed; juice often milky.....171. **EUPHORBIACEÆ.**
- CC. Hypogynous disk absent: micropyle toward axis; no milky juice.....172. **BUXACEÆ.**
- BB. Endosperm 0; fr. a nut; male infl. usually in catkins; woody.  
C. Carpels 2; pistillate fls. usually in spikes.....173. **BETULACEÆ.**
- CC. Carpels 3; pistillate fls. not in spikes.....174. **FAGACEÆ.**

**Series 7. Anomalous Families.** Somewhat related to the Unisexuales.

- A. Fls. in catkins: caps. 2-4-valved; woody.....175. **SALICACEÆ.**
- AA. Fls. axillary, or rarely in a terminal head: drupe 2- $\infty$ -stoned, stones 1-seeded; low shrubs.....176. **EMPETRACEÆ.**

**Class 2. GYMNOSPERMÆ.** Ovules naked upon a scale, bract or disk: cotyledons 2 or more; fls. unisexual.

- A. Lvs. undivided.  
B. The lvs. fan-shaped: fls. in pairs.....177. **GINKGOACEÆ.**
- BB. The lvs. not fan-shaped.  
C. Perianth present: no resin-tubes, but true vessels in wood.....178. **GNETACEÆ.**
- CC. Perianth wanting: no true vessels, but resin-tubes present.  
D. Ovule solitary, arillate.....179. **TAXACEÆ.**
- DD. Ovules in cones, not arillate.....180. **PINACEÆ.**
- AA. Lvs. pinnatisect, ample, crowded at apex of the woody st.: fls. of both sexes in cones.....181. **CYCADACEÆ.**

**Subdivision 2. MONOCOTYLEDONS.** St. without central pith or annular layers, but having the woody bundles distributed irregularly through it (a transverse section showing the bundles as dots scattered through the cellular tissue); embryo with a single cotyledon: early lvs. always alternate: parts of the fl. usually in 3's, never in 5's; lvs. mostly parallel-veined.

**Series 1. MICROSPERMÆ.** Perianth corolla-like, at least inside; ovary inferior, 1-celled with 3 parietal placentæ, or rarely 3-celled with axile placenta: seeds very small and numerous; without endosperm.

- A. Fls. regular, usually unisexual; stamens usually 2, 6, or 9; aquatic herbs.....182. **HYDROCHARI-  
[TACEÆ.]**
- AA. Fls. usually very irregular; stamens and styles connate into a column; anther 1, rarely 2: terrestrial or epiphytic herbs, rarely climbers.....183. **ORCHIDACEÆ.**

**Series 2. EPIGYNEÆ.** Perianth corolla-like, at least within: ovary generally inferior: endosperm copious.

- A. Fls. normally unisexual; stamens 6, or those opposite the inner perianth-lobes imperfect or deficient; ovary 3-celled; seeds 2.....184. **DIOSCOREACEÆ**
- AA. Fls. normally bisexual, sometimes polygamous or otherwise.  
B. Stamens regular, perianth regular or nearly so: embryo small, included in the endosperm.  
C. Ovary 1-celled; endosperm solid; embryo minute: stamens 6, hooded.....185. **TACCACEÆ.**
- CC. Ovary usually 3-celled.  
D. Stamens 3, opposite the outer lobes: endosperm horny.....186. **IRIDACEÆ.**
- DD. Stamens 6, rarely 3 and opposite the inner lobes, rarely  $\infty$ ; endosperm fleshy.  
E. Placentæ scarcely intruding.....187. **AMARYLLIDACEÆ.**

- EE. Placentæ intruding lamella-like, and peltate.....188. VELLOSIACEÆ.
- BB. Stamens 1 or 5 perfect, the other 5 or 1, variously changed into antherless staminodia; fls. irregular: embryo in a central canal of endosperm, straight, incurved, or horseshoe-shaped.
- C. Fertile stamens 5.....189. MUSACEÆ.
- CC. Fertile stamen 1.
- D. Staminodium 1, often traces of more; a ligule at top of petiole; anther 2-celled.....190. ZINGIBERACEÆ.
- DD. Staminodia 5; no ligule; anther 1-celled.
- E. Ovary-cells 1-seeded: a joint at summit of petiole.....191. MARANTACEÆ.
- EE. Ovary-cells  $\infty$ -seeded: no joint.....192. CANNACEÆ.
- BBB. Stamens regular or nearly so: perianth regular: embryo in a small marginal cave or pit of endosperm, rarely much intruded, never wholly included.
- C. Endosperm mealy: perianth calyx-like outside; stamens 6: lvs. rigid.....193. BROMELIACEÆ.
- CC. Endosperm fleshy: perianth corolla-like or woolly outside; stamens sometimes 6 and equal, sometimes 1-3 and slightly dissimilar, or 3 opposite the inner lobes.
- (Hæmendoraceæ, mostly incl. in Liliaceæ and Amaryllidaceæ.)

**Series 3. CORONARIÆ.** Perianth corolla-like, at least inside: ovary free, rarely shortly adnate at the base: endosperm copious.

- A. Embryo minute or more or less elongated, included in fleshy or horny endosperm: perianth regular: stamens 6: ovary usually 3-celled.....194. LILIACEÆ.
- AA. Embryo straight, in a central canal of mealy endosperm: perianth regular or irregular, from a spathe; stamens 3 or 6: ovary 1- or 3-celled.....195. PONTEDERIACEÆ.
- AAA. Embryo marginal, lying in mealy endosperm and under a little callosity of the seed-coat: perianth regular or slightly irregular, of 3 herbaceous sepals and 3 deliquescent colored petals: some stamens usually sterile and altered; stamen-hairs conspicuous.....196. COMMELINACEÆ.

**Series 4. CALYCINÆ.** Perianth calyx-like, small, somewhat rigid or glumaceous, or rarely herbaceous: ovary free; endosperm copious.

- A. Fr. a 3-valved, many-seeded caps; embryo included in more or less fleshy endosperm: plant grass-like.....197. JUNCACEÆ.
- AA. Fr. berry- or drupe-like, 1-seeded, rarely 2-3-seeded; embryo immersed in a small pit near the periphery of the endosperm: palm-like plants.....198. PALMACEÆ.

**Series 5. NUDIFLORE.** Perianth 0, or reduced to scales or bristles; ovary superior; carpels solitary or, if more, syncarpous, 1- $\infty$ -ovuled: seeds usually with endosperm.

- A. Plants minute, thalloid, 1-3 lines wide, aquatic: fls. solitary or in pairs from marginal fissures.....199. LEMNACEÆ.
- AA. Plants larger: fls. on spadices.
- B. Fls. dioecious; perianth 0; carpels usually confluent in clusters; spadices clustered or paniced: stiff plants.....200. PANDANACEÆ.
- BB. Fls. dioecious, or monœcious in different spadices; perianth 0, or the short segms. distinct or connate; spadices solitary: stiff plants.....201. CYCLANTHACEÆ.
- BBB. Fls. monœcious in different spadices, rarely dioecious; perianth reduced to membranous scales or thread-like chaff; spadices rarely solitary: reed-like marsh plants.....202. TYPHACEÆ.
- BBBB. Fls. bisexual, or monœcious in same spadix, rarely dioecious; perianth 0, or of 4 membranous or fleshy imbricate scales; spadices solitary: herbaceous or fleshy plants.....203. ARACEÆ.

**Series 6. APOCARPÆ.** Perianth in 1-2 series, or 0: ovary superior; carpels solitary, or, if more, distinct: seeds without endosperm.

- A. Embryo complicate or horseshoe-shaped: perianth-segms. 6, in 2 series, the inner petaloid.
- B. Ovules 1, rarely 2-5, basal.....204. ALISMACEÆ.

- BB. Ovules numerous, borne between the margins and midrib of the carpel....205. BUTOMACEÆ.
- AA. Embryo curved: perianth of 4 herbaceous segms., or 0: ovule solitary....206. NAIADACEÆ.
- AAA. Embryo straight: perianth of several petaloid parts: ovules 2-6.....207. APONOGETONACEÆ.

**Series 7. GLUMACEÆ.** Fls. disposed in spikes or spikelets which are variously arranged; bracts of the spikelet scale-like (glumes), usually imbricate; perianth-segms. small, scale-like, bristle-like, or 0; ovary 1-celled, 1-ovuled: seeds with endosperm.

- A. Fr. an achene; seed free from the pericarp; palea and lodicules 0.....208. CYPERACEÆ.
- AA. Fr. a caryopsis; seed usually adherent to pericarp; palea and lodicules present.....209. GRAMINEÆ.

Other families, of which plants are more or less in cultivation and described in this Cyclopædia, are: Adoxaceæ (Adoxa), Basellaceæ (Anredera), Candolleaceæ (Candollea), Caryocaraceæ (Caryocarp), Datisaceæ (Datisca), Frankeniaceæ (Frankenia), Goodeniaceæ (Goodenia, Scævola), Incacinaceæ (Pyrenacantha), Orobanchaceæ (Aphyllon), Restiaceæ (Restio), Turneraceæ (Turnera), Vochysiaceæ (Vochysia).

**Division 2. PTERIDOPHYTA.** Bearing spores instead of seeds, but with a usually separate more insignificant stage which bears sexual organs. Ferns, lycopods, horsetails and the like.

- A. Plants like large moss-plants, with scale- or needle-like lvs.
- B. Spores all alike, minute.....210. LYCOPODIACEÆ.
- BB. Spores of two kinds, larger (megaspores) and smaller (microspores).211. SELAGINELLACEÆ.
- AA. Plants consisting mainly of slender-jointed herbaceous sts. with whorls of scale-like appressed lvs. at the joints.....212. Equisetaceæ.
- AAA. Plants true ferns, with usually expanded lvs. (Azolla, a moss-like water-plant is exceptional.) (Filicales.)
- B. Ferns epiphytic or terrestrial (one Ceratopteris partly aquatic): spores uniform, minute.
- C. Sporangia with thick walls, arising from tissues beneath the epidermis.
- D. The sporangia in spikes or panicles.....213. OPHIOGLOSSACEÆ.
- DD. The sporangia in round or oval sori on under surface of ordinary lf.....214. MARATTIACEÆ.
- CC. Sporangia walls only 1 cell thick, derived from epidermis.
- D. Small membranous ferns: sporangia borne on thread-like projections along margin of lvs.....215. HYMENOPHYLLACEÆ.
- DD. Usually larger, thicker-lvd. ferns: sporangia not on thread-like projections. [ACEÆ]
- E. Plants terrestrial.
- F. Ring of sporangia obsolete; sporangia in panicles.....216. OSMUNDACEÆ.
- FF. Ring of sporangia apical; sporangia ovate, sessile.....217. SCHIZACEÆ.
- FFF. Ring of sporangia vertical.
- G. The sporangia mostly long-stalked: lvs. pinnate or palmate.....218. POLYPODIACEÆ.
- GG. The sporangia mostly sessile or very short-stalked.
- H. Sporangia in sori of 2-8, radiating in a single plane; lf. branching often dichotomous; growth indeterminate.....219. GLEICHENIACEÆ.
- HH. Sporangia numerous in the globose sori: mostly arborescent.....220. CYATHEACEÆ.
- EE. Plants aquatic, with floating sterile lvs. and pod-like sporophylls: sporangia sessile with broad ring or 0....221. CERATOPTERIDACEÆ.
- BB. Ferns, aquatic, urn-like in appearance; spores of 2 sorts,—large macrospores and minute microspores.
- C. Plants floating: lvs. simple, folded: microspores and macrospores in separate sporocarps.....222. SALVINIACEÆ.
- CC. Plants rooting in mud: lvs. quadrifoliate, cloverlike: microspores and macrospores in the same sporocarp.....223. MARSILEACEÆ.

## PART II.—KEY TO THE GENERA

## 1. RANUNCULACEÆ.

- A. Sepals usually valvate; lvs. opposite..... 1. *Clematis*.  
 AA. Sepals imbricate.  
 B. Carpels 1-ovuled; fr. an indehiscent schene.  
 C. Ovule pendulous; raphe dorsal.  
 D. Petals conspicuous..... 2. *Adonis*.  
 DD. Petals 0, or very small.  
 E. Fls. not subtended by involucre..... 3. *Thalictrum*.  
 EE. Fls. subtended by involucre remote from the calyx or close under it.  
 F. Involucre remote from calyx..... 4. *Anemone*.  
 FF. Involucre of 3 simple, sessile lvs. closer under the fl..... 5. *Hepatica*.  
 FFF. Involucre of 3 compound sessile lvs..... 6. *Syndesmon*.  
 CC. Ovules ascending.  
 D. Petals wanting..... 7. *Troutvel-  
[teria]*.  
 DD. Petals 3 to many..... 8. *Ranunculus*.  
 BB. Carpels several- or many-ovuled; fr. usually dehiscent at maturity, rarely berry-like.  
 C. Petals large and showy..... 9. *Paeonia*.  
 CC. Petals medium small, deformed, or 0.  
 D. Fls. irregular.  
 E. Posterior sepal forms a spur..... 10. *Delphinium*.  
 EE. Posterior sepal forms a hood..... 11. *Aconitum*.  
 DD. Fls. regular.  
 E. Infl. racemose.  
 F. Stamens 5 or 10; shrubs..... 12. *Xanthorrh-  
[iza]*.  
 FF. Stamens numerous; herbs.  
 G. Fr. a berry..... 13. *Actæa*.  
 GG. Fr. consisting of follicles, dehiscent..... 14. *Cimicifuga*.  
 EE. Infl. paniculate, or fls. solitary.  
 F. Lvs. palmately veined or cut; not ternate.  
 G. Petals wanting.  
 H. Ovules many, in 2 series along the ventral suture..... 15. *Caltha*.  
 HH. Ovules only 2..... 16. *Hydrastis*.  
 GG. Petals small or narrow; mostly nectar-bearing.  
 H. Sepals commonly deciduous; petals not 2-lipped, nor scale-bearing..... 17. *Trollius*.  
 HH. Sepals persistent; broad petals 2-lipped or bearing a scale..... 18. *Helleborus*.  
 HHH. Sepals deciduous, narrow; petals bearing a scale..... 19. *Eranthis*.  
 FF. Lvs. ternately or subpinnately decompound.  
 G. Sepals 5-6.  
 H. Petals spurred..... 20. *Aquilegia*.  
 HH. Petals not spurred; often small or 0.  
 I. The carpels connate at the base or higher..... 21. *Nigella*.  
 II. The carpels free.  
 J. Carpels stalked..... 22. *Coptis*.  
 JJ. Carpels not stalked..... 23. *Isopyrum*.  
 GG. Sepals and petals numerous..... 24. *Anemonop-  
[sis]*.

The genus *Callianthemum* is also in cultivation.

## 2. DILLENIACEÆ.

- A. Anthers adnate, linear; carpels 5-20, partly connate; upright trees or shrubs..... 1. *Dillenia*.  
 AA. Anthers oblong or rarely orbicular, the cells parallel and contiguous..... 2. *Hibbertia*.  
 AAA. Anthers versatile, emarginate at the base; carpels completely connate; fr. a berry; twining shrubs.  
 B. Stamens and carpels  $\infty$ ; winter-buds inclosed in the swollen base of the petiole..... 3. *Actinidia*.  
 BB. Stamens 10; carpels 5; winter-buds free..... 4. *Clemato-  
[clethra]*.

## 3. CALYCANTHACEÆ.

- A. Stamens 10- $\infty$ ; all sepals brownish red..... 1. *Calycanthus*.  
 AA. Stamens 5; outer sepals white, inner purple..... 2. *Meratia*.

## 4. MAGNOLIACEÆ.

- A. Stamens  $\infty$ ; perianth-segms. 6- $\infty$ .  
 B. Fls. bisexual; upright trees or shrubs.  
 C. Stipules 0..... 1. *Illicium*.

- CC. Stipules present, inclosing young lvs. in the bud.  
 D. Anthers face out..... 2. *Lirioden-  
[dron]*.  
 DD. Anthers face in.  
 E. Structure bearing the carpels stalked..... 3. *Michelia*.  
 EE. Structure bearing the carpels sessile.  
 F. Dehiscence of carpel circumscissile..... 4. *Talauma*.  
 FF. Dehiscence 2-valved..... 5. *Magnolia*.  
 BB. Fls. unisexual; twining shrubs.  
 C. Carpels after anthesis spicate..... 6. *Schizandra*.  
 CC. Carpels after anthesis globose-capitate..... 7. *Kadsura*.  
 AA. Stamens 4; perianth-segms. 4; fls. in slender spikes, small; lvs. palminerved; tree..... 8. *Tetracen-  
[tron]*.

Members of the genus *Drimys* are sometimes cultivated.

## 5. TROCHODENDRACEÆ.

- A. Carpels 5-8, sessile, with many seeds; fls. perfect; evergreen tree..... 1. *Trochoden-  
[dron]*.  
 AA. Carpels  $\infty$ , stipitate, developing into winged nutlets with 1 or few seeds; fls. polygamous; deciduous tree..... 2. *Euptelea*.

## 6. CERCIDIPHYLLACEÆ.

The only genus..... *Cercidiphyllum*.

## 7. EUCOMMACEÆ.

The only genus..... *Eucommia*.

## 8. ANNONACEÆ.

- A. Fr. an aggregation of many carpels closely crowded into a spheroid or ovoid mass; ovules solitary.  
 B. Carpels fused together with the receptacle (torus) into a fleshy (often edible) syncarpium.  
 C. Corolla gamopetalous, 3-lobed or 3-spurred, almost closed, with only a minute opening above the stamens and pistils..... 1. *Rollinia*.  
 CC. Corolla polypetalous; petals 6 in 2 series, inner series sometimes minute or even wanting, outer petals valvate..... 2. *Annona*.  
 BB. Carpels distinct, rigid, polygonal, becoming detached from the receptacle when mature; corolla polypetalous, the petals imbricate or overlapping..... 3. *Duguetia*.  
 AA. Fr. a cluster of distinct carpels, usually stipitate, never crowded so closely as to become polygonal or prism-shaped; ovules geminate or many in 1 or 2 series.  
 B. Ovules geminate, vertical, parallel..... 4. *Artabotrys*.  
 BB. Ovules horizontal or in 2 vertical rows.  
 C. Petals narrow, long, strap-shaped..... 5. *Canangium*.  
 CC. Petals suborbicular to obovate-oblong.  
 D. Inner petals with their margins involute, ear-shaped or boat-shaped..... 6. *Cymbopet-  
[alum]*.  
 DD. Inner petals with margins not involute..... 7. *Asimina*.

*Fusæa*, *Unona*, *Uvaria*, and *Xylopia* are also slightly in cultivation.

## 9. MENISPERMACEÆ.

- A. Filaments coalesced into a column which is subpetalate at apex.  
 B. Sepals 6; petals 0..... 1. *Anamirta*.  
 (See article *Cocculus*.)  
 BB. Sepals 4; petals grown together, making a small cup..... 2. *Cissampelos*.  
 AA. Filaments free, either at base or apex.  
 B. Stamens 9-20.  
 C. Sepals and petals 6, in whorls; stamens 9-12..... 3. *Sinomen-  
[ium]*.  
 CC. Sepals and petals irregularly arranged; sepals 4-10; petals 6-9; stamens 12-24..... 4. *Menisper-  
[mum]*.  
 BB. Stamens 6.  
 C. Petals 6, shorter than sepals, stamens high-monoadelphous..... 5. *Cocculus*.  
 CC. Petals 0, unless the 3 inner and larger sepals are regarded as petals; outer stamens free..... 6. *Abuta*.

*Calyocarpum* and *Jatrochirrhiza* are sometimes cultivated.

## 10. BERBERIDACEÆ.

- A. Venation or lobing pinnate; lvs. penninerved, pinnatisect, pinnately 2-3-ternate or compound.  
 B. Ovules few, erect from the base.  
 C. Plants are shrubs.  
 D. Foliage-lvs. simple, often fascicled; branches usually bearing reduced spine-lvs. .... 1. *Berberis*.  
 DD. Foliage-lvs. pinnate; evergreen branches unarmed.  
 E. Lfts. serrate; lvs. simply pinnate. .... 2. *Mahonia*.  
 EE. Lfts. entire; lvs. 2-3-pinnate. .... 3. *Nandina*.  
 CC. Plants are herbs.  
 D. Petals 6, reduced to small nectaries. .... 4. *Leontice*.  
 DD. Petals 6, scarcely smaller than sepals and flat. .... 5. *Leontice*, § [*Bongardia*].  
 BB. Ovules placed ventrally in 2 series; herbs.  
 C. Sepals 12-15; petals 0, reduced to nectaries. .... 6. *Vancouveria*.  
 CC. Sepals 8; petals 4, reduced to nectaries. .... 7. *Epimedium*.  
 CCC. Sepals 7-8; petals 4, a little smaller; flat. .... 8. *Aceranthus*.  
 AA. Venation or lobing palmate; lvs. palminerved, palmilobed, or 2-parted.  
 B. Sepals 6; petals 6; ovules in 2 series. .... 9. *Diphylleia*.  
 BB. Sepals 6; petals 6-9; ovules in many series. .... 10. *Podophyl- lum*.  
 BBB. Sepals 4; petals 8. .... 11. *Jeffersonia*.  
 BBBB. Sepals and petals 0. .... 12. *Achlys*.

The species of *Caulophyllum* may be expected in wild gardens.

## 11. LARDIZABALACEÆ.

- A. Lvs. pinnate; upright shrub. .... 1. *Decaisnea*.  
 AA. Lvs. digitate; twining shrubs.  
 B. Carpels 3, many-seeded.  
 C. Stamens monadelphous.  
 D. Sepals 6; petals 6, much smaller. .... 2. *Lardizabala*.  
 DD. Sepals 6; petals 0. .... 3. *Stauntonia*.  
 CC. Stamens free.  
 D. Sepals 6; petals 6.  
 E. Pedicels elongated; sepals acuminate; connective produced above the anthers. .... 4. *Holboellia*.  
 EE. Pedicels short; sepals rounded; connective not produced; racemes very long. .... 5. *Sinofranchetia*.  
 DD. Sepals 3; petals 0. .... 6. *Akebia*.  
 BB. Carpels ∞, 1-seeded; stamens free; lvs. deciduous. .... 7. *Sargentodoxa*.

## 12. NYMPHÆACEÆ.

- A. Fls. small ( $\frac{1}{2}$ -1 in.).  
 B. Stamens 3-6; submerged lvs. dissected. .... 1. *Cabomba*.  
 BB. Stamens 12-25; lvs. all petulate. .... 2. *Brasenia*.  
 AA. Fls. large and showy ( $1\frac{1}{2}$ -12 in.); sepals 4-5; petals and stamens ∞.  
 B. Carpels in pits in a top-shaped receptacle. .... 3. *Nelumbo*.  
 BB. Carpels forming a distinct many-seeded ovary.  
 C. Plants prickly.  
 D. Stamens, inner ones, sterile. .... 4. *Victoria*.  
 DD. Stamens all fertile. .... 5. *Euryale*.  
 CC. Plants not prickly.  
 D. Ovary wholly free and superior. .... 6. *Nuphar*.  
 DD. Ovary with stamens and inner petals inserted on it. .... 7. *Nymphaea*.

## 13. SARRACENIACEÆ.

- A. Style umbrella-shaped. .... 1. *Sarracenia*.  
 AA. Style 5-cut at apex. .... 2. *Darlingtonia*.

*Heliamphora* may be expected in choice botanical collections.

## 14. PAPAVERACEÆ.

- A. Stigmas distinct; lvs. mainly opposite or whorled; sepals usually 3; petals usually 6, in 2 series; placenta never separate from the valves.  
 B. Lvs. lobed. .... 1. *Romneya*.  
 BB. Lvs. entire.  
 C. Filaments dilated; stigmas ∞, linear; fr. not capsular. .... 2. *Platystemon*.  
 CC. Filaments slightly dilated; stigmas 3, broader; fr. capsular. .... 3. *Platystigma*.

- AA. Stigmas confluent; lvs. alternate, ternately compound; sepals 2; petals 4; placenta remain attached to the margin of the valves.  
 B. Sepals coherent and covering fl. like a candle-extinguisher. .... 4. *Eschscholtzia*.  
 BB. Sepals separate.  
 C. Lobes of stigma 2, erect. .... 5. *Dendromecon*.  
 CC. Lobes of stigma 4, spreading. .... 6. *Hunneimannia*.  
 AAA. Stigmas confluent; lvs. alternate or mainly so; fls. rarely 3-merous; caps. dehiscing by pores or valves, the placenta remaining as a frame alternate with and free from the valves.  
 B. Caps. dehiscing by pores near the top. .... 7. *Papaver*.  
 BB. Caps. shortly dehiscing by valves.  
 C. Stigmatic lobes radiating on the depressed summit of a very short style. .... 8. *Argemone*.  
 CC. Stigmatic lobes radiating on the club-shaped top of a distinct style. .... 9. *Meconopsis*.  
 BBB. Caps. dehiscing by valves to the base or nearly so.  
 C. The caps. long and linear.  
 D. Seeds pitted. .... 10. *Glaucium*.  
 DD. Seeds crested. .... 11. *Chelidonium*.  
 CC. The caps. ovoid, oblong or cylindrical.  
 D. Petals 4.  
 E. Style distinct, but short. .... 12. *Stylophorum*.  
 EE. Style long. .... 13. *Eomecon*.  
 DD. Petals 8-12. .... 14. *Sanguinaria*.  
 DDD. Petals 0. .... 15. *Bocconia*.  
 Hypecoum is in the trade.

## 15. FUMARIACEÆ.

- A. Corolla 2-spurred or bigibbous, the 2 outer and larger (lateral) petals similar.  
 B. Seeds crestless; petals permanently united into a subcordate persistent corolla which incloses the ripe caps. .... 1. *Adlumia*.  
 BB. Seeds mostly crested; petals less or slightly united into a 2-spurred or bigibbous corolla. .... 2. *Dicentra*.  
 AA. Corolla with only 1 of the outer petals spurred or gibbous by torsion becoming posterior; a nectariferous spur from the base of the filaments projects into the petal-spur.  
 B. Style mostly persistent. .... 3. *Corydalis*.  
 BB. Style deciduous; fl. smaller. .... 4. *Fumaria*.

## 16. CRUCIFERÆ.

- A. The silique transversely 2-jointed.  
 B. Lower joint indehiscent pedicel-shaped, the larger joint globose, 1-loculed, 1-seeded. .... 1. *Crambe*.  
 BB. Lower joint dehiscent, 2-valved, many seeded. .... 2. *Morisia*.  
 AA. The silique not 2-jointed, indehiscent.  
 B. Siliques in pairs. .... 3. *Senebiera*.  
 BB. Siliques not in pairs.  
 C. Texture horny or bony. .... 4. *Isatis*.  
 CC. Texture leathery, or membranaceous.  
 D. Shape straight. .... 5. *Raphanus*.  
 DD. Shape curved. .... 6. *Sobolewskaia*.  
 DDD. Shape orbicular. .... 7. *Pellaria*.  
 AAA. The silique dehiscent for its whole length (except that some Brassicas are not dehiscent at the apex).  
 B. Valves markedly concave, compressed contrary to the septum, which is often very narrow; silique short.  
 C. Cotyledons accumbent.  
 D. Sts. leafy. .... 8. *Iberis*.  
 DD. Sts. scapes. .... 9. *Hutchinsia*.  
 CC. Cotyledons incumbent.  
 D. The valves usually wingless.  
 E. Fls. rosy or violet. .... 10. *Ionopsis*.  
 EE. Fls. white. .... 11. *Lepidium*.  
 DD. The valves winged. .... 12. *Ethionema*.  
 BB. Valves (transversely septiferous in *Anastatica*), flat or concave, not compressed contrary to the septum (*Smelowskia* and certain *Vesicarias* are laterally compressed); septum as wide as the valves; silique long or short.  
 C. Cotyledons longitudinally conduplicate.  
 D. Seeds in 1 series. .... 13. *Brassica*.  
 DD. Seeds in 2 series. .... 14. *Eruca*.  
 CC. Cotyledons accumbent (sometimes incumbent or convolute in *Cheiranthus*).  
 D. Seeds in 1 series (except certain species of *Radicula* and *Arabis*; siliques long and narrow (except in *Anastatica* and sometimes *Radicula* and *Parrya*).

- E. Valves appendaged**.....15. *Anastatica*.  
(See article Resurrection Plants.)
- EE. Valves not appendaged.**
- F. Stigmatic lobes erect, connate or decurrent along the style.**
- G. Plants are herbs or branched sub-shrubs; woolly**.....16. *Matthiola*.
- GG. Plants are tufted, scape-bearing herbs**.....17. *Parrya*.
- FF. Stigma undivided or shortly lobed.**
- G. Valves elastic; seeds in 1 or 2 series, siliqua long and linear**...18. *Arabis*.
- GG. Valves not elastic.**
- H. Sepals unequal, the lateral ones saccate at the base**...19. *Cheiranthus*.
- HH. Sepals equal.**
- I. Seeds in 2 series**.....20. *Radicula*.
- II. Seeds in 1 series.**
- J. Fls. yellow**.....21. *Barbarea*.
- JJ. Fls. white or purple.**
- K. Rhizome not scaly; valves delicately netted-nerved**.....22. *Cardamine*.
- KK. Rhizome scaly; valves with very delicate midrib**.....23. *Dentaria*.
- DD. Seeds in 2 series and siliques short and broad (except in some species of Aubrietia, Draba and Cochlearia).**
- E. Siliques 2-locular, many-seeded; seeds much compressed, winged or margined.**
- F. Lvs. entire or dentate; siliques long-stalked, very broad**.....24. *Lunaria*.
- FF. Lvs. pinnatisect; siliques sessile**...25. *Selenia*.
- EE. Siliques 1-2-loculed, 2- to many-seeded; seeds rarely winged; valves often turgid.**
- F. Sepals often unequal, the lateral saccate at the base.**
- G. Fls. purple; siliques oblong; lateral sepals saccate**.....26. *Aubrietia*.
- GG. Fls. generally yellow; siliques mostly oblong; sepals equal or unequal**.....27. *Vesicaria*.
- FF. Sepals equal.**
- G. Stamens often appendaged**.....28. *Alyssum*.
- GG. Stamens not appendaged.**
- H. Plants tomentose**.....29. *Draba*.
- HH. Plants glabrous**.....30. *Cochlearia*.  
(See also Kerneria.)
- CCC. Cotyledons incumbent, straight, convolute or transversely plicate.**
- D. The cotyledons transversely biplicate**...31. *Heliotheca*.
- DD. The cotyledons not transversely biplicate.**
- E. Petals pinnatifid**.....32. *Schizopetalon*.
- EE. Petals not pinnatifid.**
- F. Stigmas erect, free or connate into a cone; sepals long and straight.**
- G. The stigmas bilamellate; lamellae erect**.....33. *Hesperis*.
- GG. The stigmas bilamellate; lamellae connivent or connate into a cone**.....34. *Malcomia*.
- FF. Stigma simple, capitate, emarginate or shortly 2-lobed; cotyledons straight.**
- G. Siliqua stipitate**.....35. *Stanleya*.
- GG. Siliqua sessile.**
- H. Sepals equal**.....36. *Smelowskia*.
- HH. Sepals unequal**.....37. *Erysimum*.

The additional genera are also treated: *Braya*, *Physaria*, and *Physotrichis*.

### 17. CAPPARIDACEÆ.

- A. Fr. capsular, 1-loculed; herbs.**
- B. Torus short, often produced into a posterior appendage**.....1. *Cleome*.
- BB. Torus long, produced into a gynophore which is elongated at the middle and bears the pistil to which the filaments are united**.....2. *Gynandropsis*.
- AA. Fr. berry-like or drupe-like.**
- B. Lvs. simple**.....3. *Capparis*.
- BB. Lvs. with 3 lfts.**.....4. *Cratæva*.

*Polanisia* is also to be expected in cultivation.

### 18. RESEDACEÆ.

In cultivation.....*Reseda*.

### 19. CISTACEÆ.

- A. Placentæ with many seeds; lvs. opposite at least below, flat.**
- B. Valves 5, rarely 3; embryo circinate or spiral; fls. solitary or cymose, rarely racemose**.....1. *Cistus*.
- BB. Valves 3; embryo biplicate, runcinate or circumflex; fls. commonly racemose**.....2. *Helianthemum*.
- AA. Placentæ with 2 seeds; lvs. alternate, scale-like or awl-shaped; heath-like shrubs**.....3. *Hudsonia*.

### 20. VIOLACEÆ.

- A. Sepals subequal, produced or spurred at base; lower petal spurred or saccate; herbs**.....1. *Viola*.
- AA. Sepals not produced at base.**
- B. Lower petal spurred or enlarged.**
- C. With a very large spur; seeds complanate; woody climber**.....2. *Corynolysis*.
- CC. With lower petal merely gibbous; seeds obovoid-subglobose; herbs**.....3. *Solea*.
- BB. Lower petal not greatly unlike the others; shrubs or trees**.....4. *Hymenanthera*.

### 21. BIXACEÆ.

- A. Caps. 2-valved; seeds straight and naked; lvs. entire**.....1. *Bixa*.
- AA. Caps. 3-valved; seeds spiral, hairy or woolly; lvs. digitate or palmately lobed**.....2. *Maximiliana*.

### 22. FLACOURTIACEÆ.

- A. Sepals and petals alike, 9-15, spirally arranged, red; stamens 7-10; twining shrub**...1. *Berberidopsis*.
- AA. Sepals 3-6, whorled; stamens usually numerous (except in No. 4); upright trees or shrubs.**
- B. Petals 4-10; sepals 3-5**.....2. *Oncoba*.
- BB. Petals wanting.**
- C. Infl. axillary; lvs. penninerved, leathery; fr. a berry or drupe.**
- D. Style simple, sometimes lobed at apex; ovary 1-celled.**
- E. The sepals imbricate; style short**.....3. *Xylosma*.
- EE. The sepals valvate; style elongated; stamens sometimes 5 or 10**.....4. *Azara*.
- DD. Styles several; ovary irregularly divided.**
- E. Fls. perfect or polygamous, in axillary racemes or panicles; fr. a drupe**.....5. *Flacourtia*.
- EE. Fls. dioecious, the pistillate solitary or few; fr. a berry**.....6. *Aberia* (or *Doryalis*).
- CC. Infl. terminal; lvs. hand-nerved or 3-nerved at base, long-stalked, deciduous.**
- D. Fr. a berry; styles usually 5; sepals imbricate**.....7. *Idesia*.
- DD. Fr. a caps.**
- E. Styles 3, 2-parted at apex; sepals valvate**.....8. *Poliathyrsis*.
- EE. Styles 3-4, 3-parted at apex; sepals reduplicate, large**.....9. *Carriera*.

### 23. PITTOSPORACEÆ.

- A. Fr. indehiscent.**
- B. Filaments longer than anthers; petals more or less connivent from the base to beyond the middle**.....1. *Billardiera*.
- BB. Filaments shorter than anthers; petals spreading from the base**.....2. *Sollya*.
- AA. Fr. a caps. which is loculicidally dehiscent.**
- B. Caps. thick-coriaceous; seeds numerous.**
- C. Seeds not winged, thick or slightly compressed**.....3. *Pittosporum*.
- CC. Seeds winged, flat, compressed, horizontal.**
- BB. Caps. thinly coriaceous; seeds 1-2 in each locule, compressed, not winged, vertical**...4. *Bursaria*.

### 24. TREMANDRACEÆ.

- A. Anthers 2-celled, or 4-celled in 2 planes**.....1. *Tetradlea*.
- AA. Anthers 4-celled in 1 plane**.....2. *Platytheca*.

### 25. POLYGALACEÆ.

In cultivation.....*Polygala*.

## 26. CARYOPHYLLACEÆ.

- A. Ovary 1-ovuled; corolla absent.  
 B. Segms. of involucrate perianth hooded near apex and mucronate on back..... 1. *Paronychia*.  
 BB. Segms. of hardly involucrate perianth not hooded, and blunt..... 2. *Herniaria*.  
 AA. Ovary several-ovuled; petals usually present.  
 B. Sepals coalesced into a toothed or lobed calyx; petals and stamens hypogynous, being raised with the ovary on a gynophore, rarely sessile; petals with or without a scale at the apex of the claw.  
 C. Hilum facial; embryo straight.  
 D. Calyx tubular, multistriate..... 3. *Dianthus*.  
 DD. Calyx top-shaped or long-tubular, 5- or 15-ribbed; plants and fls. smaller..... 4. *Tunica*.  
 CC. Hilum lateral; embryo peripheral.  
 D. Calyx 10-nerved, rarely with many parallel nerves.  
 E. Styles commonly 3: caps. shortly 3- or 6-valved..... 5. *Silene*.  
 EE. Styles commonly 5 or 4: caps. shortly 5-10- or 4-8-valved..... 6. *Lychnis*.  
 DD. Calyx obscurely veined..... 7. *Saponaria*.  
 DDD. Calyx broadly or obscurely 5-nerved..... 8. *Gypsophila*.  
 BB. Sepals free or only coalesced at the very base; petals and stamens hypogynous on a short torus or usually very shortly perigynous.  
 C. Stipules small, scarious..... 9. *Spergula*.  
 CC. Stipules 0.  
 D. Valves (or rather teeth) of the caps. twice as many as the styles..... 10. *Cerastium*.  
 DD. Valves of the caps. as many as the styles.  
 E. Petals 2-fid; styles commonly 3..... 11. *Stellaria*.  
 EE. Petals entire; styles commonly 3..... 12. *Arenaria*.  
 EEE. Petals entire or 0; styles as many as the sepals..... 13. *Sagina*.

Alsine is also cultivated.

## 27. PORTULACACEÆ.

- A. Ovary cohering below with the calyx-tube..... 1. *Portulaca*.  
 AA. Ovary free from the calyx.  
 B. Embryo arched; endosperm scant..... 2. *Anacamp-*  
 BB. Embryo more incurved or annular, including the endosperm. [seros].  
 C. Sepals usually deciduous..... 3. *Talinum*.  
 CC. Sepals persistent, at least usually in Calandrinia.  
 D. Number of sepals 5-8..... 4. *Lewisia*.  
 DD. Number of sepals 2.  
 E. Shape of sepals roundish heart-shaped, scarious..... 5. *Spraguea*.  
 EE. Shape of sepals ovate, herbaceous.  
 F. Stamens 3, rarely 5..... 6. *Montia*.  
 FF. Stamens definitely 5..... 7. *Claytonia*.  
 FFF. Stamens indefinitely 5 to many..... 8. *Calandrinia*.

## 28. TAMARICACEÆ.

- A. Stamens 4-5, free..... 1. *Tamarix*.  
 AA. Stamens 10, connate below..... 2. *Myricaria*.

## 29. FOUQUIERIACEÆ.

The only genus..... *Fouquieria*.

## 30. HYPERICACEÆ.

- A. Fls. 4-merous..... 1. *Ascyrum*.  
 AA. Fls. 5-merous..... 2. *Hypericum*.

## 31. GUTTIFERÆ.

- A. Style very short or 0: ovules solitary in each locule of the ovary.  
 B. Sepals 4..... 1. *Garcinia*.  
 BB. Sepals 2..... 2. *Rheedia*.  
 AA. Style elongated; ovules solitary or 2.  
 B. Ovary 1-loculed, 1-ovuled..... 3. *Calophyl-*  
 lum.  
 BB. Ovary 2-4-loculed, 4-ovuled..... 4. *Mammea*.

The genera *Ochrocarpus* and *Platonia* are also treated.

## 32. EUCRYPHIACEÆ.

The only genus..... *Eucryphia*.

## 33. TERNSTRÆMIACEÆ.

- A. Anthers basifixed.  
 B. Calyx of 5 sepals, sub-connate at the base, at length fleshy and adhering to the ovary... 1. *Visnea*.  
 BB. Calyx inferior; sepals free.  
 C. Fls. rather large; petals coalesced at base; anthers glabrous; ovules 2-4 in each locule, pendulous from the apex..... 2. *Ternstræmia*.  
 CC. Fls. medium-sized; petals free or hardly coalesced; anthers pilose; ovules  $\infty$  in the middle of the locule..... 3. *Cleyera*.  
 CCC. Fls. small, dioecious; petals coalesced at base; anthers glabrous; ovules  $\infty$  in the middle of the locule..... 4. *Eurya*.  
 AA. Anthers versatile.  
 B. Radicles inferior.  
 C. Ovules ascending; seeds lens-shaped; embryo straight..... 5. *Stuartia*.  
 CC. Ovules laterally affixed; seeds flat, winged on back; cotyledons flat and radicle inflexed..... 6. *Schima*.  
 BB. Radicles superior.  
 C. Ovules  $\infty$ ; seeds winged above..... 7. *Gordonia*.  
 CC. Ovules few in each locule; seeds not winged.  
 D. Fls. sessile; sepals deciduous..... 8. *Camellia*.  
 DD. Fls. pedicelled; sepals persistent..... 9. *Thea*.

## 34. STACHYURACEÆ.

The only genus..... *Stachyurus*.

## 35. MALVACEÆ.

- A. Fr. a caps., loculicidally dehiscent (in *Adansonia* indehiscent, and woody).  
 B. Seeds usually kidney-shaped; stigmas or style-branches finally spreading.  
 C. Bractlets 5 to many, rarely 0, or reduced to teeth: style-branches finally spreading..... 1. *Hibiscus*.  
 CC. Bractlets 0 or 3; stigmas distinct, free, radiating..... 2. *Lagunaria*.  
 BB. Seeds obovoid or angled; style club-shaped at apex, undivided or with short erect branches.  
 C. Bractlets 3-5, small..... 3. *Thespesia*.  
 CC. Bractlets 3, large, cordate..... 4. *Gossypium*.  
 AA. Fr. composed of carpels which separate at maturity.  
 B. Staminal column anther-bearing outside; truncate or 5-toothed at the apex; style-branches 10.  
 C. Bractlets 5-8, herbaceous or setiform; carpels with or without 1-3 awns..... 5. *Pavonia*.  
 CC. Bractlets  $\infty$ , herbaceous or setiform; carpels fleshy outside, connate into a berry, later separating..... 6. *Malvaviscus*.  
 CCC. Bractlets 4-6, large and colored; carpels naked, mucous..... 7. *Gæthea*.  
 BB. Staminal column bearing anthers at or near the apex.  
 C. Carpels  $\infty$ , crowded into a mass without order.  
 D. Bractlets 3..... 8. *Malope*.  
 DD. Bractlets 0..... 9. *Palava*.  
 CC. Carpels in a single whorl.  
 D. Ovules 2 or more.  
 E. Bractlets 4-6..... 10. *Kydia*.  
 EE. Bractlets 0..... 11. *Abutilon*.  
 EEE. Bractlets 3..... 12. *Sphæralcea*.  
 DD. Ovule solitary.  
 E. The ovule ascending.  
 F. Styles longitudinally stigmatose inside.  
 G. Fls. dioecious..... 13. *Napæa*.  
 GG. Fls. bisexual. (See article *Sida*.)  
 H. Staminal column double, the outer of 5 clusters..... 14. *Sidalcea*.  
 HH. Staminal column single.  
 I. Bractlets 3-9, connate at base.  
 J. Axis of fr. not surpassing carpels..... 15. *Althæa*.  
 JJ. Axis of fr. surpassing carpels..... 16. *Lavatera*.  
 II. Bractlets 0-3, distinct.  
 J. Carpels with transverse appendages inside under the beak..... 17. *Callirhoë*.

- JJ. Carpels not appendaged... 18. *Malva*.  
 FF. Style-branches tipped with small  
 capitate or club-shaped stigmas... 19. *Malvastrum*.  
 EE. The ovules pendulous.  
 F. Style-branches longitudinally stig-  
 matose inside... 20. *Plagianthus*.  
 FF. Style-branches truncate at apex or  
 with small capitate stigmas... 21. *Sida*.

Other genera described are *Hoheria*, *Ingenhousia*, *Kitabelia*,  
 and *Kosteletzkya*.

### 36. BOMBACACEÆ.

- A. Lvs. digitate: cotyledons conduplicate or  
 convolute.  
 B. Staminal column separated above into  
 numerous filaments.  
 C. Caps. 5-valved, densely woolly within... 1. *Bombax*.  
 CC. Caps. woody, not woolly within.  
 D. Calyx 5-cut... 2. *Adansonia*.  
 DD. Calyx truncate... 3. *Pachira*.  
 BB. Staminal column 5-cut or 5-toothed, the  
 branches bearing 2-3 anthers.  
 C. Column outside below the middle annu-  
 lately 5-10-lobed... 4. *Chorisia*.  
 CC. Column not annulate... 5. *Ceiba*.  
 AA. Lvs. simple, feather-veined, entire: cotyledons  
 plane, leafy or fleshy... 6. *Durio*.

### 37. STERCULIACEÆ.

- A. Petals concave or hooded at the base.  
 B. Anthers solitary between the staminodes... 1. *Rulingia*.  
 BB. Anthers 2 or more between the staminodes.  
 C. Fr. a membranous caps... 2. *Abroma*.  
 CC. Fr. a woody caps... 3. *Guazuma*.  
 CCC. Fr. drupaceous... 4. *Theobroma*.  
 AA. Petals flat.  
 B. The petals deciduous.  
 C. Anthers sessile; calyx club-shaped or bell-  
 shaped... 5. *Reevesia*.  
 CC. Anthers stipitate; sepals at length free... 6. *Pterosper-*  
*ium*.  
 BB. The petals persistent or marcescent.  
 C. Anthers 10 or 15, rarely 20.  
 D. Ovules 2 in each locule... 7. *Dombeya*.  
 DD. Ovules ∞... 8. *Pentapetes*.  
 CC. Anthers 5... 9. *Mahernia*.  
 AAA. Petals 0.  
 B. Fls. bisexual... 10. *Fremontia*.  
 BB. Fls. unisexual or polygamous.  
 C. Anthers crowded without order: seeds  
 without endosperm... 11. *Sterculia*.  
 CC. Anthers in a single ring: seeds with en-  
 dosperm... 12. *Cola*.

*Brachychiton*, *Chiranthodendron*, and *Heritiera* are also treated.

### 38. TILIACEÆ.

- A. Calyx bell-shaped, 3-5-cut... 1. *Beria*.  
 AA. Calyx composed of distinct sepals.  
 B. Petals pitted at the base, inserted around  
 the base of a more or less elevated torus.  
 C. Fr. unarmed, glabrous, or tomentose... 2. *Grewia*.  
 CC. Fr. echinate or setose... 3. *Triumfetta*.  
 BB. Petals not pitted, inserted immediately  
 around the stamens.  
 C. Fr. indehiscent globose, usually 1-seeded... 4. *Tilia*.  
 CC. Fr. a caps.  
 D. Caps. loculicidally dehiscent.  
 E. The stamens all bear anthers.  
 F. The caps. globose, echinate... 5. *Entelea*.  
 FF. The caps. pod-like, usually naked... 6. *Corchorus*.  
 EE. The outer stamens have no anthers... 7. *Sparmannia*.  
 DD. Caps. dehiscent at the apex... 8. *Luehea*.

### 39. ELÆOCARPACEÆ.

- A. Fr. a berry... 1. *Aristolelia*.  
 AA. Fr. a drupe... 2. *Elæocarpus*.  
 AAA. Fr. a dehiscent loculicidal caps... 3. *Tricuspid-*  
*laria*.

### 40. LINACEÆ.

- A. Styles 5: lvs. entire; glands equal... 1. *Linum*.  
 AA. Styles 3-4: lvs. usually serrate; glands usually  
 unequal or absent... 2. *Reinwardtia*.

### 41. ERYTHROXYLACEÆ.

- In cultivation... *Erythroxylon*.

### 42. MALPIGHIACEÆ.

- A. Fr. a fleshy 3-stoned drupe... 1. *Malpighia*.  
 AA. Fr. a caps. composed of 3 dehiscent berries:  
 fls. in terminal racemes... 2. *Galphimia*.  
 AAA. Fr. consists of 1-3 samaras: fls. in umbel-like  
 corymbs... 3. *Stigmaphyl-*  
*lon*.

Other genera described are *Byrsonima*, *Janusia*, *Sphegamno-*  
*carpus* and *Tristellateia*.

### 43. ZYGOPHYLLACEÆ.

- A. Ovary sessile: lvs. with 2 lfts., rarely 1 lft... 1. *Zygophyl-*  
*lum*.  
 AA. Ovary stalked: lvs. abruptly pinnate... 2. *Guaiacum*.

### 44. GERANIACEÆ.

- A. Fls. irregular, the posterior sepal spurred;  
 spur adnate to the pedicel... 1. *Pelargonium*.  
 AA. Fls. regular or nearly so.  
 B. Stamens 10, usually all fertile: tails of car-  
 pels usually not bearded inside... 2. *Geranium*.  
 BB. Stamens, 5 fertile and 5 reduced to scales;  
 tails of carpels usually bearded inside... 3. *Erodium*.  
 BBB. Stamens 15, anther-bearing, in groups of 5... 4. *Monsonia*.

### 45. TROPÆOLACEÆ.

- The only genus... *Tropæolum*.

### 46. LIMNANTHACEÆ.

- In cultivation... *Limnanthes*.

### 47. OXALIDACEÆ.

- A. Fr. a loculicidal caps.  
 B. Valves of caps. separating to the middle... 1. *Oxalis*.  
 BB. Valves of caps. separating to the base... 2. *Biophytum*.  
 AA. Fr. an indehiscent berry... 3. *Averrhoa*.

### 48. BALSAMINACEÆ.

- In cultivation... *Impatiens*.

### 49. RUTACEÆ.

- A. Ovary entire or slightly 2-5-lobed; style ter-  
 minal, entire at base: fr. drupe-like or berry-  
 like, but leathery, usually indehiscent.  
 B. Fls. hermaphrodite; petals and stamens  
 free or connate; ovules 1, 2 or many: fr.  
 usually with a cortex outside and pulpy  
 within: seeds ex-albuminous. (Subfamily  
*Citrææ*.)  
 C. Cotyledons thin and twisted in seed: frs.  
 dry... 1. *Micromelum*.  
 CC. Cotyledons thick and fleshy, plano-con-  
 vex: frs. more or less fleshy or pulpy.  
 D. Thorns absent: lvs. pinnate: lfts. alter-  
 nate on rachis: frs. fleshy berries.  
 E. Styles very short and thick, persist-  
 ent: fls. small, urceolate: young  
 growth densely covered with brown  
 velvety pubescence... 2. *Glycosmis*.  
 EE. Styles long or, if short, dehiscent.  
 F. Fls. small: ovarian cells with scat-  
 tered hairs: frs. with thick fleshy  
 dissepiments... 3. *Clauцена*.  
 FF. Fls. large: ovarian cells with tufted  
 conducting hairs: frs. fleshy but  
 with thin dissepiments... 4. *Chalcas*.  
 DD. Thorns usually present: lvs. simple or,  
 if compound, with the lateral lfts.  
 exactly opposite. (Tribe *Citrææ*.)  
 E. Frs. large, hard-shelled: cells filled  
 with mucilage. (Subtribe *Æglinae*.)  
 F. Lvs. pinnate: ovary 5-celled but  
 by confluence becoming 1-celled.  
 G. Seeds woolly; exocarp woody,  
 continuous... 5. *Feronia*.  
 GG. Seeds smooth; exocarp prismatic... 6. *Feroniella*.  
 FF. Lvs. trifoliate or simple: ovary  
 6-15-celled.

- G.** The lvs. always simple; fr. with thin dissepiments, 6-celled; seeds smooth..... 7. *Eglopsis*.
- GG.** The lvs. trifoliate; fr. 8-15-celled. H. Seeds woolly.
- I.** The frs. hard-shelled, 10-15-celled..... 8. *Egle*.
- II.** The frs. long-oval, leathery, 8-10-celled..... 9. *Chaetospermum*.
- HH.** Seeds smooth; fr. subglobose, very hard-shelled..... 10. *Balsamocitrus*.
- EE.** Frs. not hard-shelled. (Subtribe Lavanginae.)
- F.** The frs. small, fleshy or with mucilage in cells, without pulp-vesicles.
- G.** Petioles very long; lvs. trifoliate; climbing shrubs..... 11. *Lavanga*.
- GG.** Petioles short, often winged.
- H.** The lvs. pinnate; rachis broadly winged; frs.  $\frac{1}{2}$  in. diam..... 12. *Hesperethusa*.
- HH.** The lvs. trifoliate or simple.
- I.** Lvs. trifoliate or bifoliate.
- J.** Petioles of medium length, narrowly winged; frs. 1 in. diam..... 13. *Pleiospermum*.
- JJ.** Petioles very short, wingless; frs. 3-merous; frs.  $\frac{1}{2}$  in. diam..... 14. *Triphasia*.
- II.** Lvs. simple or unifoliate.
- J.** Frs. angled; seeds very long, flattened..... 15. *Merope*.
- JJ.** Frs. not angled.
- K.** Plant a climbing shrub; petioles long..... 16. *Paramignya*.
- KK.** Plant a shrub or tree; petioles short.
- L.** Diam. of frs.  $\frac{1}{2}$  in.; lvs. venose; cells not filled with mucilage..... 17. *Severinia*.
- LL.** Diam. of frs. 1 in.; cells filled with mucilage; lvs. smooth..... 18. *Pamburus*.
- FF.** The frs. hesperidia, the cells filled with stalked pulp-vesicles containing juice. (Subtribe Citrinae.)
- G.** Lvs. pinnate; rachis broadly winged; ovules 1 in each cell..... 19. *Citropsis*.
- GG.** Lvs. trifoliate or simple; ovules usually 2 or more in each cell.
- H.** The lvs. trifoliate, deciduous..... 20. *Poncirus*.
- HH.** The lvs. simple, persistent.
- I.** Stamens 8 or 10, twice as many as the petals..... 21. *Atalantia*.
- II.** Stamens 16-40, 4 or more times as many as petals.
- J.** Lvs. isofacial, gray-green, with stomates and hairs on both faces; frs. small, 3-4-celled..... 22. *Eremocitrus*.
- JJ.** Lvs. not isofacial, without stomates on upper surface.
- K.** Ovary 3-5-celled; lvs. pale below, punctate..... 23. *Fortunella*.
- KK.** Ovary 6-15-celled.
- L.** The stamens polyadelphous..... 24. *Citrus*.
- LL.** Stamens free.
- M.** Cotyledons aerial on germination; first foliage lvs. opposite; fr. small, 10-12-celled..... 25. *Papeda*.
- MM.** Cotyledons hypogeous; first foliage lvs. alternate cataphylls; frs. 5- or 6-celled..... 26. *Microcitrus*.
- BB.** Fls. usually polygamo-dioecious; petals and stamens free; ovules 2, except in the first 2 genera; seeds usually aluminous.
- C.** Ovules solitary.
- D.** Petals 4-5, valvate; stamens 4-5; drupe 2-4-stoned..... 27. *Skimmia*.
- DD.** Petals 5, valvate; stamens 5; ovary 5-lobed; stigma sessile..... 28. *Casimiroa*.
- CC.** Ovules twin.
- D.** Petals 2-5, valvate or imbricate; stamens 2-5; fr. 4-7-loculed..... 29. *Toddalia*.
- DD.** Petals 5-8, valvate; stamens 5-6; fr. a 5-stoned drupe..... 30. *Phellodendron*.
- DDD.** Petals 4-5, imbricate; stamens 4-5; fr. a 2-3-loculed samara..... 31. *Ptelea*.
- AA.** Ovary deeply 2-5-lobed; styles basilar or ventral, or the stigmas connate; fr. capsular or 3-5-berried.
- B.** Ovules 3 or more in each locule.
- C.** Petals 4-5, equal; stamens 8-10, straight..... 32. *Ruta*.
- CC.** Petals 5, unequal; stamens 10, declinate..... 33. *Dictamnus*.
- BB.** Ovules 2 in each locule.
- C.** Fls. irregular..... 34. *Ravenia*.
- CC.** Fls. regular.
- D.** The fls. unisexual or polygamous.
- E.** Lvs. alternate.
- F.** Foliage pinnate; fls. polygamous..... 35. *Xanthoxyrum*.
- FF.** Foliage simple; fls. unisexual..... 36. *Oriza*. (lum.)
- EE.** Lvs. opposite; fls. unisexual..... 37. *Evodias*.
- DD.** The fls. hermaphrodite.
- E.** Albumen fleshy (unknown in Choisyia).
- F.** Petals erect, long, connate or connivent, forming a cylindrical tube..... 38. *Correa*.
- FF.** Petals free, spreading.
- G.** The petals imbricate.
- H.** Stamens 8; petals 4; lvs. opposite..... 39. *Boronia*.
- HH.** Stamens 8-10; petals 4-5; lvs. alternate..... 40. *Eriostemon*.
- HHH.** Stamens 10; petals 5; lvs. opposite..... 41. *Choisyia*.
- GG.** The petals valvate..... 42. *Pilocarpus*.
- EE.** Albumen 0.
- F.** The caps. 5-loculed..... 43. *Calodendrum*.
- FF.** The ovary-lobes 1-5, free..... 44. *Diosma*.
- G.** Staminodes 0..... 44. *Diosma*.
- GG.** Staminodes 5.
- H.** Style short; stigma capitate; fls. terminal..... 45. *Adenandra*.
- HH.** Style long; stigma simple; fls. axillary..... 46. *Barosma*.
- The following genera are also described: Amyris, Chloroxylon, Diplolæna, Limonia, and Spathelia.

## 50. SIMARUBACEÆ.

- A.** Stamens 10, twice as many as petals.
- B.** Petals united into a tube..... 1. *Quassia*.
- BB.** Petals spreading..... 2. *Ailanthus*.
- AA.** Stamens 4-5, as many as petals..... 3. *Picrosma*.

## 51. OCHNACEÆ.

- A.** Ovary 3-10-loculed; locules 1-ovuled; seeds without endosperm.
- B.** Stamens many; panicle lateral..... 1. *Ochna*.
- BB.** Stamens 10; panicle terminal..... 2. *Ouratea*.
- AA.** Ovary 2-5-loculed, many-ovuled, with endosperm..... 3. *Cespedesia*.

## 52. BURSERACEÆ.

- A.** Calyx-tube broadly urn-shaped, covered by the torus..... 1. *Garuga*.
- AA.** Calyx small, 4-6-parted..... 2. *Bursera*.

## 53. MELIACEÆ.

- A.** Stamens free.
- B.** Ovary 4-5-celled; cells 8-12-ovuled..... 1. *Cedrela*.
- BB.** Ovary 2-celled; cells 1-ovuled..... 2. *Pteroxylon*.
- AA.** Stamens coalesced into a tube, at least at base.
- B.** Locules of the ovary many-ovuled..... 3. *Sweetenia*.
- BB.** Locules of the ovary 1-2-ovuled.
- C.** Lvs. simple..... 4. *Turraea*.
- CC.** Lvs. 3-foliolate or 1-3-pinnate.
- D.** Anthers 5..... 5. *Aglaia*.
- DD.** Anthers 8-12.
- E.** Disk cup-like..... 6. *Melia*.
- EE.** Disk ring-like..... 7. *Trichilia*.

## 54. OLACACEÆ.

- A.** Stamens twice as many as the petals, all fertile. 1. *Ximenia*.
- AA.** Stamens anther-bearing, 3-5, staminodia 6 or less..... 2. *Olaz*.

## 55. AQUIFOLIACEÆ.

- A.** Petals connate at base; ovary 4-5-loculed.... 1. *Ilex*.
- AA.** Petals free, linear; ovary 3-5-loculed..... 2. *Nemopanthes*.

## 56. CYRILLACEÆ.

- A.** Racemes terminal; stamens 10; caps. winged.. 1. *Cliftonia*.
- AA.** Racemes lateral; stamens 5; caps. not winged. 2. *Cyrilla*.

## 57. CELASTRACEÆ.

- A. Fr. indehiscent..... 1. *Elæoden-*  
 AA. Fr. a dehiscent caps. [dron.  
 B. Lvs. opposite.  
 C. Ovules 1-2, in the axis of the locule..... 2. *Evonymus*.  
 CC. Ovules 2, in the locules, erect..... 3. *Pachystima*.  
 BB. Lvs. alternate.  
 C. Ovary confluent with the disk.  
 D. Locules generally 1-ovuled: plants un-  
 armed: fls. solitary, clustered or  
 cymose..... 4. *Maytenus*.  
 DD. Locules 2-ovuled: plants often armed:  
 fls. cymose..... 5. *Gymnos-*  
 [poria.  
 CC. Ovary free..... 6. *Celastrus*.  
 Other genera treated are Cassine, Catha, and Tripterygium.

## 58. STACKHOUSIACEÆ.

In cultivation..... *Stackhousia*.

## 59. RHAMNACEÆ.

- A. Calyx-lobes persistent, the often star-shaped  
 disk joining its tube to the entire surface of  
 the ovary: fr. dry, 3-winged..... 1. *Gouania*.  
 AA. Calyx-lobes deciduous.  
 B. Disk lining the shallow calyx-tube nearly or  
 quite free from the ovary: fr. drupaceous,  
 mostly fleshy and often edible, with a  
 single 1-4-celled stone inclosing as many  
 seeds, or 1-seeded by abortion; seed-coats  
 membranous.  
 C. Petals 0: endosperm copious, ruminant .. 2. *Reynosia*.  
 CC. Petals 5.  
 D. Fr. winged, dry, leathery: plants  
 prickly: lvs. 3-nerved..... 3. *Paliurus*.  
 DD. Fr. a fleshy drupe: plants prickly: lvs.  
 3-nerved..... 4. *Zizyphus*.  
 DDD. Fr. a drupe with leathery sarcocarp:  
 plants unarmed: lvs. penninerved... 5. *Berchemia*.  
 BB. Disk lining the calyx-tube, or both adherent  
 to ovary: fr. drupaceous or becoming dry.  
 C. Lvs. very small or wanting, the spines li-  
 ke..... 6. *Colletia*.  
 CC. Lvs. ordinary.  
 D. Fr. a fleshy drupe free from calyx, con-  
 taining 2-4 separate nut-like stones... 7. *Rhamnus*.  
 DD. Fr. becoming nearly or quite dry,  
 partly inferior, separating into 3  
 nutlets: ovary adnate to disk at its  
 base..... 8. *Ceanothus*.  
 DDD. Fr. a caps. with membranous covering,  
 inferior, separating into 3 cocci,  
 which are dehiscent inside..... 9. *Pomaderris*.  
 DDDD. Fr. indehiscent, pea-shaped, 3-celled,  
 3-seeded: ovary free..... 10. *Hovenia*.  
 The genus *Rhamnella* is sometimes cultivated.

## 60. VITACEÆ.

- A. Stamens free: climbing shrubs or herbs.  
 B. Petals expanding; fls. in cymes: bark close;  
 pith white.  
 C. Plants climbing, mostly by adhesion of  
 dilated and disk-shaped tips of the  
 tendril-branches: no distinct disk or  
 free nectariferous glands, but a nec-  
 tariferous and wholly confluent thick-  
 ening of the base of the ovary, or even  
 this obsolete: lvs. never pinnate..... 1. *Partheno-*  
 [cissus.  
 CC. Plants climbing by the prehension and  
 coiling of naked-tipped tendrils: nec-  
 tariferous disk or glands surrounding  
 the ovary or its base, and at least partly  
 free from it.  
 D. Fls. 5-merous: woody plants, mostly  
 hardy..... 2. *Ampelopsis*.  
 DD. Fls. 4-merous: more or less fleshy,  
 woody or herbaceous; mostly tropi-  
 cal or subtropical..... 3. *Cissus*.  
 BB. Petals cast off from the base while cohering  
 by their tips; hypogynous disk or 5  
 nectariferous glands alternate with the  
 stamens; fls. in panicles: berries usually  
 edible: lvs. rarely compound, never pin-  
 nate..... 4. *Vitis*.  
 AA. Stamens with connate filaments: lvs. 1-3-pin-  
 nate: upright trees or shrubs..... 5. *Leea*.  
 Tetrastigma is also briefly treated.

## 61. SABIACEÆ.

In cultivation..... *Meliosma*.

## 62. ACERACEÆ.

- A. Nutlets winged all around: lvs. pinnate, with  
 9-15 lfts..... 1. *Dipteronia*.  
 AA. Nutlets with an elongated wing on one side:  
 lvs. simple or compound..... 2. *Acer*.

## 63. STAPHYLEACEÆ.

- A. Lvs. opposite: several seeds in each cell.  
 B. Ovary 2-3-parted at base.  
 C. Caps. vesiculose..... 1. *Staphylea*.  
 CC. Follicles coriaceous..... 2. *Euscaphis*.  
 BB. Ovary 3-lobed: fr. fleshy or leathery..... 3. *Turpinia*.  
 AA. Lvs. alternate: 1 seed in each cell: fr. berry-  
 like..... 4. *Tapiscia*.

## 64. MELIANTHACEÆ.

- A. Calyx subsaccate, the segms. narrow, very  
 unequal at base; ovules in the locules 2-4... 1. *Melanthus*.  
 AA. Calyx of 5 free, roundish sepals: ovules  
 numerous in 2 series on the placenta..... 2. *Greya*.

## 65. HIPPOCASTANACEÆ.

In cultivation..... *Æsculus*.

## 66. SAPINDACEÆ.

- A. Fls. irregular.  
 B. Ovules solitary in the locules (rarely 2 in  
 Paullinia): plant climbing..... 1. *Serjania*.  
 C. Fr. a winged samara..... 2. *Cardiosper-*  
 [mum.  
 CC. Fr. bladder, membranous, loculicidal... 3. *Paullinia*.  
 CCC. Fr. a pear-shaped, septicidal caps..... 4. *Kalreuteria*.  
 BB. Ovules 2 or more in the locules: plant erect.  
 C. Sepals valvate; petals 3-4..... 5. *Ungnadia*.  
 CC. Sepals imbricate; petals 4-5.....  
 AA. Fls. regular, or nearly so.  
 B. Stamens inserted at the base of the ovary  
 inside the disk, often unilateral.  
 C. Fr. dehiscent; ovules 2 or more in cells.  
 D. Disk produced into 5 horns; fls. in  
 racemes before the lvs., showy..... 6. *Xanthoceras*.  
 DD. Disk annular or cup-shaped; fls.  
 usually in panicles.  
 E. Lvs. ternate: sepals glabrous; disk  
 cupular..... 7. *Delavaya*.  
 EE. Lvs. pinnate.  
 F. Petals 5; sepals imbricate, pubes-  
 cent..... 8. *Blighia*.  
 FF. Petals 0; sepals valvate..... 9. *Stadmannia*.  
 CC. Fr. indehiscent.  
 D. Aril present; fr. edible.  
 E. Calyx deeply 5-parted, imbricate;  
 petals present..... 10. *Euphoria*.  
 EE. Calyx with small valvate lobes or  
 obsoletely toothed; petals 0..... 11. *Litchi*.  
 DD. Aril wanting.  
 E. Fr. deeply lobed or divided into 3  
 (-1) cocci: sepals 5: lfts. usually  
 many..... 12. *Sapindus*.  
 EE. Fr. not deeply lobed: sepals 4: lfts.  
 2-4..... 13. *Melicocca*.  
 BB. Stamens inserted outside the disk or disk  
 wanting; petals 0: caps. winged, papery  
 or leathery: lvs. simple or pinnate..... 14. *Dodonæa*.  
 Additional genera are somewhat cultivated, as *Alectryon*, *Ber-*  
*samo*, and *Diploglottis*.

## 67. ANACARDIACEÆ.

- A. Lvs. simple  
 B. Stamens 5; styles 3..... 1. *Semecarpum*.  
 BB. Stamens 8-10 (all or some fertile); style  
 eccentric; stigma a mere dot..... 2. *Anacardium*.  
 BBB. Stamens 1-5; style lateral; stigma simple. 3. *Mangifera*.  
 AA. Lvs. pinnate or composed of 3 lfts.  
 B. Ovary 1-celled.  
 C. Ovules suspended at or near the apex.  
 D. Styles in the pistillate fls. short, in  
 the staminate fls. 4-5..... 4. *Tapiria*.  
 DD. Styles 3..... 5. *Cyrtocarpa*.  
 CC. Ovules suspended by a basilar funiculus.  
 D. Styles 3..... 6. *Schinus*.  
 DD. Styles 3..... 7. *Pistacia*.

- DD. Petals 4-6 or more.  
 E. Stamens in a single whorl.  
 F. The petals valvate. .... 8. *Sorindeia*.  
 FF. The petals imbricate.  
 G. Style lateral in fr.; pedicels becoming plumose; lvs. simple. .... 9. *Cotinus*  
 GG. Style terminal in fr.; pedicels not plumose in fr.; lvs. compound, rarely simple. .... 10. *Rhus*.  
 EE. Stamens in 2 whorls, the outer alternate with the petals; petals valvate. .... 11. *Lithræa*.  
 BB. Ovary 2-5-celled.  
 C. Fls. polygamous; stamens 8-10; petals subvalvate. .... 12. *Spondias*.  
 CC. Fls. diœcious; stamens 8-9; petals imbricate. .... 13. *Harpehylum*.  
 The genera *Corynocarpus* and *Smodingium* are also described in this Cyclopædia.

## 68. CORIARIACEÆ.

The only genus. .... *Coriaria*.

## 69. MORINGACEÆ.

The only genus. .... *Moringa*.

## 70. LEGUMINOSÆ.

## I. Summary of Suborders and Tribes.

Ignoring exceptions and six tribes of which no examples appear to be cult. in America. (Other genera of Leguminosæ may be met with now and then in cultivation, but they are so little grown and so many that the introduction of them here would make the key unnecessarily complicated; some of these are mentioned at the end of the Leguminosæ, p. 95.)

## Suborder I.—MIMOSEÆ.

- A. Fls. regular, small; calyx gamosepalous or valvately parted; petals valvate, often connate, below the middle.  
 B. Stamens numerous, ∞.  
 C. The stamens free. .... 1. ACACIA TRIBE.  
 CC. The stamens monadelphous. .... 2. INGA TRIBE.  
 BB. Stamens fewer, definite.  
 C. Anthers usually appendaged with a stalked gland; stamens twice as many as the petals, rarely as many; fls. generally 5-merous. .... 3. ADENANTHERA [TRIBE].  
 CC. Anthers not glandular; stamens as many as the petals, rarely twice as many; fls. 4-5-merous, rarely 3- or 6-merous. .... 4. MIMOSA TRIBE.  
 AA. Fls. irregular and truly papilionaceous, i. e., like a sweet pea, the standard outside of the other petals and inclosing them in the bud; sepals more or less united above the disk into a tube or cup; radicles inflexed, acuminate or rarely very short and straight. (Compare AAA.)

## Suborder II.—PAPILIONÆÆ.

- B. Lvs. simple, or else digitately compound. (Exceptions: A few members of the Trifolium Tribe are digitately compound and some of the Phaseolus Tribe are subdigitately compound. Some lvs. that appear to be simple have been reduced from several lfts. to 1, generally leaving a gland, joint or other indication of the reduction.)  
 C. Stamens 10, free; shrubs, rarely herbs. .... 5. PODALYRIA TRIBE.  
 CC. Stamens 10, monadelphous, rarely diadelphous; racemes terminal or opposite the lvs. or the fls. solitary or subsessile at the axils. .... 6. GENISTA TRIBE.  
 BB. Lvs. pinnate, rarely digitate in the Trifolium Tribe, or subdigitate in the Phaseolus Tribe or the lvs. sometimes reduced to a single lft.  
 C. Stamens 10, free; lfts. 5 or more, sometimes reduced to 1 large lft., rarely 3. .... 7. SOPHORA TRIBE.  
 CC. Stamens monadelphous or diadelphous.

- D. The pod jointed, rarely 1-jointed; 1-seeded by abortion. Otherwise like the Lotus, Galega and Phaseolus Tribes. An artificial division. .... 8. HEDYSARUM [TRIBE].  
 DD. The pod not jointed.  
 E. Pod indehiscent, larger than calyx, membranous, leathery, woody or drupaceous; lfts. 5 or more, rarely 3-1; trees or tall shrubs or climbers. .... 9. DALBERGIA [TRIBE].  
 EE. Pod dehiscent or if indehiscent usually of small size, generally 2-valved.  
 F. Fls. in heads or umbels, rarely solitary; lfts. 3 or more, entire; alternate filaments usually dilated at the apex; herbs or shrubs. .... 10. LOTUS TRIBE.  
 FF. Fls. solitary or racemose, sometimes paniced or fascicled.  
 G. Plants typically climbing herbs, raising themselves by means of tendrils at the tips of the petioles; sometimes there is a mere bristle; lfts. often denticulate at apex. .... 11. VICIA TRIBE.  
 GG. Plants twining or erect, not climbing by tendrils.  
 H. Lfts. generally 3.  
 I. Habit of plants mostly twining. .... 12. PHASEOLUS [TRIBE].  
 II. Habit of plants mostly erect. .... 13. TRIFOLIUM TRIBE.  
 HH. Lfts. mostly 5 or more. .... 14. GALEGA TRIBE.  
 AAA. Fls. more or less irregular, but not truly papilionaceous. When they seem to be so, the petal answering to the standard will be found within the other petals instead of outside as in AA: radicle straight, very rarely slightly oblique.

## Suborder III.—CÆSALPINIÆÆ.

- B. Calyx gamosepalous beyond the disk or valvately parted; lvs. simple and entire or 2-lobed, or rarely cut into 2 lfts.; stipe of ovary free or adnate to calyx-tube. .... 15. BAUHINIA TRIBE.  
 BB. Calyx usually parted to the very disk and the segms. imbricate.  
 C. Stipe of ovary adnate to the disk-bearing calyx-tube; lvs. mostly abruptly pinnate. .... 16. AMHERSTIA TRIBE.  
 CC. Stipe of ovary free in the bottom of the calyx.  
 D. Anthers versatile; lvs. mostly bipinnate. .... 17. CÆSALPINIA TRIBE.  
 DD. Anthers basifixed, erect but longitudinally dehiscent by 2 pores or short cracks. .... 18. CASSIA TRIBE.

## II. Key to the Tribes.

## 1. Acacia Tribe.

The only genus. .... 1. *Acacia*.

## 2. Inga Tribe.

- A. Lvs. once pinnate. .... 2. *Inga*.  
 AA. Lvs. mostly twice pinnate.  
 B. Shape of pods circinate, arched or variously twisted.  
 C. Pod usually 2-valved; seeds generally surrounded by a thin pulp. .... 3. *Pithecolobium*.  
 CC. Pod indehiscent, usually septate between the seeds. .... 4. *Enterolobium*.  
 BB. Shape of pods straight, or at most slightly sickle-shaped.  
 C. Valves separating from the persistent sutures. .... 5. *Lysiloma*.  
 CC. Valves elastically dehiscent and revolute from apex to base. .... 6. *Calliandra*.  
 CCC. Valves not elastic; pod often indehiscent. .... 7. *Albizzia*.

## 3. Adenanthera Tribe.

- A. Fls. short-pedicel. .... 8. *Adenanth-  
era*.  
 AA. Fls. sessile.  
 B. The pod indehiscent (presumably so in *Stryphnodendron*).

- c. Pod straight, thick-compressed, transversely septate inside between the seeds. .... 9. *Stryphnodendron*.
- cc. Pod straight, falcate or variously twisted, thick-compressed or subterete, usually septate inside between the seeds. .... 10. *Prosopis*.
- BB. The pods 2-valved. (See also BBB.)
- c. Pod straight or arched, flat; valves entire, continuous within: shrubs or trees. .... 11. *Piptadenia*.
- cc. Pod obliquely oblong, deflexed from the stipe: herbs or diffuse sub-shrubs, prostrate or floating. .... 12. *Neptunia*.
- BBB. The pod flat, with thickened persistent continuous sutures, the valves transversely jointed between the sutures, the joints 1-seeded. .... 13. *Entada*.

#### 4. Mimosa Tribe.

- A. Pods provided with a replum, i. e., a frame-like placenta, which remains after the valves have fallen away from it.
- B. Valves wider than replum. .... 14. *Mimosa*.
- BB. Valves narrower than the replum or hardly wider. .... 15. *Schrankia*.
- AA. Pods 2-valved in the ordinary fashion. .... 16. *Leucaena*.

#### 5. Podalyria Tribe.

- A. Keel-petals free or slightly connate: foliage herbaceous.
- B. Pod linear or oblong-inflated. .... 17. *Thermopsis*.
- BB. Pod globose or ovoid, turgid or inflated. .... 18. *Baptisia*.
- AA. Keel-petals connate on the back: foliage mostly leathery.
- B. Ovules 4 or more.
- c. Keel about as long as the wings. .... 19. *Oxylobium*.
- cc. Keel much shorter than wings. .... 20. *Chorizema*.
- BB. Ovules 2.
- c. Pod indehiscent: calyx shortly 5-toothed. .... 21. *Viminaria*.
- cc. Pod 2-valved: calyx 5-fid, or bilabiate. .... 22. *Pullenaea*.

#### 6. Genista Tribe.

- A. Stamens coalesced into a sheath which is split above the middle.
- B. Seeds strophiolate.
- c. Lvs. simple or reduced to mere scales. .... 23. *Templetonia*.
- cc. Lvs. pinnate; lfts. 3. .... 24. *Goodia*.
- BB. Seeds not strophiolate. .... 25. *Crotalaria*.
- AA. Stamens coalesced into a closed tube.
- B. Seeds not strophiolate.
- c. Calyx-lobes or lips much longer than the tube. .... 26. *Lupinus*.
- cc. Calyx-lobes or -teeth shorter than the tube, rarely somewhat longer.
- d. Lfts. 3.
- E. Pod stalked. .... 27. *Laburnum*.
- EE. Pod sessile.
- F. Claws of petals adnate to staminal tube. .... 28. *Petteria*.
- FF. Claws of petals free.
- G. Shrubs unarmed: upper calyx-lobes distinct. .... 29. *Adenocarpus*.
- GG. Shrubs usually spinescent: calyx short, truncate. .... 30. *Calycotome* [pus].
- DD. Lfts. usually all wanting, rarely 3 or 1: shrubs with spiny or rush-like branches.
- E. Shrub with rush-like branches. .... 31. *Spartium*.
- EE. Shrubs spiny or unarmed: lfts. reduced to 1 or 0, rarely 3.
- F. Fls. yellow; calyx not inflated. .... 32. *Genista*.
- FF. Fls. violet or bluish; calyx inflated: spiny shrub. .... 33. *Erinacea*.
- BB. Seeds strophiolate.
- c. Calyx colored, 2-parted; the upper segms. 2-toothed, lower 3-toothed: leafless shrubs, the branchlets and petioles transformed into spines. .... 34. *Ulex*.
- CC. Calyx with the 2 upper lobes or teeth connate or free, the 3 lower connate into a lower lip. .... 35. *Cytisus*.

#### 7. Sophora Tribe.

- A. Fl. with petals all nearly alike. .... 36. *Cadia*.
- AA. Fl. distinctly papilionaceous.
- B. Pod 2-valved. .... 37. *Castanospermum*.
- BB. Pod indehiscent or at most tardily dehiscent to a slight extent.
- C. The pod moniliform. .... 38. *Sophora*.
- CC. The pod not moniliform, linear.
- d. Color of fls. yellow in axillary racemes. .... 39. *Calpurnia*.
- DD. Color of fls. white, panicle.
- E. Winter-buds inclosed in the base of the enlarged petiole: panicle loose, drooping. .... 40. *Cladrastis*.
- EE. Winter-buds free: panicle dense, upright. .... 41. *Maackia*.

#### 8. Hedysarum Tribe.

- A. Stamens all free among themselves. .... 42. *Adesmia*.
- AA. Stamens all connate in a closed tube. .... 43. *Arachis*.
- AAA. Stamens nearest the standard free or connate with the others only at the base or at the middle.
- B. Filaments all dilated above or only alternate ones.
- C. Keel obtuse. .... 44. *Ornithopus*.
- CC. Keel acute or beaked. .... 45. *Coronilla*.
- BB. Filaments normal.
- C. Wings short or very short, rarely as long as the keel; lfts. not provided with minute stipules.
- D. Pod flat or compressed.
- E. Joints many, rarely 2: standard-stamens free. .... 46. *Hedysarum*.
- EE. Joints 2: standard-stamen connate with others at middle. .... 47. *Onobrychis*.
- DD. Pod thickish, subterete. .... 48. *Alhagi*.
- CC. Wings as long as or longer than the keel: partial petioles of lfts. bear minute stipules (except in *Lespedeza* 0).
- D. Pod indehiscent, rarely opening at the lower suture; joints flat. .... 49. *Desmodium*.
- DD. Pod of about 4 small, distinct, 1-seeded, smooth, veined joints included in the calyx. .... 50. *Uraria*.
- DDD. Pod 1-seeded, indehiscent; no joints. .... 51. *Lespedeza*.

#### 9. Dalbergia Tribe.

- A. Fr. drupaceous, globose or ovoid, indehiscent, the endocarp woody. .... 52. *Andira*.
- AA. Fr. not drupaceous.
- B. Lfts. mostly alternate.
- C. Anthers versatile, the locules parallel, longitudinally dehiscent. .... 53. *Tipuana*.
- CC. Anthers small, erect, didymous, the locules placed back to back; generally dehiscent at apex by a short crack. .... 54. *Dalbergia*.
- BB. Lfts. opposite.
- C. Pod longitudinally 4-winged. .... 55. *Piscidia*.
- CC. Pod with a narrow wing along the upper suture or both sutures. .... 56. *Derris*.

#### 10. Lotus Tribe.

- A. Pod indehiscent or tardily 2-valved. .... 57. *Anthyllis*.
- AA. Pod 2-valved.
- B. Calyx-lobes usually longer than tube; keel rostrate. .... 58. *Lotus*.
- BB. Calyx-teeth shorter than tube; keel obtuse. .... 59. *Hosackia*.

#### 11. Vicia Tribe.

- A. St. woody: infl. subterminal; stamens 9, the standard-stamen absent. .... 60. *Abrus*.
- AA. St. herbaceous: fls. solitary or racemose in the axils; stamens 10.
- B. Wings adherent to the keel. .... 61. *Lens*. (See article Lentil.)
- BB. Wings free or only slightly adherent.
- C. Sheath of stamens oblique at the mouth; style slender, bearded or hairy only at the apex or all around the upper part. .... 62. *Vicia*.
- CC. Sheath of stamens equal at the mouth.
- D. Calyx-lobes leafy; style rigid, dilated above and the margins reflexed and joined together so that it becomes flattened laterally; bearded down the inner edge. .... 63. *Pisum*.
- DD. Calyx-lobes not leafy; style flattened above on the back and front; bearded down one face. .... 64. *Lathyrus*.

#### 12. Phaseolus Tribe.

- A. Style longitudinally bearded above on the inner side or rarely pilose only around the stigma; petals normal or the keel long-beaked or spiral: infl. nodose-racemose.
- B. Calyx-teel not longer than lobe.
- C. Keel spiral. .... 65. *Phaseolus*.
- CC. Keel obtuse or arched beaked.
- D. Stigma strongly oblique or introrse. .... 66. *Vigna*.
- DD. Stigma subglobose on inner face; style flattened out at apex. .... 67. *Pachyrhizus*.
- DDD. Stigma small, terminal; style filiform or subulate at apex. .... 68. *Dolichos*.
- BB. Calyx-tube cylindrical, longer than lobes. .... 69. *Clitoria*.
- AA. Style not bearded.
- B. Standard-stamen free only at the very base, thence connate with the rest into a closed tube; calyx mostly 4-lobed.
- C. Calyx bell-shaped.
- D. Pod broad, the upper suture thickened or 2-winged. .... 70. *Dioclea*.
- DD. Pod linear, narrow or flat. .... 71. *Pueraria*.

- cc. Calyx bilabiate, the upper lip larger, entire or 2-lobed or 2-parted.....72. *Canavalia*.
- BB. Standard-stamen free or connate only at the base.
- c. Calyx 4-lobed.....73. *Galactia*.
- CC. Calyx not 4-lobed.
- D. Infl. usually racemose, the rachis of the raceme jointed.
- E. Standard much larger than the wings and keel.....74. *Erythrina*.
- EE. Standard smaller than the keel.
- F. Pod 2-valved.
- G. Anthers of 2 kinds.....75. *Mucuna*.
- GG. Anthers uniform.....76. *Apios*.
- FF. Pod not dehiscent, except at the top.....77. *Butea*.
- DD. Infl. sometimes racemose but the rachis of the raceme not jointed.
- E. Lvs., especially beneath, with minute resinous dots: infl. racemose or subumbellate or the fls. solitary.
- F. Ovules 2.....78. *Flemingia*.
- FF. Ovules 4 or more.
- G. Pod turgid; seeds strophiolate...79. *Fagelia*.
- GG. Pod compressed; seeds not strophiolate.....80. *Cajanus*.
- EE. Lvs. without minute resinous dots: fls. clustered or racemose in the axils, solitary or twin along the rachis.
- F. Fls. showy; standard large, flattened out; bracts persistent....81. *Centrosema*.
- FF. Fls. medium-sized; standard erect, complicate, sides often reflexed: bracts persistent.....82. *Amphicarapa*.
- FFF. Fls. small (showy in *Kennedy*); standard spreading or reflexed; bracts persistent or small and deciduous.
- G. Seeds not strophiolate.....83. *Glycine*.
- GG. Seeds strophiolate.
- H. The fls. small; keel usually much smaller than wings...84. *Hardenbergia*.
- HH. The fls. showy; keel usually equaling or surpassing the wings.....85. *Kennedy*.
- 13. Trifolium Tribe.**
- A. Standard-stamen connate with the others into a closed tube; keel beaked.....86. *Ononis*.
- AA. Standard-stamen free; keel obtuse or in Parochetus acutish.
- B. Lfts. digitate (rarely pinnate in Trifolium).
- c. Pod 2-valved: keel acutish; petals not adnate.....87. *Parochetus*.
- cc. Pod usually indehiscent: claws of all or the lower petals adnate to the staminal tube.....88. *Trifolium*.
- BB. Lfts. 3, pinnate.
- c. Pod straight, sickle-shaped or arched, sometimes thick and beaked, sometimes linear, sometimes broad and flat, indehiscent or folliculately gaping or rarely 2-valved.....89. *Trigonella*.
- cc. Pod spirally falcate, circinnate or cochleate.....90. *Medicago*.
- CCC. Pod small, subglobose or ovoid, thick, indehiscent or tardily 2-valved.....91. *Melilotus*.
- 14. Galega Tribe.**
- A. Connective of the anthers appendaged with a small gland or mucro: ovules mostly  $\infty$ , 1-2 in a few species; pod 2-valved.....92. *Indigofera*.
- AA. Connective not appendaged.
- B. Ovules 1-2, rarely 3-4. (See also BB.)
- c. Number of ovules 1.....93. *Psoralea*.
- cc. Number of ovules 2, rarely 3-4.
- d. Stamens 10.....94. *Amorpha*.
- DD. Stamens 5.....95. *Petalostemon*.
- BB. Ovules  $\infty$  (1-2 in a few species of Tephrosia).
- c. Infl. terminal or opposite the lvs., mostly racemose (in Galega both axillary and terminal, in some Tephrosias axillary): pod 2-valved.
- D. Style longitudinally bearded on the inner side; calyx long-tubular; petals very long-clawed.....96. *Barbieria*.
- DD. Style glabrous (or merely penicillate at the stigma in some tephrosias).
- E. Standard-stamen connate with the rest from the base.....97. *Galega*.
- EE. Standard-stamen free or connate with the others from the middle.
- F. The pod narrow or short, with slender valves and nerviform or hardly thickened sutures.....98. *Tephrosia*.
- FF. The pod thick, leathery or woody.
- G. Pod usually tardily dehiscent: infl. mostly panicle.....99. *Milletia*.
- GG. Pod easily dehiscent: infl. racemose.....100. *Wistaria*.
- cc. Infl. axillary, except where noted below.
- D. Pod flat, except where the seeds finally make it turgid.....101. *Robinia*.
- DD. Pod inflated, turgid or terete, longitudinally septate or undivided, rarely flat and when so always longitudinally septate.
- E. Styles variously bearded above
- F. Petals acuminate.....102. *Clanthus*.
- FF. Petals not acuminate.
- G. Standard erect.....103. *Sutherlandia*.
- GG. Standard spreading or reflexed.
- H. Stigma small.....104. *Swainsona*.
- HH. Stigma prominent.....105. *Colutea*.
- EE. Style not bearded.
- F. Lvs. even-pinnate: shrubs or trees.
- G. The pod stipitate, obovoid or oblong.....106. *Halimodendron*.
- GG. The pod linear, usually acute.....107. *Caragana*.
- FF. Lvs. odd-pinnate or with a spiny petiole instead of an odd lft.
- G. Anther-cells confluent at apex...108. *Glycyrrhiza*.
- GG. Anthers uniform.....[iza].
- H. Petals not all narrow, the standard obovate or orbicular.....109. *Calophaea*.
- HH. Petals narrow.
- I. Keel blunt.....110. *Astragalus*.
- II. Keel acute.....111. *Oxytropis*.
- 15. Bauhinia Tribe.**
- A. Petals erect or spreading, only slightly unequal.....112. *Bauhinia*.
- AA. Petals falsely pea-like, the standard inmost.....113. *Cercis*.
- 16. Amherstia Tribe.**
- A. The petals absent; sepals 4.....114. *Saraca*.
- AA. The petals present.
- B. Bractlets persistent, inclosing the bud.
- c. Petals 5, slightly unequal.....115. *Brownea*.
- cc. Petals unequal, 1 very wide, 2 narrow, 2 minute and rudimentary.....116. *Amherstia*.
- BB. Bractlets small or deciduous.
- c. Lfts. 1 pair.....117. *Hymenaea*.
- cc. Lfts. 2 or more pairs.
- D. Petals 5, 3 perfect, 2 rudimentary....118. *Tamarindus*.
- DD. Petals 5, slightly unequal.....119. *Schotia*.
- 17. Cæsalpinia Tribe.**
- A. Calyx-lobes strongly imbricate; disk-bearing tube short; seed not albuminous.
- B. Pod indehiscent: stigma peltate.....120. *Peltopodium*.
- BB. Pod 2-valved: stigma not peltate.....121. *Cæsalpinia*.
- AA. Calyx-tube long, or top-shaped or bell-shaped; segms. short or narrow and open: seeds, when known, albuminous.
- B. Pod turgid or subterete.....122. *Gymnocladus*.
- BB. Pod flattish.....123. *Gleditsia*.
- AAA. Calyx-segms. valvate.
- B. Segms. 4, the upper ones connate; highest petal widest, lowest narrow.....124. *Colvillea*.
- BB. Segms. 5; petals roundish, about equal.....125. *Poinciana*.
- AAAA. Calyx-segms. slightly imbricate or valvate: seeds albuminous.
- B. Ovary adnate to calyx-tube.....126. *Schizolobium*.
- BB. Ovary free in bottom of calyx.....127. *Parkinsonia*.
- 18. Cassia Tribe.**
- A. Petals 5; fls. hermaphrodite.....128. *Cassia*.
- AA. Petals 0; fls. polygamous.....129. *Ceratonina*.
- The following genera also are described as having more or less horticultural interest: *Azelia*, *Amicia*, *Aotus*, *Baikia*, *Baphia*, *Brachysema*, *Camdensia*, *Carmichaelia*, *Cicer*, *Copaifera*, *Dalea*, *Desmanthus*, *Dichroanthus*, *Diphysa*, *Ebenus*, *Eutaxia*, *Galedupa*, *Gliricidia*, *Hematoxylon*, *Hippocrepis*, *Hoffmannseggia*, *Hovea*, *Jacksonia*, *Kerstingia*, *Krameria*, *Lonchocarpus*, *Minklersia*, *Piptanthus*, *Podalyria*, *Pterocarpus*, *Pterolobium*, *Rhynchosia*, *Scorpiurus*, *Sesbania*, *Toluifera*, *Youapa*.

## 71. ROSACEÆ.

## I. Summary of Tribes.

- A. Ovary inferior; carpels 2-5, more or less connate and adnate to the cup-shaped receptacle, the whole developing into a fleshy fr. (pome): trees or shrubs with free stipules..... 4. POME TRIBE.
- AA. Ovary superior.
- B. Carpels usually many, if 1 or 2, fr. not drupaceous; calyx persistent.
- C. Fr. follicular, dehiscent.
- D. Seeds not winged; fls. small.... 1. SPIRÆA TRIBE.
- DD. Seeds winged, flattened; fls. rather large..... 2. QUILLAJA TRIBE.
- CC. Fr. not follicular, indehiscent, or carpels growing into drupelets.
- D. Pistils borne on a flat, hemispherical or convex receptacle, subtended by a cup-shaped portion of the receptacle (hypanthium), usually many.
- E. The pistils 2-5: shrubs, with simple lvs.
- F. Stipules wanting; fls. small, in large panicles..... 3. HOLODISCUS TRIBE.
- FF. Stipules present: fls. solitary or in few-fl. corymbs..... 5. KERRIA TRIBE.
- EE. The pistils many (if few, lvs. compound): herbs or shrubs.
- F. Carpels becoming dry achenes.
- G. Ovules 2; carpels 5-15: calyx without bractlets: herbs..... 9. ULMARIA TRIBE.
- GG. Ovules 1: carpels many; calyx usually with bractlets alternating with the lobes..... 6. POTENTILLA [TRIBE].
- DD. Pistils inclosed in the tubular or urn-shaped receptacle (hypanthium).
- E. Number of pistils 1 or 4; petals sometimes wanting.
- F. Hypanthium tubular or campanulate, the achenes loosely and usually only partly inclosing; pistils usually 1: shrubs..... 8. CERCOCARPUS [TRIBE].
- FF. Hypanthium urceolate, completely inclosing the 1-4 achenes; sepals usually 4: herbs or shrubs..... 10. SANGUISORBA [TRIBE].
- EE. Number of pistils many; calyx tube becoming fleshy; petals present: shrubs with odd-pinnate lvs..... 11. ROSE TRIBE.
- BB. Carpels 1, rarely 2: fr. drupaceous; calyx usually deciduous.
- C. Fls. symmetrical; style subterminal; ovules pendulous; radicles superior..... 12. PRUNUS TRIBE.
- CC. Fls. often unsymmetrical; style basilar; ovules ascending; radicles inferior..... 13. CHRYSOBALANUS [TRIBE].

## II. Key to the Tribes.

## 1. Spiræa Tribe.

- A. Pistils opposite to the petals or less than 5.
- B. Lvs. simple, often lobed, rarely pinnatifid: stamens inserted on the margin of the hypanthium: shrubs, rarely undershrubs.
- C. Stipules large, caducous: staminal disk wanting: seeds shining, crustaceous.
- D. Follicles dehiscent along both sutures, often inflated, 1-5: fls. in terminal corymbs..... 1. Physocarpus.
- DD. Follicles dehiscent only along the ventral suture, 1-2, not inflated.
- E. Fls. in terminal panicles; style terminal; pistils 2, rarely 1: follicles usually 5-seeded..... 2. Neillia.
- EE. Fls. in small terminal corymbs; style lateral; pistil 1: follicles 1-or rarely 2-seeded..... 3. Stephanandra.
- CC. Stipules wanting: staminal disk usually present: seeds dull.
- D. The lvs. entire, serrate or lobed: stamens free.
- E. Carpels free.
- F. Fls. in panicles, corymbs or umbel-like racemes; carpels dehiscent along the ventral suture: lvs. usually serrate or lobed..... 4. Spiræa.

- FF. Fls. in racemes; carpels dehiscent on both sutures: lvs. entire, evergreen: cespitose undershrub..... 5. Petrophytum.
- EE. Carpels connate at the base; fls. polygamo-dioecious, in panicles: lvs. entire, deciduous: upright shrub..... 6. Sibiræa.
- DD. The lvs. twice trifid: stamens connate at the base: fls. in racemes: prostrate undershrub..... 7. Luetkea.
- BB. Lvs. 2-3-pinnate: fls. dioecious, in ample panicles composed of slender spikes: herbs..... 8. Aruncus.
- AA. Pistils opposite to the sepals, 5.
- B. Petals roundish, imbricate in the bud; carpels connate at the base: lvs. pinnate or bipinnate: shrubs.
- C. Lvs. pinnate; lfts. coarsely serrate..... 9. Sorbaria.
- CC. Lvs. bipinnate; segms. minute, entire..... 10. Chamæbatiaria.
- BB. Petals strap-shaped, convolute in the bud: carpels distinct: lvs. ternate: herbs..... 11. Gillenia.

## 2. Quillaja Tribe.

- A. Carpels free, spreading, star-like at maturity: evergreen trees.
- B. Stamens 10..... 12. Quillaja.
- BB. Stamens 20..... 13. Kageneckia.
- AA. Carpels connate into a 5-celled caps.: stamens 15-20: deciduous shrub..... 14. Ezechorda.

## 3. Holodiscus Tribe.

- Lvs. doubly serrate or slightly lobed..... 15. Holodiscus.

## 4. Pome Tribe.

- A. Carpels bony at maturity: fr. hence with 1-5 stones.
- B. Pistils with 2 fertile ovules: lvs. entire or crenate.
- C. Lvs. entire: spineless shrubs: styles 2-5..... 16. Cotoneaster.
- CC. Lvs. crenate, persistent: usually spiny shrubs: styles 5..... 17. Pyracantha.
- BB. Pistils with only 1 fertile ovule: lvs. usually doubly serrate or lobed.
- C. Ovules 2, 1 fertile and 1 sterile: lvs. simple, often pinnately lobed.
- D. Number of carpels 5, wholly connate and covered at the top by the flesh of the fr.: fls. solitary, 2 in. across: lvs. entire or occasionally dentate..... 18. Mespilus.
- DD. Number of carpels 1-5, more or less distinct at the ventral suture and free at the top: fls. 1 in. or less across, usually in corymbs: lvs. often lobed..... 19. Crataegus.
- CC. Ovule but 1; stones 5: lvs. pinnate (the simple-lvd. species belong to Hespecomeles, which is not in cult.)..... 20. Osteomeles.
- AA. Carpels with leathery or papery walls at maturity: fr. hence 1-5-celled, each cell with 1 or 2, rarely many seeds.
- B. Fls. in compound corymbs.
- C. Styles 1-5, distinct or connate; carpels partly free.
- D. Fr. solid and pointed at the top; walls of cells leathery: lvs. deciduous, simple or pinnate.
- E. Sepals deciduous: lvs. always simple, serrate with excurrent veins: styles 2-3..... 21. Micromeles.
- EE. Sepals persistent.
- F. Number of styles usually 2, rarely 3 or 5, free or connate: lvs. pinnate or simple and serrate or lobed with excurrent veins, deciduous..... 22. Sorbus.
- FF. Number of styles 3-5: lvs. serrate to crenulate, with curving veins.
- G. Lvs. deciduous, with glands on the midrib above: styles 5, connate below: endocarp thin..... 23. Aronia.
- GG. Lvs. evergreen, without glands on the midrib: styles 3-5: endocarp firm..... 24. Stranvæsia.
- DD. Fr. hollow and rounded at the top, small, 1- or 2-seeded; walls usually papery: styles usually 2: lvs. simple, deciduous or evergreen with curving veins..... 25. Photinia.
- CC. Styles 5, distinct; carpels wholly connate: fr. pear-shaped, rather large, yellow: lvs. evergreen with excurrent veins..... 26. Eriobotrya.
- BB. Fls. in umbels, racemes or solitary.
- C. The carpels 4- to many-seeded.
- D. Styles free: lvs. entire..... 27. Cydonia.
- DD. Styles connate at the base: lvs. serrate or serrulate.
- E. Ovules many in each cell: calyx glabrous outside..... 28. Chanomeles.
- EE. Ovules 4-5 in each cell; calyx densely tomentose outside..... 29. Docynia.
- CC. The carpels 1-2-seeded.

- D. Cells of the ovary as many as styles, each with 2 ovules.  
 E. Ovary 2-celled: fr. 1-2-seeded, black; fls. in upright racemes, sometimes paniced; lvs. evergreen. 30. *Raphiolepis*.  
 EE. Ovary 3-5-celled: fls. in umbels; lvs. deciduous.....31. *Pyrus*.  
 DD. Cells of the ovary twice as many as styles, each with 1 ovule.  
 E. Styles usually 5; fls. in racemes: lvs. serrate, or crenate at the apex.....32. *Amelanchier*.  
 EE. Styles 2-3; fls. in few-fl. umbels; calyx-tube cylindric; lvs. entire or denticulate, narrow.....33. *Peraphyllium*.  
**5. Kerria Tribe.**  
 A. Petals wanting; fls. in few-fl. corymbs; achenes 2-5, drupaceous.....34. *Nerissa*.  
 AA. Petals present; fls. solitary, large.  
 B. Lvs. alternate: fls. 5-merous, yellow; achenes drupaceous, yellow.....35. *Kerria*.  
 BB. Lvs. opposite: fls. 4-merous, white; achenes dry, black.....36. *Rhodotypos*.

- 6. Potentilla Tribe.**  
 A. Style deciduous.  
 B. Receptacle in fr. much enlarged, colored.  
 c. Fls. white: receptacle pulpy, juicy.....37. *Fragaria*.  
 cc. Fls. yellow: receptacle dry.....38. *Duchesnea*.  
 BB. Receptacle not fleshy, even in fr.  
 c. Pistils only 1-12.  
 d. Stamens 5; petals minute.....39. *Sil. baldia*.  
 DD. Stamens numerous; petals conspicuous. 40. *Waldsteinia*.  
 CC. Pistils very numerous.  
 d. Petals white or yellow, obtuse or emarginate.....41. *Potentilla*.  
 DD. Petals purple, abruptly acuminate, much smaller than calyx.....42. *Comarum*.  
 AA. Style elongated after anthesis, often plumose.  
 B. Fls. 5-merous: lvs. pinnate or pinnatifid.  
 c. Sepals valvate; hypanthium flat: herbs. 43. *Geum*.  
 cc. Sepals imbricate; hypanthium concave: shrubs.  
 d. Calyx with bracts outside.....44. *Fallugia*.  
 DD. Calyx without bracts.....45. *Cowania*.  
 BB. Fls. 8-9-merous: lvs. undivided: prostrate undershrub.....46. *Dryas*.

- 7. Rubus Tribe.**  
 A. Drupelets pulpy.....47. *Rubus*.  
 AA. Drupelets nearly dry, inclosed by calyx.....48. *Dalibarda*.

- 8. Cercocarpus Tribe.**  
 A. Fls. apetalous; style elongated and plumose in fr.; hypanthium tubular.....49. *Cercocarpus*.  
 AA. Fls. with petals.  
 B. Style with terminal stigma: lvs. linear, needle-shaped.....50. *Adenostoma*.  
 BB. Style with decurrent stigma.  
 c. Lvs. 3-fid at the apex: sepals imbricate: fr. inclosed about half.....51. *Purshia*.  
 cc. Lvs. bipinnate: sepals valvate: fr. inclosed.....52. *Chamaebatia*.

- 9. Ulmaria Tribe.**  
 Herbs with large pinnate lvs. and large stipules and small white or pink fls. in large panicles...53. *Filipendula*.

- 10. Sanguisorba Tribe.**  
 A. Calyx with 5-6 bractlets or 10-12-out in 2 series or in Agrimonia with a setose limb.  
 B. Petals 0.....54. *Alchemilla*.  
 BB. Petals 4 or 5.....55. *Agrimonia*.  
 AA. Calyx without bractlets; petals 0; lvs. pinnate.  
 B. Fls. axillary, solitary.....56. *Margyricarpus*.  
 BB. Fls. spicate or capitate.  
 c. The calyx valvate; stamens 1-10, short; carpels 1-2.....57. *Acæna*.  
 CC. The calyx imbricate.  
 d. Fr. rarely rugose: fls. usually bisexual; carpel 1; stamens 4-12.....58. *Sanguisorba*.  
 DD. Fr. often rugose: fls. polygamodigious, rarely bisexual; carpels 2; stamens ∞.....59. *Poterium*.

- 11. Rose Tribe.**  
 The only genus.....60. *Rosa*.

- 12. Prunus Tribe.**  
 A. Sepals usually 10, small; petals often wanting or small; carpels in the staminate fl. 2, 1 in the fertile fl.....61. *Maddenia*.

- AA. Sepals 5.  
 B. Carpels solitary.  
 c. Style terminal: lvs. usually serrate; pith of branches solid.....62. *Prunus*.  
 cc. Style lateral: lvs. entire: pith lamellate.....63. *Prinsevia*.  
 BB. Carpels 5: lvs. entire.....64. *Osmaronia*.

### 13. Chrysobalanus Tribe.

- Anthers small, short, didymous; ovary 1-loculed, inserted in the base of the calyx-tube; stamens 15 or more.....65. *Chrysobalanus*.  
 The genus *Plagiospermum* is also cultivated.

## 72. SAXIFRAGACEÆ.

### I. Summary of Tribes.

1. Plants are trees or shrubs.  
 B. Lvs. opposite.....1. **HYDRANGÆA TRIBE**  
 BB. Lvs. alternate.  
 c. Stipules absent: lvs. often coriaceous or glandular-serrate: stamens usually isomerous with petals.....2. **ESCALLONIA TRIBE**  
 cc. Stipules absent or adnate to petiole at base: fls. generally racemose; ovary 1-locular, 2-merous; seeds immersed in pulp.....3. **RIBES TRIBE**.  
 AA. Plants are herbs.  
 B. Fls. 4-merous.....4. **FRANCOA TRIBE**.  
 BB. Fls. generally 5-merous.....5. **SAXIFRAGÆ TRIBE**.

### II. Key to the Tribes.

#### 1. Hydrangea Tribe.

- A. Ovary superior  
 B. Number of petals 4; stamens 10; filaments 2-lobed; styles 3.....1. *Fendlera*.  
 BB. Number of petals 5 or 6.  
 c. Ovules solitary: stamens 4-12; styles 3-5. 2. *Whipplea*.  
 cc. Ovules 4; stamens 15; carpels 2, separate. 3. *Lyonothamnus*.  
 d. Petals 5, convolute: stamens 10; styles 3-5.....4. *Jamesia*.  
 DD. Petals 5 or 6, imbricate: stamens numerous; style 1, with a 5-7-lobed stigma.....5. *Carpenteria*.  
 AA. Ovary inferior or semi-superior.  
 B. Stamens 8, 10 or 12.  
 c. Petals induplicate or imbricate: fr. capsular.....6. *Deutzia*.  
 CC. Petals valvate.  
 d. Fr. a caps.  
 E. Styles 4 or 5, free or connate at the base; petals 4 or 5.....7. *Hydrangea*.  
 EE. Style 1, with a 4-5-lobed stigma; petals 5.....8. *Schizophragma*.  
 DD. Fr. a berry: petals 5 or 6; styles 3-5, club-shaped.....9. *Dichroa*.  
 BB. Stamens ∞.  
 c. Petals induplicate, 7-10; style 1.....10. *Decumaria*.  
 CC. Petals imbricate; styles 1-5.....11. *Philadelphus*.  
 CCC. Petals valvate.  
 d. Styles 2; petals 4.....12. *Platycrater*.  
 DD. Styles 3; petals 5.....13. *Cardiandra*.

#### 2. Escallonia Tribe.

- A. Petals imbricate; style 1; ovary 2- or 3-loculed.....14. *Escallonia*.  
 AA. Petals valvate; styles divisible into 2; ovary 2-loculed.....15. *Itea*.

#### 3. Ribes Tribe.

- The only genus.....16. *Ribes*.

#### 4. Francoa Tribe.

- Sepals and petals equal.....17. *Francoa*.

#### 5. Saxifrage Tribe.

- A. Ovary 1-loculed.  
 B. Placentæ basilar or nearly so.....18. *Tiarella*.  
 BB. Placentæ parietal, opposite the stigmas.....19. *Parnassia*.  
 BBB. Placentæ parietal, alternate with stigmas.  
 c. Stamens 3; petals 5, capillary.....20. *Tolmiea*.  
 CC. Stamens 5-10.  
 d. Caps. not beaked, superior: petals 5, 3-cut or pinnatifid.....21. *Mitella*.  
 DD. Caps. 2-beaked.  
 E. Number of stamens 5; petals 5 or 0; caps. inferior.....22. *Heuchera*.

- |   |                          |
|---|--------------------------|
| EE. Calyx-tube urn-shaped, much longer than ovary; sepals and stamens 5; fls. in long and slender racemes...              | 5. <i>Sinowilsonia</i>   |
| BB. Petals as many as calyx lobes.  |                          |
| c. Fls. borne in catkins, 5-merous.   |                          |
| d. Shape of petals broad; stamens with long-filament; disk present.....   | 6. <i>Corylopsis</i> .   |
| DD. Shape of petals subulate, as long as sepals; stamens nearly sessile; disk 0.  | 7. <i>Fortunearia</i> .  |
| CC. Fls. in clusters, 4-merous.   |                          |
| d. Lvs. deciduous, crenate; anthers obtuse, the locules opening with 1 valve.   | 8. <i>Hamamelis</i> .    |
| DD. Lvs. persistent, entire; anthers beaked, the locules opening with 2 valves....  | 9. <i>Loropetalum</i> .  |
| AA. Ovary-locules 2- or more-ovuled.  |                          |
| B. Fls. unisexual.....  | 10. <i>Liquidambar</i> . |
| BB. Fls. bisexual.....  | 11. <i>bar.</i>          |
| C. The fls. 5, in a head, surrounded by an involucre of which the outer bracts are small, the inner gradually larger..... | 11. <i>Rhodoleia</i> .   |
| CC. The fls. 2 together with very short bracts at the base.....   | 12. <i>Disanthus</i> .   |

78. BRUNIACEÆ.

In cultivation..... *Audouinia*.  
(See article *Diosma*.)

## 79. HALORAGIDACEÆ.

- A. Stamens 1-2; calyx 3-4-lobed; ovary 1-loculed 1. *Gunnera*.  
 AA. Stamens 2-8; calyx truncate or 4-toothed;  
 ovary deeply 2- or 4-grooved..... 2. *Myriophyl-  
 lum*.  
 AAA. Stamen 1; calyx truncate; ovary 1-loculed ... 3. *Hippuris*.

## 80. RHIZOPHORACEÆ.

A. Anthers 8, subsessile.....	1. <i>Rhizophora</i> .
AA. Anthers 15-30, on filaments.....	2. <i>Cassipourea</i> .

## 81. COMBRETACEÆ.

- |   |                        |
|---|------------------------|
| A. Petals 0; calyx-tube not produced beyond ovary.....          | 1. <i>Terminalia</i> . |
| AA. Petals 5 (0 in a few species of <i>Combretum</i> ).....     |                        |
| b. Calyx-tube straight, constricted above ovary.....            |                        |
| c. Cotyledons convolute.....                                    | 2. <i>Poirrea</i> .    |
| cc. Cotyledons deeply furrowed or twisted and plaited.....      | 3. <i>Combretum</i> .  |
| BB. Calyx-tube produced to a great length beyond the ovary..... | 4. <i>Quisqualis</i> . |

## 82. MYRTACEÆ.

- |  |                        |
|--|------------------------|
| A. Ovary 1-located.....  | 1. <i>Thrypto-</i>     |
| AA. Ovary 2- or more-located.  | <i>[mene.]</i>         |
| B. Fr. a caps., which is loculicidally dehiscent at apex, rarely 1-2-seeded and sub-indehiscent. |                        |
| C. Anthers basifixed.....  | 2. <i>Calotham-</i>    |
| CC. Anthers versatile.   | <i>[nus.]</i>          |
| D. Individual fls. pedicelled.   |                        |
| E. Stamens 5-adelphous.....  | 3. <i>Tristania.</i>   |
| EE. Stamens free.  |                        |
| F. Fls. in globose heads.....  | 4. <i>Syncarpia.</i>   |
| FF. Fls. in forking cymes.....   | 5. <i>Metrosid-</i>    |
| DD. Individual fls. not pedicelled.  | <i>[eros.]</i>         |
| E. Fls. solitary in the axils of the floral lvs. or bracts.                                      |                        |
| F. Stamens distinct, not longer than petals.....   | 6. <i>Leptosper-</i>   |
| FF. Stamens distinct, long-exserted....  | <i>[mum.]</i>          |
| FFF. Stamens united in clusters, long-exserted .....   | 7. <i>Callistemon.</i> |
| EE. Fls. in cymose or umbellate heads.   |                        |
| F. Petals distinct....   | 8. <i>Melaleuca.</i>   |
| FF. Petals wanting (or adnate to the calyx-lid).....   | 9. <i>Angophora.</i>   |
| BB. Fr. a berry or rarely an indehiscent drupe: lvs. opposite, punctate.                         | 10. <i>Eucalyptus.</i> |
| C. Stamens straightish in the bud: seeds with endosperm.....                                     | 11. <i>Peisjoa.</i>    |
| CC. Stamens inflexed or involute in the bud: seeds without endosperm.                            |                        |
| D. Calyx-limb closed in bud, deeply divided in anthesis.....                                     | 12. <i>Psidium.</i>    |
| DD. Calyx 4-5-lobed or -parted in the bud, not cut-deeper in anthesis.                           |                        |

76. DROSERACEÆ.

- |  |                                |
|--|--------------------------------|
| A. Stamens 4-8; styles 2-5; placentæ parietal....            | 1. <i>Drosera</i> .            |
| AA. Stamens about 15; style columnar; placentæ<br>basal..... | 2. <i>Dionæa</i> .             |
| AAA. Stamens 10-20; styles 5, filiform.....                  | 3. <i>Drosophyl-<br/>lum</i> . |

## 77. HAMAMELIDACEÆ.

- A. Ovary-locules 1-ovuled.  
 B. Petals 0.  
 C. Lvs. evergreen.  
   D. Stamens 2-8, with long filaments; fls. in racemes. 1. *Distylium*.  
 DD. Stamens  $\infty$ , with short filaments; fls. in heads; calyx-tube in the pistillate fl. tubular. 2. *Sycopsis*.  
 CC. Lvs. deciduous.  
   D. Number of stamens about 24; fls. in dense spikes. 3. *Fothergilla*.  
 DD. Number of stamens 5-7.  
   E. Calyx-tube not urn-shaped; sepals and stamens 5-7; fls. in short head-like racemes. 4. *Parrotia*.

- The only genus..... *Trapa*.

## 89. LOASACEÆ.

- A. Petals hooded.  
 B. Caps. 3-5-valved at apex, rarely twisted.... 1. *Loasa*.  
 BB. Caps. longitudinally 5-10-valved, usually twisted spirally..... 2. *Blumenbachia*.  
 BBB. Caps. narrow, straight, longitudinally 5-valved ..... 3. *Scyphanthus*.  
 AA. Petals not hooded.  
 B. Seeds very numerous, arranged in many series..... 4. *Eucnide*.  
 BB. Seeds few or, if numerous, arranged in 2 series..... 5. *Mentzelia*.

## 90. PASSIFLORACEÆ.

- A. Hypanthium long; petals and stamens 5.... 1. *Tacsonia*.  
 AA. Hypanthium short; petals 4-5, rarely 0; stamens 4-5..... 2. *Passiflora*.  
 AAA. Hypanthium medium or short; fls. unisexual. 3. *Modecca*.

## 91. CARICACEÆ.

In cultivation ..... *Carica*.

## 92. CUCURBITACEÆ.

## I. Summary of Tribes.

- A. Series 1. Ovules horizontal..... 1. CUCURBITA TRIBE.  
 AA. Series 2. Ovules erect or ascending, rarely horizontal  
 B. Fr. ruptures elastically..... 2. CYCLANTHERA [TRIBE].  
 BB. Fr. does not rupture elastically.... 3. ABOBRA TRIBE.  
 AA. Series 3. Ovules pendulous..... 4. SICYOS TRIBE.

## II. Key to the Tribes.

## 1. Cucurbita Tribe.

- A. Anther-cells straight, rarely curved, not flexuous..... 1. *Melothria*.  
 AA. Anther-cells flexuous or conduplicate.  
 B. Corolla bell-shaped, 5-lobed to the middle or a little below.  
 C. Anthers free..... 2. *Sicana*.  
 CC. Anthers coherent.  
 D. Filaments connate..... 3. *Coccinia*.  
 DD. Filaments free..... 4. *Cucurbita*.  
 BB. Corolla rotate and 5-petaled or bell-shaped and 5-parted to the base.  
 C. Petals fimbriate or tendril-bearing.  
 D. Seeds large, fibrous..... 5. *Telfairea*.  
 DD. Seeds small, not fibrous..... 6. *Trichosanthes*.  
 CC. Petals entire.  
 D. Hypanthium of male fls. long; anthers coherent in an oblong head, usually included.  
 E. Pistillodes in male fls. 1-3, subulate or setiform..... 7. *Gymnopetalum*.  
 EE. Pistillode absent or reduced to a gland  
 F. Anthers coherent..... 8. *Peponia*.  
 FF. Anthers free..... 9. *Lagenaria*.  
 DD. Hypanthium of male fls. short; anthers free or slightly coherent, usually exerted.  
 E. Stamens inserted in the mouth of the hypanthium.  
 F. Scales in bottom of hypanthium..... 10. *Thladiantha*.  
 FF. Scales in bottom of hypanthium 2-3..... 11. *Momordica*.  
 EE. Stamens inserted in hypanthium.  
 F. Male fls. in racemes.  
 G. Fr. dry, fibrous, dehiscent by lid at top..... 12. *Luffa*.  
 GG. Fr. fleshy, not fibrous.  
 H. Female fls. solitary..... 13. *Ecballium*.  
 HH. Female fls. racemose or clustered..... 14. *Bryonia*.  
 FF. Male fls. solitary or fascicled.  
 G. Sepals somewhat leafy, serrate, reflexed..... 15. *Benincasa*.  
 GG. Sepals awl-shaped, entire, erect.  
 H. Pollen minutely muricate; pistillode 0..... 16. *Bryonopsis*.  
 HH. Pollen smooth; pistillode reduced to a small gland.  
 I. Tendrils not branched; connective usually produced upward beyond locule..... 17. *Cucumis*.  
 II. Tendrils 2-3-fid; connective not produced..... 18. *Citrullus*.

## 2. Cyclanthera Tribe.

- A. Fr. oblique, gibbous, rupturing elastically.... 19. *Cyclanthera*.  
 AA. Fr. not gibbous, opening by 1 or 2 pores at the top or by irregular rupture..... 20. *Echinocystis*.  
 (Incl. *Megarrhiza*.)

## 3. Abobra Tribe.

Anther-cells flexuous; stamens free..... 21. *Abobra*.

## 4. Sicyos Tribe.

Fls. 5-merous, monœcious: fr. fleshy..... 22. *Sechium*.

The genera *Actinostemma*, *Gurania*, *Herpetospermum*, *Hodgsonia* and *Sicyos* are sometimes cultivated.

## 93. BEGONIACEÆ.

- A. Ovary wholly inferior.  
 B. Petals all free ..... 1. *Begonia*.  
 BB. Petals of pistillate fl. grown together..... 2. *Symbegonia*.  
 AA. Ovary partly superior..... 3. *Hillebrandia*.

## 94. CACTACEÆ.

- A. Fl.-tube wanting.  
 B. Lvs. large and persistent.  
 C. Seeds black and shining..... 1. *Pereskia*.  
 CC. Seeds white, dull and covered with hairs. 2. *Peresklopsis*.  
 BB. Lvs. wanting or minute and caducous.  
 C. Plant epiphytic, spineless: fls. small.  
 D. Flowering joints bottle-shaped..... 3. *Hariota*.  
 DD. Flowering joints not bottle-shaped.... 4. *Rhipsalis*.  
 CC. Plant not epiphytic, usually very spiny: fls. large.  
 D. Petals spreading; filaments much shorter than the petals..... 5. *Opuntia*.  
 DD. Petals erect and closely surrounding the stamens; filaments longer than the petals..... 6. *Nopalea*.  
 AA. Fl.-tube present, often much elongated.  
 B. Plants epiphytic or nearly so, either flat or 3-angled, usually spineless and always with spineless fr.  
 C. Sts. 3-angled, bearing small spines at the areoles; ovary and fr. bearing large bracts..... 7. *Hylocereus*.  
 CC. Sts. normally flat, spineless; ovary and fr. bearing only minute bracts.  
 D. The sts. weak, divided into many short joints.  
 E. Fls. irregular..... 8. *Zygocactus*.  
 EE. Fls. regular..... 9. *Schlumbergera*.  
 DD. The sts. stouter than the last, with elongated joints.  
 E. Fl.-tube very short or nearly wanting..... 10. *Disocactus*.  
 EE. Fl.-tube very definite, often much elongated.  
 F. Fls. small, diurnal..... 11. *Wittia*.  
 FF. Fls. large, nocturnal ..... 12. *Epiphyllum*.  
 BB. Plants not epiphytic, never flat, with several to many ribs.  
 C. Sts. globular or cylindrical, not jointed.  
 D. Plant-body covered with more or less definite tubercles: fr. naked.  
 E. The plant terminated by a cephalium..... 13. *Cactus*.  
 EE. The plant without a terminal cephalium.  
 F. Without spines except in the seedlings.  
 G. Plant tumid, without woody tubercles..... 14. *Lophophora*.  
 GG. Plant with dry prominent woody tubercles..... 15. *Ariocarpus*.  
 FF. With spines on the tubercles.  
 G. Tubercles terete or angled, with various kinds of spines..... 16. *Mammillaria*.  
 GG. Tubercles flattened, with pectinate spines..... 17. *Pelecypophora*.  
 DD. Plant-body covered with more or less definite ribs: fr. scaly.  
 E. Tubercles elongated, finger-like..... 18. *Leuchtenbergia*.  
 EE. Tubercles, if present, always low.  
 F. Top of plant naked or nearly so..... 19. *Echinocactus*.  
 FF. Top of plant very woolly..... 20. *Malacocarpus*.  
 CC. Sts. often tall, cylindrical, more-or-less branched, erect or climbing, sometimes low and then always with spiny fr.  
 D. Flowering plants taking on various forms like a cephalium, long hairs or wool, peculiar bristles or spines from near the top.  
 E. Ribs of sts. 4-7..... 21. *Lophocereus*.  
 EE. Ribs of sts. many.

- F. Fls. diurnal; flowering areoles with acicular spines, but no wool. 22. *Carnegiea*.  
 FF. Fls. nocturnal; wool or hairs usually produced in abundance with the fls.  
 G. Ovary and fr. nearly smooth, the few minute bracts with no hairs in their axils. .... 23. *Cephalocereus*.  
 GG. Ovary and fr. covered with bracts with long hairs in their axils. .... 24. *Oreocereus*.  
 DD. Flowering plants not different from the sterile plants.  
 E. Plants tall erect trees.  
 F. Fl., after withering, dropping from the ovary. .... 25. *Cereus*.  
 FF. Fl., after withering, persisting on the ovary.  
 G. Fr. and fls. minute, often several coming from each flowering areole. .... 26. *Myrtillocactus*.  
 GG. Fr. and fls. medium-sized or larger, only 1 coming from each flowering areole.  
 H. Ovary and fr. covered with thin scales, but no fls. .... 27. *Escontria*.  
 HH. Ovary and fr. spiny but not bearing large chartaceous scales.  
 I. The fr. edible, juicy. .... 28. *Lemnaireocereus*.  
 II. The fr. dry. .... 29. *Pachycereus*.  
 EE. Plants low, often vines; or, if at first elongated and erect, finally becoming procumbent or clambering.  
 F. Fls. nocturnal.  
 G. Fr. smooth, yellow. .... 30. *Harrisia*.  
 GG. Fr. spiny, red.  
 H. Sts. producing an abundance of aerial roots. .... 31. *Selenicereus*.  
 HH. Sts. not producing an abundance of aerial roots.  
 I. Ribs usually 3. .... 32. *Acanthocereus*.  
 II. Ribs 10 or more. .... 33. *Nyctocereus*.  
 FF. Fls. diurnal.  
 G. The fls. irregular, narrow.  
 H. Sts. slender, weak. .... 34. *Aporocactus*.  
 HH. Sts. stout, at first erect.  
 I. Fr. spiny, with red pulp. .... 35. *Rathbunia*.  
 II. Fr. not spiny, with white pulp. .... 36. *Cleistocactus*.  
 GG. The fls. regular.  
 H. Fl.-tube much elongated; spines on the ovary reduced to stiff bristles. .... 37. *Echinopsis*.  
 HH. Fl.-tube short, at least never much elongated.  
 I. Plants producing a cluster of tubers. .... 38. *Wilcoxia*.  
 II. Plants without tubers.  
 J. Usually stout but low, sometimes procumbent; stigmas green. .... 39. *Echinocephalus*.  
 JJ. Viny; stigmas not green.  
 K. Fls. small, yellow. .... 40. *Bergerocactus*.  
 KK. Fls. large, red or white. .... 41. *Hellocereus*.

Epiphyllanthus and Pterocactus are described.

## 95. AIZOACEÆ.

- A. Petals numerous; caps. 5- or more valved. .... 1. *Mesembryanthemum*.  
 AA. Petals 0; drupe 3-8-stoned. .... 2. *Tetragonia*.  
 AAA. Petals 5-∞; caps. circumscissile. .... 3. *Sesuvium*.

## 96. UMBELLIFERÆ.

Key condensed from Coulter & Rose's "Monograph of North American Umbelliferae." Not arranged in sequence of relationship.

- A. Fls. in dense heads. .... 1. *Eryngium*.  
 AA. Fls. not in heads, evidently umbellate.  
 B. Fr. conspicuously bristly.  
 C. The fr. covered with spines or hooked bristles. .... 2. *Sanicula*.  
 CC. The fr. with bristles only on the ribs. .... 3. *Daucus*.  
 BB. Fr. not bristly (except *Osmorhiza* and *Cuminum*).  
 C. Oil-tubes obsolete or obscure.  
 D. The fr. strongly flattened laterally: lvs. simple. .... 4. *Hydrocotyle*.  
 DD. The fr. not strongly flattened.  
 E. Seed-face concave.  
 F. Stylopodium conical.  
 G. At base, fr. attenuate. .... 5. *Osmorhiza*.

- GG. At base, fr. rounded.  
 H. Ribs slender. .... 6. *Scandix*.  
 HH. Ribs broad, 3-angled, or almost wing-like. .... 7. *Myrrhis*.  
 FF. Stylopodium flat or wanting.  
 G. Lvs. simple and perfoliate. .... 8. *Bupleurum*.  
 GG. Lvs. large and compound. .... 9. *Conium*.  
 EE. Seed-face plane. .... 10. *Ægopodium*.  
 CC. Oil-tubes distinct.  
 D. Dorsally the fr. strongly flattened, with lateral ribs more or less prominently winged (see *Musineon*).  
 E. The oil-tubes solitary in the intervals between the ribs, rarely 2.  
 F. Stylopodium conical.  
 G. Slender and glabrous plants. .... 11. *Ozypolis*.  
 GG. Stout and pubescent, at least in the umbel. .... 12. *Heracleum*.  
 FF. Stylopodium flat or wanting.  
 G. Plants caulescent and branching.  
 H. Color of fls. white.  
 I. Lvs. pinnately dissected; dorsal ribs filiform: plant slender. .... 13. *Anethum*.  
 II. Lvs. ternately or pinnately compound; dorsal ribs prominent but slender: plant stout. .... 14. *Angelica*.  
 III. Lvs. pinnately compound; dorsal ribs winged: plant stout. .... 15. *Selinum*.  
 HH. Color of fls. yellow. .... 16. *Levisticum*.  
 II. Dorsal ribs filiform. .... 17. *Pastinaca*.  
 GG. Plants acaulescent or nearly so. .... 18. *Lomatium*.  
 EE. The oil-tubes more than 1 in the intervals, usually several.  
 F. Plants caulescent or nearly so: fls. yellow or white. .... 18. *Lomatium*.  
 FF. Plants caulescent and branching.  
 G. Fr. winged: fls. white. .... 19. *Archangel*.  
 GG. Fr. not winged: fls. yellow. .... 20. *Ferula*.  
 DD. Dorsally the fr. not strongly flattened, usually more or less laterally flattened.  
 E. The oil-tubes solitary in the intervals between the ribs.  
 F. Stylopodium conical: lfts. linear or filiform.  
 G. Involucre wanting.  
 H. Fls. white. .... 21. *Coriandrum*.  
 HH. Fls. yellow. .... 22. *Feniculum*.  
 GG. Involucre present.  
 H. Fls. rose-color: fr. bristly. .... 23. *Cuminum*.  
 HH. Fls. white: fr. smooth. .... 24. *Carum*.  
 FF. Stylopodium flat or wanting.  
 G. Fls. white. .... 25. *Apium*.  
 GG. Fls. yellow. (See article *Celery*).  
 H. Ribs equal, broad and corky. .... 26. *Petroselinum*.  
 HH. Ribs winged or filiform.  
 I. The ribs conspicuously winged. .... 27. *Thaspium*.  
 II. The ribs filiform. .... 28. *Zizia*.  
 EE. The oil-tubes more than 1 in the intervals.  
 F. Stylopodium conical. .... 29. *Ligusticum*.  
 FF. Stylopodium flat or wanting.  
 G. Seed-face sulcate or decidedly concave.  
 H. Carpels flattened dorsally. .... 30. *Musineon*.  
 HH. Carpels strongly flattened laterally. .... 31. *Erigenia*.  
 GG. Seed-face plane or but slightly concave.  
 H. Ribs all filiform: lfts. entire. .... 32. *Tamaria*.  
 HH. Ribs corky at least the lateral.  
 I. Lvs. simple and perfoliate: oil-tubes continuous about seed-cavity. .... 8. *Bupleurum*.  
 II. Lvs. pinnate, usually serrate: oil-tubes 1-3 in the intervals. .... 33. *Sium*.

The following genera are also treated: *Aciphylla*, *Arracacia*, *Astrantia*, *Chaerophyllum*, *Crithmum*, *Dorema*, *Hacquetia*, *Meum*, *Molopospermum*, *Peucedanum*, *Portenschlagia*, and *Seseli*.

## 97. ARALIACEÆ.

- A. Petals more or less imbricate, broadly affixed at base.  
 B. Lvs. pinnate.  
 C. Lfts. entire or indistinctly crenate: ovary 2-celled: glabrous evergreen shrubs. .... 1. *Delarbrea*.  
 CC. Lfts. serrate: ovary 2-5-celled: herbs or small deciduous trees. .... 2. *Aralia*.  
 BB. Lvs. digitate, whorled: fls. in simple terminal umbels; styles 2-3, distinct in the fertile fls.: herbs. .... 3. *Panax*.

- AA. Petals valvate.  
 B. Pedicels jointed or fls. sessile: evergreen tropical or subtropical trees or shrubs.  
 C. Fls. pedicelled.  
 D. Lvs. 1-3-pinnate: ovary 1-10-celled; styles usually distinct..... 4. *Polyscias*.  
 DD. Lvs. digitate or occasionally simple: styles 5, distinct..... 5. *Pseudo*-[*panax*.]  
 CC. Fls. sessile: ovary usually 5-celled, rarely 1-4- or 6-12-celled; endosperm usually ruminate: lvs. usually simple and lobed, rarely digitate..... 6. *Oreopanax*.  
 BB. Pedicels not jointed.  
 C. Lvs. digitate.  
 D. Anthers 4-celled; ovary 10-celled, styles distinct: evergreen..... 7. *Dizygotheca*.  
 DD. Anthers 2-celled; styles usually connate.  
 E. Stipules wanting: lvs. deciduous: ovary 2 5-celled..... 8. *Acantho*-[*panax*.]  
 EE. Stipules developed: lvs. evergreen: ovary 5- to many-celled..... 9. *Schefflera*.  
 CC. Lvs. simple, usually lobed.  
 D. Fls. 4- or 8-12-merous: lvs. palmately lobed, large.  
 E. Styles, connate into a column: fls. 8-12-merous..... 10. *Trevesia*.  
 EE. Styles distinct, 2: fls. 4-merous: lvs. deciduous..... 11. *Tetrapanax*.  
 DD. Fls. 5-merous, rarely 5-8-merous.  
 E. With distinct styles.  
 F. Shrub, evergreen, unarmed: styles 5..... 12. *Fatsia*.  
 FF. Shrub deciduous, prickly: styles 2..... 13. *Echino*-[*panax*.]  
 EE. With connate styles.  
 F. Habit climbing: endosperm ruminate: lvs. simple, usually lobed, evergreen..... 14. *Hedera*.  
 FF. Habit upright.  
 G. Ovary 5-8-celled; calyx indistinctly toothed: lvs. usually entire, occasionally 2-5-lobed, evergreen..... 15. *Gilibertia*.  
 GG. Ovary 2-celled; calyx with 5 short teeth: lvs. palmately lobed or digitate, deciduous... 8. *Acantho*-[*panax*.]

*Meryta* and *Tupidanthus* are also in cultivation.

### 98. GARRYACEÆ.

The only genus..... *Garrya*.

### 99. NYSSACEÆ.

- A. Ovary 1-celled; calyx minute; petals usually 5: pistillate and staminate fls. in distinct heads with small deciduous bracts..... 1. *Nyssa*.  
 AA. Ovary 6-10-celled; perianth 0 in staminate fls.; heads consisting of 1 pistillate fl. and numerous staminate fls. with 2 or 3 very large white bracts at the base..... 2. *Davidia*.

### 100. ALANGIACEÆ.

The only genus..... *Alangium*.

### 101. CORNACEÆ.

- A. Fls. bisexual, usually in cymes; petals short, valvate; ovary 2-celled: lvs. usually opposite..... 1. *Cornus*.  
 AA. Fls. unisexual.  
 B. Lvs. opposite, evergreen: fls. in terminal panicles; ovary 1-celled..... 2. *Aucuba*.  
 BB. Lvs. alternate.  
 C. Petals valvate, 4: fls. in few-fl. cymes on the upper surface of the lvs..... 3. *Helwingia*.  
 CC. Petals imbricate, 5: fls. in terminal racemes or panicles..... 4. *Griselinia*.

### 102. CAPRIFOLIACEÆ.

- A. Corolla rotate or nearly so; limb regular; style short, deeply 2-5-cut.  
 B. Lvs. pinnately cut..... 1. *Sambucus*.  
 BB. Lvs. simple..... 2. *Viburnum*.  
 AA. Corolla tubular or bell-shaped; limb usually irregular; style long, usually with capitate stigma.

- B. Ovary 2-5-celled; all the cells 1-ovuled: herbs with rather small whorled fls..... 3. *Triosteum*.  
 BB. Ovary 3-4-celled; 1 or 2 cells 1-ovuled, the others with numerous ovules.  
 C. Fr. a berry, usually 2-seeded: corolla campanulate or tubular-funnelform, nearly regular..... 4. *Symphoricarpos*.  
 CC. Fr. a leathery achene.  
 D. Achene inclosed between large peltate bracts: corolla campanulate-funnelform, 2-lipped; ovary 4-celled..... 5. *Dipelta*.  
 DD. Achene not inclosed between bracts: ovary 3-celled; corolla nearly or quite regular.  
 E. Ovary narrow; sepals 2-5, large, persistent; corolla tubular or campanulate-funnelform..... 6. *Abelia*.  
 EE. Ovary subglobose; sepals 5, lanceolate deciduous; corolla campanulate-funnelform: trailing under-shrub with the fls. in pairs on slender upright stalks..... 7. *Linnæa*.  
 BBB. Ovary 2-8-celled, the cells with many ovules or 1 cell empty.  
 C. Fr. an achene or caps.  
 D. Stamens 4: fls. in coalescent pairs inserted at unequal height; ovary 3-celled, often 1 cell empty: fr. an achene..... 8. *Kolkwitzia*.  
 DD. Stamens 5: fls. in cymes: fr. a 2-celled dehiscent caps..... 9. *Diervilla*.  
 CC. Fr. a berry.  
 D. Cells of ovary 2-3, rarely 4-5: fls. in pairs or whorls; calyx deciduous... 10. *Lonicera*.  
 DD. Cells of ovary 5-8: fls. in whorls; calyx persistent..... 11. *Leycesteria*.

*Alseuosmia* is also briefly treated.

## 103. RUBIACEÆ.

### 1. Summary of Tribes.

Ignoring exceptions and omitting eight tribes not within the scope of this work.

- A. Number of ovules in each locule ∞.  
 B. Fr. dry, capsular or 2-5-berried or nutlike.  
 C. Fls. compacted or confluent into a spherical head..... 1. NAUCLEA TRIBE.  
 CC. Fls. not disposed in a spherical head.  
 D. Seeds winged or appendaged, with endosperm: caps. 2-celled, 2. CINCHONA TRIBE.  
 DD. Seeds not winged.  
 E. Corolla valvate.  
 F. The seeds with endosperm: caps. 2-celled..... 3. CONDAMINEA [TRIBE].  
 FF. The seeds minute: fr. indehiscent, 2-berried or capsular, 2-4-celled..... 4. HEDYOTIS TRIBE.  
 EE. Corolla imbricate or convolute: caps. 2-celled; seeds with endosperm..... 5. RONDELETIA [TRIBE].  
 BB. Fr. fleshy, bursting irregularly or dehiscent at apex, or a drupe with 2 or more stones, the stones many-seeded.  
 C. Corolla valvate: seeds numerous, minute, angled..... 6. MUSSENDA TRIBE.  
 CC. Corolla imbricate or convolute: seeds numerous, minute, often angled..... 7. HAMELIA TRIBE.  
 CCC. Corolla strictly convolute: seeds numerous or few, large and compressed or smaller and angled.... 8. GARDENIA TRIBE.  
 AA. Number of ovules in each locule 1.  
 B. Radicles superior.  
 C. Stamens inserted at base of corolla; corolla valvate or imbricate.... 9. CHIOCOCCA TRIBE.  
 CC. Stamens inserted at throat of corolla.  
 D. Corolla strictly convolute..... 10. ALBERTA TRIBE.  
 DD. Corolla valvate..... 11. VANGUERIA TRIBE.  
 BB. Radicles inferior.  
 C. Corolla strictly convolute..... 12. IXORA TRIBE.  
 CC. Corolla valvate.  
 D. Ovules affixed to septum, rarely basilar, generally amphitropous: trees and shrubs..... 13. MORINDA TRIBE.  
 DD. Ovules affixed to septum, amphitropous or anatropous: herbs..... 14. GALIUM TRIBE.  
 DDD. Ovules basilar, erect, anatropous.  
 E. Stamens inserted on the throat of the corolla: fr. indehiscent: style entire or with short branches... 15. PSYCHOTRIA TRIBE.

- EE. Stamens inserted on the throat, rarely at base of corolla: fr. capsular or 2-berried: style-branches filiform.....16. *PÆDERIA* TRIBE.
- EEE. Stamens inserted at base of corolla, rarely on throat: fr. berry-like or indehiscent: style entire or with long branches.....17. *ANTHOSPERMA* TRIBE.

## II. Key to the Tribes.

### 1. Nauclea Tribe.

- Calyx-tubes confluent: fr. a globose, fleshy syncarp: ovary 2-celled; ovules solitary, pendulous.....1. *Cephalanthus*.

### 2. Cinchona Tribe.

- A. Corolla valvate.  
 B. Placentæ ascending from the base of the septum, or erect.....2. *Manettia*.  
 BB. Placentæ adnate to the middle of the septum.  
 C. Caps. septicidal.....3. *Cinchona*.  
 CC. Caps. loculicidal.....4. *Bouvardia*.  
 AA. Corolla imbricate; stamens inserted in the throat.  
 B. Sepals never bract-like.....5. *Luculia*.  
 BB. One of the sepals in some fls. in each infl. developing into a large white persistent appendage.....6. *Emmenopteris*.

### 3. Condaminea Tribe.

- One calyx-lobe dilated into an ample colored blade.....7. *Pinckneya*.

### 4. Hedyotis Tribe.

- A. Calyx-lobes unequal: caps. loculicidal.....8. *Pentas*.  
 AA. Calyx-lobes equal: caps. loculicidal at the top.....9. *Houstonia*.

### 5. Rondeletia Tribe.

- Corolla imbricate, lobes equal or nearly so.....10. *Rondeletia*.

### 6. Mussænda Tribe.

- Infl. terminal, corymbose; ovary 1-2-celled; calyx-lobes 5, 1 dilated and colored.....11. *Mussænda*.

### 7. Hamelia Tribe.

- A. Corolla 5-ribbed: berry 5-celled.....12. *Hamelia*.  
 AA. Corolla 4-5-lobed: berry 2-3-celled.....13. *Hoffmannia*.

### 8. Gardenia Tribe.

- A. Infl. usually terminal.  
 B. Corolla-tube short.....14. *Burchellia*.  
 BB. Corolla-tube long.  
 C. Calyx 5-toothed.....15. *Posoqueria*.  
 CC. Calyx-lobes large and leafy.....16. *Leptactina*.  
 AA. Infl. usually axillary.  
 B. Style has a spindle or club-shaped stigma, entire or 2-toothed.  
 C. Seed-coat membranous.  
 D. Calyx-limb various; ovary 2-celled.....17. *Randia*.  
 DD. Calyx-limb often tubular; ovary 1-celled.....18. *Gardenia*.  
 CC. Seed-coat fibrous or subfibrous.  
 D. Corolla-tube long and slender.....19. *Oxyanthus*.  
 DD. Corolla-tube short.  
 E. Calyx 5-parted.....20. *Mitrostigma*.  
 EE. Calyx truncate or 5-toothed.....21. *Genipa*.  
 BB. Style-branches 2, distinct (except sometimes in *Kraussia*).  
 C. Throat of corolla bearded.....22. *Kraussia*.  
 CC. Throat of corolla glabrous.....23. *Tricalysia*.

### 9. Chiococca Tribe.

- Corolla valvate: infl. axillary, racemose; anthers dorsifixed; stigma club-shaped.....24. *Chiococca*.

### 10. Alberta Tribe.

- Infl. terminal; the 2-4 calyx-lobes dilated; anthers pilose on back.....25. *Alberta*.

### 11. Vangueria Tribe.

- A. Drupe 1-2-stoned.....26. *Plectronia*.  
 AA. Drupe 3-6-stoned.....27. *Vangueria*.

### 12. Ixora Tribe.

- A. Fls. clustered in axils.....28. *Coffea*.  
 AA. Fls. in 2-3-forking corymbs.  
 B. Style-branches 2, short, rarely connate: lvs. leathery.....29. *Ixora*.  
 BB. Style very far exserted, the slender spindle-shaped stigma usually long: lvs. usually membranous.....30. *Pavetta*.

### 13. Morinda Tribe.

- A. Fls. confluent in heads, which are many-fld., solitary or umbellate.....31. *Morinda*.  
 AA. Fls. free; calyx-limb 4-5-fld; corolla villous at throat; stigma club-shaped, 2-4-lobed; drupe 1-4-stoned: infl. axillary.....32. *Damnanus*.

### 14. Galium Tribe.

- A. Corolla funnel-shaped or somewhat tubular.  
 B. Fls. 4-merous, with or without bracts, but no bractlets; style-branches subequal.....33. *Asperula*.  
 BB. Fls. 4-5-merous, bracted and with 2 bractlets; style-branches unequal.....34. *Crucianella*.  
 AA. Corolla rotate or rotate-campanulate.  
 B. Fls. 5-merous.....35. *Rubia*.  
 BB. Fls. 4-merous.....36. *Galium*.

### 15. Psychotria Tribe.

- Infl. terminal; calyx usually 5-toothed; corolla 5-lobed, rarely 4-lobed; tube usually short.....37. *Psychotria*.

### 16. Pæderia Tribe.

- A. Ovary 2-celled; stigma 2, capillary, twisted: fr. drupaceous: twining plant.....38. *Pæderia*.  
 AA. Ovary 5-celled: fr. a caps.: small upright shrubs.....39. *Leptodermis*.

### 17. Anthosperma Tribe.

- A. Stamens inserted in throat; style-branches 4.....40. *Mitchelia*.  
 AA. Stamens inserted at or near base of corolla.  
 B. Fls. bisexual; style shortly 2-cut; shrub.....41. *Serissa*.  
 BB. Fls. unisexual or bisexual; style 2-parted to the base or near it.  
 C. Plants are creeping herbs.....42. *Nertera*.  
 CC. Plants are shrubs or small trees.....43. *Coprosma*.

Other genera incidentally described are: *Catesbæa*, *Cephaelis*, *Exostemma*, *Fernelia*, *Guettarda*, *Oldenlandia*, *Plocama*, and *Sarcocephalus*.

### 104. VALERIANACEÆ.

- A. Stamens 4.....1. *Patrinia*.  
 AA. Stamens 1, rarely 2: corolla-tube spurred, the limb spreading.....2. *Centranthus*.  
 AAA. Stamens 2; corolla-tube spurred, the limb 2-lipped.....3. *Fedia*.  
 AAAA. Stamens usually 3.  
 B. Calyx-limb finally pappiform.....4. *Valeriana*.  
 BB. Calyx-limb various but not pappiform.....5. *Valerianella*.

### 105. DIPSACACEÆ.

- A. Stigma terminal, straight: fls. densely crowded in the axils of the floral lvs., forming whorls after the manner of the mint family.....1. *Morina*.  
 AA. Stigma oblique or lateral, rarely straightish: fls. in terminal heads.  
 B. Bracts of involucre generally herbaceous; chaff of receptacle rigidly awl-shaped-acuminate or spinescent; corolla 4-fld.....2. *Dipsacus*.  
 BB. Bracts and chaff rigidly paleaceous, rarely sub-herbaceous; corolla 4-fld.....3. *Cephalaria*.  
 BBB. Bracts leafy, in about 2 series; chaff short, or very narrow or abortive; corolla 4-5-cut.....4. *Scabiosa*.

### 106. COMPOSITÆ.

#### I. Summary of Tribes.

**Series I. TUBULIFLOREÆ.** Corollas tubular and regular in all the bisexual fls.

- A. Heads composed entirely of disk-fls., which are all perfect and never truly yellow.  
 B. Style-branches awl-shaped, acute, minutely hairy: lvs. generally alternate: anthers sagittate at base.... 1. **VERNONIA TRIBE.**

- BB. Style-branches subterete, obtuse, covered with minute papillae: lvs. opposite or alternate: anthers subentire at base..... 2. EUPATORIUM [TRIBE.]
- AA. Heads with all perfect or some imperfect fls., with or without rays and often yellow.
- B. Anthers tailed.
- C. Style-branches linear: heads with or without rays..... 3. INULA TRIBE.
- CC. Style-branches united or short; heads without rays; typically with spiny or scarious appendages, many-bracted involucre and fleshy receptacle..... 4. CYNARA TRIBE.
- BB. Anthers not conspicuously tailed.
- C. Style-branches in disk-fls. flattened out, and with a distinct though sometimes very short terminal appendage..... 5. ASTER TRIBE.
- CC. Style-branches not flattened out.

NOTE.—It is impossible to make a key to separate the following tribes from one another. Some of the important characters are italicized:

- Receptacle chaffy or rarely naked under the sterile disk-fls.: style-branches truncate or appendaged or the style of the sterile fls. undivided; pappus sometimes absent but generally of 2-4 awns, which are slender or somewhat chaffy and with or without intermediate scales which are free or connate at base: lvs. opposite, rarely alternate.....* 6. HELIANTHUS [TRIBE.]
- Receptacle naked; style-branches truncate or appendaged; pappus usually chaffy, rarely of awns or bristles, or absent: lvs. opposite or alternate: involucre bracts in 1 or 2 series, rarely 3-4, herbaceous or membranous: herbage often resinous-dotted.....* 7. HELENIUM TRIBE.
- Receptacle chaffy or naked; style-branches truncate; pappus when present crown-shaped, rarely of short chaff: lvs. mostly alternate: involucre bracts in 2 or more series, dry or scarious at apex.....* 8. ANTHEMIS TRIBE.
- Receptacle usually naked; style-branches truncate or appendaged; pappus usually of bristles: lvs. mostly alternate: inner involucre bracts in 1 series, subequal, the outer ones small or wanting, or rarely all imbricate in numerous series.....* 9. SENECIO TRIBE.
- Receptacle naked; style-branches truncate or the style of the sterile fls. undivided; pappus absent or wool-like: lvs. usually alternate or radical: involucre bracts in 1-2 series, subequal, narrow.....* 10. CALENDULA TRIBE.
- Receptacle naked, chaffy or alveolate; style-branches rounded at apex, obtuse or rarely truncate or the style of the sterile fls. undivided; pappus absent, or chaffy or crown-shaped: lvs. radical or alternate: involucre bracts in an indefinite number of series, often scarious at apex or spinescent.....* 11. ARCTOTIS TRIBE.

Series 2. LABIATIFLORÆ. Corollas of all or only of the bisexual fls. bilabiate..... 12. MUTISIA TRIBE.

Series 3. LIGULIFLORÆ. Corollas all ligulate and fls. bisexual: juice milky..... 13. CICHORIUM TRIBE.

## II. Artificial Key to the Composite Tribes.

(Condensed from Engler & Prantl.)

- A. Plants without milky juice: corolla of disk-fls. not ligulate (except some of the Mutisia Tribe, recognized by the peculiar style and caudate anthers).
- B. Style below its point of branching neither thickened nor with a ring of long sweeping hairs.
- C. Anthers not caudate.
- D. Style-branches awl-shaped, acute, minutely hairy outside and often on style below, stigmatose over the whole inner face..... VERNONIA TRIBE.
- DD. Style-branches subterete, obtuse, covered with minute papillae, stigmatose in 2 lines near the base..... EUPATORIUM TRIBE.
- DDD. Style-branches flattened, with distinct though often short-terminal, usually short-hairy appendages, stigmatose in 2 lines..... ASTER TRIBE.

- DDDD. Style-branches flattened, stigmatose in 2 lines, very diverse in form (i. e., truncate or appendiculate, but with a distinct tendency toward a ring of long sweeping hairs somewhere above the fork (transitions frequent to the above 3 tribes).
- E. Pappus not capillary, but composed of scales, plumose bristles, or strong awns, or crown-like or wanting.
- F. Involucre bracts without scarious margins, rarely with narrow membranous margins (in some genera which may be separated by strongly developed scaly pappus from the Anthemis Tribe).
- G. Chaff present..... HELIANTHUS TRIBE.
- GG. Chaff absent..... HELENIUM TRIBE.
- FF. Involucre bracts scarious margined: pappus 0 or reduced, sometimes unilaterally developed..... ANTHEMIS TRIBE.
- EE. Pappus capillary, simple..... SENECIO TRIBE.
- DDDDD. Style-branches of the bisexual fls. (which are sterile) almost or quite wanting, rarely of normal size, not stigmatose.
- E. Plants more or less completely dioecious: chaff 0.
- F. Involucre bracts in 1 row, of equal length (often with tiny bracteoles at the base)..... Petasites.
- FF. Involucre bracts in many rows..... Baccharis.
- EE. Plants not dioecious: heads bisexual.
- F. Chaff 0.
- G. Achene of female fls. with pappus of coarse or fine bristles or hairs, sometimes plumose.
- H. Involucre bracts in several rows..... Some members of ASTER TRIBE.
- HH. Involucre bracts in 1 row, separate, with tiny bracteoles at base..... Tussilago.
- HHH. Involucre bracts in 1 row, connate at base..... Othonna and [Gamolepis]
- GG. Achene of female fls. with scaly pappus..... Gutierrezia.
- GGG. Achene of female fls. with no pappus.
- H. Lvs. opposite or radical..... Osteospermum.
- HH. Lvs. alternate..... Some members of CALENDULA TRIBE.
- FF. Chaff present.
- G. Involucre not scarious, nor woolly (see Milampodineæ and Ambrosiæ of the Helianthus Tribe).
- GG. Involucre scarious margined; inner bracts woolly..... Eriocapitatus.
- CC. Anthers caudate.
- D. Style-branches awl-shaped, acute, minutely hairy outside and often on style below, stigmatose on whole inner face..... Members of VERNONIA TRIBE.
- DD. Style-branches otherwise.
- E. Limb of corolla of bisexual fls. 5- (rarely 4-) toothed or lobed, rarely, in the Inula Tribe, slightly 2-lipped.
- F. Plants dioecious..... Antennaria.
- FF. Plants not dioecious.
- G. Heads with filiform female marginal fls., or fls. all alike. Some members of INULA TRIBE.
- GG. Heads with fls. of 2 sexes: corolla of female fls. (marginal) ligulate, rarely tubular, with broad regular or 2-lipped limb.
- H. Pappus present..... Some members of INULA TRIBE.
- HH. Pappus 0..... CALENDULA TRIBE.

- EE. Limb of corolla of bisexual fls.  
regular and deeply 5-divided  
or 2-lipped. . . . . **MUTISIA TRIBE.**
- BB. Style with sweeping hairs beginning  
at or below the point of forking,  
forming a ring; or style there thick-  
ened, or at least there different in  
color; style-branches often co-  
herent.
- C. Head with female or neutral ligu-  
late ray-fls. . . . . **ARCTOTIS TRIBE.**
- CC. Head of all bisexual fls. or with  
nonligulate neutral fls. or rarely  
with female ray-fls. . . . . **CYNARA TRIBE.**
- AA. Plants with milky juice; fls. in head  
all ligulate. . . . . **CICHORIUM TRIBE.**

### III. Regular Key to the Tribes.

#### 1. Vernonia Tribe.

- A. Genus anomalous with enlarged palmately  
quasiligulate outer corollas. . . . . 1. *Stokesia*.
- AA. Genus normal with tubular 5-lobed corollas. . . . . 2. *Vernonia*.

#### 2. Eupatorium Tribe.

- A. Anthers truncate at apex, not appendaged;  
achenes 5-angled, secondary ribs not  
prominent. . . . . 3. *Piqueria*.
- AA. Anthers appendaged.
- B. Achenes 5-ribbed, no secondary ribs visible.
- C. Pappus wholly of capillary bristles.
- D. Involucral bracts 4. . . . . 4. *Mikania*.
- DD. Involucral bracts more than 4. . . . . 5. *Eupatorium*.  
(Incl. *Conoclinium*.)
- CC. Pappus chaffy, awned, blunt or crown-  
shaped. . . . . 6. *Ageratum*.
- BB. Achenes 10-ribbed (rarely 7-8-ribbed),  
secondary ribs conspicuous.
- C. Involucral bracts not herbaceous, striate-  
nerved, conspicuously so when dry.
- D. Heads few-fld., corymbose. . . . . 7. *Adenostyles*.
- DD. Heads always paniculate. . . . . 8. *Brickellia*.
- CC. Involucral bracts somewhat herbaceous  
or partly colored, inconspicuously stri-  
ate if at all.
- D. The outer bracts successively shorter. . . . . 9. *Liatris*.
- DD. The bracts nearly all equal in length. . . . . 10. *Trilisa*.

#### 3. Inula Tribe.

- A. The fls. containing both stamens and pistil all  
sterile, only the unisexual fls. fertile; heads  
monoecious or dioecious.
- B. Pappus bristles, especially of fertile fls.,  
united at the base in a ring.
- C. Heads strictly dioecious, corymbose,  
rarely solitary; sterile pappus club-  
shaped. . . . . 11. *Antennaria*.
- CC. Heads containing 1 or both sexes, mono-  
ecious or dioecious, crowded in a small  
cluster or cyme surrounded by a long  
conspicuous woolly involucre. . . . . 12. *Leontopod-*  
*ium*.
- BB. Pappus bristles free; involucre rosette-like,  
very white-papery. . . . . 13. *Anaphalis*.
- AA. The fls. containing both stamens and style  
usually fertile.
- B. Heads with disk-fls. only.
- C. The heads compound; 1-fld. heads aggre-  
gated in an involucre cluster, often  
with petaloid appendages. . . . . 14. *Myrio-*  
*cephalus*.
- CC. The heads simple.
- D. Pappus 0. . . . . 15. *Humen*.
- DD. Pappus crown- or cup-shaped. . . . . 16. *Ammobium*.
- DDD. Pappus bristly.
- E. Achenes not beaked.
- F. Bristles often plumose at base. . . . . 17. *Helipterum*.
- FF. Bristles smooth, scarious, barked  
or plumose at apex. . . . . 18. *Helichry-*  
*sum*.
- EE. Achenes beaked. . . . . 19. *Waitzia*.
- BB. Heads composed of both ray- and disk-fls.
- C. Receptacle not chaffy.
- D. Stigmatic lines not confluent at apex. . . . . 20. *Podolepis*.
- DD. Stigmatic lines fusing at apex. . . . . 21. *Inula*.
- CC. Receptacle chaffy or bristly. . . . . 22. *Bupthal-*  
*um*.

#### 4. Cynara Tribe.

- A. Heads 1-fld., aggregated into larger involu-  
crate heads. . . . . 23. *Echinops*.
- AA. Heads several-fld.
- B. Fr. with basal areole.
- C. The fr. woolly, not margined.
- D. Pappus scales pointed or terminated  
by a simple awn. . . . . 24. *Xerantho-*  
*num*.

- DD. Pappus-scales plumose. . . . . 25. *Carlina*.
- CC. The fr. glabrous, marginal at summit.
- D. Receptacle bristly.
- E. Filaments glabrous; involucre bracts  
hooked. . . . . 26. *Arctium*.
- EE. Filaments warty, hairy, or pectinate-  
ciliate.
- F. The receptacle not fleshy.
- G. Pappus-bristles not plumose. . . . . 27. *Carduus*.
- GG. Pappus-bristles plumose. . . . . 28. *Cirsium*.
- FF. The receptacle fleshy. . . . . 29. *Cynara*.
- DD. Receptacle not bristly. . . . . 30. *Onopordon*.
- BB. Fr. with oblique lateral areole.
- C. Heads not involucre with lvs.
- D. Involucral-bracts without appendages. . . . . 31. *Serratula*.
- DD. Involucral-bracts with dry, scarious or  
thorny appendages. . . . . 32. *Centaurea*.
- CC. Heads surrounded by an involucre of  
thorny lvs.
- D. Pappus simple, of bristles, scales or 0. . . . . 33. *Carthamus*.
- DD. Pappus of 2 unequally long rows of  
bristles. . . . . 34. *Cnicus*.

#### 5. Aster Tribe.

- A. Heads dioecious and composed wholly of disk-  
fls. . . . . 35. *Baccharis*.
- AA. Heads not dioecious.
- B. Color of fls. yellow.
- C. Rays absent. . . . . 36. *Bigelovia*.
- CC. Rays present.
- D. The pappus composed of long paleæ,  
which are sometimes reduced to a  
crown. . . . . 37. *Gutierrezia*.
- DD. The pappus not as in D.
- E. Pappus-bristles few (4-8).
- F. Involucral bracts in 8 series,  
leathery or scarious at apex. . . . . 38. *Grindelia*.
- FF. Involucral bracts in 2-3 series,  
scarious at margins. . . . . 39. *Pentstemon*.
- EE. Pappus-bristles copious, in 2-8 series,  
sometimes few in ray-fls.
- F. Bristles of 2 kinds, the inner  
series capillary, outer very short  
and setulose or squamellate. . . . . 40. *Chrysopsis*.
- FF. Bristles mostly alike.
- G. Rays usually wanting. . . . . 41. *Linosyris*.
- GG. Rays present.
- H. The bristles broad at base,  
aristate. . . . . 42. *Xanthisma*.
- HH. The bristles capillary.
- I. Heads usually many-fld.
- J. Achenes many-nerved. . . . . 43. *Aplopappus*.
- JJ. Achenes few-nerved. . . . . 44. *Hazardia*.
- II. Heads usually few-fld.
- J. Bristles rudimentary,  
shorter than achene. . . . . 45. *Brachycheta*.
- JJ. Bristles longer than  
achene. . . . . 46. *Solidago*.
- BB. Color of ray fls. at least not yellow.
- C. The pappus 0, or forming a more-or-less  
conspicuous ring of short bristles or  
hairs, uniform in all fls.
- D. Bracts dry or scarious at margin. . . . . 47. *Brachycome*.
- DD. Bracts herbaceous. . . . . 48. *Bellis*.
- CC. The pappus composed of numerous bri-  
stles in 1 or more series, uniform in all fls.
- D. Involucre with outer bracts partly  
leafy, inner bracts membranous or  
scarious. . . . . 49. *Callistephus*.
- DD. Involucral bracts all nearly alike.
- E. Bracts in about 2 series.
- F. Achenes usually small. . . . . 50. *Erigeron*.
- FF. Achenes larger, longer; pappus  
more copious. . . . . 51. *Vittadinia*.
- EE. Bracts usually in several series,  
sometimes 2 series in Aster and  
*Felicia*.
- F. Plants woody, resinous.
- G. Achenes cylindrical. . . . . 52. *Olearia*.
- GG. Achenes compressed. . . . . 53. *Felicia*.
- FF. Plant herbaceous.
- G. Involucral bracts coriaceous. . . . . 54. *Sericocar-*  
*pus*.
- GG. Involucral bracts membranous  
or herbaceous. . . . . 55. *Aster*.
- CCC. The pappus anomalous or absent from the  
rays.
- D. Pappus-bristles shortly plumose; style-  
branches broad. . . . . 56. *Chariesis*.
- DD. Pappus-bristles in 1 series, unequal,  
rigid, thickened or dilated toward  
the base. . . . . 57. *Townsendia*.
- DDD. Pappus of the ray composed of very  
short paleæ; disk-pappus of copious  
slender bristles in 1-2 series. . . . . 58. *Heteropap-*  
*pus*.
- DDDD. Pappus-bristles very short, usually  
accompanied by 2-4 awns not longer  
than the achene. . . . . 59. *Boltonia*.

6. *Helianthus* Tribe.

Subtribe 1. MELAMPODIEÆ. Rays pistillate; disk-fls. staminate: achenes usually with coriaceous or thicker pericarp: style mostly entire; receptacle chaffy throughout; pappus none.

- A. Involucre of the many-fl. heads broad; inner bracts concave, embracing and half inclosing the thick, turgid, obovoid achenes. . . . . 60. *Polymnia*.
- AA. Involucre broad, of plane or barely concave bracts; innermost subtending obcompressed achenes, but not inclosing nor embracing them.
- B. Rays, or rather their ovaries and achenes, in more than 1 series. . . . . 61. *Silphium*.
- BB. Rays and achenes in a single series.
- C. Heads nearly discoid or rays short. . . . . 62. *Parthenium*.
- CC. Heads conspicuously radiate, mostly of 5 fertile and rather numerous sterile fls. . . . . 63. *Chrysogonum*.

Subtribe 2. AMBROISEÆ. Pistillate fls. apetalous, or with corolla reduced to a tube or ring around base of 2-parted style; staminate fls. with 4-5-lobed corolla; anthers slightly united or free; style abortive, hairy only at the somewhat enlarged and depressed summit.

- A. Herbs: heads of 2 kinds, the fertile with a bur-like involucre. . . . . 64. *Ambrosia*.
- AA. Shrubs: heads all alike. . . . . 65. *Iva*.

Subtribe 3. ZINNIEÆ. Rays pistillate; the tube absent or very short, persistent on achene and at length papery; disk-fls. bisexual, rarely sterile, subtended or embraced by chaffy bracts: lvs. opposite.

- A. Receptacle flattish. . . . . 66. *Sanvitalia*.
- AA. Receptacle conical, cylindrical or elongated.
- B. Achenes, at least inner ones, 1-3-awned. . . . . 67. *Zinnia*.
- BB. Achenes without pappus. . . . . 68. *Heliopsis*.

Subtribe 4. VERBESINÆ. Rays pistillate, or neutral, becoming papery and persistent; disk-fls. bisexual; anthers often blackish: achenes various, but those of disk never obcompressed; pappus various.

- A. Chaff of receptacle permanently investing achenes as an accessory covering. . . . . 69. *Sclerocarpus*.
- AA. Chaff of receptacle concave or complicate, loosely embracing or subtending the disk-achenes, mostly persistent.
- B. Rays sometimes absent. Certain species of. . . . . 70. *Spilanthes*.
- BB. Rays usually present.
- C. Receptacle high, from conical to columnar or subulate, at least in fr.
- D. The rays, if present, pistillate. . . . . 70. *Spilanthes*.
- DD. The rays sterile.
- E. Color of rays rose or rose-purple. . . . . 71. *Echinacea*.
- EE. Color of rays yellow or partly brown-purple (sometimes wholly so).
- F. Achenes 4-angled, prismatic. . . . . 72. *Rudbeckia*.
- FF. Achenes short and broad, compressed. . . . . 73. *Lepachys*.
- CC. Receptacle low, flat to convex, rarely becoming conical.
- D. Achenes not winged nor very flat, when flattened not margined nor sharp-edged.
- E. Rays pistillate. . . . . 74. *Balsamorhiza*.
- EE. Rays sterile.
- F. Achenes pubescent. . . . . 75. *Viguiera*.
- FF. Achenes glabrous. . . . . 76. *Helianthus*.
- DD. Achenes of the ray or margin often triquetrous, of the disk either flat-compressed and margined or thin-edged, or if turgid some of them winged.
- E. Rays neutral.
- F. Pappus 0, or an awn or its rudiment answering to each margin of the wingless achene. . . . . 77. *Encelia*.
- FF. Pappus of delicate squamellæ between the 2 chaffy teeth or awns which surmount the 2 acute margins of the achene. . . . . 78. *Helianthella*.
- FFF. Pappus of 2 slender-subulate naked awns, at length divergent, sometimes with 2 or 3 intermediate awns. . . . . 79. *Actinomeris*.
- EE. Rays pistillate, rarely neutral in Verbesina.
- F. Pappus of  $\infty$  distinct squamellæ. . . . . 80. *Pascalica*.
- FF. Pappus of dilated awns or 2 awn-like paleæ on the angles of the achene, with 2 small intermediate squamellæ on each side. . . . . 81. *Podachnium*.
- FFF. Pappus of 2 awns, sometimes 1-3 or 0, and no intermediate squamellæ. . . . . 82. *Verbesina*.

Subtribe 5. COREOPSIDÆ. Rays pistillate or neutral; disk-fls. fertile; receptacle chaffy; chaff flat or hardly concave: achenes more or less dorsally compressed, often 2-awned.

- A. Involucral bracts distinct, the outer herbaceous, inner somewhat like paleæ. . . . . 83. *Guizotia*.
- AA. Involucre double; inner bracts membranous, subequal, connate at base or often higher; outer bracts few and small or minute.
- B. Plants are all climbers with pistillate rays, achenes much enlarging and sterile disk-fls. with undivided style. . . . . 84. *Hidalgoo*.
- BB. Plants not climbing; rays usually sterile.
- C. Style-branches with long hairy appendages. . . . . 85. *Dahlia*.
- CC. Style-branches truncate, penicillate or with short appendages.
- D. Bracts of inner involucre united into a cup. . . . . 86. *Thelesperma*.
- DD. Bracts of involucre distinct, or united only at the common base.
- E. Achenes beaked, slender; rays purple or rose, in 1 species yellow; white vars. in cult.; awns mostly deciduous. . . . . 87. *Cosmos*.
- EE. Achenes not beaked; rays yellow or white.
- F. Tube of disk-fl. without ring at top.
- G. Lvs. or divisions entire. . . . . 88. *Coreopsis*.
- GG. Lvs. or divisions serrate. . . . . 89. *Bidens*.
- FF. Tube of disk-fls. with a ring near the top. . . . . 90. *Leptosyne*.

Subtribe 6. GALINOGÆ. Heads rayless and homogamous (in Marshallia). Pappus of  $\infty$  distinct paleæ. . . . . 91. *Marshallia*.

Subtribe 7. MADIEÆ. Rays pistillate, each subtended by an involucral bract which partly or completely incloses its achene; disk-fls. with both stamens and styles, but some or all sterile: glandular, viscid and heavy-scented herbs.

- A. Achenes laterally compressed. . . . . 92. *Madia*.
- AA. Achenes not laterally compressed. . . . . 93. *Layia*.

7. *Helenium* Tribe.

- A. Involucral bracts united nearly throughout into an oblong cup or tube. . . . . 94. *Tagetes*.  
(See also *Lasthenia*.)
- AA. Involucral bracts hardly at all imbricated; when broad, nearly equal or in 1 series.
- B. Receptacle mostly high-conical, and acute, beset after the achenes have fallen by projecting points (as if pedicels on which they were inserted).
- C. The involucre a single series of bracts connate by their edges into a 5-15-toothed green cup. . . . . 95. *Lasthenia*.
- CC. The involucre of loose, distinct bracts. . . . . 96. *Baria*.  
(Also *Actinolepis coronaria*.)
- BB. Receptacle flat or convex, rarely obtusely conical: achenes from linear to obpyramidal, rarely 5-angled. (See also BBB.)
- C. Herbage mostly woolly: involucral bracts erect, not membranous. . . . . 97. *Eriophyllum*.
- CC. Herbage usually not woolly.
- D. Disk-fls. deeply 5-cleft: involucral bracts mostly appressed. . . . . 98. *Polypterus*.
- DD. Disk-fls. with long and narrow throat and 5 short lobes or teeth.
- E. Heads solitary. . . . . 99. *Hulsea*.
- EE. Heads paniculate or corymbose.
- F. Plants tomentose herbs, the lvs. dissected.
- G. Involucral bracts free, narrow. . . . . 100. *Chænactis*.
- GG. Involucral bracts connected at the base, broad and obtuse. . . . . 101. *Bahia*.
- FF. Plants not tomentose, the lvs. not dissected. . . . . 102. *Pericome*.
- BBB. Receptacle from convex to oblong: achenes short, obpyramidal or top-shaped, 5-10-ribbed or angled, mostly silky hairy: disk-fls. all fertile.
- C. The receptacle destitute of awn-like fimbriæ among the fls.
- D. Involucre erect or nearly so. . . . . 103. *Actinella*.
- DD. Involucre spreading or soon reflexed. . . . . 104. *Helenium*.
- CC. The receptacle beset with bristle-like or awl-shaped or rarely dentiform fimbriæ among the fls. . . . . 105. *Gaillardia*.

3. *Anthemis* Tribe.

- A. Receptacle chaffy.
- B. Heads usually discoid.
- C. Shrubs with small, closely clustered lvs. . . . . 106. *Eriocaphala*.
- CC. Herbs, or sometimes slightly shrubby.
- D. Corolla with a hood-like appendage at base. . . . . 107. *Santolina*.
- DD. Corolla without such appendage. . . . . 108. *Onos*.

- BB. Heads usually radiate.  
 c. Achene compressed, with 2 narrow margins.....109. *Achillea*.  
 CC. Achenes 4-5-cornered or  $\infty$ -ribbed.  
 D. The heads peduncled at tips of branches.....110. *Anthemis*.  
 DD. The heads sessile in forks, surrounded by 5-6 dissected floral lvs.....111. *Cladanthus*  
 AA. Receptacle naked or alveolate-fimbriate.  
 B. Involucral bracts in many series.  
 c. Rays present.....112. *Chrysanthemum*.  
 (Consult also *Pyrethrum*).  
 CC. Rays absent.....113. *Tanacetum*.  
 BB. Involucral bracts in 1 or 2 or few series.  
 c. Rays present.....114. *Matricaria*  
 CC. Rays absent or inconspicuous.  
 D. Involucre top-shaped.....115. *Centa*.  
 DD. Involucre ovoid or broadly bell-shaped.....116. *Artemisia*.

## 9. Senecio Tribe.

- A. Involucral bracts in 1 series and connate at the base or beyond the middle in a cup; no outer bracts; style-branches of the fertile bisexual fls. truncate at apex, usually penicillate.  
 B. Style undivided; disk-fls. sterile.....117. *Othonna*.  
 BB. Style bifid; disk-fls. all or some fertile.....118. *Gamolepis*.  
 AA. Involucral bracts in 1 or 2 series, not connate in a cup but free, at least finally.  
 B. Style-branches of hermaphrodite fertile fls. roundish obtuse or at least not truncate and wholly without appendage or hairiness at summit.  
 c. Heads composed entirely of bisexual and fertile fls., homogamous, discoid.....119. *Cacaliopsis*.  
 CC. Heads submonocleous or subdioecious, the fls. containing both stamens and pistils, sterile.  
 D. The heads radiate, yellow.....120. *Tussilago*.  
 DD. The heads discoid, purplish or white.  
 E. Style of hermaphrodite fls. undivided; heads several.....121. *Petasites*.  
 EE. Style branched; heads 2.....122. *Homogyne*.  
 BB. Style-branches (of hermaphrodite fls.) either truncate or capitate at summit, which is either penicillate, hairy or naked and not rarely bears a short conical or flattened appendage.  
 c. Bracts of involucre herbaceous, acuminate.  
 D. Receptacle flat.....123. *Arnica*.  
 DD. Receptacle hemispherical.....124. *Doronicum*.  
 CC. Bracts of involucre narrow, strict, usually ribbed or keeled.  
 D. Apex of style usually truncate and penicillate.  
 E. Involucral bracts numerous.  
 F. Achenes subterete.....125. *Senecio*.  
 FF. Achenes dorsally compressed.....126. *Cineraria*.  
 EE. Involucral bracts few, 4-5; heads homogamous.....127. *Tetradymia*.  
 DD. Apex of style with long, subulate hairy appendages; heads homogamous.....128. *Gynura*.  
 DDD. Apex of style with appendages short and obtuse, or long and acutish; heads homogamous.....129. *Emilia*.

## 10. Calendula Tribe.

- A. Achenes or the rays thick, hard and bony; those of the disk usually all empty.....130. *Osteospermum*.  
 AA. Achenes straight, those of the rays usually triquetrous; disk-achenes often flattish or 2-winged.....131. *Dimorphotheca*.  
 AAA. Achenes incurved, heteromorphous.....132. *Calendula*.

## 11. Arctotis Tribe.

- A. Involucral bracts free, the inner ones broadly scarious, at least at the apex.  
 B. Herbs glabrous or pubescent: receptacle chaffy.....133. *Urtica*.  
 BB. Herbs tomentose: receptacle naked or alveolate.  
 c. Achenes usually villous, crowned by hyaline palea which are often convolute.....134. *Arctotis*.  
 CC. Achenes glabrous, with or without a crown of minute palea.....135. *Venidium*.  
 AA. Involucral bracts grown together at the base; lvs. not spinescent; alveoli short.....136. *Gazania*.

## 12. Mutisia Tribe.

- A. Rays in 1-2 series, 2-lipped.....137. *Gerbera*.  
 AA. Rays in 2-3 series, the outer always strap-shaped.....138. *Chaptalia*.

## 13. Cichorium Tribe.

- A. Pappus 0. or of 2-3 long bristles, which soon fall away.....139. *Scolymus*.  
 AA. Pappus paleaceous or partly so, or aristiform, or plumose.  
 B. Involucre of equal bracts and no short calyculate ones at base.  
 c. Achenes long-beaked.....140. *Tragopogon*.  
 CC. Achenes truncate.....141. *Krigia*.  
 BB. Involucre either calyculate or imbricate, i. e., principal bracts equal and some short ones at base, or less unequal bracts in 2 or more series.  
 c. Achenes (at least inner ones) tapering into a beak.  
 D. Receptacle with membranous chaff.....142. *Hypochaeris*.  
 DD. Receptacle naked.....143. *Leontodon*.  
 CC. Achenes usually short, with summit truncate or only a trifle contracted below apex.  
 D. Receptacle chaffy.....144. *Catananche*.  
 DD. Receptacle not chaffy.  
 E. Fls. normally blue.....145. *Cichorium*.  
 EE. Fls. yellow.....146. *Scorzonera*.  
 AAA. Pappus of capillary bristles that are scabrous, rarely barbellulate, never plumose nor paleaceous-dilated: receptacle naked (except in 1 species of *Troximon*).  
 B. Achenes flattened: pappus of copious fine soft capillary bristles.  
 c. The achenes distinctly beaked.....147. *Lactuca*.  
 CC. The achenes beakless.....148. *Sonchus*.  
 BB. Achenes not flattened: pappus persistent or bristles tardily falling (except 1 or 2 species of *Crepis*).  
 c. Beak distinct and slender (except in 1 or 2 species of *Troximon*).  
 D. The achenes 10-ribbed or 10-nerved, not muricate.....149. *Troximon*.  
 DD. The achenes 4-5-ribbed or angled, muricate.....150. *Taraxacum*.  
 CC. Beak 0, or achene merely narrow at apex.  
 D. Fls. whitish or cream-color to violet or rose-red.....151. *Prenanthes*.  
 DD. Fls. mostly yellow, sometimes orange-red or white.  
 E. Pappus of rather rigid, scabrous, fragile bristles which are usually rather dirty or neutral-colored.....152. *Hieracium*.  
 EE. Pappus of copious white and usually soft capillary bristles.....153. *Crepis*.

The following genera (and others) also are briefly treated: *Amellus*, *Asterinosyris*, *Bellium*, *Cacalia*, *Calimeris*, *Celmisia*, *Chamaemelum*, *Cotula*, *Cryptostemma*, *Erlangea*, *Euryps*, *Gymnolomia*, *Haplocarpha*, *Kuhnia*, *Leptocarpha*, *Montanoa*, *Oldenburgeria*, *Pertusa*, *Psilostrophe*, *Pteronia*, *Saussurea*, *Tithonia*, *Toipis*, *Tricholepis*, *Wedelia* and *Zaluzania*.

## 107. CAMPANULACEÆ.

- A. Fls. irregular, rarely nearly regular; anthers united.  
 B. Corolla open down to the base on one side.... 1. *Lobelia*.  
 BB. Corolla with a closed tube.  
 c. Stamens in a tube free from the corolla.... 2. *Downingia*.  
 CC. Stamens more or less adnate to the corolla up to near the throat, then monadelphous and free or farther adnate on one side only..... 3. *Palmerella*.  
 CCC. Stamens affixed at top of corolla-tube or above the middle: caps. 2-valved at apex..... 4. *Isotoma*.  
 CCCC. Stamens affixed at base of corolla-tube.  
 D. Fr. an indehiscent berry..... 5. *Centropogon*.  
 DD. Fr. a caps. 2-valved at apex..... 6. *Siphocampylus*.  
 AA. Fls. regular or nearly so; anthers usually separate.  
 B. Fr. an indehiscent, fleshy berry.  
 c. Ovary inferior..... 7. *Canarina*.  
 CC. Ovary superior as to calyx but not corolla. 8. *Campanula*.  
 BB. Fr. a caps.  
 c. Caps. dehiscing loculicidally by apical valves.  
 D. Corolla 5-parted nearly to base..... 9. *Jasione*.  
 DD. Corolla broadly bell-shaped, 5-lobed..... 10. *Platycodon*.  
 DDD. Corolla narrowly (or not broadly) bell-shaped or tubular.  
 E. Calyx-tube adnate, hemispherical..... 11. *Codonopsis*.  
 EE. Calyx-tube free, long-campanulate or inflated..... 12. *Cyananthus*.  
 CC. Caps. closed at apex, dehiscing laterally between the ribs by small lids or small solitary valves.  
 D. Corolla 5-cut-lobed, or -parted.  
 E. Ovary linear or narrowly oblong..... 13. *Specularia*.

- EE. Ovary hemispherical or top-shaped.  
 F. Anthers connate in a tube. .... 14. *Symphyan-*  
 FF. Anthers not connate in a tube. .... [dra].  
 G. Style girt at base by an epigynous fleshy disk, which is cup-shaped or tubular. .... 15. *Adenophora*  
 GG. Style without such disk.  
 H. Corolla 5-parted to the base; lobes narrow, either long-cohering above or rotate-spreading. .... 16. *Phyteuma*.  
 HH. Corolla 5-cut shortly or to the middle, rarely farther, bell-shaped, tubular, funnel-shaped or subrotate. .... 17. *Campanula*.  
 DD. Corolla narrowly tubular, shortly 3-cut at apex. .... 18. *Trachelium*.  
 DDD. Corolla usually 7-10-cut, rarely 5-cut.  
 E. Number of lobes 5-9, usually 7; fls. bell-shaped. .... 19. *Ostrowskia*.  
 EE. Number of lobes 8-10; lobes narrow and spreading. .... 20. *Michauxia*  
 Githopsis, Leptocodon and Lightfootia are also mentioned in the Cyclopedia.

## 108. MONOTROPACEÆ.

in cultivation. .... *Sarcodes*.

## 109. CLETHRACEÆ.

The only genus. .... *Clethra*.

## 110. PYROLACEÆ.

- A. Style very short, obconical: sts. leafy. .... 1. *Chimaphila*.  
 AA. Style mostly elongated; scape naked or leafy only at base.  
 B. Fls. solitary. .... 2. *Moneses*.  
 BB. Fls. racemose. .... 3. *Pyrola*.

## 111. ERICACEÆ (Inc. Vacciniaceæ).

Subfamily 1. VACCINIEÆ. Ovary inferior: fr. a berry or drupe.

Subfamily 2. ERICINEÆ. Ovary superior: fr. a caps., except  
 n Tribe 1 of Subfamily 2.

- Fr. fleshy, a berry or drupe. .... 1. ARBUTUS TRIBE.  
 Fr. a loculicidal caps., chiefly 5-celled; corolla deciduous. .... 2. ANDROMEDA TRIBE  
 Fr. a caps., with loculicidal or sometimes septicidal dehiscent and 4 or 5 cells; corolla marcescent persistent. .... 3. ERICA TRIBE.  
 Fr. a septicidal caps.: corolla deciduous. .... 4. RHODODENDRON [TRIBE].

## Subfamily 1. VACCINIEÆ.

- A. Corolla tubular or cylindric; filaments connate or free.  
 B. Filaments connate or cohering; anthers produced into a single long beak.  
 C. Stamens shorter than corolla. .... 1. *Macleana*.  
 CC. Stamens equaling or exceeding the corolla.  
 BB. Filaments distinct; anthers ending in 2 long beaks. .... 3. *Agapetes*.  
 AA. Corolla campanulate, urceolate or rotate; filaments usually free.  
 B. The ovary wholly inferior.  
 C. Ovary 10-celled, 10-ovuled. .... 4. *Gaylussacia*.  
 CC. Ovary 4 5-celled, or by false partitions from the back of these cells, 8-10-celled; ovules numerous. .... 5. *Vaccinium*.  
 BB. The ovary at first a third to half superior. .... 6. *Chiogenes*.

## Subfamily 2. ERICINEÆ.

## 1. Arbutus Tribe.

- A. The anthers have a pair of awns on the back.  
 B. Ovary-cell many-ovuled. .... 7. *Arbutus*.  
 BB. Ovary-cells 1-ovuled.  
 C. Nutlets coalescent: lvs. persistent, entire. .... 8. *Arctostaphylos*.  
 CC. Nutlets distinct: lvs. deciduous, serrate. .... 9. *Arctous*.  
 AA. The anthers awnless on back. .... 10. *Pernettya*.

## 2. Andromeda Tribe.

- A. Anther-cells opening through their whole length, not appendaged; stigma 5-lobed, the lobes adnate to a surrounding ring or cup. .... 11. *Epigæa*.

- AA. Anthers opening only at the top; stigma usually entire.  
 B. Calyx becoming fleshy in fr., forming a berry and inclosing the small caps. .... 12. *Gaultheria*.  
 BB. Calyx unchanged and dry under the caps.  
 C. Sepals or calyx-lobes valvate or open in the bud, never overlapping.  
 D. The anthers destitute of appendages or awns. .... 13. *Lyonia*.  
 DD. The anthers awned.  
 E. The anthers short and obtuse, with 2 pores topped by slender, ascending awns; corolla urn-shaped. .... 14. *Andromeda*.  
 EE. Anthers lanceolate, produced into 2 small tubes, each surmounted by a pair of slender, ascending awns; corolla bell-shaped. .... 15. *Zenobia*.  
 EEE. Anthers with 2 spreading or deflexed awns or teeth, on the back of the filament or at its junction with the anther. .... 16. *Pieris*.  
 CC. Sepals or calyx-lobes imbricated, at least in the early bud.  
 D. Lvs. heath-like, small, thick or needle-like, mostly overlapping: anther fixed near apex. .... 17. *Cassiope*.  
 DD. Lvs. not heath-like, usually larger, flat, broad and leathery.  
 E. Corolla cylindraceous to conical-urceolate; anthers fixed near base.  
 F. Seeds imbricated in 2 rows. .... 18. *Chama-daphne*.  
 FF. Seeds pendulous or in all directions. .... 19. *Leucothoe*.  
 FFF. Seeds all ascending or erect. .... 20. *Oxydendrum*.  
 EE. Corolla bell-shaped or urn-shaped. .... 21. *Enkianthus*.

## 3. Erica Tribe.

- A. Anthers 2-awned on back at base. .... 22. *Calluna*.  
 AA. Anthers 2-parted, blunt or awned, usually cristate or lamellate at base. .... 23. *Erica*.  
 AAA. Anthers blunt on back, not cristate. .... 24. *Bruckenthalia*.

## 4. Rhododendron Tribe.

- A. Corolla polypetalous or nearly so.  
 B. Fls. in elongated racemes or panicles: lvs. deciduous.  
 C. Petals 4; stamens 8. .... 25. *Elliottia*.  
 CC. Petals 3; stamens 6. .... 26. *Tripetaleia*  
 BB. Fls. solitary; petals 5; stamens 10: lvs. deciduous. .... 27. *Cladothamnus*.  
 BBB. Fls. in umbel-like racemes; petals 5; stamens 5-10: lvs. evergreen.  
 C. Lvs. tomentose below: caps. 5-celled; seeds winged. .... 28. *Ledum*.  
 CC. Lvs. glabrous: caps. 2-3-celled; seeds angular. .... 29. *Leiophyllum*.  
 AA. Corolla gamopetalous.  
 B. Seeds compressed, winged: corolla slightly irregular; stamens 5-10.  
 C. Stamens usually exserted; anthers opening by a round terminal pore; corolla rotate, campanulate or funnelform. .... 30. *Rhododendron*.  
 CC. Stamens included; anthers opening by an oblique pore; corolla urceolate: lvs. deciduous. .... 31. *Menziesia*.  
 BB. Seeds subglobose or trigonous, not winged: corolla regular.  
 C. Stamens 10.  
 D. The corolla cup-shaped with 10 pouches receiving the anthers; fls. in corymbs or solitary. .... 32. *Kalmia*.  
 DD. The corolla rotate; fls. terminal, 1-3: lvs. oblong-elliptic, ciliate. .... 33. *Rhodothamnus*.  
 DDD. The corolla urceolate or campanulate; fls. terminal, solitary or in umbels: lvs. heath-like. .... 34. *Phyllodoce*.  
 CC. Stamens 5 or 8.  
 D. Fls. 5-merous, in umbels, 2-5; corolla broadly funnelform: lvs. elliptic, opposite, smooth. .... 35. *Loiseleuria*  
 DD. Fls. 4-merous: lvs. alternate.  
 E. Corolla rotate, 4-parted; fls. 2-10, in loose racemes: lvs. heath-like. .... 36. *Bryanthus*.  
 EE. Corolla campanulate-urceolate with short 4-toothed limb; fls. in loose racemes: lvs. tomentose below. .... 37. *Dabæcia*.

The genus *Pentaptergyium* is included in the work.

## 112. EPACRIDACEÆ.

Style inserted in the intruded vertex of the ovary; stamens epipetalous; anthers 1-celled; corolla-lobes quincuncially imbricate; bracts numerous, passing into sepals. .... *Epacris*.  
 The recent genus *Rupicola* is also mentioned in the work.

## 113. DIAPENSIACEÆ.

- A. Corolla persistent; staminodes 0.  
 B. Fls. sessile. .... 1. *Pyxidanthera*.  
 BB. Fls. pedunculate. .... 2. *Diapensia*.  
 AA. Corolla deciduous; staminodes 5.  
 B. Staminodes small, scale-like, separate; corolla-lobes crenate. .... 3. *Shortia*.  
 BB. Staminodes long, linear, separate; corolla-lobes fimbriate. .... 4. *Schizocodon*.  
 BBB. Staminodes spatulate, connate with stamens; corolla-segms. entire. .... 5. *Galax*.

## 114. PLUMBAGINACEÆ.

- A. Calyx-limb usually spreading, scarious and colored.  
 B. Lvs. usually needle-like; styles distinct at angles of ovary; stigmas sub-capitate. .... 1. *Acantholimon*.  
 BB. Lvs. flat; styles as above; stigmas capitate, oblong or linear; infl. cymose or dense or scape 1- to few-fl'd. .... 2. *Statice*.  
 BBB. Lvs. flat or linear-subulate; styles shortly subconnate at vertex of ovary; stigmas linear; scape 1-headed. .... 3. *Armeria*.  
 AA. Calyx-lobes or teeth erect with merely scarious sinuses.  
 B. Stamens free; calyx glandular. .... 4. *Plumbago*.  
 BB. Stamens adnate to middle of corolla; calyx not glandular. .... 5. *Cerastium*.

## 115. PRIMULACEÆ.

- A. Corolla-lobes imbricated in quincunx fashion.  
 B. Plants aquatic; ovules anatropous; umbilicus basal. .... 1. *Hottonia*.  
 BB. Plants terrestrial; ovules semi-anatropous; umbilicus ventral.  
 C. Caps. dehisces by a lid at top. .... 2. *Soldanella*.  
 CC. Caps. dehisces by valves.  
 D. The corolla-lobes bent back. .... 3. *Dodecatheon*.  
 DD. The corolla-lobes spreading or ascending.  
 E. Stamens affixed to base of corolla; anthers long-acuminate. .... 4. *Cortusa*.  
 EE. Stamens affixed to corolla-tube; anthers obtuse.  
 F. Corolla-tube usually longer than calyx.  
 G. Caps. many-seeded. .... 5. *Primula*.  
 GG. Caps. 1-2-seeded. .... 6. *Douglasia*.  
 FF. Corolla-tube as long as calyx or shorter; caps. few or many-seeded. .... 7. *Androsace*.  
 AA. Corolla-lobes convolute in the bud; ovules semi-anatropous; umbilicus ventral.  
 B. Caps. circumscissile. .... 8. *Anagallis*.  
 BB. Caps. longitudinally dehiscent by valves.  
 C. Lobes of corolla bent back. .... 9. *Cyclamen*.  
 CC. Lobes of corolla not bent back.  
 D. Corolla-lobes 5-6; testa of seed with a firm epidermis. .... 10. *Lysimachia*.  
 EE. Staminodes 5, each corolla-lobe curved around its stamen. .... 11. *Steironema*.  
 EEE. Staminodes 5, tooth-like; corolla-lobes not encircling stamens. .... 12. *Naumburgia*.  
 DD. Corolla-lobes usually 7; testa of seed with a lax epidermis. .... 13. *Trientalis*.

The genus *Glaux* may be met with occasionally in cultivation.

## 116. MYRSINACEÆ.

- A. Staminodes 5; corolla gamopetalous.  
 B. Corolla cylindrical, shortly 5-lobed; fr. many-seeded. .... 1. *Theophrasta*.  
 BB. Corolla subrotate, deeply 5-parted; fr. 1- to many-seeded. .... 2. *Clavija*.  
 BBB. Corolla rotate-campanulate, deeply 5-cut; fr. few-seeded. .... 3. *Jacquinia*.  
 AA. Staminodes 0; corolla gamopetalous or poly-petalous; fr. 1-seeded.  
 B. Corolla imbricated; fls. fascicled, lateral or axillary. .... 4. *Myrsine*.  
 BB. Corolla convolute; panicles terminal or terminal and axillary. .... 5. *Ardisia*.

The genus *Mæsa* is also accounted for.

## 117. SYMPLOCACEÆ.

- The only genus. .... *Symplocos*.

## 118. STYRACACEÆ.

- A. Fr. superior, globular or ovoid, not ribbed nor winged. .... 1. *Styrax*.  
 AA. Fr. inferior, elongated ribbed, or winged.  
 B. Infl. paniced, many-fl'd., drooping, sub-terminal. .... 2. *Pterostyrax*.  
 BB. Infl. of few-fl'd. fascicles, often lateral. .... 3. *Halesia*.

## 119. SAPOTACEÆ.

- A. Corolla-lobes, calyx-segms., stamens and staminodes (when present) isomerous.  
 B. Staminodes 0; seeds usually albuminous; fls. 5-merous, rarely 6-7-merous. .... 1. *Chrysophyllum*.  
 BB. Staminodes small, usually affixed higher than stamens, sometimes few or 0; seeds not albuminous; fls. 4-5-merous. .... 2. *Lucuma*.  
 BBB. Staminodes alternate with stamens, rarely affixed higher; seeds albuminous. .... 3. *Sideroxylon*.  
 AA. Corolla-lobes and calyx-segms. isomerous; stamens twice as many or more. .... 4. *Isanandra*.  
 AAA. Corolla-lobes usually 2 or 3 times as many as calyx-segms.  
 B. Calyx-segms. 1 series. .... 5. *Bumelia*.  
 BB. Calyx-segms. 2 series. .... 6. *Mimusops*.

The genus *Pouteria* is now described in this family.

## 120. EBENACEÆ.

- A. The fls. usually hermaphrodite; stamens in 1 series. .... 1. *Royena*.  
 AA. The fls. dioecious.  
 B. Fls. usually 3-merous; stamens 3- $\infty$ , commonly 9; ovary 3- or 6-celled. .... 2. *Maba*.  
 BB. Fls. usually 4-5-merous; stamens 4-8, usually in 2 series; ovary 4- or 8-celled. .... 3. *Diospyros*.

## 121. OLEACEÆ.

- Fr. didymous or septically divisible into two; corolla-lobes strongly imbricate; ovules laterally affixed near base; seeds erect, without endosperm; radicle inferior. .... 1. JASMINE TRIBE.  
 Fr. terete or compressed parallel to the septum, loculicidally dehiscent; ovules pendulous from apex of cells; seeds winged, pendulous; radicle superior. .... 2. LILAC TRIBE.  
 Fr. entire, dry, indehiscent, winged, a samara, compressed contrary to the septum; ovules twin, pendulous from apex of cell; seeds pendulous with endosperm; radicle superior. .... 3. ASH TRIBE.  
 Fr. fleshy and indehiscent, a drupe or rarely a berry, not lobed; ovules twin, laterally affixed near the apex; seeds solitary, suspended or pendulous, with endosperm; radicle superior. .... 4. OLIVE TRIBE.

## 1. Jasmine Tribe.

- Fr. fleshy, indehiscent, didymous or by abortion simple. .... 1. *Jasminum*.

## 2. Lilac Tribe.

- A. Corolla-lobes imbricate.  
 B. Ovules 3-4 in a cell; lvs. pinnate and fls. white; corolla-lobes shorter than tube. .... 2. *Nathusia*.  
 BB. Ovules 4-10 in a cell; lvs. entire or 3-foliate and fls. yellow; lobes many times longer than tube. .... 3. *Forsythia*.  
 AA. Corolla-lobes induplicate-valvate; tube long or short; ovules 2 in a cell; seeds albuminous. .... 4. *Syringa*.

## 3. Ash Tribe.

- A. Lvs. usually pinnate; fr. elongate, with a terminal wing, generally 1-seeded by abortion. .... 5. *Frazinus*.  
 AA. Lvs. undivided; fr. ovate or orbiculate, surrounded by a wing, usually 2-celled and 2-seeded. .... 6. *Fontanesia*.

## 4. Olive Tribe.

- A. Corolla of nearly distinct petals which are long and linear. .... 7. *Chionanthus*.  
 AA. Corolla-lobes imbricate, broad and obtuse. .... 8. *Phillyrea*.  
 B. Endocarp of drupe thinly crustaceous. .... 9. *Osmanthus*.  
 BB. Endocarp of drupe hard and somewhat woody.  
 AAA. Corolla-lobes induplicate-valvate.

- B. Fr. a drupe; endocarp hard, thick or thin:  
infl. axillary, rarely terminal.....10. *Olea*.  
BB. Fr. a berry, hardly drupaceous; endocarp  
membranous or thinly coriaceous; pan-  
icles terminal.....11. *Ligustrum*.

## 122. LOGANIACEÆ.

- A. Style 2-fid, branches linear, 2-fid..... 1. *Gelsemium*.  
AA. Style simple.  
B. Corolla-lobes valvate.  
C. Fr. a circumscissile caps..... 2. *Spigelia*.  
CC. Fr. an indehiscent drupe or berry..... 3. *Strychnos*.  
BB. Corolla-lobes imbricate.  
C. Anthers exerted..... 4. *Chilianthus*.  
CC. Anthers included..... 5. *Buddleia*.  
The genus *Logania* may afford cultivated plants now and then.

## 123. GENTIANACEÆ.

- A. Lvs. alternate or radical.  
B. Fr. indehiscent..... 1. *Nymphoides*.  
BB. Fr. dehiscent.  
C. Caps. usually 4-valved at apex..... 2. *Villarsia*.  
CC. Caps. irregularly sub-2-valved at apex.... 3. *Menyanthes*.  
AA. Lvs. opposite.  
B. Ovary perfectly 2-celled; placentæ solitary  
in each cell, often thick, adnate to septum;  
liberated by dehiscence of caps..... 4. *Exacum*.  
BB. Ovary 1-celled; placentiferous margins of  
carpels more or less intruded within or  
even touching but not connate in the mid-  
dle of the cell, spuriously 2-celled.  
C. Style often deciduous; anthers usually  
erect.  
D. Anthers spirally twisted finally..... 5. *Erythraea*.  
DD. Anthers finally recurved at apex..... 6. *Sabbatia*.  
CC. Style usually persistent; anthers versa-  
tile, finally recurved..... 7. *Lisianthus*.  
BBB. Ovary 1-celled; margins of carpels rarely  
intruded; ovules and seeds affixed at  
each side of the suture in 1 series or more  
or less extended over the parietal surface;  
placentæ adnate, very thin.  
C. Corolla has 1-2 pits at base of each lobe.  
D. Style short or scarcely any..... 8. *Swertia*.  
DD. Style subulate..... 9. *Frasera*.  
CC. Corolla has no such pits.....10. *Gentiana*.  
The genus *Chironia* may also be expected in cultivation.

## 124. ASCLEPIADACEÆ.

Subfamily 1. PERIPLOCEÆ. Pollen granular, loosely aggre-  
gated in 2 masses in each anther-cell.

Character of subfamily..... 1. PERIPLOCA TRIBE.

Subfamily 2. EUASCLEPIADEÆ. Pollen waxy, the masses  
solitary in each anther-cell.

- Anthers tipped by a membrane, which is  
inflexed or sometimes erect, and usually  
hyaline, rarely opaque or petal-like;  
pollen-masses suspended, attached in  
pairs (1 in each adjacent cell of different  
anthers) to the corpuscle or gland..... 2. CYNANCHUM TRIBE.  
Anthers usually tipped by an inflexed or  
suberect membrane, which is hyaline,  
rarely opaque; pollinia solitary in each  
cell, erect or very small..... 3. MARS DENIA  
[TRIBE].  
Anthers obtuse at apex, not appendaged  
or rarely the connective produced; pol-  
linia solitary in the cells, erect..... 4. CEROPEGIA TRIBE.  
Anthers like those of the Ceropegieæ or  
more incumbent above the top of the  
stigma or subimmersed; sts. thick and  
fleshy, leafless or with a few lvs. at top..... 5. STAPELIA TRIBE.  
Anthers broad at the top, without ap-  
pendages or more or less membranace-  
ous on the margins, the cells somewhat  
transversely dehiscent, attached  
nearly or quite on the margin of the  
stigma-disk; pollinia horizontal or  
essentially so..... 6. GONOLOBUS TRIBE.

### 1. Periploca Tribe.

- A. Scales of corona distant from staminal tube.  
B. Corolla-tube short; scales linear or club-  
shaped..... 1. *Cryptolepis*.  
BB. Corolla large, funnel-shaped; scales acumi-  
nate or 2-fid..... 2. *Cryptostegia*.  
AA. Scales of corona close to stamens.  
B. Corolla-lobes valvate..... 3. *Chlorocodon*.  
BB. Corolla-lobes imbricate..... 4. *Periploca*.

## 2. Cynanchum Tribe.

- A. The outer or single crown either simple and  
composed of 5 scales or ring-shaped, adnate  
to the corolla and not the staminal tube, or  
rarely adherent to both.  
B. Stigma depressed..... 5. *Macrosepius*.  
BB. Stigma umbonate or 2-beaked at apex;  
corona-scales attached at middle (or  
below) of corolla-tube..... 6. *Physianthus*.  
BBB. Stigma plane or umbonate; corona annular,  
adnate to corolla..... 7. *Philibertia*.  
AA. The crown of 5 scales affixed to base of  
corolla and staminal tube; caudicles of pol-  
linia appendaged with an erect fuscous  
tooth..... 8. *Orypetalum*.  
AAA. The crown of 5 scales which are distinct,  
affixed or adnate to the staminal tube or  
the back of the anthers.  
B. Scales concave or hooded with an acute  
ligula inside..... 9. *Asclepias*.  
BB. Scales fleshy, narrow, adnate to stamen-  
tube, but free and recurved at base..... 10. *Calotropis*.  
BBB. Scales (5 outer ones) carinate-complicate  
at base of staminal tube; the 5 scales at  
the apex of the long staminal tube, short,  
obtusely spreading, alternate with anthers..... 11. *Podostigma*.  
AAAA. The outer or single crown affixed to the  
staminal tube, ring- or cup-shaped, entire,  
lobed or parted.  
B. Corona villous inside..... 12. *Morrenia*.  
BB. Corona with 5 scales or ligulae inside..... 13. *Cynanchum*.  
BBB. Corona naked inside..... 14. *Vincetori-*  
cum  
BBBB. Corona of 5 short procecded opposite anthers  
and 10 ligulae alternate with anthers in  
pairs..... 15. *Rothrockia*.

## 3. Marsdenia Tribe.

- A. Corolla-lobes strictly valvate..... 16. *Hoya*.  
AA. Corolla-lobes usually overlapping dextrorsely.  
B. Fls. not pure white, urn- or salver-shaped,  
small or medium-sized..... 17. *Marsdenia*.  
BB. Fls. white, salver- or funnel-shaped, large.... 18. *Stephanotis*.

## 4. Ceropegia Tribe.

Corona double, affixed to staminal tube..... 19. *Ceropegia*.

## 5. Stapelia Tribe.

Corona double, outer spreading, inner of 5 scales. 20. *Stapelia*.

## 6. Gonolobus Tribe.

Crown cup-shaped or annular, entire or lobed.... 21. *Gonolobus*.

Additional genera described in Asclepiadaceæ are: *Caralluma*,  
*Duvalia*, *Echidnopsis*, *Gomphocarpus*, *Hoodia*, *Huernia*, *Micho-*  
*litia*, *Pectinaria*, *Piarranthus*, *Raphionacme*, *Sphaerocodon* and  
*Trichocaulon*.

## 125. APOCYNACEÆ.

- A. Anther-cells not appendaged at base.  
B. Ovary entire (*Carissa* Tribe); fls. 5-merous.  
C. Fr. a 2-valved caps.; ovary 1-celled..... 1. *Allamanda*.  
CC. Fr. a berry, indehiscent; ovary 2-celled;  
cells 1-4-ovuled.  
D. Ovules laterally affixed; cymes ter-  
minal, few-fid; spines axillary..... 2. *Carissa*.  
DD. Ovules erect from base; cymes axillary,  
dense; spines 0..... 3. *Acokanthera*.  
BB. Ovaries 2 to several; style 1 (*Plumeria* Tribe).  
C. Calyx with several glands inside or a ring  
of hairs.  
D. Carpels 2-ovuled..... 4. *Thevetia*.  
DD. Carpels many-ovuled..... 5. *Taberna-*  
montana  
CC. Calyx without glands inside.  
D. Carpels 2-ovuled.  
E. Disk 2-scaled..... 6. *Kopsia*.  
EE. Disk cup-shaped or annular..... 7. *Rauwolfia*.  
DD. Carpels 6- to many-ovuled.  
E. Ovules in 2 series.  
F. Disk 0.  
G. Seeds truncate..... 8. *Amsonia*.  
GG. Seeds winged..... 9. *Gonioma*.  
FF. Disk of 2 scales..... 10. *Vinca*.  
EE. Ovules in many series.  
F. Stamens near base of tube..... 11. *Plumeria*.  
FF. Stamens above middle of tube..... 12. *Alistonia*.  
AA. Anther-cells produced at base, (Echites  
Tribe.)  
B. The cone of anthers more or less exerted  
at apex.  
C. Throat of corolla with 5 scales..... 13. *Prestonia*.  
CC. Throat without scales..... 14. *Vallisneria*.  
BB. The anthers included.  
C. Lvs. usually in whorls of 3..... 15. *Nerium*.

- cc. Lvs. opposite.  
 d. Corolla bell-shaped, with 5 squamellae alternating with stamens.....16. *Apocymum*.  
 dd. Corolla salver-shaped or funnel-shaped, the throat without scales.  
 e. Disk of 2 scales.....17. *Dipladenia*.  
 ee. Disk many-toothed or crenulate.....18. *Odontadenia*.  
 eee. Disk of 5 lobes or scales, often truncate in *Trachelospermum*.  
 f. Fls. salver-shaped.  
 g. Infl. lax corymbose cymes.....19. *Trachelospermum*.  
 gg. Infl. racemose; rarely shortly dichotamous.....20. *Echites*.  
 ff. Fls. funnel-shaped.  
 g. In cymes.....21. *Beaumontia*.  
 gg. In racemes.....22. *Mandevilla*.

Other genera treated are: *Hunteria*, *Landolphia*, *Pachypodium*, *Parsonsia*, *Pleiocarpa* and *Strophanthus*.

## 126. POLEMONIACEÆ.

- a. Caps. deeply loculicidal: herbs or sub-shrubs.  
 b. Stamens unequally affixed to corolla-tube; not declinate.  
 c. Lvs. mostly opposite, entire.....1. *Phlox*.  
 cc. Lvs. mostly alternate, usually incised or pinnatifid.....2. *Collomia*.  
 bb. Stamens equally affixed to tube or throat.  
 c. The stamens not declinate.....3. *Gilia*.  
 cc. The stamens declinate.  
 d. Filaments pilose-appendaged at base... 4. *Polemonium*.  
 dd. Filaments not appendaged.....5. *Læselia*.  
 aa. Caps. shortly loculicidal at apex; seeds broadly winged: trees or shrubs.....6. *Cantua*.  
 aaa. Caps. deeply septicidal: tall climbers.....7. *Cobaea*.

## 127. HYDROPHYLLACEÆ.

- a. Styles 2, distinct from base; corolla-lobes imbricate.....1. *Wigandia*.  
 aa. Styles 2-cut, rarely undivided.  
 b. Corolla-lobes usually convolute.  
 c. Stamens exserted.....2. *Hydrophyllum*.  
 cc. Stamens included.....3. *Nemophila*.  
 bb. Corolla-lobes imbricate.  
 c. Fls. marcescent, bell-shaped.....4. *Emmenanthe*.  
 cc. Fls. deciduous.  
 d. The peduncles 1-fid.....5. *Hesperochiron*.  
 dd. The fls. cymose or in 1-sided racemes... 6. *Phacelia*.

## 128. BORAGINACEÆ.

- a. Ovary undivided (or only laterally 4-lobed) and surmounted by the style.  
 b. Style twice bifid; stigmas not annular; cotyledons plaited or corrugated.....1. **CORDIA TRIBE.**  
 bb. Style once bifid or 2-parted (the divisions sometimes coalescent to the top); stigmas more or less capitate; cotyledons plane.....2. **EHRETIA TRIBE.**  
 bbb. Style entire, sometimes wanting; stigma shield- or ring-shaped, forming a complete ring surmounted usually by a tip or appendage which is entire or 2-lobed and varies from hemispherical to subulate.....3. **HELIOTROPE TRIBE.**  
 aa. Ovary 4-parted (rarely 2-parted) from above into 1-celled, 1-ovuled divisions surrounding the base of the undivided (rarely 2-lobed) style; stigma not annular.....4. **BORAGE TRIBE.**

## 1. Cordia Tribe.

Calyx tubular or bell-shaped, merely toothed or lobed.....1. *Cordia*.

## 2. Ehretia Tribe.

Calyx 5-parted; style 2-fid.....2. *Ehretia*.

## 3. Heliotrope Tribe.

- a. Plants sarmentose or twining.....3. *Tournefortia*.  
 aa. Plants are herbs or sub-shrubs.....4. *Heliotropium*.

## 4. Borage Tribe.

- a. Gynobase elevated.  
 b. Apex of nutlets not projecting much beyond scar.  
 c. Nutlets divergent or divaricate (either radiately or in pairs), extended outward or backward much beyond the insertion (which is by a roundish or oblong scar); gynobase little elevated or broadly conical.  
 d. Stamens included.  
 e. Nutlets covered with small cups or cavities.....5. *Omphalodes*.  
 ee. Nutlets covered with small warts or barbed bristles.....6. *Cynoglossum*.  
 dd. Stamens exserted.  
 e. Corolla-tube longer than spreading lobes.....7. *Lindelofia*.  
 ee. Corolla tubular; lobes short, erect or somewhat spreading.....8. *Solanthus*.  
 cc. Nutlets adnate by the inner face or keel to an elevated, conical or columnar gynobase, forming a more or less globose or pyramidal fruit.....9. *Myosotidium*.  
 bb. Apex of nutlets projecting conspicuously beyond scar.  
 c. Pedicels persistent.  
 d. Nutlets keeled toward apex.....10. *Plagiobotrys*.  
 dd. Nutlets not keeled.....11. *Oreocarya*.  
 cc. Pedicels deciduous.....12. *Cryptanthus*.  
 aa. Gynobase flat or nearly so.  
 b. Scar excavated or often girt by a ring.  
 c. Throat of corolla has 5 scales inside.  
 d. Filaments appendaged with a scale....13. *Borago*.  
 dd. Filaments not appendaged.  
 e. Corolla-lobes very short and sub-erect.....14. *Symphytum*.  
 ee. Corolla-lobes spreading.....15. *Anchusa*.  
 cc. Throat naked or pilose.....16. *Pulmonaria*.  
 bb. Scar flat, either small at the inner angle or oblique.  
 c. Racemes without bracts (rarely a few bracts at base); anthers obtuse at apex.  
 d. Throat of corolla scaly.....17. *Myosotis*.  
 dd. Throat almost naked.....18. *Mertensia*.  
 cc. Racemes bracted.  
 d. Anthers obtuse at apex or hardly mucronate.  
 e. Lobes of corolla erect.....19. *Onosmodium*.  
 ee. Lobes of corolla spreading.....20. *Lithospermum*.  
 ff. Corolla-tube slender; throat naked.....21. *Arnebia*.  
 fff. Corolla tubular or salver-form; throat naked, lobes usually unequal.....22. *Echium*.  
 dd. Anthers linear, often acuminate, arrow-shaped at base.  
 e. Nutlets distinct.....23. *Onosma*.  
 ee. Nutlets connate in pairs.....24. *Cerinthe*.

## 129. CONVULVULACEÆ.

- a. Corolla-lobes small, imbricate: plants parasitic, leafless; sts. thread-like, not green....1. *Cuscuta*.  
 aa. Corolla large, plicate or induplicate in aestivation.  
 b. Fr. berry-like or harder, indehiscent: style undivided.  
 c. The ovary 4-celled, 4-ovuled.....2. *Argyriaea*.  
 cc. The ovary 2-celled, 4-ovuled.....3. *Leptostoma*.  
 bb. Fr. a 2-4-valved caps. with a thin or hard pericarp, or indehiscent with a thin pericarp; styles 2 and distinct or the style entire or divided.  
 c. Stigma capitate; style entire or 2-parted; ovary 2-celled, 4-ovuled.....4. *Porana*.  
 cc. Stigma thick, globose, often twin; ovary 2-4-celled, 4-ovuled.  
 d. Stamens and style included within the corolla-tube.....5. *Ipomæa*.  
 dd. Stamens and style exserted.  
 e. Plant a night-bloomer; corolla contorted in bud.....6. *Calonyction*.  
 ee. Plant a day-bloomer; corolla not contorted.....7. *Quamoclit*.  
 ccc. Stigma capitate; ovary 2-celled.....8. *Breweria*.  
 cccc. Stigmas 2, linear, filiform or thickish.....9. *Convolvulus*.  
 (Except *Calystegia* section, see also *Rhodorhiza*.)  
 ccccc. Stigmas 2, flat, ovate or oblong.....10. *Jacquemonia*.  
 (Also *Calystegia* section of *Convolvulus*.)

## 130. SOLANACEÆ.

- a. Stamens didynamous, the fifth (and sometimes also one of the pairs) smaller, abortive or missing.  
 B. Number of perfect stamens usually 5.  
 c. The stamens affixed at middle of tube or lower..... 1. *Petunia*.  
 cc. The stamens affixed at apex of tube..... 2. *Nierembergia*.  
 BB. Number of perfect stamens usually 4 or 2.  
 c. Corolla-tube cylindrical; limb oblique; perfect stamens 2..... 3. *Schizanthus*.  
 cc. Corolla obliquely funnel-shaped; perfect stamens 4, didynamous..... 4. *Salpiglossis*.  
 CCC. Corolla-tube cylindrical, straight; anthers of the 2 short stamens dimidiate, of the longer ones 2-celled..... 5. *Browallia*.  
 CCCC. Corolla-tube twisted; anthers as in *Browallia*..... 6. *Streptosolen*.  
 CCCCC. Corolla-tube long, not twisted; slightly widened at apex; 4 perfect anthers with confluent cells..... 7. *Brunfelsia*.  
 AA. Stamens all perfect not didynamous, normally 5.  
 B. Seeds little, if at all, flattened.  
 c. Fr. a few-seeded berry..... 8. *Cestrum*.  
 CC. Fr. a many-seeded caps.  
 D. Corolla with a narrow tube and short spreading lobes..... 9. *Fabiana*.  
 DD. Corolla funnel- or salver-shaped; limb equal or oblique..... 10. *Nicotiana*.  
 BB. Seeds flattened.  
 c. Fr. a caps.  
 D. Corolla-lobes plicate.  
 E. Caps. 4-celled, and 4-valved (sometimes indehiscent)..... 11. *Datura*.  
 EE. Caps. circumscissile above the middle..... 12. *Scopolia*.  
 DD. Corolla-lobes imbricate..... 13. *Hyoscyamus*.  
 CC. Fr. berry-like, or at least indehiscent.  
 D. Limb of corolla subequally plicate or divided into valvate or induplicate lobes.  
 E. Anthers longer than filament, connivent connate in a cylinder or cone, acuminate at apex or dehiscent by 2 apical pores.  
 F. Connective variously thickened on back..... 14. *Cyphomandra*.  
 FF. Connective slender or obsolete.  
 G. The anthers acuminate, hollow at tip, dehiscing by a longitudinal crack..... 15. *Lycopersicon*.  
 GG. The anthers opening by an apical pore which is sometimes continued into a longitudinal crack..... 16. *Solanum*.  
 EE. Anthers free, with parallel cells, and dehiscing by a longitudinal crack.  
 F. Stamens affixed above middle of tube..... 17. *Salpichroa*.  
 FF. Stamens affixed near the base of tube.  
 G. Corolla nearly rotate or broadly bell-shaped.  
 H. Fruiting calyx hardly enlarged..... 18. *Capsicum*.  
 HH. Fruiting calyx inflated or bladdery.  
 I. Calyx cut shortly or to middle..... 19. *Physalis*.  
 II. Calyx parted to base..... 20. *Nicandra*.  
 GG. Corolla tubular or narrowly funnel-shaped..... 21. *Iochroma*.  
 DD. Limb of corolla more or less imbricate, flat and distinct or connected by induplicate sinuser.  
 E. The lobes imbricated from the base, not plicate.  
 F. Plants woody.  
 G. Berry with 4 stones, each 1-2-seeded..... 22. *Grabowskia*.  
 GG. Berry with 2 cells, each 1-∞-seeded..... 23. *Lycium*.  
 FF. Plants herbaceous..... 24. *Atropa*.  
 EE. The sinuses of the corolla induplicate between the lobes.  
 F. Calyx long and tubular..... 25. *Solanum*.  
 FF. Calyx leafy, 5-fid, increasing in f. .... 26. *Mandragora*.

## 131. NOLANACEÆ.

Single genus..... *Nolana*.

## 132. SCROPHULARIACEÆ.

**Series 1. PSEUDOSOLANACEÆ.** Lvs. all alternate; infl. simple, centripetal; corolla hardly if at all bilabiate; the 2 posterior lobes external in the bud.

- A. Corolla-tube short, somewhat bell-shaped: American species..... 1. *Leucophyllum* [TRIBE].  
 AA. Corolla subrotate: Old World species... 2. *Verbascum* [TRIBE].  
**Series 2. ANTIRRHINIDÆÆ.** Lvs. prevaillingly opposite, at least the lower: infl. simple or compound, partially centrifugal, i.e., the peduncle cymosely few- to several-fid.; posterior lip or lobes of corolla generally external in the bud.  
 A. Corolla bilabiate; lips inflated, concave. 3. *Calceolaria* [TRIBE].  
 AA. Corolla bilabiate or nearly regular; lips nearly plane.  
 B. Corolla saccate or spurred.  
 c. Tube wanting..... 4. *Hemimeris* [TRIBE].  
 cc. Tube present..... 5. *Antirrhinum* [TRIBE].  
 BB. Corolla-tube not saccate nor spurred.  
 c. Infl. centrifugal, cymose, usually compound, rarely sub-simple.... 6. *Chelone* [TRIBE].  
 cc. Infl. centripetal.  
 d. Anthers 1-celled..... 7. *Manulea* [TRIBE].  
 dd. Anthers 2-celled..... 8. *Gratiola* [TRIBE].

**Series 3. RHINANTHIDÆÆ.** Lvs. various; infl. simple or compound; corolla-lobes variously imbricated, the anterior or lateral ones usually exterior.

- A. Anther-cells contiguous at apex and usually confluent: plants not parasitic. 9. *Digitalis* [TRIBE].  
 AA. Anther-cells everywhere distinct: plants often root-parasitic.  
 B. Corolla-lobes all flat, usually spreading..... 10. *Gerardia* [TRIBE].  
 BB. Corolla with posterior lip erect, concave or galeate; anterior lip often spreading..... 11. *Euphrasia* [TRIBE].

## 1. Leucophyllum Tribe.

Corolla-lobes 5, subequal, spreading..... 1. *Leucophyllum*.

## 2. Verbascum Tribe.

- A. Stamens 5..... 2. *Verbascum*.  
 AA. Stamens 4..... 3. *Celsia*.

## 3. Calceolaria Tribe.

The only genus..... 4. *Calceolaria*.

## 4. Hemimeris Tribe.

- A. Corolla more or less rotate, resupinate, the grooves inconspicuous or obsolete..... 5. *Alonsoa*.  
 AA. Corolla spread out flat, swollen or saccate under anterior lip..... 6. *Angelonia*.  
 AAA. Corolla flat or concave, with 2 basal spurs or pouches..... 7. *Diascia*.  
 AAAA. Corolla-tube short with 1 spur or sac on the anterior side..... 8. *Nemesia*.

## 5. Antirrhinum Tribe.

- A. Throat has a prominent palate.  
 B. Corolla spurred..... 9. *Linaria*.  
 BB. Corolla saccate or gibbous at base..... 10. *Antirrhinum*.  
 AA. Throat has no palate.  
 B. Caps. opens by 2 apical pores which are sometimes confluent..... 11. *Anarrhinum*.  
 BB. Caps. opens by transverse holes or irregularly.  
 c. Calyx ample, membranous..... 12. *Rhodochiton*.  
 cc. Calyx smaller, herbaceous..... 13. *Maurandia*.

## 6. Chelone Tribe.

- A. Staminode often elongated.  
 B. Caps. loculicidally dehiscent..... 14. *Tetranema*.  
 BB. Caps. septicidally dehiscent.  
 c. Fls. bilabiate.  
 D. Anterior lip with middle lobe folded upon itself and inclosing the stamens..... 15. *Collinsia*.  
 DD. Anterior lip of 3 flat spreading lobes.  
 E. Seeds winged..... 16. *Chelone*.  
 EE. Seed not winged..... 17. *Pentstemon*.  
 cc. Fls. with all the lobes flat, spreading and subequal..... 18. *Russelia*.  
 AA. Staminode usually in the form of a scale at apex of corolla-tube..... 19. *Scrophularia*.  
 AAA. Staminode small, minute or 0.  
 B. Stamens usually exerted.  
 c. Calyx 5-parted; caps. tardily dehiscent..... 20. *Phygellus*.  
 cc. Calyx cup-shaped; berry indehiscent..... 21. *Halleria*.  
 BB. Stamens included; calyx 5-cut.  
 c. Fr. an indehiscent berry..... 22. *Teedia*.  
 cc. Fr. a loculicidal caps..... 23. *Paulownia*.

## 7. Manulea Tribe.

- A. Calyx bilabiate or 2-parted..... 24. *Zaluzianskya*.  
 AA. Calyx 5-parted..... 25. *Chænostoma*.

8. *Gratiola* Tribe.

- A. Perfect stamens 2.....26. *Gratiola*.  
 A A. Perfect stamens 4.  
 B. Stamens all affixed inside corolla-tube.  
 cc. Calyx bell-shaped, 5-parted.....27. *Mazus*.  
 cc. Calyx tubular, 5-toothed and angled.....28. *Mimulus*.  
 BB. Stamens partly inside corolla-tube, partly in throat, 2 affixed in each place.....29. *Torenia*.

9. *Digitalis* Tribe.

- A. Caps. opens by loculicidal valves.  
 B. Herbs creeping.....30. *Sibthorpia*.  
 BB. Herbs upright.....31. *Rehmannia*.  
 BBB. Herbs thick-rhizomatous, the lvs. nearly or quite radical.....32. *Wulfenia*.  
 A A. Caps. opens by septicidal valves.  
 B. Lvs. alternate.  
 c. Corolla declinate, tube swollen, or bell-shaped; posterior lip spreading.....33. *Digitalis*.  
 cc. Corolla-tube slender, spreading.....34. *Erinus*.  
 BB. Lvs. opposite.....35. *Oursia*.  
 A A. Caps. 4-valved or loculicidally 2-valved.  
 B. Lvs. all alternate or radical.....36. *Synthyris*.  
 BB. Lvs. (at least lower ones) opposite.....37. *Veronica*.

10. *Gerardia* Tribe.

- Calyx-lobes shorter than tube.....38. *Gerardia*.

11. *Euphrasia* Tribe.

- A. The anther-cells equal.....39. *Pedicularis*.  
 A A. The outer anther-cell fixed by the middle; inner one pendulous or deficient.  
 B. Calyx laterally compressed, split on anterior side or both.....40. *Castilleja*.  
 BB. Calyx 4-cut.....41. *Orthocarpus*.

Other genera to be looked for are: *Bowkeria*, *Craterostigma*, *Herpustis*, *Lindenbergia*, *Seymeria*.

## 133. LENTIBULARIACEÆ.

- A. Posterior lip of corolla erect; calyx 2-parted or deeply 2-lobed.....1. *Utricularia*.  
 A A. Posterior lip of corolla spreading; calyx 4-5-parted.....2. *Pinguicula*.

## 134. BIGNONIACEÆ.

- A. Ovary 2-celled: caps. dehiscent: lvs. mostly opposite.  
 B. Valves opening parallel with septum.  
 c. Lvs. 2-3-foliate: shrubs, climbing with tendrils.  
 D. Tendrils filiform, simple.  
 E. Disk present.  
 F. Caps. smooth or slightly warty, broadly linear; calyx with black gland.....1. *Adenocalymma*.  
 FF. Caps. rough, broad: disk crenate; calyx not glandular, with 5 subulate teeth.....2. *Clytostoma*.  
 EE. Disk warty; calyx with 5 short teeth or truncate: caps. linear.....3. *Cydista*.  
 DD. Tendrils 3-parted, filiform, slender.  
 E. Corolla straight or slightly curved, membranous: caps. narrow, smooth.  
 F. Lobes of corolla imbricate; stamens inclosed: tendrils twice or thrice 3-parted.....4. *Anisostichus*.  
 (See under Bignonia.)  
 FF. Lobes valvate; stamens exserted: tendrils simply 3-parted.....5. *Pyrostegia*.  
 EE. Corolla strongly curved; calyx leathery, tomentose.  
 F. Stamens inclosed; fls. white.  
 G. Ovary warty: caps. broad, rough, not curved: branches angular.....6. *Pithecolitium*.  
 GG. Ovary smooth: caps. oblong, curved, with a convex and a concave valve: branches terete.....7. *Diactis*.  
 FF. Stamens exserted; fls. red; ovary tomentose.....8. *Phædranthus*.  
 DDD. Tendrils 3-parted, the ramifications hooked, claw-like.  
 E. Calyx truncate or lobed; disk simple.....9. *Bignonia*.  
 EE. Calyx splitting on one side; disk double.....10. *Macfadyenia*.  
 CC. Lvs. 2-3-pinnate: upright tree.....11. *Orozylon*.  
 BB. Valves opening at right angles to septum: upright plants or climbing without tendrils.

- c. Habit climbing (upright in some forms of *Campsis*): lvs. pinnate.  
 D. Stamens exserted: fls. serrate.....12. *Tecomaria*.  
 DD. Stamens inclosed.  
 E. Climbing by rootlets: fls. serrate: corolla campanulate-funnelform.....13. *Campsis*.  
 EE. Climbing without rootlets: fls. entire.  
 F. Corolla club-shaped, straight, upright; fls. in racemes.....14. *Campsidium*.  
 FF. Corolla campanulate-funnelform; fls. in panicles.....15. *Pandorea*.  
 CC. Habit upright: herbs, with alternate lvs.: caps. folliculately dehiscent.  
 D. Seeds with membranous wing: lvs. simple or compound.....16. *Incarvillea*.  
 DD. Seeds with fringed hairs, lvs. pinnate.....17. *Amphicome*.  
 CCC. Habit upright: trees or shrubs with usually opposite lvs.  
 D. Lvs. simple or digitate.  
 E. Seeds fringed with hairs: lvs. simple, entire.  
 F. Fertile stamens 4: lvs. linear, alternate.....18. *Chilopsis*.  
 FF. Fertile stamens 2: lvs. cordate, opposite.....19. *Catalpa*.  
 EE. Seeds winged: lvs. simple or digitate.....20. *Tabebuia*.  
 DD. Lvs. pinnate, rarely simple and serrate.  
 E. Septum flat.  
 F. Calyx campanulate, truncate, toothed or lobed.  
 G. Staminate not elongated.  
 H. Anthers with enlarged leafy connective; calyx regularly 5-toothed: shrubs: fls. serrate; lvs. rarely simple.....21. *Tecoma*.  
 HH. Anthers without enlarged connective; calyx irregularly 2-5-lobed: tree: fls. usually entire.....22. *Heterophragma*.  
 GG. Staminate much elongated and enlarged at the apex; calyx small; fls. in large terminal panicles: lvs. 1-2-pinnate with numerous fls.....23. *Jacaranda*.  
 FF. Calyx spathe-like, splitting on one side; corolla broadly campanulate.....24. *Spathodea*.  
 EE. Septum thick, spongy.  
 F. Seeds in deep impressions of the septum: calyx truncate or indistinctly toothed: lvs. usually bipinnate.....25. *Radermachia*.  
 FF. Seeds in shallow impressions of the septum: calyx 3-5-lobed: lvs. pinnate.....26. *Stereospermum*.  
 A A. Ovary 1-celled.  
 B. Fr. a dehiscent caps.; corolla tubular, narrowed at the mouth: lvs. opposite, pinnate: climbing with tendrils.....27. *Ecrcromocarpus*.  
 BB. Fr. indehiscent: corolla campanulate or campanulate-funnelform; trees or shrubs, with alternate lvs.  
 C. Lvs. simple or 3-foliate.  
 D. Calyx spathe-like, splitting on one side; corolla regular; fls. on the old wood.....28. *Parmentiera*.  
 DD. Calyx campanulate, irregularly lobed; corolla very irregular; fls. at the end of the branches.....29. *Crescentia*.  
 CC. Lvs. pinnate: corolla irregular.....30. *Kigelia*.

The genus *Colea* is also more or less in cultivation within our limits.

## 135. GESNERIACEÆ.

- A. Ovary more or less inferior: fr. capsular.  
 B. Disk 0.....1. *Niphaea*.  
 BB. Disk annular.  
 cc. Fls. smallish, pallid or white.....2. *Dicentra*.  
 CC. Fls. largish, variously colored.  
 D. Corolla-tube broadly swollen or bell-shaped; calyx-lobes usually membranous or leafy.....3. *Gloxinia*.  
 (Of botanists, not of florists.)  
 DD. Corolla-tube cylindrical or broadened above; calyx-lobes narrow or short.  
 E. The fls. axillary.....4. *Achimenes*.  
 (Consult also *Scheeria*.)  
 EE. The fls. alternate in a terminal, leafless raceme.....5. *Nagelia*.  
 BBB. Disk of 5 distinct or but slightly united glands, these equal or unequal.  
 c. Caps. inferior to the middle or higher.  
 D. Anther-cells confluent at apex.....6. *Sinningia*.  
 (Gloxinia of florists.)  
 DD. Anther-cells distinct.....7. *Isoloma*.  
 CC. Caps. shortly immersed at base, almost superior.....8. *Gesneria*.

- AA. Ovary wholly superior: fr. capsular or baccate, unknown in *Saintpaulia*.  
 B. Anther-cells distinct and parallel.  
 C. Disk with a large posterior gland, otherwise small or wanting.  
 D. Filaments free among themselves. .... 9. *Episcia*.  
 DD. Filaments connate into a sheath which is split on the posterior side.  
 E. Anthers separate. .... 10. *Alloplectus*.  
 EE. Anthers connate cross-like. .... 11. *Columnnea*.  
 CC. Disk annular, elevated, almost cup-shaped.  
 D. Perfect stamens 2. .... 12. *Agalmylea*.  
 DD. Perfect stamens 4. .... 13. *Trichosporum*.  
 CCC. Disk obsolete. .... 14. *Mitraria*.  
 BB. Anther-cells divaricate or diverging, rarely sub-parallel.  
 C. Disk 0.  
 D. Anthers free. .... 15. *Ramonda*.  
 DD. Anthers cohering in a tube extending beyond the cells. .... 16. *Conandron*.  
 CC. Disk reduced to a posterior gland. .... 17. *Codonanthe*.  
 CCC. Disk a ring (rarely dimidiate in *Chirita*).  
 E. Lvs. cauline, opposite.  
 F. Stamens 4. .... 18. *Besleria*.  
 FF. Stamens 2. .... 19. *Chirita*.  
 EE. Lvs. basal (rarely opposite in *Streptocarpus*).  
 F. Stamens 4. .... 20. *Habertia*.  
 FF. Stamens 2. .... 21. *Streptocarpus*.  
 GG. Corolla-tube long. .... 21. *Streptocarpus*.  
 GG. Corolla-tube short. .... 22. *Saintpaulia*.  
 Additional genera described are: *Acanthonema*, *Boea*, *Corytholoma*, *Cyrtandra*, *Klugia*, *Lysionotus*, *Rhabdothamnus* and *Roettlera*.

## 136. MARTYNIACEÆ.

- A. Corolla-tubes swollen above the short base. .... 1. *Martynia*.  
 AA. Corolla-tube very long, slender and cylindrical with a bell-shaped throat. .... 2. *Craniolaria*.

## 137. PEDALIACEÆ.

- A. Caps. truncate at apex, the angles awned or horned. .... 1. *Ceratotheca*.  
 AA. Caps. obtuse or acuminate, unarned. .... 2. *Sesamum*.

## 138. ACANTHACEÆ.

- A. Corolla expanded into a single obovate lip.  
 B. Calyx of normal texture; posterior segms. 3-5-nerved. .... 1. *Blepharis*.  
 BB. Calyx usually cartilaginous; posterior segm. 3-5-nerved. .... 2. *Acanthus*.  
 AA. Corolla with subequal limb, or 2-lipped.  
 B. The corolla contorted.  
 C. Ovary with 2 collateral ovules in each cell, or by abortion 1. .... 3. *Thunbergia*.  
 CC. Ovary with 2 to many ovules in each cell, in 1 series or alternately placed one above another.  
 D. Filaments connate in pairs at the base.  
 E. Caps. subterete. .... 4. *Ruellia*.  
 EE. Caps. compressed parallel to the septum. .... 5. *Dædalacanthus*.  
 DD. Filaments equidistant or subconnate at the base in pairs; calyx-lobes obtuse. .... 6. *Sanchezia*.  
 DDD. Filaments crowded or connate at the base on the posterior wall of the tube or 2 posterior filaments affixed a little higher.  
 E. Calyx ample, membranous or colored. .... 7. *Whitfieldia*.  
 EE. Calyx-segms. linear, not colored.  
 F. Ovules 2 in each cell. .... 8. *Strobilanthes*.  
 FF. Ovules 3 to many in each cell. .... 9. *Hemigraphis*.  
 BB. The corolla not contorted.  
 C. Corolla of 5 flat lobes, not bilabiate.  
 D. Stamens 4.  
 E. The corolla-lobes variously imbricated, lateral ones usually outer.  
 F. Anthers all 2-celled. .... 10. *Barleria*.  
 FF. Anthers all 1-celled. .... 11. *Crossandra*.  
 EE. The anterior corolla-lobe outside, posterior one inside.  
 F. Anthers all 1-celled. .... 12. *Stenandrium*.  
 FF. Anthers all 2-celled (in *Chameranthemum*, the posterior anthers sometimes 1-celled).  
 G. Tube swollen into a long or broad throat. .... 13. *Asystasia*.

- GG. Tube long, slender, scarcely swollen at apex. .... 14. *Chameranthemum*.  
 DD. Stamens 2: ovules in each cell 2. .... 15. *Erantheimum*.  
 CC. Corolla bilabiate or sub-equally 4-cut.  
 D. Ovules in each cell 3 or more. .... 16. *Phlogocanthus*.  
 DD. Ovules in each cell 2.  
 E. Fls. with 2 or 4 bracts longer than calyx. .... 17. *Peristrophe*.  
 EE. Fls. without such bracts.  
 F. Stamens 4, anthers all 1-celled. .... 18. *Aphelandra*.  
 FF. Stamens 2, anthers 2-celled.  
 G. Anther-cells unlike, one larger or affixed higher. (In *Jacobinia* cells often subequal.)  
 H. The lower anther cell usually spurred. .... 19. *Justicia*.  
 HH. The anther-cells not spurred, sometimes equally mucronate at base.  
 I. The corolla with short tube and ample lips. .... 20. *Adhatoda*.  
 II. The corolla-tube usually long and narrow. .... 21. *Jacobinia*.  
 GG. Anther-cells equal.  
 H. Staminodes at base of filaments small.  
 I. Corolla-tube swollen above; posterior lip incurved, anterior spreading, 3-cut. .... 22. *Graptophyllum*.  
 II. Corolla-tube elongated; limb sub-bilabiate, 4-lobed. .... 23. *Thysanocanthus*.  
 HH. Staminodes 0.  
 I. Veins of lvs. white or colored. .... 24. *Fittonia*.  
 II. Veins of lvs. green.  
 J. Calyx-segms. linear or bristle-like. .... 25. *Schaueria*.  
 JJ. Calyx small; lobes acute or acuminate. .... 26. *Anisacanthus*.

The following genera are also treated: *Anisotes*, *Beloperone*, *Dianthera*, *Dicliptera*, *Duvernoia*, *Dyschoriste*, *Lepidagathis*, *Micanthus*, *Pseuderanthemum*, *Rungia* and *Warpuria*.

## 139. GLOBULARIACEÆ, or SELAGINACEÆ.

- A. Calyx 5-cut; the 2 posterior lobes of the corolla narrow or connate or deficient. .... 1. *Globularia*.  
 AA. Calyx cut down one side; posterior lobes of corolla 4. .... 2. *Hebenstreitlia*.

## 140. PHRYMACEÆ.

The only genus. .... *Phryma*.

## 141. MYOPORACEÆ.

Corolla more or less bell-shaped, rarely funnel-shaped, with a subregular limb; ovary 2- or more-celled; cells 1-ovuled, rarely 2-celled and 2-ovuled. .... *Myoporum*.

## 142. VERBENACEÆ.

- A. Infl. centripetal.  
 B. Fls. sessile in the spike.  
 C. Nutlets 2, or by abortion 1, 1-seeded.  
 D. Fr. a juicy berry. .... 1. *Lantana*.  
 DD. Fr. drupaceous; calyx 2-4-cut or toothed. .... 2. *Lippia*.  
 DDD. Fr. dry; calyx 5-toothed. .... 3. *Stachytarpheta*.  
 CC. Nutlets or cells of fr. 4, or by abortion fewer, 1-seeded. .... 4. *Verbena*.  
 BB. Fls. pedicelled.  
 C. Nutlets 1-seeded.  
 D. Number of nutlets 4. .... 5. *Amasonia*.  
 DD. Number of nutlets 2 or 1. .... 6. *Petræa*.  
 CC. Nutlets 2-seeded, in pyrenes 2-5, 2-locellate. .... 7. *Duranta*.  
 AA. Infl. centrifugal.  
 B. Fr. drupe-like, entire or 4-lobed, exocarp usually pulpy or fleshy, the endocarp entire or 4-celled, often separating into 4 nutlets.  
 C. Corolla regular; stamens as many as petals. .... 8. *Callicarpa*.  
 CC. Corolla-limb oblique, with anterior lobe produced, or sub-bilabiate; stamens 4, didynamous or arched under posterior lobes.  
 D. Drupe with one 4-celled stone.  
 E. Corolla-tube cylindrical, short. .... 9. *Vitex*.

- EE. Corolla-tube strongly dilated above. .10. *Gmelina*.  
 DD. Drupe 4-parted, with 4 stones, or by reduction 1-stoned (this 1-celled).  
 E. Fertile stamens 2. .11. *Oxera*.  
 EE. Fertile stamens 4. .12. *Clerodendron*.  
 BB. Fr. dry, subcapsular; exocarp with 4 valves involute at the margin from the base up, which carry off the nutlets and leave no central column. .13. *Caryopteris*.  
 Other genera in cultivation in North America are *Avicennia*, *Citharexylum*, *Congea*, *Diostea*, *Faradaya*, *Premna*.

## 143. LABIATÆ.

## I. Summary of Tribes.

Ignoring exceptions.

- A. The nutlets fleshy or drupe-like, affixed to a small basal or oblong introrsely oblique areole; ovary 4-lobed. 1. PRASIA TRIBE.  
 AA. The nutlets dry or hard.  
 B. Ovary shortly, rarely deeply 4-lobed; nutlets wrinkled or netted, affixed to an obliquely introrse or lateral, usually large, areole.  
 C. Seeds, when known, with endosperm; corolla with an ample throat and broad lobes. .2. PROSTANTHERA TRIBE.  
 CC. Seeds without endosperm; corolla various. .3. AJUGA TRIBE.  
 BB. Ovary 4-parted to the base; nutlets affixed to a small basal or slightly oblique areole.  
 C. Stamens declinate; perfect ones 4, rarely 2; anthers 1-celled by confluent. .4. OCIMUM TRIBE.  
 D. Subtribe 1. EUOCIMEÆ. Areole basal; stamens usually exerted; anterior corolla-lobe usually unlike the others.  
 DD. Subtribe 2. LAVANDULEÆ. Areole extrorsely oblique; stamens included; corolla-lobes equal or the anterior lobe with the lateral ones forming the anterior lip.  
 CC. Stamens ascending, or in the Stachys Tribe sometimes included. (Consult also CCC.)  
 D. Perfect stamens 2; anther-cells linear, separate, solitary or confluent. .5. MONARDA TRIBE.  
 DD. Perfect stamens 4, rarely 2 in the Nepeta Tribe.  
 E. Calyx usually 15-nerved; posterior stamens longer than the anterior. .6. NEPETA TRIBE.  
 EE. Calyx 5- or 10-nerved; posterior stamens shorter than anterior; posterior lip of corolla erect, usually concave or fornicate, anterior spreading, 3-cut. .7. STACHYS TRIBE.  
 F. Subtribe 1. SCUTELLARIEÆ. Calyx bilabiate or at length 2-parted, the mouth closed after anthesis.  
 FF. Calyx not bilabiate.  
 G. Subtribe 2. MELITTEÆ. Corolla-tube long-exserted; calyx broad, of 5 short teeth or 3-4 broad lobes.  
 GG. Corolla-tube included or slightly exerted, rarely long-exserted; calyx tubular or bell-shaped, 5-10-toothed.  
 H. Subtribe 3. MARRUBIEÆ. Stamens included.  
 HH. Subtribe 4. LAMIEÆ. Stamens exerted.  
 CCC. Stamens straight, diverging or ascending; perfect ones 4 or 2; calyx 5-, 10-, or 13-nerved, rarely 15-nerved; corolla-lobes usually flat. .8. SATUREIA TRIBE.  
 D. Subtribe 1. POGOSTEMONÆ. Anthers 1-celled, subglobose; stamens distinct, straight.  
 DD. Anthers 2-celled, at least the younger ones.  
 E. Subtribe 2. MENTHOIDEÆ. Calyx usually 5- or 10-nerved; stamens distant or divaricate.

- EE. Subtribe 3. MELISSEÆ. Calyx usually 13-nerved; stamens ascending, at least at the base.

## II. Key to the Tribes.

## 1. Prasias Tribe.

Not in cultivation.

## 2. Prostanthera Tribe.

- A. Calyx bilabiate; lips entire or anterior emarginate. .1. *Prostanthera*.  
 AA. Calyx equal, 5-toothed. .2. *Westringia*.

## 3. Ajuga Tribe.

- A. Corolla-tube slender, lobes 5, subequal, spreading. .3. *Trichostema*.  
 AA. Corolla-tube, quasi 1-lipped, the posterior lobes and small lateral ones declinate at the contracted base of the very large anterior lobe, or rarely erect. .4. *Teucrium*.  
 AAA. Corolla-tube short or exerted, the posterior lip short, erect, 2-cut, anterior much longer and its middle lobe largest. .5. *Ajuga*.

## 4. Ocimum Tribe.

- A. Subtribe 1. EUOCIMEÆ.  
 B. Anterior lobe of corolla hardly longer than the others, often narrower, declinate, flat or slightly concave.  
 C. Fruiting calyx deflexed. .6. *Ocimum*.  
 CC. Fruiting calyx scarcely enlarging, often declinate. .7. *Moschosma*.  
 BB. Anterior lobe of corolla longer than others, concave or boat-shaped.  
 C. Filaments connate at the base in a tube. .8. *Coleus*.  
 CC. Filaments free. .9. *Plectranthus*.  
 AA. Subtribe 2. LAVANDULEÆ. Sole genus. .10. *Lavandula*.

## 5. Monarda Tribe.

- A. Calyx tubular. .11. *Monarda*.  
 AA. Calyx bilabiate.  
 B. Fertile anther-cells 2: upper lip of corolla 4-lobed. .12. *Perowskia*.  
 BB. Fertile anther-cells 1: upper lip of corolla entire or bifid.  
 C. Connective continuous with filament and not indicated unless by a slender reflexed tooth. .13. *Rosmarinus*.  
 CC. Connective articulated to the filament but not produced or very shortly acuminate. .14. *Audibertia*.  
 CCC. Connective elongated, versatile on the short filament, its sterile end continued beyond the articulation and either dilated or bearing an abortive rudiment of the second anther-cell. .15. *Salvia*.

## 6. Nepeta Tribe.

- A. Calyx bilabiate or with the posterior tooth much wider than the others. .16. *Dracocephalum*.  
 AA. Calyx tubular, mouth straight or oblique.  
 B. Stamens erect or divergent; anther-cells parallel or at length divergent. .17. *Lophanthus*.  
 BB. Stamens ascending or straightish; anther-cells parallel. .18. *Cedronella*.  
 BBB. Stamens ascending and parallel or in a few species rather lax and distant; anther-cells divergent or divaricate. .19. *Nepeta*.

## 7. Stachys Tribe.

## Subtribe 1. Scutellarieæ.

- A. The calyx-lip entire. .20. *Scutellaria*.  
 AA. The posterior calyx-lip 3-toothed, anterior 2-fid. .21. *Brunella*.

## Subtribe 2. Melitteæ.

- A. Anther-cells parallel; calyx subequally 5-toothed. .22. *Physostegia*.  
 AA. Anther-cells divergent; calyx 3-lobed. .23. *Melittis*.

## Subtribe 3. Marrubieæ.

- Calyx 5-10-toothed; corolla-tube included; anther-cells at length confluent. .24. *Marrubium*.

Subtribe 4. *Lamieæ*.

- A. The posterior lip of corolla often short or flat, glabrous or pubescent.....25. *Colquhounia*.  
 AA. The posterior lip concave or fornicate, rarely flattish, usually villous.  
 B. Teeth of calyx 6-13, rarely 5.  
 cc. Calyx very broad at apex.....26. *Moluccella*.  
 cc. Calyx long-tubular.....27. *Leonotis*.  
 BB. Teeth of calyx 5.  
 c. Stamens often cast to one side after anthesis.....28. *Stachys*.  
 cc. Stamens often hairy on the back of the anthers.....29. *Lamium*.  
 CCC. Stamens often have the posterior filaments appendaged at the base.....30. *Phlomis*.

8. *Satureia* Tribe.Subtribe 1. *Pogostemonæ*.

- Calyx, 5-toothed; corolla 4-cut; anterior lobes usually wider spreading.....31. *Pogostemon*.

Subtribe 2. *Menthoideæ*.

- A. Whorls spicate or racemose, not axillary.  
 B. Calyx equal, erect, often elongated in fr.; whorls many-fld.....32. *Elsholtzia*.  
 BB. Calyx subequal in anthesis, but declinate and bilabiate in fr.; whorls 2-fld.  
 c. Nutlets smooth.....33. *Collinsonia*.  
 cc. Nutlets netted-veined.....34. *Perilla*.  
 AA. Whorls axillary (or, in a few species of *Mentha*, crowded in a dense terminal spike).  
 B. Perfect stamens 4.....35. *Mentha*.  
 BB. Perfect stamens 2.....36. *Cunila*.  
 AAA. Whorls in dense heads surrounded by involucre bracts.  
 B. Corolla sub-bilabiate; whorls densely many-fld.  
 c. Lobes of corolla ovate; heads often corymbose-panicled.....37. *Pycnanthemum*.  
 cc. Lobes of corolla oblong or linear; heads globose, solitary.....38. *Monardella*.  
 BB. Corolla bilabiate; whorls 2-fld., rarely more; heads solitary, crowded or corymbose-panicled.....39. *Origanum*.  
 AAAA. Whorls few-fld., axillary or the upper ones spicate; calyx-throat closed by villous hairs.40. *Thymus*.  
 AAAA. Whorls axillary or the highest spicate; calyx open-bell-shaped, equal.  
 B. Calyx 10-nerved; stamens ascending.....41. *Satureia*.  
 BB. Calyx 15-nerved; stamens divergent.....42. *Hyssopus*.

Subtribe 3. *Melisseæ*.

- A. Posterior lip of corolla concave, sickle-shape or galeate.....43. *Acanthomintha*.  
 AA. Posterior lip of corolla flattish or slightly concave.  
 B. Calyx distinctly 2-lipped.  
 c. Corolla-tube straight or slightly curved.....44. *Satureia* § *Calamintha*.  
 cc. Corolla-tube below the middle recurved-ascending.....45. *Melissa*.  
 BB. Calyx equal or sub-bilabiate.  
 c. Perfect stamens 4.....46. *Micromeria*.  
 cc. Perfect stamens 2.....47. *Hedeoma*.  
 Other genera treated are: *Eremostachys*, *Galeopsis*, *Pyclostachys*, *Sideritis*, *Synandra* and *Tinnea*.

144. *PLANTAGINACEÆ*.

- One genus in cultivation..... *Plantago*.

145. *NYCTAGINACEÆ*.

- A. Fls. involucrete.  
 B. Stigma with a small head; anthers didynamous.....1. *Mirabilis*.  
 BB. Stigma linear; anthers not didynamous.....2. *Abronia*.  
 AA. Fls. not involucrete, but bracted.  
 B. Bracts large, colored.....3. *Bougainvillea*.  
 BB. Bracts very small.....4. *Pisonia*.

146. *AMARANTACEÆ*.

- A. Anthers 2-celled.  
 B. Ovary 2-ovuled.  
 c. Fr. a utricle.....1. *Celosia*.  
 cc. Fr. berry-like.....2. *Deeringia*.  
 BB. Ovary 1-ovuled.  
 c. Ovule erect, with a short funiculus.

- D. Segms. of perianth stellate in fr.: fls. in terminal racemes: shrubs.....3. *Bosea*.  
 DD. Segms. of perianth upright in fr.: fls. in clusters or panicles: herbs.....4. *Amarantus*.  
 CC. Ovule suspended from the apex of an elongated funiculus.  
 D. Perianth-segms. scarious at apex, connate at base.....5. *Trichinium*.  
 DD. Perianth-segms. hyaline, membranous or somewhat papery, lanate.....6. *Erva*.  
 AA. Anthers 1-celled.  
 B. Fls. minute in glomerules or little-spiked along the sparse branches of the panicle.....7. *Iresine*.  
 BB. Fls. in heads or spikes rarely panicled.  
 C. Stigmas 2.  
 D. Perianth-segms. free or connate at base.8. *Gomphrena*.  
 DD. Perianth-tube 5-cut, cristate or winged in fr.....9. *Frælichia*.  
 CC. Stigma simple.  
 D. Staminal tube short or long, with 5 anther-bearing awl-shaped laciniae and 5 antherless laciniae interposed.....10. *Telanthera*.  
 DD. Staminal tubes with no antherless laciniae interposed.....11. *Pfiaffia*.

147. *CHENOPODIACEÆ*.

- A. Fls. with 4 bractlets, 2 of which are adnate to the perianth at the base, or higher.  
 B. Embryo spiral: filaments straight in the bud.1. *Basella*.  
 BB. Embryo semi-annular: filaments recurved at apex or lower in the bud.....2. *Boussingaultia*.  
 AA. Fls. with bractlets not adnate to perianth.  
 B. Embryo spiral: endosperm scant or 0.....3. *Salsola*.  
 BB. Embryo ring-shaped or horseshoe-shaped: endosperm copious. (*Salicornia* has conduplicate embryo and no endosperm.)  
 C. St. and branches articulated: fls. immersed in caves in the superposed joints: no foliage-lvs.....4. *Salicornia*.  
 CC. St. not articulated.  
 D. Perianths heteromorphous; staminate without bracts, 3-5-lobed or parted; pistillate usually 0: fls. with 2 bractlets accrescent in fr. free or connate into a sack, and no perianth.  
 E. Pistillate fls. without perianth, 3-4-toothed.....5. *Spinacia*.  
 EE. Pistillate fls. with ample bracts which enlarge in fr.; perianth 0.....6. *Atriplex*.  
 DD. Perianths homomorphous, i.e., not of two different forms in the same plant.  
 E. Fls. hermaphrodite and feminine, solitary or glomerate: seed horizontal; embryo annular, albumen scant.....7. *Kochia*.  
 EE. Fls. glomerate, hermaphrodite or unisexual: seed erect, inverse or horizontal; embryo annual or horse-shoe-shaped.  
 F. Perianth-tube surrounded by a wing, stamens 5: seed horizontal, bony.....8. *Cycloloma*.  
 FF. Perianth 5-parted, usually unchanged in fr.: stamens 1-5: seed erect or horizontal, bony or leathery.....9. *Chenopodium*.  
 FFF. Perianth 5-lobed, hardened at the base in fr.: seed horizontal, leathery.....10. *Beta*.

The genus *Ullucus*, allied to *Basella*, is also described briefly

148. *PHYTOLACCACEÆ*.

- A. Ovary superior.  
 B. Carpel 1.....1. *Rivina*.  
 BB. Carpels 2-∞, united into a berry.....2. *Phytolacca*.  
 BBB. Carpels 1 or 2, united, the fr. with scales at top.....3. *Petiveria*.  
 AA. Ovary semi-inferior: fr. inferior.....4. *Agdestis*.

149. *POLYGONACEÆ*.

- A. The fls. fascicled in the axils or at the nodes of infl. (In the first 3 genera sometimes along the rachis of infl.)  
 B. Endosperm 3-6-lobed with longitudinal grooves and usually ruminate.  
 C. Fruiting perianth fleshy or berry-like at the base or everywhere, the nut included or exserted at the apex.....1. *Muehlenbeckia*.  
 CC. Fruiting perianth with fleshy or berry-like tube, including the nut and often adnate to it, crowned by the unchanged connivent or marcescent limb.....2. *Coccoloba*.

- ccc. Fruiting perianth enlarged, membranous or scarious, colored, outer segms. larger and broadly cordate, inner ones oblong. . . . . 3. *Antigonon*.
- cccc. Fruiting perianth developing wings on the 3 outer parts. . . . . 4. *Triplaris*.
- bb. Endosperm equable, entire. . . . .
- c. Perianth 5-merous, rarely 4-merous; styles usually filiform and stigmas usually capitate.
- d. Pistil 2-3-merous; stamens usually 6-8; shrubs, often spinescent. . . . . 5. *Atraphaxis*.
- dd. Pistil 3-merous: stamens 8 or fewer; herbaceous, rarely suffruticose.
- e. Nut entirely or nearly covered by the fruiting perianth. . . . . 6. *Polygonum*.
- ee. Nut much longer than the fruiting perianth. . . . . 7. *Fagopyrum*.
- cc. Perianth 6-merous, rarely 4-merous.
- d. Stamens 9, rarely 6; fruiting perianth unchanged: nut 3-winged. . . . . 8. *Rheum*.
- dd. Stamens 6, rarely 9; inner segms. of fruiting perianth much enlarged, erect and including the 3-angled nut. . . . . 9. *Rumex*.
- aa. The fls. in infl. dichotomously or umbellately branched, the floral lvs. or bracts connate below the branches into one 3-cut bract, or free and 3-∞ in number. . . . . 10. *Eriogonum*.

## 150. NEPENTHACEÆ.

The only genus. . . . . *Nepenthes*.

## 151. ARISTOLOCHACEÆ.

- a. Perianth persistent, 3-lobed above ovary; regular stamens 12 surrounding the style in 2 series; anthers free. . . . . 1. *Asarum*.
- aa. Perianth deciduous, irregular, polymorphous; anthers 6-∞, adnate in 1 series to a stylar column. . . . . 2. *Aristolochia*.

## 152. SAURURACEÆ.

- a. Stamens 3. . . . . 1. *Houttuynia*.
- aa. Stamens 5-8.
- b. Carpels connate. . . . . 2. *Anemopsis*.
- bb. Carpels distinct. . . . . 3. *Saururus*.

## 153. PIPERACEÆ.

- a. Stamens 2-6; anther-cells usually distinct; stigmas 3-4, rarely 2 or 5. . . . . 1. *Piper*.
- aa. Stamens 2, anther-cells confluent into one 2-valved anther; stigma terminal or lateral, penicillate or undivided. . . . . 2. *Peperomia*.

## 154. CHLORANTHACEÆ.

In cultivation. . . . . *Chloranthus*.

## 155. MYRISTICACEÆ.

Sole genus. . . . . *Myristica*.

## 156. MONIMIACEÆ.

- a. Stamens numerous; anther-cells dehiscing in a 2-valved fashion by a longitudinal crack. . . . . 1. *Peumus*.
- aa. Stamens 6-12; anther-cells dehiscing above. . . . . 2. *Laurelia*.

## 157. LAURACEÆ.

- a. Anthers 2-locellate, valves laterally dehiscent or quickly deciduous. . . . . 1. *Hernandia*.
- aa. Anthers extrorsely locellate, valves dehiscent upwards.
- b. The whole perianth persisting under the fr., appressed or slightly spreading; perianth sometimes deciduous from the base. . . . . 2. *Persea*.
- bb. The perianth-segms. at length transversely cut, leaving the fruiting tube bell-shaped or expanded and 6-toothed. . . . . 3. *Cinnamo-* [mum]

- bbb. The perianth-segms. deciduous from base, fruiting tube flattened or disk-shaped and entire or truncate. . . . . 4. *Cinnamo-* [mum] § [Camphora]
- aaa. Anthers introrsely locellate; valves dehiscing upward.
- b. Fls. in a short, lax raceme, accompanied by small and narrow bracts. . . . . 5. *Sassafras*.
- bb. Fls. umbellate, capitate or rarely solitary; umbels or heads before anthesis included in a 4-6-bracted involucre.
- c. Locellæ of anther 4. . . . . 6. *Umbellul-* [aria]
- cc. Locellæ 2.
- d. Stamens usually 9; fls. dioecious. . . . . 7. *Benzoin*.
- dd. Stamens usually 12-20; fls. polygamous 8. *Laurus*.
- The genus *Litsea* is sparingly in cultivation.

## 158. THYMELÆACEÆ.

- a. Stamens fewer than the corolla-lobes. . . . . 1. *Pimelea*.
- aa. Stamens twice as many as corolla-lobes.
- b. Disk 0 or a very short ring.
- c. Perianth-tube cylindrical; limb spreading. . . . . 2. *Daphne*.
- cc. Perianth much swollen above, obliquely truncate; limb not spreading. . . . . 3. *Dirca*.
- bb. Disk more or less lobed or oblique.
- c. Fls. 5-merous; disk cup-shaped. . . . . 4. *Dais*.
- cc. Fls. 4-merous.
- d. The disk annular; lobes very short. . . . . 5. *Edgeworthia*.
- dd. The disk 4-cut or 2-cut. . . . . 6. *Wikstrœmia*.
- The genera *Gnidia*, *Lagetta*, and *Thymelæa* will also be found in the book.

## 159. PROTEACEÆ.

**Series 1.** Fr. an indehiscent nut or drupe; fls. usually solitary with a bract under each one.

- a. Fls. dioecious by abortion, regular. . . . . 1. *Lewaden-* [dron]
- aa. Fls. hermaphrodite, irregular. . . . . 2. *Protea*.

**Series 2.** Fr. follicular, capsular or rarely indehiscent and subdrupaceous; fls. usually in pairs along the rachis with only 1 bract for each pair.

- a. Ovules 2, collateral.
- b. Fls. racemose or fascicled; involucre none or inconspicuous; bracts deciduous.
- c. The ovules pendulous, orthotropous.
- d. Fr. scarcely or tardily dehiscing; pericarp thick, fleshy or hard; seeds with thick, often unequal cotyledons.
- e. Perianth-limb recurved. . . . . 3. *Guevina*.
- ee. Perianth straight. . . . . 4. *Macadamia*.
- dd. Fr. follicular or obliquely 2-valved; seeds compressed, margined or winged. . . . . 5. *Roupala*.
- cc. The ovules laterally affixed or ascending.
- d. Seeds with or without a narrow wing. . . . . 6. *Grevillea*.
- dd. Seeds samara-like; wing oblong, terminal. . . . . 7. *Hakea*.
- bb. Fls. in dense bracted spikes or cones. . . . . 8. *Banksia*.
- aa. Ovules 4 or more.
- b. Fls. umbellate: seeds winged below. . . . . 9. *Stenocarpus*.
- bb. Fls. in dense racemes: seeds samara-like, with an oblong terminal wing. . . . . 10. *Telopea*.
- bbb. Fls. twin, in short or long racemes: seeds samara-like with a terminal truncate wing. . . . . 11. *Lomatia*.

## 160. ELÆAGNACEÆ.

- a. Lvs. alternate: stamens 4.
- b. Fls. hermaphrodite. . . . . 1. *Elæagnus*.
- bb. Fls. unisexual, usually dioecious. . . . . 2. *Hippophaë*.
- aa. Lvs. opposite: stamens 8. . . . . 3. *Shepherdia*.

## 161. LORANTHACEÆ.

- a. Perianth double. . . . . 1. *Loranthus*.
- aa. Perianth single or simple. . . . . 2. *Phoraden-* [dron]
- Viscum is also of general interest.

## 162. SANTALACEÆ.

- a. Plant herbaceous, low. . . . . 1. *Comandra*.
- aa. Plant woody, shrubs or trees.
- b. Fls. perfect. . . . . 2. *Santalum*.
- bb. Fls. dioecious or polygamous.
- c. Lvs. alternate. . . . . 3. *Pyralia*.
- cc. Lvs. opposite. . . . . 4. *Buckleya*.

## 163. PLATANACEÆ.

Sole genus..... *Platanus*.

## 164. MORACEÆ.

- A. Anthers reversed on the bud with inflexed filaments.  
 B. The male fls. spicate, racemose or capitate; female globose, capitate.  
 C. Female perianth dentate..... 1. *Broussonetia*.  
 CC. Female perianth deeply 4-fid..... 2. *Maclura*.  
 BB. The fls. of either sex spicate; spikes short and dense or long and lax..... 3. *Morus*.  
 BBB. The fls. crowded on fleshy receptacle..... 4. *Dorstenia*.  
 AA. Anthers erect from the beginning.  
 B. Plants, trees or shrubs; fls. usually on a fleshy receptacle.  
 C. The receptacle fleshy, globose or ovoid, clearly inclosing the numerous fls., but with a small mouth which is bracteate introrsely; the mouth is closed in fr..... 5. *Ficus*.  
 CC. The receptacle androgynous, male fls. numerous, females solitary in the center of the receptacle..... 6. *Brosimum*.  
 CCC. The receptacle unisexual, with an involucre of numerous bracts overlapping in series..... 7. *Antiaris*.  
 CCCC. The fl.-clusters unisexual, with or without 3-4 bracts at the base, in heads, spikes, rarely in racemes or the female 1-fld.  
 D. Stamens 4..... 8. *Cudrania*.  
 DD. Stamens 1..... 9. *Artocarpus*.  
 BB. Plants, herbs; fls. not on a fleshy receptacle.  
 C. St. climbing; lvs. opposite; embryo spirally involute..... 10. *Humulus*.  
 CC. St. not climbing; lvs. alternate or the lowest opposite; embryo curved..... 11. *Cannabis*.

Coussapoa is also briefly treated.

## 165. URTICACEÆ.

- A. Hairs stinging.  
 B. Achene straight..... 1. *Urtica*.  
 BB. Achene oblique..... 2. *Urea*.  
 AA. Hairs harmless.  
 B. Perianth of the female fl. 3-5-parted.  
 C. Lvs. opposite; stamens 4, rarely 2-3..... 3. *Pilea*.  
 CC. Lvs. alternate, distichous, oblique at base; stamens 5, rarely 4..... 4. *Pellionia*.  
 BB. Perianth of the female fl. tubular, inclosing the achene, not adnate; lvs. opposite or alternate; fls. in clusters or panicles..... 5. *Boehmeria*.  
 BBB. Perianth of the female fl. tubular adnate to the achene; lvs. alternate, tomentose below; fls. in globular heads often forming cymes..... 6. *Debregeasia*.

Helxine, Parietaria, and Pipturus are described.

## 166. ULMACEÆ.

- A. Fr. drupaceous; fls. on the young growth.  
 B. Cotyledons very broad.  
 C. Sepals connate; style excentric..... 1. *Zelkova*.  
 CC. Sepals distinct or nearly so; style central.  
 D. Fr. globose, not winged..... 2. *Celtis*.  
 DD. Fr. winged..... 3. *Pteroceltis*.  
 BB. Cotyledons narrow.  
 C. Fertile fls. perfect; fls. in cymes..... 4. *Trema*.  
 CC. Fertile fls. unisexual, solitary, staminate in cymes before the lvs..... 5. *Aphananthe*.  
 AA. Fr. not drupaceous, winged or mucicate; fls. on last year's branches.  
 B. Fr. stalked, surrounded by a broad wing..... 6. *Ulmus*.  
 BB. Fr. not winged, everywhere somewhat fleshy and mucicate..... 7. *Planera*.

## 167. JUGLANDACEÆ.

- A. The fls. of either sex in erect spikes, imbricate-bractate..... 1. *Platycarya*.  
 AA. The staminate fls. in pendulous catkins; pistillate fls. spicate or subsolitary.  
 B. In germinating, cotyledons are borne above ground and remain green..... 2. *Pterocarya*.  
 BB. In germinating, cotyledons remain inside the nut.  
 C. Husk at length splitting into segms.; nut smooth or angled..... 3. *Carya*.  
 CC. Husk indehiscent; nut wrinkled or sculptured..... 4. *Juglans*.

## 168. LEITNERIACEÆ.

The only genus..... *Leitneria*.

## 169. MYRICACEÆ.

- A. Lvs. serrate or entire, not stipulate; ovary subtended by 2-4 bractlets..... 1. *Myrica*.  
 AA. Lvs. pinnatifid, stipulate; ovary subtended by 8 linear, persistent bractlets..... 2. *Comptonia*.

## 170. CASUARINACEÆ.

Sole genus..... *Casuarina*.

## 171. EUPHORBIACEÆ.

- A. Ovules 2 in each cell of ovary; plant without milky juice (or red juice in *Bischofia*).  
 B. Lvs. alternate, simple (sometimes opposite in *Poranthera*).  
 C. Calyx of staminate fls. imbricate.  
 D. Petals present, at least in staminate fls.  
 E. Plant a shrub with broad, glabrous or somewhat hairy lvs.; ovary 3-celled..... 1. *Andrachne*.  
 EE. Plant a tree, with scaly herbage; ovary 1-celled..... 2. *Ætioxicon*.  
 EEE. Plant a heath-like sub-shrub; lvs. narrow, with recurved margin..... 3. *Poranthera*.  
 DD. Petals 0.  
 E. Fls. single or in axillary clusters.  
 F. Styles slender or only broadened at apex.  
 G. Rudimentary pistil present in staminate fls.; disk present; lvs. entire.  
 H. Seed grooved on inner face; disk of pistillate fl. lobed..... 4. *Plugges*.  
 HH. Seed not grooved; disk entire..... 5. *Securinega*.  
 GG. Rudimentary pistil absent.  
 H. Disk present..... 6. *Phyllanthus*.  
 HH. Disk absent, at least from pistillate fls.  
 I. Fr. a caps..... 7. *Glochidion*.  
 II. Fr. more or less fleshy.  
 J. The styles 2-parted..... 8. *Breynia*.  
 JJ. The styles almost entire..... 9. *Sauropus*.  
 FF. Styles broad, spreading.  
 G. Stamens arising from a disk.  
 H. Staminate fls. with rudimentary pistil..... 10. *Drypetes*.  
 HH. Staminate fls. without rudimentary pistil..... 11. *Hemicyclia*.  
 GG. Stamens 2-4, without disk..... 12. *Putranjiva*.  
 EE. Fls. in elongated catkin-like or branched infl., dioecious; lvs. large, broad and plane.  
 F. Ovary 1-celled; stamens 2-5..... 13. *Antidesma*.  
 FF. Ovary 2-5-celled.  
 G. Staminate fls. with rudimentary pistil..... 14. *Baccaurea*.  
 GG. Staminate fls. without rudimentary pistil..... 15. *Daphniphyllum*.  
 CC. Calyx of staminate fls. valvate; petals small..... 16. *Lebidieropsis*.  
 BB. Lvs. alternate, compound..... 17. *Bischofia*.  
 BBB. Lvs. opposite, compound..... 18. *Olafieldia*.  
 BBBB. Lvs. whorled, simple..... 19. *Hyænanche*.  
 AA. Ovules 1 in each cell of the ovary.  
 B. Fls. produced singly or in ordinary infl.  
 C. Stamens incurved in the bud; pubescence stellate or scaly; juice not milky..... 20. *Croton*.  
 CC. Stamens erect in the bud.  
 D. Juice not milky (see also *Codiaeum* and relatives); calyx valvate; lvs. simple.  
 E. Staminate fls. with petals; herbs..... 21. *Chrozophora*.  
 EE. Staminate fls. apetalous.  
 F. Stamens much branched; herbs with lvs. palmately veined and peltate..... 22. *Ricinus*.  
 FF. Stamens not branched.  
 G. Lvs. opposite; styles free (see also *Mallotus*).  
 H. The stamens as many as 50..... 23. *Trewia*.  
 HH. The stamens 8-20..... 24. *Mercurialis*.  
 GG. Lvs. alternate, or rarely opposite.  
 H. Plant a thorny shrub; stamens 8-15..... 25. *Adelia*.  
 HH. Plant with holly-like spiny margined lvs.; stamens 3-8..... 26. *Alchornea*.

- HHH. Plant unarmed or with stinging hairs.  
 I. Styles free or united only at base.  
 J. Anther-cells spherical to oblong.  
 K. Anthers 2-celled.....27. *Mallotus*.  
 KK. Anthers 3-4-celled: lvs. usually peltate.....28. *Macaranga*.  
 JJ. Anther-cells elongated, often vermiform.....29. *Acalypha*.  
 II. Styles united above the base: st. often climbing.  
 J. Infl. without conspicuous involucre.  
 K. Number of stamens usually 3; styles free at apex.....30. *Tragia*.  
 KK. Number of stamens 8-30; styles united to the apex into a swollen column.....31. *Plukenetia*.  
 JJ. Infl. subtended by a conspicuous involucre.....32. *Dalechampia*.  
 DD. Juice almost always more or less milky (chief exceptions in *Cluytia* and relatives).  
 E. The fls. with petals, at least the staminate.  
 F. Calyx valvate.  
 G. Lvs. simple, palmate.....33. *Aleurites*.  
 GG. Lvs. compound.....34. *Joannesia*.  
 FF. Calyx imbricate.  
 G. Petals free from one another.  
 H. The stamens in 2 or more whorls.  
 I. Number of stamens about 10: lvs. usually palmately veined.....35. *Jatropha*.  
 II. Number of stamens 15-30 or more: lvs. pinnately veined: styles entire.....36. *Codizum*.  
 HH. The stamens in 1 whorl, usually about 3-5.....37. *Cluytia*.  
 GG. Petals connate: lvs. usually palmately veined.  
 H. Some of the filaments united: lvs. simple.....35. *Jatropha*.  
 HH. Filaments free: lvs. compound.....38. *Ricinodendron*.  
 EE. The fls. apetalous.  
 F. Sepals valvate or slightly imbricate in some.  
 G. Lvs. trifoliate.....39. *Hevea*.  
 GG. Lvs. simple, pinnately veined.  
 H. Number of stamens 3: lvs. spiny margined.....40. *Pachystroma*.  
 HH. Number of stamens 1: lvs. not spiny.....41. *Ophthalmolobon*.  
 FF. Sepals or lobes of calyx, if any, imbricate: lvs. simple.  
 G. Number of stamens usually 10 or more (5-50).  
 H. Staminate calyx with 5 sepals connate, at least at base: lvs. usually palmately veined: st. erect.  
 I. Herbage with stinging hairs.....35. *Jatropha*.  
 II. Herbage usually glabrous.....42. *Manihot*.  
 HH. Staminate calyx 3-5-lobed: lvs. pinnately veined: st. climbing or trailing.....43. *Mabea*.  
 HHH. Staminate calyx of 1 or 2 sepals.....44. *Homalium*.  
 HHHH. Staminate calyx cupulate, truncate or dentate: lvs. broad, hairy.....45. *Hura*.  
 GG. Number of stamens 1-5.  
 H. Staminate calyx with 4-5 free sepals: st. climbing.....46. *Omphalia*.  
 HH. Staminate calyx with 2-3 sepals, free or connate at base.  
 I. Infl. usually terminal: seed carunculate.....47. *Sebastiania*.  
 II. Infl. usually axillary: seed not carunculate.....48. *Ezocaccaria*.  
 HHH. Staminate calyx with connate sepals, 1-3-lobed.  
 I. The stamens 2-3.  
 J. Stamens free.  
 K. Base of caps. persistent as a pointed piece.....49. *Sapium*.  
 KK. Base of caps. not persistent, only a 3-parted central column remaining.....50. *Stillingia*.  
 JJ. Stamens united.  
 K. Pistil 4-celled.....51. *Maprounia*.  
 KK. Pistil 6-9-celled.....52. *Hippomane*.  
 II. The stamens 1.  
 J. Infl. terminal.....51. *Maprounia*.  
 JJ. Infl. lateral or axillary.....41. *Ophthalmolobon*.  
 HHHH. Staminate calyx 0, or rarely 1-2 minute scales.....53. *Colliguaya*.  
 BB. Fls. in cyathia (see explanation under Euphorbia).  
 C. Cyathia regular or nearly so.  
 D. Involucral glands free from one another, alternate with lobes of involucre.....54. *Euphorbia*.  
 DD. Involucral glands united into a ring around the lobes.....55. *Synadenium*.  
 CC. Cyathia decidedly irregular.....56. *Pedilanthus*.
- ### 172. BUXACEÆ.
- A. Cells of ovary with 2 ovules each; stamens 4.  
 B. Lvs. alternate.  
 C. Evergreen shrubs: lvs. entire.....1. *Sarcococca*.  
 CC. Evergreen herbs: lvs. dentate.....2. *Pachysandra*.  
 BB. Lvs. opposite.....3. *Buzus*.  
 AA. Cells of ovary with 1 ovule each; stamens numerous: lvs. opposite.....4. *Simmondsia*.
- ### 173. BETULACEÆ.
- A. Staminate fls. with 4 perianth-segms. or by abortion fewer (Birch Tribe).  
 B. Stamens 2.....1. *Betula*.  
 BB. Stamens 4.....2. *Alnus*.  
 AA. Staminate fls. with no perianth (Hazel Tribe).  
 B. Nut large, inclosed by a leafy involucre: staminate fls. with 2 bractlets; pistillate fls. 2-4, capitate.....3. *Corylus*.  
 BB. Nut small, subtended by or inclosed in a large bractlet; staminate fls. with no bractlets; pistillate catkins spike-like.  
 C. Fruiting bractlet flat, 3-cleft and incised.....4. *Carpinus*.  
 CC. Fruiting bractlet bladder-like, closed, membranous.....5. *Ostrya*.
- ### 174. FAGACEÆ.
- A. Ovary of pistillate fls. 6-celled; spikes of either sex erect and strict: fruiting involucre or bur densely covered with strong prickles.....1. *Castanea*.  
 AA. Ovary of pistillate fls. 3-celled, rarely 4- or 5-celled in some species of *Quercus*.  
 B. Staminate fls. 1-3 in a cluster: lvs. usually small.....2. *Nothofagus*.  
 BB. Staminate fls. in loose, roundish pendulous heads: lvs. generally large.....3. *Fagus*.  
 BBB. Staminate fls. in pendulous catkins or the spikes of either sex erect and strict.  
 C. Involucre of numerous scales forming a cup in fr. and subtending the acorn.....4. *Quercus*.  
 CC. Involucre in fr. armed with clusters of prickles or tubercles, wholly including the fr., perfectly closed or at length split irregularly.....5. *Castanopsis*.
- ### 175. SALICACEÆ.
- A. Lvs. usually narrow: disk composed of 1 or 2 glands which are distinct or barely connate at base.....1. *Salix*.  
 AA. Lvs. usually broad: disk cyathiform, often oblique or cup-shaped, entire or lobed.....2. *Populus*.
- ### 176. EMPETRACEÆ.
- A. Fls. axillary, solitary; stamens 3; pistil 6-9-merous.....1. *Empetrum*.  
 AA. Fls. axillary in 2's or 3's; stamens 2; pistil 2-merous.....2. *Ceratiola*.  
 AAA. Fls. subcapitate; stamens usually 3; pistil 3-merous.....3. *Corema*.
- ### 177. GINKGOACEÆ.
- Ovule-bearing blade, long-stalked, shortly 2-∞ cut at apex, the lobes dilated into a ring or short cup adnate to the seed: anther-cells 2, pendulous: lvs. fan-shaped.....*Ginkgo*.

## 178. GNETACEÆ.

Leafless shrubs with jointed branches and scales opposite the nodes connate into a little sheath. . . *Ephedra*.

The very curious genus *Welwitschia* may be found in botanical collections.

## 179. TAXACEÆ.

- A. Anthers 2-celled; tropical or subtropical trees and shrubs.
- B. Scales of pistillate aments few, adnate to peduncle and with it usually fleshy; lvs. linear to ovate, rarely scale-like. . . . . 1. *Podocarpus*.
- BB. Scales of pistillate aments short, broad and somewhat fleshy, imbricate; lvs. minute and scale-like; branchlets flattened and lf.-like. . . . . 2. *Phyllocladus*.
- AA. Anthers 3-8-celled; lvs. linear; hardy or nearly hardy trees and shrubs.
- B. Pistillate fls. consisting of several decussate 2-ovuled carpicles; lvs. with 2 glaucous lines below broader than the 3 green lines. . . . . 3. *Cephalotaxus*.
- BB. Pistillate fls. reduced to 1 ovule.
- C. Carpicles at maturity inclosing the seed and adnate to it; anthers 4-celled, cells free; lvs. with 2 glaucous lines below narrower than the green lines. . . . . 4. *Torreya*.
- CC. Carpicles at maturity partly inclosing the seed, not adnate to it; anthers 6-8-celled, cells connate; lvs. pale green below. . . . . 5. *Taxus*.

## 180. PINACEÆ.

- A. Lvs. spirally arranged.
- B. Carpicles simple; ovule 1, reversed; cone-scales with 1 seed. . . . . 1. ARAUCARIA TRIBE.
- BB. Carpicles divided into scale and bract, sometimes connate.
- C. Ovules 2, reversed; scale and bract always distinct; cone-scales with 2 usually winged seeds. . . . . 2. ABIES TRIBE.
- CC. Ovules 2-8, axillary and upright or on the scale and at least finally reversed; cone-scales with 2-8 seeds. . . . . 3. TAXODIUM TRIBE.
- AA. Lvs. opposite or whorled, often scale-like; ovules upright. . . . . 4. CUPRESSUS TRIBE.

## 1. Araucaria Tribe.

- A. Seeds free from the scale, with 1 or 2 wings; lvs. broad, generally elliptic, more or less distichous and rather remote. . . . . 1. *Agathis*.
- AA. Seeds adnate to the winged or wingless scale; lvs. large, scale-like or needle-shaped, spirally arranged, crowded. . . . . 2. *Araucaria*.

## 2. Abies Tribe.

- A. Foliage deciduous, partly fascicled.
- B. Male fls. solitary in a leafless scaly bud; connective not produced beyond anther-cells nor scarcely prominent; cones reflexed; scales persistent. . . . . 3. *Larix*.
- BB. Male fls. clustered, pendulous; cone-scales deciduous. . . . . 4. *Pseudolarix*.
- AA. Foliage evergreen.
- B. Connective of anthers usually produced into a scale-like appendage.
- C. Male fls. subsapicate at base of new shoots; cone-scales persistent; lvs. in clusters of 2-5, rarely solitary. . . . . 5. *Pinus*.
- CC. Male fls. solitary in the cluster of lvs. which terminate short branchlets; cone-scales finally deciduous; lvs. partly fascicled as in the larch. . . . . 6. *Cedrus*.
- CCC. Male fls. solitary in the axils; cones reflexed; scales persistent; lvs. solitary, 4-angled or flattened and glaucous above, green on the back. . . . . 7. *Picea*.
- BB. Connective of anthers simply umbonate beyond the cells or hardly prominent; male fls. solitary in axils; lvs. solitary, usually flattened, glaucous or paler below.
- C. Cones reflexed; scales persistent.
- D. Subtending bract conspicuous. . . . . 8. *Pseudotsuga*.
- DD. Subtending bract small. . . . . 9. *Tsuga*.
- CC. Cones erect.
- D. Scales persistent; seeds about as long as scales; bracts much shorter than scales; lvs. flattened, keeled above, pale below. . . . . 10. *Keteleeria*.

DD. Scales deciduous; seeds shorter than scales; bracts shorter or longer; lvs. flattened and grooved above, usually glaucous below, rarely 4-angled. . . . . 11. *Abies*.

## 3. Taxodium Tribe.

- A. Lvs. connate into pairs, arranged in whorls; ovule-bearing blade finally much increased and hardened, making the greater part of the woody cone. . . . . 12. *Sciadopitys*.
- AA. Lvs. solitary, scattered.
- B. Scales of cone flat.
- C. Carpicles entire at apex; anther-cells 2-4; seeds surrounded by a narrow wing; lvs. lanceolate flat, rather large, glaucous below. . . . . 13. *Cunninghamia*.
- CC. Carpicles toothed at the apex; anther-cells 4-5; seeds 2-3-angled; lvs. awl-shaped, curved. . . . . 14. *Cryptomeria*.
- BB. Scales peltate.
- C. Seeds usually 5, narrowly winged; lvs. scale-like or linear, persistent. . . . . 15. *Sequoia*.
- CC. Seeds 2, angular; lvs. linear, deciduous with the branchlets. . . . . 16. *Taxodium*.

## 4. Cupressus Tribe.

- A. Fr. a cone.
- B. Cone-scales all fertile, 4-8, forming apparently 1 whorl; lvs. usually scale-like, opposite or in whorls of 3 or 4, rarely alternate on sterile branches. . . . . 17. *Callitris*.
- BB. Cone-scales fertile at middle of cone and sterile at top and base. . . . . 18. *Fitzroya*.
- BBB. Cone-scales partly fertile, partly empty, arranged in opposite pairs; lvs. scale-like, opposite only on juvenile branches, sometimes needle-shaped.
- C. Scales of cone imbricate.
- D. Seeds 4-5; pairs of scales 3-4 (excluding the upper connate pair). . . . . 19. *Thujaopsis*.
- DD. Seeds 2.
- E. Pairs of scales 4, the upper pair fertile. . . . . 20. *Libocedrus*.
- EE. Pairs of scales 6-8; the 2 upper pairs fertile. . . . . 21. *Thuja*.
- CC. Scales of cone peltate.
- D. Number of seeds 2; cones small.
- E. Wings of seeds very large, unequal. . . . . 22. *Fokienia*.
- EE. Wings of seeds narrow, equal. . . . . 23. *Chamaecyparis*.
- DD. Number of seeds many; cones usually rather large and woody. . . . . 24. *Cupressus*.
- AA. Fr. fleshy, indehiscent berry or drupe, with 2-6 fertile scales; lvs. scale-like, opposite or needle-shaped and usually in 3's. . . . . 25. *Juniperus*.

Consult also the genus *Athrotaxis*, allied to *Cephalotaxus* and *Sequoia*.

## 181. CYCADACEÆ.

- A. Lf.-segms. circinally involute in veneration; female cones proliferous after anthesis; scales elongate, the margins bearing 2 to many ovules. . . . . 1. *Cycas*.
- AA. Lf.-segms. straight in veneration; female cones deciduous after anthesis; scales peltate.
- B. Cone-scales superposed in vertical series.
- C. Shield of the scales transversely 2-horned at apex. . . . . 2. *Ceratozamia*.
- CC. Shield of the scales truncate, not horned at apex. . . . . 3. *Zamia*.
- BB. Cone-scales overlapping in alternating series.
- C. The lf.-segms. ribbed and nerved; nerves spreading on either side of midrib, very numerous, simple or forked. . . . . 4. *Stangeria*.
- CC. The lf.-segms. with parallel, longitudinal nerves.
- D. Shield of cone-scales flat, erect, ovate-cordate. . . . . 5. *Dioon*.
- DD. Shield thickened, ascending, usually prolonged into an erect, acuminate blade. . . . . 6. *Macrozamia*.
- DDD. Shield thickened truncate, decurved at apex. . . . . 7. *Encephalartos*.

The genera *Bowenia* and *Microcycas* are also included.

## 182. HYDROCHARITACEÆ.

- A. St. elongated, submerged, everywhere leafy; lvs. short; spathes small, sessile in axils; placenta little prominent in ovary. . . . . 1. *Elodea*.
- AA. St. very short, sometimes emitting creeping or floating stolons; lvs. crowded, immersed, sessile, elongated; spathes pedunculate; placenta hardly prominent. . . . . 2. *Vallisneria*.

- AAA. St. very short; lvs. crowded, some sessile and submerged, others (except in *Stratiotes*) long-stalked, with a floating blade: spathes peduncled; placenta of 2 lamellæ, strongly intruded, dividing the ovary more or less perfectly into 6 cells.
- B. Styles 3; stamens 3-9..... 3. *Limnobia*.
- BB. Styles 6, 2-fid.
- C. Stamens with 6 2-fid filaments, of which 3 have 2 anthers and 3 have 1 anther.... 4. *Hydrocharis*.
- CC. Stamens 11-15..... 5. *Stratiotes*.

## 183. ORCHIDACEÆ.\*

## I. Summary of Tribes.

- A. Fertile stamens 2, with a broad shield-shaped sterile one (staminodium) .. 1. *CYPRIPEDIUM* [TRIBE.
- AA. Fertile stamen 1, with no staminodium.
- B. Anther persistent; pollinia with basal appendages.
- C. The anther erect.
- D. Stigma flat, unappendaged..... 2. *SERAPIAS* TRIBE.
- DD. Stigma with appendages..... 3. *HABENARIA* TRIBE.
- CC. The anthers placed obliquely..... 4. *SATYRIUM* TRIBE.
- BB. Anther usually readily deciduous; pollinia not appendaged or with terminal ones.
- C. Infl. terminal.
- D. Lf.-buds convolute.
- E. Lf.-blade not jointed to stalk.
- F. The anther commonly much exceeding the beak of the column which is not distinctly cut.
- G. Lip without hypochil, usually spurless.
- H. St. short, with only 1 or 2 lvs..... 5. *POGONIA* TRIBE.
- HH. St. long, with many lvs..... 6. *VANILLA* TRIBE.
- GG. Lip with distinct hypochil, which is often spurred..... 7. *CEPHALANTHERA* [TRIBE.
- FF. The anther commonly about as long as the beak of the column which usually bears a sharp cut or groove.
- G. Pollinia waxy or powdery, not divided.
- H. Lip turned down..... 8. *SPIRANTHES* TRIBE.
- HH. Lip turned up ..... 9. *CRANICHIS* TRIBE.
- GG. Pollinia divided into distinct masses..... 10. *PHYSURUS* TRIBE.
- EE. Lf.-blade distinctly jointed to the petiole.
- F. Pollinia 8: st. slender: fls. usually with spurs or chins..... 11. *THUNIA* TRIBE.
- FF. Pollinia 4: st. a short pseudobulb: fls. without spurs or chins..... 12. *CÆLOGYNE* TRIBE.
- DD. Lf.-buds conduplicate.
- E. Sepals and petals about equally developed, the lip usually very conspicuous.
- F. Lvs. usually not jointed: column footless..... 13. *LIPARIS* TRIBE.
- G. Nerves of lvs. 1.
- H. Pollinia 2-4, with very short stalks..... 14. *POLYSTACHYA* [TRIBE.
- HH. Pollinia 4-8, with distinct caudicles.
- I. Column-foot forming a chin with the lateral sepals or a short sac with the lip..... 15. *PONERA* TRIBE.
- II. Column footless..... 16. *CATTLEYA* TRIBE.
- GG. Nerves of lvs. several..... 17. *SOBRALIA* TRIBE.
- EE. Sepals much more developed than the petals and lip..... 18. *PLEUROTHALLIS* [TRIBE.
- CC. Infl. lateral, or on separate shoot.
- D. Lf.-buds convolute.
- E. St. slender or gradually swollen.
- F. Pollinia with caudicles but without stalks..... 19. *PHAJUS* TRIBE.
- FF. Pollinia without caudicles but with stalks.
- G. Lip jointed to column-foot or forming a spur with it..... 20. *CYRTOPODIUM* [TRIBE.

- GG. Lip not jointed, often with a distinct hypochil. 21. *CATASETUM* TRIBE.
- EE. St. a short distinct pseudobulb.
- F. Lip jointed to the column-foot.
- G. Callus-ridges lengthwise. 22. *LYCASTE* TRIBE.
- GG. Callus-ridges transverse. 23. *ZYGOPETALUM* [TRIBE.
- FF. Lip continuous with column-foot..... 24. *GONGORA* TRIBE.
- DD. Lf.-buds conduplicate.
- E. St. terminating its growth in 1 year.
- F. Lip movably jointed to foot of column.
- G. Lvs. not strap-shaped: pollinia unappendaged or with either caudicles or stipes, but not with both.
- H. Flowering st. arising from near the apex of the slender st. or from the pseudobulb. 25. *DENDROBIUM* [TRIBE.
- HH. Flowering st. arising under the pseudobulb or at the base of the st.
- I. Pollinia without appendages..... 26. *BULBOPHYLLUM* [TRIBE.
- II. Pollinia with distinct stalks.
- J. Pseudobulbs usually present: flowering st. arising lower than new growth..... 27. *MAXILLARIA* [TRIBE.
- JJ. Pseudobulbs usually wanting: flowering st. arising higher than new growth..... 28. *HUNTLEYA* TRIBE.
- GG. Lvs. strap-shaped: pollinia with broad caudicles and stipes..... 29. *CYMBIDIUM* TRIBE.
- FF. Lip immovably united to foot of column.
- G. Fls. with spurs..... 30. *IONOPSIS* TRIBE.
- GG. Fls. without spurs.
- H. The fls. narrow, not open..... 31. *ADA* TRIBE.
- HH. The fls. wide, open.
- I. Lip enrolled around the column..... 32. *TRICHOPILIA* [TRIBE.
- II. Lip not enrolled.
- J. The lip united to column to the middle..... 33. *ASPASIA* TRIBE.
- JJ. The lip united only to the base of the column..... 34. *ODONTOGLOSSUM* [TRIBE.
- EE. St. increasing in length from year to year..... 35. *AERIDES* TRIBE.

## II. Key to the Tribes.

1. *Cypripedium* Tribe.

- A. Fl. persistent, withering on the ovary: lf.-buds convolute..... 1. *Cypripedium* [tribum
- AA. Fl. soon deciduous: lf.-buds conduplicate.
- B. Ovary 3-celled, the placenta central; mouth of lip with broad returned margin... 2. *Phragmoped-* [tribum
- BB. Ovary 1-celled, the placenta parietal; mouth of lip usually with no broad returned margins..... 3. *Paphi-* [pedilum

2. *Serapias* Tribe.

- A. Lip spurred.
- B. Sepals free..... 4. *Orchis*.
- BB. Sepals united into an arching hood..... 5. *Galeorchis*.
- AA. Lip spurless.
- B. Pollinia glands in a single sac..... 6. *Serapias*.
- BB. Pollinia glands separate, in 2 distinct sacs... 7. *Ophrys*.

3. *Habenaria* Tribe.

- A. Lip adnate to column at base; stigma broad... 8. *Cynorchis*.
- AA. Lip free; stigma slender..... 9. *Habenaria*.

4. *Satyrion* Tribe

- Dorsal sepal helmet-shaped..... 10. *Disa*.

\*For explanation of orchid flowers and of terms, see the article *Orchids*.

5. *Pogonia* Tribe.

- A. Fls. on a scape with a terminal whorl of lf.-like bracts.....11. *Isotria*.  
 AA. Fls. on a leafy st.  
 c. Lip crested.....12. *Pogonia*.  
 BB. Lip not crested.....13. *Triphora*.

6. *Vanilla* Tribe.

- Sts. rooting at nodes.....14. *Vanilla*.

7. *Cephalanthera* Tribe.

- A. Fls. with a chin; lip long.....15. *Cephalanthera*.  
 AA. Fls. chinless; lip round.....16. *Epipactis*.

8. *Spiranthes* Tribe.

- A. Dorsal sepal forming a hood with the petals.  
 B. Infl. 1-sided; fls. without a chin.....17. *Spiranthes*.  
 BB. Infl. not 1-sided; fls. with a chin.....18. *Stenorrhynchus*.  
 AA. Sepals and petals spreading.....19. *Listera*.

9. *Cranichis* Tribe.

- Lip and petals inserted upon the elongated column.....20. *Ponthieva*.

10. *Physurus* Tribe.

- A. Lip with a distinct spur.  
 B. Lvs. green; lip concave above the spur.....21. *Physurus*.  
 BB. Lvs. usually variegated; lip with a long fimbriate claw.....22. *Anætochilus*.  
 AA. Lip spurless or nearly so.  
 B. Column straight; fls. symmetric.  
 C. The lip not clawed.....23. *Goodyera*.  
 CC. The lip clawed.....24. *Dossinia*.  
 BB. Column twisted; fls. not symmetric.  
 C. The column with 2 upright appendages in front.....25. *Macodes*.  
 CC. The column without appendages.....26. *Hæmaria*.

11. *Thunia* Tribe.

- A. Fls. without chin.  
 B. Sts. without basal pseudobulbs.....27. *Thunia*.  
 BB. Sts. with basal pseudobulbs.....28. *Bletilla*.  
 AA. Fls. with a distinct chin, formed of lateral sepals and column-foot.....29. *Trichosma*.

12. *Cœlogyne* Tribe.

- A. Base of lip with sac-like hollow.  
 B. Column short; winged above; sepals flat.....30. *Pholidota*.  
 BB. Column slender; sepals sac-like, concave.....31. *Neogyne*.  
 AA. Base of lip flat.  
 B. Column slender, without horns.  
 C. Lvs. and pseudobulbs perennial.....32. *Cœlogyne*.  
 CC. Lvs. and pseudobulbs annual.....33. *Pleione*.  
 BB. Column short, with 2 horns.....34. *Platykinis*.

13. *Liparis* Tribe.

- A. Lvs. green; fls. without chin.  
 B. Lip shoe-shaped.....35. *Calypso*.  
 BB. Lip not shoe-shaped.  
 C. Column short; lip turned upward.....36. *Microstylis*.  
 CC. Column slender; lip turned downward.....37. *Liparis*.  
 AA. Lvs. wanting; fls. with chin.....38. *Corallorhiza*.

14. *Polystachya* Tribe.

- A. Lip spurred.  
 B. Plant tuberous; spur slender.....39. *Tipularia*.  
 BB. Plant not tuberous; spur funnel-shaped.....40. *Galeandra*.  
 AA. Lip not spurred.  
 B. The lip 3-lobed.  
 C. Column short; chin distinct.....41. *Polystachya*.  
 CC. Column slender, curved; chin indistinct.....42. *Ansellia*.  
 BB. The lip entire.....43. *Neobenthamia*.

15. *Ponera* Tribe.

- A. Lip normal.  
 B. St. slender, leafy; no pseudobulbs; pollinia 4.....44. *Isorchilus*.  
 BB. St. a pseudobulb; pollinia 8.....45. *Cælia*.  
 AA. Lip forming a beaker-like cavity, with the column, or the former hollow at base.  
 B. Young shoots at the apex of the old.....46. *Hexisea*.  
 BB. Young shoots from base of old.  
 C. Fls. in dense spikes; pollinia 8.....47. *Arpophytum*.  
 CC. Fls. in short clusters; pollinia 4.....48. *Hartwegia*.

16. *Cattleya* Tribe.

- A. Anther not toothed, nor in an excavation.  
 B. Pollinia 4.  
 C. Lip adnate to the column, at least at its base.  
 D. Ovary produced into a hollow neck.....49. *Broughtonia*.  
 DD. Ovary not so produced.....50. *Epiden-drum*.  
 CC. Lip free.  
 D. The lip flat, with 2 elevations on upper side.....51. *Diacrium*.  
 DD. The lip enrolled about column, with no elevations.....52. *Cattleya*.  
 BB. Pollinia 5-7, some of them often abortive.....53. *Laelio-burgkia*.  
 BBB. Pollinia 8.  
 C. Stigma pitted upon the front of the column, anther inclined.  
 D. Base of lip gradually merging into blade.  
 E. Lip distinctly surrounding the column; sepals and petals not wavy.....54. *Lælia*.  
 EE. Lip not as above; sepals and petals distinctly wavy.....55. *Schomburgkia*.  
 DD. Base of lip tightly encompassing column, suddenly broadened into the broad blade.....56. *Brassavola*.  
 CC. Stigma running up on 2 extensions of the column-apex; anther erect.....57. *Sophrontitis*.  
 AA. Anther 2-toothed below, in an excavation in the column.....58. *Leptotes*.

17. *Sobralia* Tribe.

- A. St. many-lvd., not bulbous at base; lip not bearded.....59. *Sobralia*.  
 AA. St. 1- or 2-lvd., bulbous at base; lip bearded.....60. *Calopogon*.

18. *Pleurothallis* Tribe.

- A. Lip turned upward; lateral sepals united into a boat-shaped hood.....61. *Scaphosepalum*.  
 AA. Lip turned down.  
 B. Sepals united.....62. *Masdevallia*.  
 BB. Sepals free, or the lateral only united.  
 C. Dorsal sepal and petals attenuated into a club-shaped apex.....63. *Restrepia*.  
 CC. Dorsal sepal and petals not as above.....64. *Pleurothallis*.

19. *Phajus* Tribe.

- A. Lvs. not articulated to petiole.  
 B. Lip free, encompassing the column.....65. *Phajus*.  
 BB. Lip adnate to column, the blade spreading.....66. *Calanthe*.  
 AA. Lvs. articulated to petiole.  
 B. Sepals and petals spreading.  
 C. Lip with its base tightly inclosing the column, the blade spreading.....67. *Limnæodes*.  
 CC. Lip not inclosing column.  
 D. Fls. with distinct chin.....68. *Chysis*.  
 DD. Fls. without chin.  
 E. Pollinia 8.  
 F. Middle lobe of lip not clawed.....69. *Bletia*.  
 FF. Middle lobe of lip clawed.....70. *Spathoglottis*.  
 EE. Pollinia 4.....71. *Apectrum*.  
 BB. Sepals and petals erect.....72. *Acanthophippium*.

20. *Cyrtopodium* Tribe.

- A. Fls. spurred or with sac-like base.  
 B. Sepals narrower and less colored than petals.....73. *Lissochilus*.  
 BB. Sepals and petals alike or nearly so.....74. *Eulophia*.  
 AA. Fls. not spurred nor saccate.  
 B. Lip only inserted on column-foot.....75. *Cyrtopodium*.  
 BB. Lip and lateral sepals inserted on column-foot.  
 C. Chin distinct, rectangular.....76. *Warrea*.  
 CC. Chin indistinct, round.....77. *Eulophiella*.

21. *Catasetum* Tribe.

- A. Fls. perfect; column twisted.....78. *Mormodes*.  
 AA. Fls. of 2 or 3 forms; column not twisted.  
 B. Column stout, straight; fls. with antennæ.....79. *Catasetum*.  
 BB. Column slender, curved; fls. without antennæ.....80. *Cynoches*.

22. *Lycaste* Tribe.

- A. Pollinia upon a single stalk.  
 B. Fls. globose.....81. *Anguloa*.  
 BB. Fls. with spreading sepals and petals.  
 C. Stalk of pollinia long and narrow; fls. 1 to few.  
 D. Infl. of a single erect fl.; lip turned down.....82. *Lycaste*.

- DD. Infl. of 2 to few drooping fls.; lip turned upwards..... 83. *Paphinia*.  
 CC. Stalk of pollinia short; fls. many..... 84. *Bateman-*  
*inia*.  
 AA. Pollinia upon 2 separate stalks..... 85. *Bifrenaria*.

## 23. Zygopetalum Tribe.

- A. Lip clawed distinctly..... 86. *Colax*.  
 AA. Lip not distinctly clawed..... [lum].  
 B. The lip with horseshoe-shaped callus..... 87. *Zygopeta-*  
 BB. The lip with few longitudinal lamellæ..... 88. *Eriopsis*.

## 24. Gongora Tribe.

- A. Lip turned downwards.  
 B. Fls. with sepals and petals erect or incurved.  
 C. Hypochil separated from column by a strong stricture; no pleuridia..... 89. *Lacæna*.  
 CC. Hypochil united with column by a broad base; pleuridia present.  
 D. Epichil movably attached to hypochil; pollinia with short stalk at most..... 90. *Peristeria*.  
 DD. Epichil immovably attached to hypochil; pollinia with elongated stalk..... 91. *Acineta*.  
 BB. Fls. with sepals and petals spreading or reflexed.  
 C. Lateral sepals much larger than the dorsal sepal and petals..... 92. *Coryanthes*.  
 CC. Sepals and petals nearly alike.  
 D. Hypochil concave; epichil flat.  
 E. Pollinia 2..... 93. *Stanhopea*.  
 EE. Pollinia 4..... 94. *Aganisia*.  
 DD. Hypochil not concave..... 95. *Houlletia*.  
 AA. Lip turned upwards..... 96. *Gongora*.

## 25. Dendrobium Tribe.

- A. Sts. many-jointed; rhizome short.  
 B. Lip without callus, or with lamellate or elevated lines..... 97. *Dendro-*  
 BB. Lip with basal callus; joints of st. long-fila-  
 mentose..... [bium].  
 98. *Inobulbon*.  
 AA. Sts. 1- or rarely 2-jointed; rhizome long-creeping..... 99. *Sarcopod-*  
 [ium].

## 26. Bulbophyllum Tribe.

- A. Lateral sepals with their outer margins adhering, except at the free base..... [lum].  
 AA. Lateral sepals free..... 100. *Cirrhopeta-*  
 101. *Bulbophyl-*  
 [lum].

## 27. Maxillaria Tribe.

- A. Lip without claw, movable; lvs. normal..... 102. *Maxillaria*.  
 AA. Lip clawed, or adnate to column-base; lvs. whip-shaped..... 103. *Scuticaria*.

## 28. Huntleya Tribe.

- A. Pseudobulbs distinct..... 104. *Promenæa*.  
 AA. Pseudobulbs wanting or rudimentary.  
 B. Lip entire..... 105. *Chondror-*  
 BB. Lip lobed..... [rhyncha].  
 C. Callus of lip fringed..... 106. *Huntleya*.  
 CC. Callus not fringed.  
 D. Column boat-shaped, concave..... 107. *Bollea*.  
 DD. Column slender, not concave.  
 E. Claw very short; callus free in front and resting upon the lip..... 108. *Warszewicz-*  
 [ella].  
 EE. Claw distinct; callus not free in front..... 109. *Pescatorea*.

## 29. Cymbidium Tribe.

- A. Lvs. many; sts. elongated..... 110. *Grammat-*  
 AA. Lvs. few; sts. short..... [ophyllum].  
 B. Sts. concealed by the lf.-sheaths.  
 C. Pollinia pear-shaped, upon a quadrate stalk; st. not bulbous..... 111. *Cyperor-*  
 CC. Pollinia round, upon a stalk much broader [chis].  
 than high; st. bulbous..... 112. *Cymbid-*  
 [ium].  
 BB. Sts. naked; lvs. only at its apex..... 113. *Gram-*  
 [mangis].

## 30. Ionopsis Tribe.

- A. Sepals free..... 114. *Trichocen-*  
 AA. Sepals, the lateral ones, united, at least below..... [trum].  
 B. The lip spurred..... 115. *Rodri-*  
 BB. The sepals spurred..... [guesia].  
 C. Spur short..... 116. *Ionopsis*.  
 CC. Spur long and slender..... 117. *Comparet-*  
 [tia].

## 31. Ada Tribe.

- A. Lvs. flat.  
 B. Sepals free..... 118. *Ada*.  
 BB. Lateral sepals united..... 119. *Mesos-*  
 [pinidium].  
 AA. Lvs. cylindric..... 120. *Quekettia*.

## 32. Trichopilia Tribe.

- Lip rolled around the column..... 121. *Trichopilia*.

## 33. Aspasia Tribe.

- A. Middle lobe of lip broad..... 122. *Aspasia*.  
 AA. Middle lobe of lip narrow..... 123. *Cochlidia*.

## 34. Odontoglossum Tribe.

- A. Lip surrounding column with 2 longitudinal calluses; blade reflexed..... 124. *Gomeza*.  
 AA. Lip not as above.  
 B. Base of lip parallel to column and sometimes adnate to it..... 125. *Odontoglos-*  
 BB. Lip spreading from base of column..... [sum].  
 C. Lateral sepals united entirely; lip like dorsal sepal..... 126. *Palum-*  
 CC. Lateral sepals free or only partly united; lip unlike dorsal sepal..... [bina].  
 D. Sepals and petals long and much attenuated; lip entire or fiddle-shaped..... 127. *Brassia*.  
 DD. Sepals and petals not much attenuated.  
 E. The lip entire, flat, broad..... 128. *Miltonia*.  
 EE. The lip mostly 3-lobed, with warts or a cushion at base..... 129. *Oncidium*.

## 35. Aerides Tribe.

- A. Lip movably joined to column.  
 B. Middle lobe of spurless lip flat..... 130. *Renan-*  
 [thera].  
 BB. Middle lobe of spurred lip compressed..... 131. *Arach-*  
 AA. Lip immovably united with column..... [nantha].  
 B. Spurless.  
 C. Column without a foot.  
 D. Summit of lip laterally compressed..... 132. *Vandopsis*.  
 DD. Summit of lip not compressed..... 133. *Luisia*.  
 CC. Column with a foot, the lateral sepals attached to it..... 134. *Phalænop-*  
 BB. Spurred..... [sis].  
 C. Column without a foot.  
 D. Pollinia upon a single stalk.  
 E. Spur appendaged.  
 F. With a longitudinal septum..... 135. *Sarcanthus*.  
 FF. With the mouth covered with a plate..... 136. *Cleisos-*  
 EE. Spur not appendaged..... [toma].  
 F. Stalk of the pollinia filiform.  
 G. Fls. firm; lip turned downwards..... 137. *Saccola-*  
 GG. Fls. fragile; lip turned upwards..... 138. *Acampe*.  
 FF. Stalk of the pollinia broadened upwards or throughout.  
 G. Spur short and broad..... 139. *Vanda*.  
 GG. Spur long and slender..... 140. *Angræcum*.  
 DD. Pollinia on 2 separate stalks, or these united by the gland.  
 E. Stalks membranous, the pollinia attached to the face.  
 F. Plants leafy; lip entire..... 141. *Macrolec-*  
 FF. Plants without lvs.; lip 3-lobed..... 142. *Polyrrhiza*.  
 EE. Stalks slender.  
 F. Column bent toward the dorsal sepal..... 143. *Listro-*  
 FF. Column straight..... [stachys].  
 CC. Column with a foot, the lateral sepals attached to it..... 144. *Mystaci-*  
 D. Spur curved upwards against the lip-blade..... 145. *Aërides*.  
 DD. Spur straight or reflexed.  
 E. Lip 3-lobed..... 146. *Camarotis*.  
 EE. Lip entire..... 147. *Rhyn-*  
 [chostylis].

Other orchid genera entered are: Acriopsis, Arethusa, Bromheadia, Collabium, Corysanthes, Cryptophoranthus, Cryptostylis, Diuris, Eria, Eriochilus, Geodorum, Govenia, Holothrix, Ione, Lapanthes, Lueddemannia, Megacalinum, Monomeria, Moorea, Neolaucha, Neottia, Nervilia, Neuwiedia, Notylia, Oberonia, Octomeria, Ornithidium, Ornithocephalus, Ornithochilus, Panisea, Physisiphon, Platylepis, Polycynis, Pterostylis, Sarcophilus, Satyrium, Scaphyglottis, Schlimmia, Sievekingia, Sigmatostalix, Solenidium, Staurophilus, Stelis, Stenia, Tainia, Thecostele, Thelymitra, Trichoglottis, Trigoniidium, Xylobium, and many bi- and tri-generic hybrids.

## 184. DIOSCOREACEÆ.

- A. Fr. globose and berry-like, indehiscent..... 1. *Tamus*.  
 AA. Fr. capsular, winged.  
 B. Caps. 1-carpeled by abortion..... 2. *Rajania*.  
 BB. Caps. 3-carpeled or lobed, winged above..... 3. *Testudi-*  
 BBB. Caps. 3-carpeled or lobed, winged below or all around, or rarely not at all..... 4. *Dioscorea*.

## 185. TACCACEÆ.

In cultivation..... *Tacca*.

## 186. IRIDACEÆ.

- A. Fls. never more than 1 to a spathe, spicate, not fugitive.  
 B. Style-branches simple, not bifid.  
 C. Stamens equilateral; perianth regular.  
 D. The style short; branches long and subulate.  
 E. Rootstock not bulbous; roots in dense tufts, fibrous, some fleshy.... 1. *Schizostylis*.  
 EE. Rootstock bulbous..... 2. *Hesperantha*.  
 DD. The style longer; branches shorter and more or less broadened.  
 E. The spathe-valves oblong, green or brownish upwards..... 3. *Geissorhiza*.  
 EE. The spathe-valves scarious or hyaline, cut or 3-parted at apex..... 4. *Dierama*.  
 EEE. The outer spathe-valve short, emarginate, membranous or papery..... 5. *Ixia*.  
 CC. Stamens unilateral and arched.  
 D. Foliage very hairy and plaited..... 6. *Babiana*.  
 DD. Foliage not hairy and plaited.  
 E. Perianth-limb irregular.  
 F. Tube funnel-shaped; spathe-valves lanceolate..... 7. *Gladiolus*.  
 FF. Tube cylindrical in lower half, suddenly dilated at the middle, spathe-valves oblong-lanceolate.. 8. *Antholyza*.  
 EE. Perianth-limb subregular.  
 F. Fls. small; no tube; segms. very acuminate..... 9. *Melast[æ]rula*.  
 FF. Fls. larger; tube present; segms. more or less oblong.  
 G. Spathe valves large, green, lanceolate..... 10. *Acidanthera*.  
 GG. Spathe-valves small, oblong.  
 H. Caps. inflated, globose..... 11. *Crocsmia*.  
 HH. Caps. small, oblong..... 12. *Tritonia*.  
 GGG. Spathe-valves scarious and deeply lacerated..... 13. *Sparaxis*.  
 BB. Style-branches bifid; stamens unilateral.  
 C. Tube broadly funnel-shaped, with stamens inserted below the throat..... 14. *Freesia*.  
 CC. Tube slender with stamens inserted at the throat..... 15. *Lapeyrouisia*.  
 CCC. Tube broadly funnel-shaped above the middle where the stamens are inserted.. 16. *Watsonia*.  
 AA. Fls. usually more than 1 to a spathe, stalked, often fugitive and opening one after another.  
 B. Style-branches opposite stamens and outer perianth-segms.  
 C. Stigmas transverse; style-branches have crests that overtop anthers.  
 D. Inner perianth-segms. not convolute.  
 E. Ovary 1-celled, with 3 parietal placentæ; rootstock digitate..... 17. *Herm[odactylus]*.  
 EE. Ovary 3-celled.  
 F. Perianth-tube usually present; filaments free; rootstock usually a rhizome, sometimes a bulb. 18. *Iris*.  
 FF. Perianth without a tube; filaments monadelphous; rootstock usually a tunicated corm..... 19. *Moræa*.  
 DD. Inner perianth-segms. convolute.  
 E. Style-crests petaloid; lvs. in 2-ranked rosette, not plaited; peduncle flattened; rootstock not bulbous. 20. *Marica*.  
 EE. Style-crests large, spur-like or flattened; lvs. superposed, plaited; st. terete; rootstock bulbous..... 21. *Cypella*.  
 (See also *Phalocallis*.)  
 CC. Stigmas terminal; style-branches do not overtop anthers.  
 D. Perianth without any tube; inner segms small, not convolute; style-branches bifid at tip..... 22. *Herbertia*.  
 DD. Perianth-segms. connivent in a cup, without any spreading blade..... 23. *Hydrotænia*.  
 DDD. Perianth-segms. connivent in a cup, then spreading, at least the outer ones.  
 E. Style-branches with 2 petal-like stigmatose crests..... 24. *Homeria*.  
 EE. Style-branches bifid.  
 F. Ditto penicillate, i.e., shaped like an artist's brush, a dense tuft of hairs..... 25. *Ferraria*.  
 FF. Ditto not penicillate.  
 G. Inner segms. very small; outer with a large, reflexed blade.... 26. *Rigidella*.  
 GG. Inner and outer segms. dissimilar, various..... 27. *Tigridia*.  
 BB. Style-branches alternate with anthers.  
 C. Rootstock not a bulb or corm.

- D. Spathes essentially 1-fld.  
 E. Peduncle short, hidden; perianth with a long tube and ascending segms..... 28. *Crocus*.  
 EE. Peduncle long; perianth-segms. much longer than the short tube..... 29. *Romulea*.  
 DD. Spathes usually with more than 1 fl..... 30. *Nemastylis*.  
 CC. Rootstock not a bulb or corm; spathes usually more than 1-fld.  
 D. Perianth-segms. unequal.  
 E. Inner segms. shorter, connivent; upper stamen imperfect..... 31. *Diplarrhena*.  
 EE. Inner segms. obovate-cuneate; outer oblong, usually shorter; stamens all perfect..... 32. *Libertia*.  
 DD. Perianth-segms. subequal.  
 E. Style-branches flattened and emarginate at apex; infl. a lax corymb.... 33. *Belemcanda*.  
 EE. Style-branches subulate.  
 F. Pedicels short; clusters panicled... 34. *Orthosanthus*.  
 FF. Pedicels long; clusters terminal, single or fascicled..... 35. *Sisyrinchium*.

Other genera described are: *Aristea*, *Cipura*, *Eleutherine* and *Ennealophus*.

## 187. AMARYLLIDACEÆ.

- A. Subterranean axis a bulb; scapose; infl. umbelloid and involucrate, or solitary..... 1. AMARYLLIS TRIBE.  
 AA. Subterranean axis a rhizome; st. leafy, at least at base.  
 B. Plants with large, thick, fleshy, rosette-like lvs.; infl. racemose or paniculate..... 2. AGAVE TRIBE.  
 BB. Plants with ordinary lvs. of small size; infl. various.  
 C. Lf.-blades inverted, upper face downward; infl. an involucrate umbel..... 3. ALSTROEMERIA TRIBE.  
 CC. Lf.-blades normal, linear; infl. not umbelloid.  
 D. Plant hairy or glabrous, scapose; infl. spicate or racemose..... 4. HYPOXIS TRIBE.  
 DD. Plant glabrous, with leafy sts.; infl. loose, racemose or solitary; anther opening by apical pore..... 5. CONANTHERA TRIBE.  
 DDD. Plant densely woolly with leafy sts.; infl. scorpioid; lvs. capitate..... 6. CONOSTYLIS TRIBE.

## 1. Amaryllis Tribe.

Subtribe 1. CORONATÆ. Fl. furnished with a crown between the perianth and stamens, which is not to be confused with a staminal cup formed by the growing together of filaments.

1. *Narcissus*.

Subtribe 2. AMARYLLIDÆ GENUINÆ. Corona 0, and filaments not united into a staminal cup.

- A. Anthers erect; filaments inserted at or near the base of anthers.  
 B. Stamens epigynous; filaments short.  
 C. The perianth-segms. all alike..... 2. *Leucojum*.  
 CC. The inner segms. different, permanently connivent..... 3. *Galanthus*.  
 BB. Stamens perigynous.  
 C. Fls. solitary..... 4. *Cooperia*.  
 CC. Fls. umbellate..... 5. *Chlidanthus*.  
 AA. Anthers dorsifixed, versatile.  
 B. Ovules many, superposed; testa black.  
 C. Fls. solitary; spathe tubular in the lower half.  
 D. The fl. gaping, horizontal, bright red, 3 lower segms. convolute..... 6. *Sprekelia*.  
 DD. The fls. regular, erect or suberect.  
 E. Seeds globose; fls. yellow; peduncle short or long..... 7. *Sternbergia*.  
 EE. Seeds flat; peduncle long..... 8. *Zephyranthes*.  
 CC. Fls. umbellate; spathe 2-4-valved, and pedicels subtended by filiform bracteoles.  
 D. Perianth-tube short or almost 0, rarely long in *Hippeastrum*.  
 E. Peduncle solid; seeds few in a cell.... 9. *Lycoris*.  
 EE. Peduncle hollow.  
 F. Fl. often furnished with minute scales or a distinct neck at the throat; seeds many in a cell..... 10. *Hippeastrum*.  
 FF. Fl. with a sort of corolla, which is funnel-shaped, and deeply cut, the divisions emarginate..... 11. *Placea*.  
 DD. Perianth-tube long.  
 E. Tube broadly funnel-shaped, pulvinate at throat..... 12. *Vallota*.  
 EE. Tube 2-3 times longer than segms., naked at throat..... 13. *Cyrtanthus*.

- BB. Ovules 2, basal, collateral; testa pale. . . . . 14. *Griffinia*.  
 BBB. Ovules 2 or few, collateral or fasciated from the center of the placenta.  
 c. Fr. baccate.  
 d. Bulb imperfect; ovules several. . . . . 15. *Clivia*.  
 dd. Bulb large, tunicated; ovules 2. . . . . 16. *Hæmanthus*.  
 cc. Fr. capsular. . . . . 17. *Buphane*.  
 BBBB. Ovules few or many, superposed; seeds few, turgid, testa green.  
 c. Fr. indehiscent or bursting irregularly.  
 d. Perianth-tube long. . . . . 18. *Crinum*.  
 dd. Perianth-tube short.  
 e. Segms. broad. . . . . 19. *Amaryllis*.  
 ee. Segms. narrow. . . . . 20. *Ammoch-*  
 cc. Fr. a 3-valved caps. . . . . [aris].  
 d. Caps. top-shaped, acutely angled. . . . . 21. *Brunsvigia*.  
 dd. Caps. globose, obtusely angled. . . . . 22. *Nerine*.

Subtribe 3. **PANCRAEÆ.** Corona 0, but stamens appendaged toward base and often united into a distinct cup,

- A. Ovules superposed, many or few.  
 B. Lvs. broad, petioled.  
 c. Perianth white.  
 d. Ovary globose.  
 e. Filaments with a large tooth on each side of the anthers. . . . . 23. *Calliph-*  
 [ruria].  
 ee. Filaments united in a distinct cup. . . . . 24. *Eucharis*.  
 dd. Ovary 3-lobed; hybrid. . . . . 25. *Urceoch-*  
 cc. Perianth colored. . . . . [aris].  
 d. The perianth-tube cylindrical, suddenly dilated. . . . . 26. *Urceolina*.  
 dd. The perianth subcylindrical; segms. long or short. . . . . 27. *Phædran-*  
 BB. Lvs. linear or ligulate, sessile. . . . . [arisa].  
 c. Perianth colored, subcylindrical; tube long; filaments united in an entire or toothed cup. . . . . 28. *Stenomesson*.  
 cc. Perianth white; tube funnel-shaped; staminal cup large. . . . . 29. *Pancratium*.  
 AA. Ovules collateral, basal, 2-6. . . . . 30. *Hymeno-*  
 AAA. Ovules medial, 2-3. . . . . [callis].  
 B. Perianth funnel-shaped; segms. narrow. . . . . 31. *Vagaria*.  
 BB. Perianth with a slender tube and broad segms. . . . . 32. *Eurycles*.

## 2. Agave Tribe.

- A. Lvs. thick, fleshy, usually spiny at edge and point.  
 B. Perianth funnel-shaped; filaments normal. . . . . 33. *Agave*.  
 BB. Perianth rotate; filaments swollen on one side at base. . . . . 34. *Furcraea*.  
 AA. Lvs. comparatively thin, not spiny at edge or point.  
 B. Segms. short.  
 c. Fls. white, in a lax, simple spike; tube long, curved, subcylindrical. . . . . 35. *Polyanthes*.  
 cc. Fls. greenish brown in a lax raceme; tube abruptly curved and dilated at middle. . . . . 36. *Prochny-*  
 ccc. Fls. red or white, laxly spicate or racemose; tube curved, subcylindrical. . . . . [anthes].  
 37. *Bravoa*.  
 BB. Segms. long; tube scarcely any.  
 c. Fls. greenish red, in a simple or panicked raceme; segms. oblanceolate. . . . . 38. *Beschor-*  
 cc. Fls. bright red, in a capitulum or thyrsoid [neria].  
 panicle; segms. narrow, falcate. . . . . 39. *Doryanthes*.

## 3. Alstrœmeria Tribe.

- A. Rootstock bulbous; perianth-segms. subequal. 40. *Ixiolirion*.  
 AA. Rootstock 0; 3 outer perianth-segms. different from 3 inner.  
 B. Inner segms. unequal: st. erect. . . . . 41. *Alstrœmeria*.  
 BB. Inner segms. equal: st. with runners or stolons. . . . . 42. *Bomarea*.

## 4. Hypoxis Tribe.

- A. Ovary often produced into a long slender beak simulating a perianth-tube: fr. succulent, indehiscent. . . . . 43. *Curculigo*.  
 AA. Ovary not beaked: fr. a caps. usually circumscissile at apex. . . . . 44. *Hypoxis*.

## 5. Conanthera Tribe.

- Stamens, 3 only, fertile. . . . . 45. *Tecophilæa*.

## 6. Conostylis Tribe.

- Fls. irregular. . . . . 46. *Anigozan-*  
 [thos].

Also in cultivation: *Anoiganthus*, *Callipsyche*, *Cummingia*, *Cyanella*, *Gethyllis*.

## 188. VELLOZIACEÆ.

- A. Perianth-tube more or less extended beyond the ovary. . . . . 1. *Barbacenia*.  
 AA. Perianth-tube practically none. . . . . 2. *Vellozia*.

## 189. MUSACEÆ.

- A. Calyx tubular, later split-spathaceous. . . . . 1. *Musa*.  
 AA. Calyx of free sepals (lateral ones sometimes adnate to corolla in *Heliconia*).  
 B. Fr. a caps. loculicidally 3-valved; seeds  $\infty$ .  
 c. Petals 2, lateral connate. . . . . 2. *Strelitzia*.  
 cc. Petals separate. . . . . 3. *Ravenala*.  
 BB. Fr. indehiscent or separating into berries, the cells 1-seeded. . . . . 4. *Heliconia*.

## 190. ZINGIBERACEÆ.

- A. Ovary 1-celled, with 3 parietal placentæ. . . . . 1. *Globo.*  
 AA. Ovary perfectly 3-celled, or at least 3 celled much above the middle; placentæ axile.  
 B. Lateral staminodes ample and petal-like.  
 c. Connective not appendaged at the base.  
 d. Filament short; bracts 1-f. . . . . 2. *Kaempferia*.  
 dd. Filament long; bracts 1-co-fid. . . . . 3. *Hedychium*.  
 cc. Connective appendaged at the base.  
 d. Spur 2-fid; lateral staminodes narrowed at base. . . . . 4. *Roscoea*.  
 dd. Spurs 2; lateral staminodes connate with the petaloid filament. . . . . 5. *Curcuma*.  
 BB. Lateral staminodes small, tooth-like or 0, rarely longer, narrow and adnate to labellum.  
 c. Filament short or very short.  
 d. Infl. cone-like.  
 e. Anther-cells divergent at apex; connective either short or produced beyond cells into an entire or 3-lobed crest. . . . . 6. *Amomum*.  
 ee. Anther-cells contiguous; connective produced beyond the cells into a long, linear appendage. . . . . 7. *Zingiber*.  
 dd. Infl. not cone-like.  
 e. Connective not produced beyond cells.  
 f. Anther-cells contiguous to apex. . . . . 8. *Eleteria*.  
 ff. Anther-cells separate. . . . . 9. *Renealm.*  
 ee. Connective produced beyond cells into a long lanceolate, concave appendage. . . . . 10. *Burbridgea*.  
 cc. Filament elongated (in *Costus* petal-like).  
 d. Infl. cone-like. . . . . 11. *Costus*.  
 dd. Infl. not cone-like. . . . . 12. *Alpinia*.

Also in cultivation: *Bamburanta*, *Brachychilus*, *Cautleya*, *Rhynchanthus*.

## 191. MARANTACEÆ.

- A. Ovary 1-celled after a fashion, the other cells being minute and empty.  
 B. Bracts narrow, convolute, inclosing the rachis. . . . . 1. *Maranta*.  
 BB. Bracts and bractlets usually colored, spreading, long persistent. . . . . 2. *Stromanth.*  
 BBB. Bracts spreading, deciduous. . . . . 3. *Thalia*.  
 AA. Ovary usually 3-celled and 3-ovuled.  
 B. Corolla-tube usually short. . . . . 4. *Phrynium*.  
 BB. Corolla-tube usually slender and longer. . . . . 5. *Calathea*.  
 Ctenanthe is also briefly treated.

## 192. CANNACEÆ.

Sole genus. . . . . *Canna*.

## 193. BROMELIACEÆ.

(Following Mez in DC. Monog. Phaner. vol. 9.)

- A. Fr. a berry, indehiscent; ovary inferior; seeds not winged nor plumed.  
 B. Pollen-grains entire, not provided with pores or a longitudinal membranous fold.  
 c. Calyx without a tube or cup. . . . . 1. *Bromelia*.  
 cc. Calyx with a tube or cup. . . . . 2. *Cryptanthus*.  
 BB. Pollen-grains furnished with pores.  
 c. Infl. immersed in a central bowl of lvs. and surrounded by an involucre formed from the reduced inmost lvs. and usually colored.

- d. Petals without ligules, connate, at least toward base.  
 e. The infl. simple..... 3. *Aregelia*.  
 ee. The infl. compound..... 4. *Nidularium*.  
 dd. Petals with ligules, free..... 5. *Canistrum*.  
 cc. Infl. not surrounded by a distinct involucre: st. or scape tall.  
 d. Petals furnished with 2 ligules inside.  
 e. Berries connate among themselves and also to the bracts and axis.... 6. *Ananas*.  
 ee. Berries free.  
 f. Sepals with long awns, or, if awnless, the ovules with very long tails..... 7. *Echmea*.  
 (See also *Echinostachys*.)  
 ff. Sepals without awns or only obscurely awned: ovules obtuse.. 8. *Quesnelia*.  
 dd. Petals not provided with ligules inside.  
 e. Fls. very flat and crowded into dense cones..... 9. *Hohenbergia*.  
 ee. Fls. more or less loosely spicate on the branches of the infl..... 10. *Streptocalyx*.  
 bbe. Pollen-grains furnished with a longitudinal membranous groove..... 11. *Billbergia*.  
 aa. Fr. a dehiscent caps: ovary superior or nearly so.  
 b. Seeds winged, or appendaged: pollen grooved.  
 c. Ovary semi-superior..... 12. *Pitcairnia*.  
 cc. Ovary superior.  
 d. Fls. of 2 forms and dioecious..... 13. *Hechtia*.  
 dd. Fls. all the same form.  
 e. Petals free to the very base..... 14. *Puya*.  
 ee. Petals coalesced toward the base..... 15. *Dyckia*.  
 bb. Seed with a long, plumose appendage: ovary superior.  
 c. Petals free.  
 d. The petals ligulate inside..... 16. *Vriesea*.  
 dd. The petals not ligulate inside..... 17. *Tillandsia*.  
 cc. Petals connate or intimately confluent. 18. *Guzmania*.  
 (See also *Massangea*.)  
 Catopsis and Neoglaziovia are also in cultivation.

## 194. LILIACEÆ.

## I. Summary of Tribes.

Ignoring many exceptions.

**Series 1.** Anthers introrsely dehiscent: fr. usually berry-like: plant not bulbous, usually scaly at the base of the st. and leafy above, sometimes with a scaly scape.

- a. Stigma not broadly petlate.  
 b. Ovules orthotropous or hemianatropous: "foliage" abnormal, in the *Smilax* Tribe 3-5-nerved but with netted veinlets; in the *Asparagus* Tribe li-shaped or needle-like "phylloclades" are present.  
 c. Anthers abnormal, the inner valve of each cell being so narrow that the open anther seems to be 1-celled: st. sarmentose or scandent..... 1. *SMILAX* TRIBE.  
 cc. Anthers normally 2-celled, or cells confluent at apex: st. branched or scandent..... 2. *ASPARAGUS* TRIBE.  
 bb. Ovules anatropous, rarely hemianatropous in the *Luzuriaga* Tribe.  
 c. St. shrubby and branched, or scandent..... 3. *LUZURIAGA* TRIBE.  
 cc. St. herbaceous, unbranched or sparingly branched; leafy above.. 4. *SOLOMON'S SEAL* [TRIBE].  
 ccc. Stemless herbs with lvs. clustered on the rhizome and often inclosed (together with the lateral leafless scape) by sheathing scales at the base..... 5. *LILY-OF-THE-VALLEY* TRIBE.  
 aa. Stigma usually very broadly petlate: lvs. on the rhizome few, ample: scape very short and 1-fid. or bearing a dense spike at apex..... 6. *ASPIDISTRA* TRIBE.

**Series 2.** Anthers introrsely dehiscent: fr. loculicidally dehiscent, rarely indehiscent or berry-like: lvs. on a rhizome, or densely crowded at the apex of a caudex, or forming a bulb at the base of the scape.

- a. Anthers with a pit on the back into which the filament intrudes.  
 b. Lvs. linear or membranous, crowded on a short rhizome: perianth cylindrical, funnel-shaped, or bell-shaped..... 7. *LEMON-LILY* OR [HEMEROCALLIS] TRIBE.  
 bb. Lvs. usually thick, fleshy or rigid, sometimes spiny: rhizome hard, often extended above ground into a woody caudex: perianth-segms. connivent or connate into a tube or sometimes with spreading tips.... 8. *ALOE* TRIBE.

- aa. Anthers not pitted (sometimes slightly pitted in the *Asphodel* Tribe): lvs. not thick, and fleshy as in a century plant.  
 b. Rootstock, if any, rhizomatous; rhizome usually short, often very short in *Asphodel* Tribe, sometimes produced into a woody caudex in *Dracæna* Tribe (see also bb).  
 c. Seeds fleshy: perianth marcescent. 9. *OPHIPOGON* [TRIBE].  
 cc. Seeds not fleshy.  
 d. Perianth tubular-bellshaped, connate, persistent; infl. racemose..... 10. *ALETIS* TRIBE.  
 dd. Perianth shaped like a bell or cylinder, rarely a funnel, the segms. usually distinct, deciduous; infl. often panicked..... 11. *DRACÆNA* TRIBE.  
 ddd. Perianth-segms. usually distinct and spreading, deciduous; infl. sparingly branched, if at all..... 12. *ASPHODEL* TRIBE.  
 bb. Rootstock bulbous as a rule: in the *Onion* Tribe sometimes a corm and rarely a very short rhizome; bulb usually tunicated, but in the *Tulip* Tribe often scaly.  
 c. Stemless plants with the infl. terminal on a leafy scape.  
 d. Infl. an umbel with an involucre of at least 2 bracts..... 13. *ONION* TRIBE.  
 dd. Infl. a raceme, or rarely a spike..... 14. *SQUILL* TRIBE.  
 cc. St. leafy, or at least with 1 lf.: fls. few or in a lax raceme..... 15. *TULIP* TRIBE.

**Series 3.** Anthers usually introrsely affixed but extrorsely dehiscent (the whole *Colchicum* Tribe exceptional): fr. usually a septicidal caps., rarely loculicidal or in the *Medeola* Tribe an indehiscent berry. Plants fibrous-rooted, rarely cormous or bulbous.

- a. Fr. a berry: plant not bulbous: lvs. few, subradical or whorled on the st..... 16. *MEDEOLA* OR [CUCUMBER-ROOT] TRIBE.  
 aa. Fr. a caps. rarely, in the *Bellwort* Tribe, a berry.  
 b. Anthers introrsely dehiscent. The only tribe in Series 3 with a cormous rootstock..... 17. *COLCHICUM* OR [AUTUMN CROCUS] TRIBE.  
 bb. Anthers extrorsely dehiscent, rarely otherwise in the *Narthecium* Tribe: plants not bulbous except sometimes in *False Hellebore* Tribe.  
 c. St. lvs. smaller than the radical lvs. which are either crowded or petiolate), sometimes very small or 0: caps. septicidal or loculicidal..... 18. *NARTHECIUM* [TRIBE].  
 cc. St. leafy, herbaceous or high climbing: lvs. alternate, sessile or clasping, without sheath..... 19. *BELLWORT* OR [UVULARIA] TRIBE.  
 ccc. St. usually tall, leafy or hardly so beyond the radical lvs.: plants not bulbous or bulbous: anthers with confluent cells, roundish-petlate after dehiscence..... 20. *FALSE HELLEBORE* [OR *VERATRUM* TRIBE].

## II. Key to the Tribes.

1. *Smilax* Tribe.

- a. Perianth 6-parted..... 1. *Smilax*.  
 aa. Perianth undivided; mouth minutely toothed.. 2. *Hetero-* [smilax].

2. *Asparagus* Tribe.

- a. Filaments connate into a little urn, with the anthers sessile at the mouth of the urn.  
 b. Anthers 3; fls. clustered on the middle of the face of the phylloclade..... 3. *Ruscus*.  
 bb. Anthers 6; fls. clustered on the margins, or rarely at the middle of the phylloclade.... 4. *Semele*.  
 bbb. Anthers 6; fls. terminal in short racemes.... 5. *Danaë*.  
 aa. Filaments free..... 6. *Asparagus*.

3. *Luzuriaga* Tribe.

- a. Fls. large or rather large, solitary or few; perianth-segms. erect; ovary 1-celled with 3 parietal placentæ.  
 b. Lvs. 3-5-nerved; perianth-segms. of about equal length..... 7. *Lapageria*.  
 bb. Lvs. 1-nerved: outer perianth-segms. much smaller than inner..... 8. *Philesia*.  
 aa. Fls. small; perianth-segms. spreading; ovary 3-celled: lvs. with  $\infty$  slender nerves.  
 b. The fls. clustered in the axils..... 9. *Eustrephus*.  
 bb. The fls. mostly terminating the branches.... 10. *Gettono-* [plesium].

## 4. Solomon's Seal Tribe.

- A. Fls. 1-2 in the axils, rarely more, usually nodding.  
 B. Perianth-tube cylindrical; lobes short; style undivided, with a small stigma. . . . . 11. *Polygonatum*.  
 BB. Perianth-tube 0; segms. spreading above or from the base; style shortly or more deeply 3-fid. . . . . 12. *Streptopus*.  
 AA. Fls. in a terminal raceme or panicle.  
 B. Floral parts in 3's. . . . . 13. *Smilacina*.  
 BB. Floral parts in 2's. . . . . 14. *Maintheum*.

## 5. Lily-of-the-Valley Tribe.

- A. Fls. racemose, nodding; perianth subglobose; lobes shorter than tube. . . . . 15. *Convallaria*.  
 AA. Fls. spicate, far apart; perianth-tube cylindrical; lobes recurved-spreading. . . . . 16. *Reineckia*.

## 6. Aspidistra Tribe.

- A. Fls. 4-merous; stigma very large, roundish-peltate, undivided. . . . . 17. *Aspidistra*.  
 AA. Fls. 3-merous; stigma broadly peltate, 3-lobed. 18. *Rohdea*.

## 7. Lemon-Lily, or Hemerocallis Tribe.

- A. Fls. erect; stamens affixed at apex of tube: lvs. long and narrow.  
 B. Perianth funnel-shaped, the cylindrical tube shorter than the lobes; panicles few-fld. . . . . 19. *Hemerocallis*.  
 BB. Perianth with subincurved segms. loosely connivent above the top-shaped tube; panicles much branched. . . . . 20. *Phormium*.  
 AA. Fls. pendulous.  
 B. Stamens affixed at middle of tube: lvs. long and narrow; perianth-tube swollen above; lobes short. . . . . 21. *Blandfordia*.  
 BB. Stamens often hypogynous.  
 C. Lvs. petioled, usually broad: fls. racemose; perianth funnel-shaped; tube short or long. . . . . 22. *Funkia*.  
 CC. Lvs. long and narrow: fls. spicate; perianth a long narrow tube with short lobes. . . . . 23. *Kniphofia*.

## 8. Aloe Tribe.

- A. Perianth-segms. strongly connate into a tube which is swollen at the base; segms. free at apex; stamens included in tube. . . . . 24. *Gasteria*.  
 AA. Perianth-segms. coherent or connivent to the very apex in a tube, or barely spreading at the very apex; stamens usually exserted. . . . . 25. *Aloe*.  
 AAA. Perianth-segms. coherent or connivent, stellate-spreading at apex; stamens a little shorter than perianth. . . . . 26. *Apicra*.  
 AAAA. Perianth usually incurved, the segms. cohering or connivent, at the apex recurved and spreading somewhat as if 2-lipped; stamens not exceeding perianth. . . . . 27. *Haworthia*.  
 AAAAA. Perianth of Aloe, but stamens a little shorter than the perianth. . . . . 28. *Lomatophyllum*.

## 9. Ophiopogon Tribe.

- A. Perianth-tube long and slender; filaments normal. . . . . 29. *Sansevieria*.  
 AA. Perianth more or less erect or spreading above the ovary; filaments shorter than the linear anthers; style longish. . . . . 30. *Ophiopogon*.  
 AAA. Perianth spreading from base of ovary; filaments about as long as the oblong anthers. . . . . 31. *Liriope*.

## 10. Aletris Tribe.

- One genus cultivated. . . . . 32. *Aletris*.

## 11. Dracæna Tribe.

- A. Ovary 1-celled; cells 3-ovuled. . . . . 33. *Dasyllirion*.  
 AA. Ovary 3-celled.  
 B. Cells 1-ovuled. . . . . 34. *Dracæna*.  
 BB. Cells 2-ovuled. . . . . 35. *Nolina*.  
 BBB. Cells  $\infty$ -ovuled.  
 C. Fls. racemose. . . . . 36. *Hesperocallis*.  
 CC. Fls. paniced.  
 D. Anthers small, sessile on a club-shaped filament; perianth subglobose or bell-shaped; segms. hardly connate at base. . . . . 37. *Yucca*.  
 DD. Anthers dorsifixed on normal or flattened filaments; perianth cylindrical or narrowly bell-shaped, with a short tube. . . . . 38. *Cordylina*.

## 12. Asphodel Tribe.

## Summary of Subtribes.

- A. Anthers dorsifixed, versatile.  
 B. Subtribe 1. EUASPHODELEÆ. Plant not bulbous: lvs. crowded at base of st.; cauline lvs. smaller, when present.  
 BB. Subtribe 2. LOMANDREÆ. Plant not bulbous: lvs. grass-like: fls. in spikes.  
 BBB. Subtribe 3. CHLOROGALEÆ. Plant bulbous: lvs. few.  
 AA. Anthers erect, affixed at or near the base.  
 B. Subtribe 4. BOWIÆ. Lvs. few, from a thick tuber or fleshy bulb, quickly vanishing before or at anthesis.  
 BB. Lvs. numerous, crowded at base of st. or sometimes in Subtribe 5 arranged along st.  
 C. Subtribe 5. ANTHERICEÆ. Lvs. not 2-ranked.  
 CC. Subtribe 6. DIANELLEÆ. Lvs. 2-ranked.

## Subtribe 1. Euasphodeleæ.

- A. Ovules 2 in a cell.  
 B. St. or scape leafless.  
 C. Anthers pitted where the filament is inserted; fls. yellow. . . . . 39. *Asphodelus*.  
 CC. Anthers not pitted. . . . . 40. *Bulbinella*.  
 (Consult *Chrysobactron*.)  
 BB. St. more or less leafy: fls. usually white. . . . . 41. *Asphodeline*.  
 AA. Ovules  $\infty$  in a cell.  
 B. Anthers pitted; filaments glabrous. . . . . 42. *Paradisæa*.  
 BB. Anthers not pitted; filaments long bearded. . . . . 43. *Bulbine*.

## Subtribe 2. Lomandreæ.

- In cultivation . . . . . 44. *Xanthorrhæa*.

## Subtribe 3. Chlorogaleæ.

- A. Perianth-segms. 3-nerved. . . . . 45. *Chlorogalum*.  
 AA. Perianth-segms. 1-nerved. . . . . 46. *Hastingsia*.

## Subtribe 4. Bowieæ.

- Lvs. linear, vanishing before anthesis: bulb tuber-like. . . . . 47. *Bowiea*.

## Subtribe 5. Anthericæ.

- A. Infl. clustered down among the radical lvs. on a very short st. . . . . 48. *Leucocrinum*.  
 AA. Infl. on a scape, simple or with few branches, racemose or spicate.  
 B. Stamens finally as long as the perianth or longer; raceme long, simple and dense. . . . . 49. *Eremurus*.  
 BB. Stamens shorter than perianth.  
 C. Caps. with hardly prominent angles. . . . . 50. *Anthericum*.  
 CC. Caps. 3-cornered or 3-winged. . . . . 51. *Chlorophytum*.

## Subtribe 6. Dianelleæ.

- Filaments fleshy or thickened at apex or middle. . . . . 52. *Dianella*.

## 13. Onion Tribe.

- A. Rootstock a short rhizome, with clusters of root-fibers. . . . . 53. *Agapanthus*.  
 AA. Rootstock a tunicated bulb or corm.  
 B. Perianth salver-shaped or urn-shaped.  
 C. Stamens 6; perianth-tube cylindrical.  
 D. Tube often crowned at throat with 3-6 scales; stamens included inside the tube in 2 series. . . . . 54. *Tristagma*.  
 DD. Tube constricted at the mouth by a scarcely noticeable ring; stamens exserted at mouth of tube; filaments very short. . . . . 55. *Milla*.  
 CC. Stamens 3, affixed at throat.  
 D. Perianth-tube subglobose, constricted at mouth; stamens alternate with a like number of staminodes. . . . . 56. *Stropholirion*.  
 DD. Perianth-tube broadly cylindrical, shortly 6-saccate at base; stamens with a like number of staminodes connate into a spurious corona behind the anthers. . . . . 57. *Brevoortia*.  
 BB. Perianth funnel-shaped or bell-shaped; lobes as long as the tube or longer.  
 C. Filaments connate into a tube; stamens 6, affixed to throat.  
 D. Tube about as long as lobes. . . . . 58. *Androstephium*.  
 DD. Tube much shorter than lobes. . . . . 59. *Bessera*.  
 CC. Filaments free, normal or very short; perfect stamens 6 or 3, affixed to throat or tube.  
 D. Pedicels articulated at apex. . . . . 60. *Brodiaea*.

- DD. Pedicels not articulated at apex.....61. *Triteleia*.  
 BBB. Perianth wheel-shaped or bell-shaped; segms. connate at the base into a ring or cup.  
 C. Rootstock a fibrous-tunicated corm.  
 D. Filaments dilated at base into truncate scales surrounding ovary.....62. *Bloomeria*.  
 DD. Filaments slightly dilated below the middle.....63. *Muilla*.  
 CC. Rootstock a tunicated bulb.  
 D. Alliacous odor absent; perianth-segms. connate at base or to the middle.....64. *Nothoscordum*.  
 DD. Alliacous odor nearly if not quite always present; perianth-segms. distinct or barely united at base in a ring.....65. *Allium*.

## 14. Squill Tribe.

- A. Perianth-segms. distinct, or united only at the very base.  
 B. Seeds strongly compressed; ovules numerous.  
 C. The outer segms. of the persistent perianth spreading, the inner a little shorter, erect, connivent at apex and variously crested.....66. *Albuca*.  
 CC. The segms. of the deciduous perianth subequal, connivent into a bell, or spreading.....67. *Urginea*.  
 BB. Seeds obovoid or globose, not flattened or angled; ovules 2-∞ in a cell.  
 C. Infl. a long dense raceme, bearded at the apex by empty bracts, which may be herbaceous or colored.....68. *Eucomis*.  
 CC. Infl. not as in C.  
 D. Nerves of perianth-segms 1.....69. *Scilla*.  
 DD. Nerves of perianth-segms 3-∞.....70. *Camassia*.  
 DDD. Nerves of perianth segms. obscure.....71. *Ornithogalum*.  
 AA. Perianth-segms. united into a tube or bell.  
 B. Ovules ∞, usually numerous.  
 C. Seeds strongly compressed or angled.  
 D. The outer lobes spreading; inner ones erect and shorter.....72. *Dipcadi*.  
 DD. The lobes all spreading and subequal, or the inner ones a little wider.....73. *Galtonia*.  
 CC. Seeds obovoid or globose.....74. *Lachenalia*.  
 BB. Ovules 2-6 in a cell, rarely more; seeds not flattened or angled.  
 C. Lobes very short, tooth-like, much shorter than tube.  
 D. Perianth cylindrical.....75. *Veltheimia*.  
 DD. Perianth urn-shaped, constricted at throat.....76. *Muscari*.  
 CC. Lobes considerably longer than the bell-shaped tube; fls. few, in a lax raceme.  
 D. Filaments erect, not connate, all or only alternate ones dilated and petal-like.....77. *Chionodoxa*.  
 DD. Filaments connate into a sort of cup which is produced beyond the anthers into a cone.....78. *Puschkinia*.  
 CCC. Lobes shorter than the tube or about as long, sometimes a trifle longer; filaments normal or dilated at base.....79. *Hyacinthus*.

## 15. Tulip Tribe.

- A. Caps. septicidally dehiscent or 3-parted: fls. erect or pendulous; outer perianth-segms. usually narrower or smaller; inner ones pitted.....80. *Calochortus*.  
 (Consult also *Cyclobothra*.)  
 AA. Caps. loculicidally dehiscent.  
 B. Anthers dorsifixed, versatile; fls. nodding or pendulous, rarely erect; claw of segms. usually furnished with a nectariferous groove.....81. *Lilium*.  
 BB. Anthers basifixed, erect; filament usually intruded.  
 C. Fls. usually erect; perianth bell-shaped or somewhat funnel-shaped; segms. often spotted near the base, not pitted.....82. *Tulipa*.  
 CC. Fls. nodding or pendulous.  
 D. Perianth bell-shaped; segms. usually furnished with a pit or nectar-bearing spot above the base.....83. *Fritillaria*.  
 DD. Perianth-segms. narrow, recurved or reflected from the middle or almost from the base.....84. *Erythronium*.

## 16. Medeola, or Cucumber-Root Tribe.

- A. Foliage at base of st.; lvs. few, stalked or contracted into a sheath; fls. in a long-peduncled umbel, rarely solitary.....85. *Clintonia*.  
 AA. Foliage whorled at top of st.  
 B. Lvs. 3; fl. solitary, 3-merous.....86. *Trillium*.  
 BB. Lvs. 4-∞; fls. solitary, 4-∞-merous.....87. *Paris*.  
 AAA. Foliage whorled at middle of st. with 3 smaller lvs. at the top surrounding the umbel.....88. *Medeola*.

## 17. Colchicum, or Autumn-Crocus Tribe.

- A. Perianth-tube entire; styles 3, distinct from the base.....89. *Colchicum*.  
 AA. Perianth-segms. with distinct claws, connivent into a tube.  
 B. Styles 3, distinct from base.....90. *Merendera*.  
 BB. Style entire inside the tube, 3-fid at apex....91. *Bulbocodium*.

## 18. Narthecium Tribe.

- A. Caps. loculicidally dehiscent.  
 B. Style undivided.....92. *Narthecium*.  
 BB. Styles 3.....93. *Zerophyllum*.  
 AA. Caps. septicidally dehiscent or parted.  
 B. Fls. few at apex of scape; style undivided....94. *Heloniopsis*.  
 BB. Fls. in a dense raceme; styles 3, very short..95. *Helonias*.

## 19. Bellwort, or Uvularia Tribe.

- A. Fr. an indehiscent berry.....96. *Disporum*.  
 AA. Fr. a septicidal caps.....97. *Tricyrtis*.  
 B. Fr. (when known) a loculicidal caps.  
 B. Fls. terminal, pendulous.  
 C. Lvs. perfoliate: seeds covered by a thin white aril.....98. *Uvularia*.  
 CC. Lvs. sessile: seeds have a swollen, spongy, brown ridge.....99. *Oakesia*.  
 BB. Fls. axillary, or long-pedicelled in the axils.  
 C. Plants are climbers.  
 D. Perianth-segms. spreading, usually wavy or crisped.....100. *Gloriosa*.  
 DD. Perianth-segms. distinct, suberect, more or less connivent and bell-shaped.....101. *Littonia*.  
 CC. Plants not climbers: perianth urn-shaped; lobes very short.....102. *Sandersonia*.

## 20. False Hellebore or Veratrum Tribe.

- A. Seeds membranous-winged nearly all the way around: sts. leafy.  
 B. Lvs. narrow or long-stalked; perianth-segms. distinctly clawed.....103. *Melanthium*.  
 BB. Lvs. usually broad, plaited, veiny, contracted into a sheath, not distinctly stalked; perianth-segms. a trifle contracted at the base.....104. *Veratrum*.  
 AA. Seeds narrow, angled, hardly winged: lvs. radical or crowded at base of st., linear or rarely sublanceolate.  
 B. Stamens much shorter than perianth; perianth more or less bell-shaped.....105. *Stenanthium*.  
 BB. Stamens a little shorter than perianth; perianth flattened out.....106. *Zygadenus*.

Other genera described are: *Acrospira*, *Alectorurus*, *Androcymbium*, *Arthropodium*, *Astelia*, *Chamaelirium*, *Dipidax*, *Drimia*, *Leucocoryne*, *Massonia*, *Oligobotrya*, *Peliosanthes*, *Thysanotus*, *Tonellia*, *Tupistra*, and *Tulbaghia*.

## 195. PONTEDERIACEÆ.

- A. Perianth funnel-shaped.  
 B. Ovary by abortion 1-celled, 1-ovuled.....1. *Pontederia*.  
 BB. Ovary 3-celled, many-ovuled.....2. *Eichhornia*.  
 AA. Perianth salver-shaped.....3. *Heteranthera*.

## 196. COMMELINACEÆ.

- A. Fr. indehiscent.  
 B. Pericarp hard and brittle.....1. *Polia*.  
 BB. Pericarp succulent or fleshy.....2. *Palisota*.  
 AA. Frs. loculicidally dehiscent.  
 B. Fls. with 3 perfect stamens, and 3 or fewer staminodes.  
 C. Anther-cells parallel and contiguous.  
 D. Ovary 3-celled; 2 anterior cells 1-2-ovuled; posterior 1-ovuled, empty or wanting.....3. *Commelina*.  
 DD. Ovary 2-3-celled; cells usually 2-∞-ovuled.....4. *Aneilema*.  
 CC. Anthers, with variously petaloid connective cells spirally twisted into numerous gyres.....5. *Cochlosoma*.  
 BB. Fls. with 6 stamens, rarely 5, all perfect; no staminodes.  
 C. Anther-cells dehiscing by a terminal pore.....6. *Dichorisandra*.  
 CC. Anthers otherwise dehiscent.  
 D. Connective transversely or divaricately 2-lobed.....7. *Zebrina*.  
 DD. Connective not 2-lobed as in D.  
 E. Ovary-cells 2-5-ovuled.

- F. Cymes fascicle-formed, with the very short rachis contracted into a receptacle, sessile inside the base of the complicate floral lvs. or variously paniculate..... 8. *Tradescantia*.  
 FF. Cyme terminal, pedunculate with 2-3 longish branches secund-fid. from base..... 9. *Tinantia*.  
 EE. Ovary cells 1-ovuled..... 10. *Rhæo*.

## 197. JUNCACEÆ.

- A. Ovary 1-celled, or more or less perfectly 3-celled; placentæ or cells  $\infty$ -ovuled..... 1. *Juncus*.  
 AA. Ovary 3-celled; cells 2- or few-ovuled..... 2. *Prionium*.

## 198. PALMACEÆ.

- A. If-segms. infolded in vernation; spadices interfoliaceous.  
 B. Fls. diœcious.  
 C. Lvs. pinnatisect; segms. acuminate; spathe solitary; ovary of 3 distinct carpels, only 1 maturing; seed deeply grooved ventrally umbilicate, embryo dorsal..... 1. PHŒNIX TRIBE.  
 CC. Lvs. plaited in a fan-shaped fashion, roundish, semi-orbicular or wedge-shaped, split: spathes numerous; ovary entire or 3-lobed, 3-celled, with erect ovules; seeds with a mere dot of a hilum: raphe ventral..... 2. CORYPHA TRIBE.  
 BB. Fls. usually hermaphrodite: lvs. much like those of Corypha Tribe; spathes numerous; ovary entire, 3-lobed, with ascending ovules; seeds with diffused hilum..... 3. BORASSUS TRIBE.  
 EA. Lf-segms. folded back in vernation.  
 B. Seeds adherent to the endocarp; hilum diffused; embryo opposite pore; spadices interfoliaceous; fls. usually monœcious in the same spadix, the lower ones in 3's with the middle one pistillate..... 4. COCOS TRIBE.  
 BB. Seed umbilicate.  
 C. Raphe dorsal; embryo ventral; spadices terminal or axillary; fls. polygamo-monoœcious..... 5. LEPIDOCARYA TRIBE.  
 CC. Raphe ventral; embryo dorsal... 6. ARECA TRIBE.

## 1. Phœnix Tribe.

- The only genus..... 1. *Phœnix*.

## 2. Corypha Tribe.

- A. Style or stigma basilar in fr.; endosperm equable.  
 B. The style short; embryo terminal. Palms fruit once and die..... 2. *Corypha*.  
 BB. The style elongated.  
 C. Embryo dorsal..... 3. *Sabal* [(*Inodes*).]  
 CC. Embryo sub-basilar..... 4. *Washingtonia*.  
 AA. Style or stigma terminal in fruit.  
 B. Perianth of imbricate petals or corolla-segms.  
 C. Fls. polygamo-diœcious; stigmas sessile, distinct; embryo dorsal..... 5. *Chamærops*.  
 DD. Endosperm equable..... 6. *Rhapidophyllum*.  
 CC. Fls. hermaphrodite; styles long, distinct.  
 D. Filaments free..... 7. *Acanthorhiza*.  
 DD. Filaments connate into a tube..... 8. *Trithrinax*.  
 BB. Perianth of valvate petals or corolla-lobes (see also BBB).  
 C. Fls. diœcious; corolla 3-toothed; anthers extrorsely dehiscent..... 9. *Rhapis*.  
 CC. Fls. polygamo-monoœcious; carpels distinct; stigmas distinct, sessile; endosperm equable, ventrally grooved; embryo dorsal..... 10. *Trachycarpus*.  
 CCC. Fls. hermaphrodite.  
 D. Embryo dorsal; endosperm equable: carpels slightly cohering or in *Livistona* sometimes distinct.  
 E. Spadix-branches not sheathed style single, short, 3-cornered..... 11. *Brahea*.  
 EE. Spadix rachis sheathed; carpels 3-cornered; style single, thread-like..... 12. *Licuala*.  
 EEE. Spadix-branches naked or lower ones bracted; carpels globose; styles short, distinct or cohering..... 13. *Livistona*.  
 DD. Embryo, sub-basilar: rachis of spadix sheathed.

- E. Endosperm ruminant: carpels 3, distinct at base; style single, short, 3-grooved..... 14. *Copernicia*.  
 EE. Endosperm equable.  
 F. Corolla-tube  $\infty$  persistent; segms. deciduous; ovary 3-cornered or 3 lobed, narrowed into a style..... 15. *Pritchardia*.  
 FF. Corolla otherwise.  
 G. Carpels free at base; style single, slender, elongated..... 16. *Serenæa*.  
 GG. Carpels slightly cohering; style single, short, 3-grooved..... 17. *Erythea*.

- BBB. Perianth minute 6-fid or obsolete..... 18. *Thrinax* (and *Coccothrinax*).

## 3. Borassus Tribe.

- A. Stamens 6.  
 B. Fls. numerous in the cavities of the spadix..... 19. *Borassus*.  
 BB. Fls. solitary in the cavities..... 20. *Hyphæne*.  
 AA. Stamens numerous.  
 B. Fls. numerous in cavities..... 21. *Lodoicea*.  
 BB. Fls. solitary in cavities..... 22. *Latania*.

## 4. Cocos Tribe.

- A. Palms armed with prickles: fr. 1-seeded; endocarp 3-porous at or above the middle.  
 B. Pistillate fls. with petals united for a considerable distance; staminate fls. smaller: endocarp bony.  
 C. Staminate fls. not immersed in spadix: lf-segms. acuminate..... 23. *Bactris*.  
 CC. Staminate fls. immersed in cavities of spadix: lf-segms. premorse..... 24. *Astrocaryum*.  
 BB. Pistillate fls. with petals connate only at base.  
 C. Staminate fls. immersed; anthers large, inserted: lf-segms. acuminate..... 25. *Acrocomia*.  
 CC. Staminate fls. not immersed; anthers included: lf-segms. wedge-shaped, premorse..... 26. *Martinezia*.  
 AA. Palms unarmed.  
 B. Endocarp 3-porous above middle: fr. 1-3-seeded..... 27. *Elæis*.  
 BB. Endocarp bony and, except in *Jubæa*, 3-6-porous toward base: fr. 1- $\infty$ -seeded.  
 C. Spadix simple..... 28. *Diplolathium*.  
 CC. Spadix simply branched.  
 D. Number of stamens 6: fr. 1-seeded (in *Scheelea* sometimes 2-3-seeded).  
 E. Petals minute, much smaller than exerted stamens of staminate fls..... 29. *Mazilia*.  
 EE. Petals lanceolate; stamens included..... 30. *Cocos*.  
 EEE. Petals shaped like a long club, or cylindrical; stamens shorter..... 31. *Scheelea*.  
 DD. Number of stamens 10-24 or more; petals of staminate fls. lanceolate; stamens included; anther-cells connate.  
 E. Fr. 2-6-seeded..... 32. *Attalea*.  
 EE. Fr. 1-seeded; the endocarp 3-porous at the middle or a little lower..... 33. *Jubæa*.

## 5. Lepidocarya Tribe.

- A. Lvs. fan-shaped; ovary perfectly 3-celled..... 34. *Mauritia*.  
 AA. Lvs. equally pinnatisect; ovary imperfectly 3-celled; spadices axillary.  
 B. Palms fruit once and die..... 35. *Plectocomia*.  
 BB. Palms fruit more than once; usually climbers.  
 C. Spathes solitary, deciduous: lf-segms. rhombic; nerves fan-shaped..... 36. *Ceratolobus*.  
 CC. Spathes numerous, persistent; lf-segms. acuminate; nerves parallel.  
 D. Spadices contracted; spathes cymbiform, beaked, long-persistent, the 2 lower ones forming an involucre for the others..... 37. *Dæmonorops*.  
 DD. Spadices diffused, or, if contracted, the spathes are flat and persistent only during anthesis..... 38. *Calamus*.

## 6. Areca Tribe.

## Key to Subtribes;

- A. Petals of the pistillate fls. valvate throughout nearly their whole length; spadices interfoliaceous; spathes 2 or more; ovary entire, 3-celled..... 1. *CARYOTIDEÆ*.  
 AA. Petals of the pistillate fls. overlapping or valvate only at apex, very rarely valvate throughout.  
 B. Spadices infralioleaceous.  
 C. Stigmas terminal in fr.; ovary entire, 1-celled.  
 D. Staminate fls. unsymmetrical; sepals usually small and not imbricate..... 2. *EUARECEÆ*.

- DD. Staminate fls. symmetrical; sepals usually roundish and widely overlapping. . . . . 3. *PTYCHOSPERMEÆ*.
- CC. Stigmas usually excentric or lateral on ovary, entire or 3-lobed; lf-segms. acuminate. . . . . 4. *ONCOSPERMEÆ*.
- DD. Spathes 2; ovary entire. . . . . 5. *IRIARTEÆ*.
- EE. Ovary deeply 3-lobed, with large stigmas; spadices club-shaped. . . . . 6. *WETTINIEÆ*.
- BB. Spadices nearly always interfoliateous. . . . . 7. *LINOSPADICEÆ*.
- C. Stigmas terminal on fr., rarely basal. . . . . 8. *CEROXYLEÆ*.
- D. Ovary 1-celled; spadix simple, with monœcious fls. immersed in cavities. . . . . 9. *MALORTIEÆ*.
- DD. Ovary 3-celled, imperfectly so in Subtribe 8. . . . . 10. *IGUANUREÆ*.
- E. Fr. globose; spadix paniculately branched, the fls. dioecious and pedicelled. . . . . 11. *CHAMÆDORÆÆ*.
- EE. Fr. elongated; spadix subdigitately branched, the fls. monœcious and not immersed. . . . . 12. *GEONOMEÆ*.
- CC. Stigmas lateral or basal on fr., rarely terminal; ovary entire. . . . . 13. *CARYOTIDEÆ*.
- D. Fls. not immersed in cavities. . . . . 14. *CARYOTIDEÆ*.
- E. Spathes 2; all the fls. or the lower ones in 3's; ovary 1-3-celled. . . . . 15. *CARYOTIDEÆ*.
- EE. Spathes numerous; ovary 3-celled; spadices inter- and infrafoliateous; fls. usually dioecious, without bracts or bractlets; perianth rather fleshy or leathery. . . . . 16. *CARYOTIDEÆ*.
- DD. Fls. immersed in cavities, monœcious or dioecious, compressed; perianth glumaceous; style often elongated, terminal or lateral. . . . . 17. *CARYOTIDEÆ*.
- Subtribe 1. Caryotideæ.
- A. Lvs. bipinnatisect; endosperm ruminate; staminate fls. with 3 sepals and stamens. . . . . 39. *Caryota*.
- AA. Lvs. pinnatisect; endosperm equable. . . . . 40. *Wallichia*.
- B. Stamens 6; calyx of staminate fls. tubular, truncate. . . . . 41. *Didymosperma*.
- BB. Stamens ∞. . . . . 42. *Arenga*.
- C. Calyx of staminate fls. cup-shaped, 3-lobed. . . . . 43. *Arenga*.
- CC. Calyx of staminate fls. of 3 sepals. . . . . 44. *Arenga*.
- Subtribe 2. Euareceæ.
- A. Ovule basal, erect. . . . . 45. *Kentia*.
- B. Endosperm ruminate. . . . . 46. *Hydriastele*.
- C. Stamens 3 or 6; staminate fls. minute, numerous, solitary or in pairs, on branches of spadix; pistillate fls. much larger, solitary toward base of branches. . . . . 47. *Veitchia*.
- CC. Stamens numerous; fls. in 3's, the middle one pistillate, arranged in 2, 4 or 6 ranks. . . . . 48. *Nenga*.
- BB. Endosperm equable; stamens 6; fls. in 3's, the middle one pistillate, arranged in 4 ranks. . . . . 49. *Kentia*.
- AA. Ovule parietal, more or less pendulous. . . . . 50. *Archontophoenix*.
- B. Fls. arranged in 4 ranks on branches of spadix. . . . . 51. *Rhopalostylis*.
- BB. Fls. arranged spirally on branches of spadix. (All "sepals" mentioned under BB refer to sepals of staminate fls. except when otherwise stated.) . . . . . 52. *Dictyosperma*.
- C. Pistillate fls. much larger than staminate; sepals papery, connate at base. . . . . 53. *Hedyscepe*.
- CC. Pistillate fls. not larger than staminate. . . . . 54. *Dictyosperma*.
- D. Length of sepals far surpassing petals; sepals narrow. . . . . 55. *Dictyosperma*.
- DD. Length of sepals not exceeding petals. . . . . 56. *Dictyosperma*.
- E. The sepals overlapping. . . . . 57. *Dictyosperma*.
- F. Sepals triangular-orbicular; stamens numerous; filaments short. . . . . 58. *Dictyosperma*.
- FF. Sepals small, keeled; stamens 9-24; filaments inflexed at apex. . . . . 59. *Dictyosperma*.
- EE. The sepals not overlapping. . . . . 60. *Dictyosperma*.
- F. Filaments inflexed at apex. . . . . 61. *Dictyosperma*.
- G. Sepals awl-shaped or lanceolate; stamens 6-12; pistillate fls. with short petals valvate at apex. . . . . 62. *Dictyosperma*.
- GG. Sepals small, acute; stamens 6; pistillate fls. with petals a little longer than the sepals. . . . . 63. *Dictyosperma*.

- FF. Filaments normal; sepals narrowly lanceolate; stamens 9-12; pistillate fls. with petals like the sepals. . . . . 53. *Hedyscepe*.

## Subtribe 3. Ptychospermeæ.

- A. Endosperm ruminate. . . . . 54. *Ptychosperma*.
- B. Stamens 20-30. . . . . 55. *Rhopaloblaste*.
- BB. Stamens 6. . . . . 56. *Drymophlaeus*.
- AA. Endosperm equable. . . . . 57. *Drymophlaeus*.
- B. Lf-segms. obliquely premorse; stamens numerous. . . . . 58. *Drymophlaeus*.
- BB. Lf-segms. narrowed at apex, or in *Cyrtostachys* entire or sometimes obliquely 2-toothed. . . . . 59. *Cyrtostachys*.
- C. Stamens 6-15; pericarp slightly fibrous, smooth inside. . . . . 60. *Cyrtostachys*.
- CC. Stamens 6; pericarp thick, granular, fibrous inside. . . . . 61. *Cyrtostachys*.

## Subtribe 4. Oncospermeæ.

- A. Staminate fls. symmetrical; sepals broad and much overlapping; stigmas on fr. excentric or lateral, or in *Cyphosperma* subterminal. . . . . 62. *Cyphosperma*.
- B. Perianth of pistillate fls. enlarged after anthesis. . . . . 63. *Cyphosperma*.
- C. Pericarp grumose and fibrous. . . . . 64. *Cyphosperma*.
- CC. Pericarp thin, leathery or bony. . . . . 65. *Cyphosperma*.
- BB. Perianth not changed after anthesis. . . . . 66. *Cyphosperma*.
- AA. Staminate fls. unsymmetrical; sepals small or narrow, not imbricate or only slightly so; stigmas lateral on fr. or basal. . . . . 67. *Cyphosperma*.
- B. Petals of pistillate fls. connate at base, valvate above. . . . . 68. *Cyphosperma*.
- C. Calyx of staminate fls. united at base. . . . . 69. *Cyphosperma*.
- CC. Calyx with 3 distinct sepals. . . . . 70. *Cyphosperma*.
- BB. Petals free. . . . . 71. *Cyphosperma*.
- C. Anthers erect. . . . . 72. *Cyphosperma*.
- CC. Anthers versatile. . . . . 73. *Cyphosperma*.
- D. Fr. globose; palms unarmed. . . . . 74. *Cyphosperma*.
- DD. Fr. minute; palms spiny. . . . . 75. *Cyphosperma*.

## Subtribe 5. Iriarteæ.

- Stamens 9-15; stigmas terminal or nearly so in fr.; lf-segms. turned in every direction. . . . . 67. *Iriarteæ*.

## Subtribe 6. Wettinieæ.

- No representatives known to be cultivated in America.

## Subtribe 7. Linospadiceæ.

- A. Anthers basifixed, erect. . . . . 68. *Bacularia*.
- B. Stamens 6, 10, or 12; pistillate fls. have ∞ staminodes; lf-segms. premorse. . . . . 69. *Howea*.
- BB. Stamens very numerous; pistillate fls. have no staminodes; lf-segms. acuminate. . . . . 70. *Linospadix*.
- AA. Anthers dorsifixed, versatile; staminodes in pistillate fls. 6-9; lf-segms. acuminate. . . . . 71. *Linospadix*.

## Subtribe 8. Ceroxyleæ.

- Stamens 9-15; fr. with basal stigmas. . . . . 71. *Ceroxylon*.

## Subtribe 9. Malortieæ.

- Not cultivated in America.

## Subtribe 10. Iguanureæ.

- A. Stigmas excentric or lateral on fr. . . . . 72. *Heterospathes*.
- AA. Stigmas basal or nearly so on fr. . . . . 73. *Stevensonia*.
- B. Stamens 15-20; ovary 1-celled; palm armed. . . . . 74. *Verschoffia*.
- BB. Stamens 6, with didymous anthers. . . . . 75. *Dypsis*.
- C. Ovary 1-celled; palm unarmed. . . . . 76. *Dypsis*.
- CC. Ovary 3-celled; palm unarmed. . . . . 77. *Dypsis*.

## Subtribe 11. Chamædoreæ.

- A. Fls. dioecious or monœcious in different spadices, spirally arranged. . . . . 76. *Chamædorea*.
- AA. Fls. monœcious in the same spadix. . . . . 77. *Chamædorea*.
- B. The fls. arranged in elongated heaps or clusters. . . . . 78. *Gaussia*.
- C. Infl. from among the lvs. . . . . 79. *Hyophorbe*.
- CC. Infl. from below the lvs. . . . . 80. *Roscheria*.
- BB. The fls. sparse, solitary or in pairs. . . . . 81. *Roscheria*.

## Subtribe 12. Geonomeæ.

- A. Base of the ovary included in the disk.  
 B. Anthers arrow-shaped.....80. *Calyptrone*.  
 BB. Anthers with long separate pendulous cells.....81. *Geonoma*.  
 AA. Disk 0: many-stemmed palms of India.....82. *Bentinckia*.

## Imperfectly Known Genera of Palms.

83. *Balaka* is a member of the Areca Tribe and probably belongs between *Ptychosperma* and *Drymophloeus*, differing from those genera as indicated in the article *Balaka*.  
 84. *Bismarckia* is a member of the Borassus Tribe.  
 85. *Chrysalidocarpus* is a well-known member of the Areca Tribe of doubtful affinity.  
 86. *Exorrhiza* is a member of the Areca Tribe, Subtribe Euareceæ.  
 87. *Nipa* is a member of the Areca Tribe but of uncertain affinity. Its nearest horticultural relative is *Phoenix*.  
 88. *Phytelephas* is a well-known member of the Areca Tribe but of doubtful affinity.  
 89. *Pseudophoenix* is a member of the Areca Tribe which probably belongs in the Subtribe Chamædoreæ, near *Hyophorbe*.  
 90. *Ptychoraphis* is a member of the Areca Tribe which probably comes after *Ptychosperma*.  
 91. *Ranevea* is known only in the juvenile state and is conjectured to be near to *Hyophorbe*.

The following genera are also treated: *Acoelorrhaphe*, *Cyphokentia*, *Desmoneus*, *Eremospatha*, *Hyospatha*, *Manicaria*, *Metroxylon*, *Microphœnix*, *Neonicholsonia*, *Enocarpus*, *Pigafetta*, *Ptychococcus*, *Synechanthus*, *Teyssmannia*, *Welfia* and *Zalacca*.

## 199. LEMNACEÆ.

- Floating plants with roots: fls. inserted on marginal cracks of the frond; stamens 1-2; anthers 2-celled.....*Lemna*.

## 200. PANDANACEÆ.

- A. Ovules solitary in carpels.....1. *Pandanus*.  
 AA. Ovules many in the locules.....2. *Freycinetia*.

## 201. CYCLANTHACEÆ.

- A. Plants with watery juice.....1. *Carludovica*.  
 AA. Plants with milky juice.....2. *Cyclanthus*.

## 202. TYPHACEÆ.

- The only genus.....*Typha*.

## 203. ARACEÆ.

- A. Perianth 0 (except female fls. of *Peltandra*).  
 B. Fls. monocious (in *Arisæma* sometimes dioecious).  
 C. Spadix appendaged (except in *Pistia*).  
 D. The male and female infl. contiguous with no neutral organs between: ovules anatroplus or semi-anatroplus.....1. *Amorphophallus*.  
 DD. The upper fls. males, lower ones females: ovules orthotroplus.  
 E. The spadix free from the spathe or adnate at the base.  
 F. Male fls. sparse: lvs. and fls. appear together.  
 G. Tube of spathe with connate margins; male fls. with 1 stamen; anthers horseshoe-shaped.....2. *Arisarum*.  
 GG. Tube of spathe convolute; fls. usually dioecious; males with 2-5 stamens.....3. *Arisæma*.  
 FF. Male fls. dense: lvs. often appear before fls.  
 G. Tube of spathe with connate margins.  
 H. Ovule solitary: lvs. entire.....4. *Biarum*.  
 HH. Ovules 2-4: lvs. pedatisect.....5. *Saurontum*.  
 GG. Tube of spathe convolute.  
 H. Ovules ∞, parietal, in 2 series.....6. *Arum*.  
 HH. Ovules few, inserted at base and apex of cell.  
 I. Male and female fls. remote; appendix of spadix hairy.....7. *Helicodieros*.  
 II. Male and female fls. contiguous.....8. *Dracunculus*.  
 EE. The spadix not appendaged, adnate to spathe on back: aquatic plant... 9. *Pistia*.

- EEE. The tube of spathe closed at mouth by dilation of spadix or else divided into 2 cells.  
 F. Tube closed at throat.....10. *Pinellia*.  
 FF. Tube 2-celled.....11. *Ambrosinia*.  
 CC. Spadix not appendaged (rarely with a naked appendage or endowed with neutral organs); upper fls. males, lower ones females.  
 D. Stamens connate in a prismatic or peltate body.  
 E. Plants are climbing shrubs.  
 F. Ovaries distinct, 2-10-celled.....12. *Philodendron*.  
 FF. Ovaries coherent, 1-2-celled.....13. *Syngonium*.  
 EE. Plants are herbs, not climbing.  
 F. The ovules orthotroplus or nearly so: micropyle superior.  
 G. Ovules numerous in 2 series on 3-5 parietal placentæ.....14. *Colocasia*.  
 GG. Ovules few, basal.....15. *Alocasia*.  
 GGG. Ovules 1 or few, subparietal: distinguished by ovary immersed in a carp and embryo not albuminous.....16. *Peltandra*.  
 FF. The ovules anatroplus or semi-anatroplus: micropyle inferior.  
 G. Ovaries distinct or slightly coherent.....17. *Caladium*.  
 GG. Ovaries distinct below, above thick, dilated and grown together.....18. *Xanthosoma*.  
 GGG. Ovary 2-5-celled.....19. *Dieffenbachia*.  
 DD. Stamens distinct.  
 E. Fr. not included by tube of spathe: the whole spathe deciduous, marcescent.  
 F. Ovule affixed to intruded placentæ: lvs. ovate.....20. *Aglaonema*.  
 FF. Ovule affixed near top of cell: lvs. broadly arrow-shaped.....21. *Nepenthes*.  
 EE. Fr. included by accrescent tube of spathe: blade of spathe marcescent, deciduous.....22. *Zantedeschia*.  
 EEE. Fr. included by spathe, blade of which is persistent.....23. *Homalomena*.  
 EEEE. Fr. girt by the top-shaped tube of spathe, which has a circumscissile, deciduous blade.....24. *Schismatoglottis*.  
 BB. Fls. hermaphrodite.  
 C. Plants marsh herbs.....25. *Calla*.  
 CC. Plants are scandent shrubs.  
 D. Ovules 2 in a cell, affixed to base of septum.....26. *Monstera*.  
 DD. Ovules solitary, basal.....27. *Scindapsus*.  
 DDD. Ovules numerous.....28. *Rhaphidophora*.  
 DDDD. Ovules 3 or 4 in a cell.....29. *Stenospermotrium*.  
 AA. Perianth of 4-8 distinct segms.; fls. all hermaphrodite.  
 B. Spadix flowering downward; spathe long, often twisted, long-persistent.....30. *Cyrtosperma*.  
 BB. Spadix flowering upward.  
 C. Spathe sheathing the very long pedunculate stipe of the spadix, with blade incomplete or 0.  
 D. Ovary 1-celled; ovules solitary, semi-anatroplus.....31. *Orontium*.  
 DD. Ovary 2-celled; ovules 1-2 in a cell, orthotroplus.....32. *Lysichiton*.  
 DDD. Ovary 1-2-celled; ovule 1 in each cell, suspended.....33. *Symplocarpus*.  
 DDDD. Ovary imperfectly 1-2-celled; ovule solitary, affixed to interior angle of cell.....34. *Dracontium*.  
 CC. Spathe provided with scale-like appendages in the tube, long-persistent: ovules semi-anatroplus or campylotroplus.....35. *Spathyema*.  
 CCC. Spathe leafy, accrescent, persistent, quite flattened out: ovules anatroplus.....36. *Spathiphyllum*.  
 CCCC. Spathe open, recurved or reflexed, accrescent, persistent: ovules various.....37. *Anthurium*.  
 CCCC. Spathe accrescent, persistent or obsolete: ovules anatroplus.....38. *Pothos*.  
 CCCCC. Spathe obsolete or obscure: ovules orthotroplus.....39. *Acorus*.

## Additional Key to the Araceæ.

The Araceæ are likely to be so difficult for the gardener that an additional key, based on other contrasts, is here inserted for his convenience.

- A. Plants free-swimming, aquatic.....*Pistia*.  
 AA. Plants not free-swimming aquatics, terrestrial or marsh plants.  
 B. Lvs. parallel-veined (see also *Calla* and *Acorus*).  
 C. Plant shrub-like or climbing: st. more or less aerial: stamens of staminate fl. separate.

- D. Blade of spathe deciduous; spathe constricted in middle, leaving a long tube when blade falls. .... *Schismato-glottis*.
- DD. Blade of spathe persistent, at least until ripening of spadix. .... *Homalomena*.  
*Philodendron*.
- CC. Plant with st. upright, aerial; stamens united into a synandrium.
- D. Pistillate fls. crowded, without staminodia; staminate fls. with only 2-3 separate stamens. .... *Aglaonema*.
- DD. Pistillate fls. with staminodia interspersed; staminate fls. with 3-4 united stamens. .... *Dieffenbachia*.
- CCC. Plant with st. subterranean.
- D. Seeds orthotropous or nearly so: the connate staminodia of the pistillate fl. forming an involucre around the gynoceum. .... *Peltandra*.
- DD. Seeds anatropous: staminodia of pistillate fls. separate. .... *Zantedeschia*.
- BB. Lvs. netted-veined (i.e. veins of 2nd, 3rd, and 4th order netted).
- C. Milk-tubes absent.
- D. Raphides absent (raphides are acicular crystals found in bundles in the plant-cell).
- E. Lvs. differentiated into petiole and blade: seeds anatropous.
- F. Seeds without endosperm. .... *Pothos*.  
*Anthurium*.
- FF. Seeds with endosperm. .... *Acorus*.
- EE. Lvs. without distinction into petiole and blade: seeds orthotropous. .... *Acorus*.
- DD. Raphides present in ground tissue of st. and lvs.
- E. Fls. without perianth; spathe deciduous before ripening of spadix: plants mostly climbing.
- F. Seeds with endosperm and axial embryo.
- G. Foliage-lvs. many on each shoot. .... *Stenospermation*.
- GG. Foliage-lvs. 1 on each shoot in addition to several bracts. .... *Raphidophora*.
- FF. Seeds without endosperm.
- G. Ovary 2-celled. .... *Monstera*.
- GG. Ovary 1-celled. .... *Scindapsus*.
- EE. Fls. with perianth; spathe not deciduous: sub-shrubs. .... *Spathiphyllum*.
- CC. Milk-tubes present in fibro-vascular bundles.
- D. The milk-tubes branched; veins of 2nd grade fusing into a collective vein between veins of 1st grade.
- E. Seeds with endosperm: st. not climbing.
- F. Ovary with basal placenta. .... *Alocasia*.
- FF. Ovary with parietal placenta. .... *Colocasia*.
- FFF. Ovary with broad, nearly central placenta.
- G. Style small. .... *Caladium*.
- GG. Style disk-like, projecting beyond ovary. .... *Xanthosoma*.
- EE. Seeds without endosperm: st. climbing. .... *Synгонium*.
- DD. The milk-tubes simple, straight; veins not as above.
- E. Perianth present; fls. bisexual.
- F. Lvs. not arrow-shaped.
- G. Ovary 2-celled; 2 ovules in each cell, suspended from middle of partition. .... *Lysichitum*.
- GG. Ovary 1-celled, 1-ovuled.
- H. Ovule from apex of cell: spadix short, nearly globose. .... *Symplocarpus*.
- HH. Ovule basal: spadix cylindrical. .... *Orontium*.
- FF. Lvs. arrow-shaped.
- G. Plants are shrubs with climbing or creeping sts.: petioles and sts. usually prickly or warty. .... *Cyrtosperma*.
- GG. Plants tuberous. .... *Dracontium*.
- EE. Perianth absent; fls. unisexual (bisexual in *Calla*).
- F. Fls. bisexual: lvs. not arrow-shaped. *Calla*.
- FF. Fls. unisexual: lvs. various.
- G. Spadix with a sterile terminal appendage, or with sterile wings: sts. various.
- H. Seeds without endosperm. .... *Amorphophallus*.
- HH. Seeds with endosperm.
- I. Appendage of spadix projecting much beyond the spathe, or included and free.
- J. Spadix with rudimentary fls. between the fertile staminate and fertile pistillate fls., or staminate infl. bordering immediately on the pistillate infl.
- K. Placenta parietal: lvs. arrow-shaped or lanceolate. .... *Arum*.
- KK. Placenta apical and basal: lvs. pedately divided.
- L. Fertile staminate infl. bordering immediately on the pistillate infl. .... *Dracunculus*.
- LL. Fertile staminate infl. separated from pistillate infl. by many rudimentary fls. .... *Helicodiceros*.
- KKK. Placenta basal.
- L. Lvs. pedately divided: seeds 2 or more. .... *Sauromatum*.
- LL. Lvs. ovate, lanceolate or linear: seeds mostly 1. .... *Biarum*.
- JJ. Spadix without rudimentary fls., but a space between the staminate and pistillate fls., or unisexual.
- K. Ovary with many ovules.
- L. Staminate fls. of 1 stamen: lvs. ovate or arrow-shaped: spadix bisexual. .... *Arisarum*.
- LL. Staminate fls. of 2-5 stamens: lvs. 3- or many-parted: spadix unisexual. .... *Arisæma*.
- KK. Ovary 1-ovuled: staminate and pistillate portions of spadix separated by a partition which reaches out from wall of spathe. .... *Pinellia*.
- II. Appendages of the spadix wing-like on the 2 sides, thus dividing the bilabiate spathe into 2 chambers, the anterior of which contains a staminate fl., the posterior a pistillate fl. .... *Ambrosinia*.
- GG. Spadix without such appendage or wings: sts. subterranean, creeping. .... *Nephtylis*.
- Other genera described are *Calloopsis*, *Cryptocoryne*, *Epipremnum*, *Gamogyne*, *Gymnostachys*, *Staurostigma*, *Typhonium* and *Typhonodorum*.

## 204. ALISMACEÆ.

- A. Carpels inserted in a whorl on a small receptacle. .... 1. *Alisma*.
- AA. Carpels densely crowded in many series on a large oblong or globose receptacle. .... 2. *Sagittaria*.

## 205. BUTOMACEÆ.

- A. Petals marcescent; stamens 9; carpels 6. .... 1. *Butomus*.
- AA. Petals deciduous; stamens numerous; carpels 15-20. .... 2. *Limnorchis*.

## 206. NAIADACEÆ.

- A. Fls. hermaphrodite, spicate; perianth 4-divided; stamens 2 or 4. .... 1. *Potamogeton*.
- AA. Fls. unisexual, axillary; perianth 0; stamens 1. .... 2. *Zannichellia*.

## 207. APONOGETONACEÆ.

- The only genus. .... *Aponogeton*.

## 208. CYPERACEÆ.

- A. Fls. strictly unisexual; female inclosed in a flask-shaped or bag-shaped scale or glume (perigynium)..... 1. *Carex*.
- AA. Fls. bisexual, rarely unisexual, not inclosed as above.
- B. With several (2 to many) of the lower scales empty.
- C. Spikelets few-fld. (usually 1-2, rarely, 3-6-fld.)..... 2. *Rhynchospora*.
- CC. Spikelets many-fld.
- D. St. leafy..... 3. *Hypolytrum*.
- DD. St. not leafy or only at base..... 4. *Mapania*.
- BB. With only 1 or 2 of the lower scales empty.
- C. Scales 2-ranked.
- D. Perianth 0..... 5. *Cyperus*.
- DD. Perianth of 8 setæ..... 6. *Dulichium*.
- CC. Scales many-ranked, overlapping.
- D. Perianth of 3-8, rarely 0, setæ.
- E. Style persistent, thickened and bulb-like at base..... 7. *Eleocharis*.
- EE. Style not or hardly thickened at base..... 8. *Scirpus*.
- DD. Perianth of many setæ, very long-exserted after anthesis, becoming wavy or cottony..... 9. *Eriophorum*.

## 209. GRAMINEÆ.

## I. Summary of the Tribes.

## Subfamily I. PANICOIDEÆ.

Spikelets 1-, rarely 2-fld.; the terminal fl. perfect, the lower staminate or neuter; rachilla articulated below the glumes, the more or less dorsally compressed spikelets falling from the pedicels entire, singly, in groups, or together with joints of an articulate rachis.

- A. Spikelets unisexual, the male and female spikelets in different infl. on the same plant or in different parts of the same infl.; awnless..... 1. INDIAN CORN [TRIBE, OR MAYDEÆ.
- AA. Spikelets perfect, sometimes with male or neutral ones intermixed.
- B. Lemma and palea hyaline, the glumes more or less indurated; spikelets in 2's or 3's on the usually articulate axis of a spike-like raceme, 1 sessile and perfect, usually awned, the other pedicelated and perfect, staminate or rudimentary..... 2. SORGHUM TRIBE, OR ANDROPOGONEÆ.
- BB. Lemma and palea more or less indurated, firmer in texture than the glumes; spikelets all perfect; first glume sometimes obsolete..... 3. MILLET TRIBE, OR PANICEÆ.

## Subfamily II. POACOIDEÆ.

Spikelets 1- to many-fld., the imperfect or rudimentary floret, if any, usually uppermost; rachilla usually articulated above the glumes which are persistent on the pedicel or rachis after the fall of the florets; when 2- to many-fld., a manifest internode of the rachis separating the florets, and articulated below them; spikelets more or less laterally compressed.

- A. Culms not woody and perennial.
- B. Infl. paniculate, the spikelets pedicelated, not sessile on opposite sides of a jointed flattened axis, forming spikes, nor sessile along one side of a slender continuous axis.
- C. Spikelets 1-fld., the rachilla sometimes continued as a minute bristle behind the palea (or in Phalaridæ a pair of rudimentary or male florets below the perfect one).
- D. Spikelets falling entire; glumes usually obsolete or nearly so... 4. RICE TRIBE, OR [ORYZÆÆ.
- DD. Spikelets persistent; glumes present.
- E. Floret with 2 minute scales (rudimentary lemmas) or 2 small male florets attached at the base and falling with it..... 5. CANARY-GRASS [TRIBE, OR PHALARIDÆÆ.
- EE. Floret with no scales attached below; glumes usually subequal; lemma awned or awnless..... 6. RED-TOP TRIBE, OR [AGROSTIDÆÆ.
- CC. Spikelets 2- to many-fld.
- D. Glumes longer than the first floret; spikelets 2- to several-fld.; 1 or more of the florets usually awned from the back or from between the teeth of a bifid apex..... [AVENÆÆ.
7. OAT TRIBE, OR
- DD. Glumes shorter than the first floret; spikelets 2- to many-fld.; awns when present terminal or nearly so..... 8. FESCUE TRIBE, OR [FESTUCÆÆ.
- BB. Infl. spicate.
- C. Spikelets sessile or subsessile in 1-sided spikes, 1- to few-fld.; spikes solitary, or digitately or racemously arranged..... 9. CHLORIS TRIBE, OR [CHLORIDÆÆ.
- CC. Spikelets sessile on opposite sides of a zigzag jointed channeled axis forming a spike; 1- to several-fld..... 10. BARLEY TRIBE, OR [HORDEÆÆ.
- AA. Culms woody, tree-like; fl.-blades articulated with the sheaths..... 11. BAMBOO TRIBE, OR [BAMBUSÆÆ.

## II. Key to the Tribes.

## 1. Indian Corn Tribe, or Maydeæ.

- A. Male spikelets in a terminal panicle; female spikelets in spikes or ears in the axils of the lvs.
- B. Female spikelets sunken in cavities of a jointed readily disarticulating axis..... 1. *Euchlæna*.
- BB. Female spikelets crowded in rows on a thickened continuous axis (the cob)..... 2. *Zea*.
- AA. Male and female spikelets in the same infl., the male at the end of the spikes.
- B. Spikes digitate, the axis of the female portion bony indurated, disarticulating with spikelets attached..... 2. *Tripsacum*.
- BB. Spikes paniculate, the female spikelets inclosed in ovoid pearly or grayish bead-like bodies, the male portion protruding from a small orifice of the bead..... 4. *Coix*.

## 2. Sorghum Tribe, or Andropogoneæ.

- A. Spikelets all alike, perfect.
- B. Axis of racemes continuous, the spikelets deciduous; panicle fan-shaped..... 5. *Miscanthus*.
- BB. Axis of racemes jointed, readily disarticulating with the spikelets attached.
- C. The spikelets awnless..... 6. *Saccharum*.
- CC. The spikelets awned..... 7. *Erianthus*.
- AA. Spikelets not all alike, the sessile perfect, the pedicelated male or neuter.
- B. Lower 1 or 2 pairs of spikelets unlike the upper pairs; racemes in pairs from boat-shaped sheaths on the ultimate branches of an elongated infl..... 8. *Cymbopogon*.
- BB. Lower pairs of spikelets like the upper.
- C. Infl. consisting of 1 to many racemes, these digitate or racemose along a short axis..... 9. *Andropogon*.
- CC. Infl. compound, paniculate.
- D. Racemes many-fld., linear, naked at base, numerous, arranged in whorls on an elongated axis..... 10. *Vetiveria*.
- DD. Racemes reduced to 2 or 3 spikelets, arranged in a compound panicle..... 11. *Holcus*.

## 3. Millet Tribe, or Paniceæ.

- A. Axis broad and corky, the spikelets sunken in its cavities..... 12. *Stenotaphrum*.
- AA. Axis not broad and corky, spikelets not sunken in its cavities.
- B. Spikelets not subtended or surrounded by bristles.
- C. Glumes and lemmas awnless, the apex of the palea inclosed in the enfolding lemma..... 13. *Panicum*.
- CC. Glumes or lemmas, or both, awned or awn-tipped.
- D. Second glume and sterile lemma tapering into an awn or point, coarsely hispid; palea free at the summit; spikelets crowded..... 14. *Echinochloa*.
- DD. Second glume and sterile lemma awned from a 2-lobed apex.
- E. Infl. of 1-sided racemes along a common axis; spikelets pubescent but not silky; palea inclosed at summit..... 15. *Opismenus*.
- EE. Infl. paniculate; spikelets covered with long silky hairs..... 16. *Tricholæna*.
- BB. Spikelets subtended or surrounded by bristles.
- C. Bristles persistent, not falling with the spikelets at maturity..... 17. *Setaria*.
- CC. Bristles falling attached to the spikelet..... 18. *Pennisetum*.

## 4. Rice Tribe, or Oryzæ.

- A. Spikelets unisexual, the female awned, erect at the summit of the panicle, the male awnless, nodding on the lower branches..... 19. *Zizania*.
- AA. Spikelets perfect, strongly flattened..... 20. *Oryza*.

## 5. Canary-Grass Tribe, or Phalarideæ.

- A. Glumes strongly compressed; sterile lemmas rudimentary.....21. *Phalaris*.  
 AA. Glumes not strongly compressed; sterile lemmas not rudimentary.  
 B. Sterile lemmas awned; glumes very unequal.....22. *Anthoxanthum*.  
 BB. Sterile lemmas awnless; glumes nearly equal.....23. *Hierochloë*.

## 6. Red-Top Tribe, or Agrostideæ.

- A. Lemma indurated, or at least firmer than the glumes.  
 B. Panicle spike-like; spikelets flattened, awnless.....24. *Ammophila*.  
 BB. Panicle not spike-like; spikelets not flattened, awned.  
 C. Floret oblong and with a sharp callus at base; awn stout, geniculate, twisted, persistent.....25. *Stipa*.  
 CC. Floret ovate, the callus blunt; awn slender, more or less deciduous.....26. *Oryzopsis*.  
 AA. Lemma of about the same texture as the glumes or more delicate.  
 B. Spikelets crowded in dense spike-like panicles or heads.  
 C. Heads oval, very woolly.....27. *Lagurus*.  
 CC. Heads cylindrical, not woolly.....28. *Phleum*.  
 BB. Spikelets not crowded in dense heads or spikes.  
 C. Lemma and palea much more delicate and shorter than the glumes, the palea shorter than the lemma, often wanting.....29. *Agrostis*.  
 CC. Lemma and palea of about the same texture as the glumes and as long or longer.  
 D. Rachilla not continued beyond the base of the floret; lemma awned from the tip or awnless.  
 E. The lemma awned or sharp-pointed, longer than the body of the awned or awnless glumes.....30. *Muehlenbergia*.  
 EE. The lemma not awned or sharp-pointed.  
 F. Nerves of lemma 1.....31. *Sporobolus*.  
 FF. Nerves of lemma 3-5.....32. *Calamovilfa*.  
 DD. Rachilla prolonged beyond the floret as a plumose bristle; lemmas awned on the back and silky hairy at base.....33. *Calamagrostis*.

## 7. Oat Tribe, or Aveneæ.

- A. Plants low, delicate; spikelets minute.....34. *Aira*.  
 AA. Plants 1 ft. or more high.  
 B. Articulation below the glumes, the spikelets falling entire from the pedicels.  
 C. Glumes much exceeding the 2 florets, the upper floret with a hook-like awn.....35. *Notholcus*.  
 CC. Glumes exceeded by the upper floret, both florets awnless.....36. *Sphenopholis*.  
 BB. Articulation above the glumes, these persistent after the fall of the florets.  
 C. Spikelets 1 in. or more long, nodding, in an open panicle; florets all alike.....37. *Avena*.  
 CC. Spikelets about  $\frac{1}{4}$  in. long, erect in a narrow panicle; lower floret staminate.....38. *Arrhenatherum*.

## 8. Fescue Tribe, or Festuceæ.

- A. Rachilla or lemma bearing long hairs as long as the lemma; tall reeds.  
 B. Spikelets unisexual; male and female spikelets on separate plants.  
 C. Lemmas much shorter than the glumes; sts. leafy throughout.....39. *Gynierium*.  
 CC. Lemmas with elongated delicate tips; lvs. crowded at the base.....40. *Cortaderia*.  
 BB. Spikelets perfect.  
 C. Lemmas hairy; rachilla naked.....41. *Arundo*.  
 CC. Lemmas naked; rachilla hairy.....42. *Phragmites*.  
 AA. Rachilla or lemma glabrous or hairy, but the hairs shorter than the lemmas.  
 B. Spikelets of 2 kinds, perfect and sterile, in the same panicle.  
 C. Fertile spikelets awnless, the sterile awned; panicle spike-like.....43. *Cynosurus*.  
 CC. Fertile spikelets awned, the sterile awnless; panicle 1-sided, the fascicled spikelets not ling.....44. *Lamarckia*.  
 BB. Spikelets all alike in the same infl.  
 C. Lemmas 1-3-nerved.  
 D. The spikelets subterete, loosely 2-4-fld.....45. *Molinia*.  
 DD. The spikelets compressed, densely, usually many-fld.  
 E. Florets membranaceous; spikelets in open panicles.....46. *Eragrostis*.  
 EE. Florets coriaceous; spikelets in rigid spike-like panicles.....47. *Desmazeria*.

## cc. Lemmas 5- to many-nerved.

- B. The spikelets with several sterile lemmas at the base, strongly flattened, in a large drooping panicle.....48. *Uniola*.  
 DD. The spikelets without sterile lemmas at the base.  
 E. Florets crowded, nearly horizontal; spikelets broad, cordate.....49. *Briza*.  
 EE. Florets not crowded; spikelets not broad and cordate.  
 F. Spikelets flattened, nearly sessile in dense clusters at the ends of the few panicle branches.....50. *Dactylis*.  
 FF. Spikelets not flattened.  
 G. Lemmas keeled, often bearing white cobwebby hairs at base.....51. *Poa*.  
 GG. Lemmas convex or keeled at the summit only, not hairy at base.  
 H. Nerves of lemma prominent, parallel; lemmas scarious at the summit.....52. *Glyceria*.  
 HH. Nerves of lemma not prominent, approaching each other at the apex; lemmas acute.  
 I. The lemmas entire, often awn-tipped.....53. *Festuca*.  
 II. The lemmas 2-toothed, usually awned just below the apex.....54. *Bromus*.

## 9. Chloris Tribe, or Chlorideæ.

- A. Spikes racemose along a common axis; spikelets falling entire.....55. *Spartina*.  
 AA. Spikes digitate at the summit of the culm.  
 B. Spikelets awnless.  
 C. The spikes slender; spikelets 1-fld.....56. *Cynodon*.  
 CC. The spikes stout; spikelets several-fld.....57. *Eleusine*.  
 BB. Spikelets awned.  
 C. Fertile lemma 1-awned.....58. *Chloris*.  
 CC. Fertile lemma 3-awned.....59. *Trichloris*.

## 10. Barley Tribe, or Hordeæ.

- A. Spikelets solitary at each joint of the axis.  
 B. Glume 1, except in terminal spikelet; spikelets placed with 1 edge to the axis.....60. *Lolium*.  
 BB. Glumes 2; spikelets placed with side to the axis.  
 C. Palea adherent to the grain; rachilla disarticulating, the florets separating.....61. *Agropyron*.  
 CC. Palea free from the grain, rachilla not disarticulating.  
 D. Shape of glumes very narrow, 1-nerved.....62. *Secale*.  
 DD. Shape of glumes ovate, 3- to many-nerved.....63. *Triticum*.  
 AA. Spikelets in clusters of 2 or 3 at each joint of the axis.  
 B. Lateral pair of each cluster pedicel, usually aborted, appearing like a cluster of awns.....64. *Horæum*.  
 BB. Lateral spikelets sessile, usually but 2 spikelets at a joint.....65. *Elymus*.

## 11. Bamboo Tribe, or Bambuseæ.

- A. Stamens 3; fr. a true caryopsis.  
 B. Spikelets 2- to many-fld.  
 C. Infl. fasciculate.....66. *Oxytenanthera*.  
 CC. Infl. racemose or paniculate, not leafy; sts. cylindrical; sheaths persistent.....67. *Arundinaria*.  
 CCC. Infl. spicate, leafy; sts. flattened on one side; sheaths early deciduous.....68. *Phyllostachys*.  
 BB. Spikelets 1-fld.....69. *Chusquea*.  
 AA. Stamens 6.  
 B. Pericarp thin, adnate to the seed, the fr. a true caryopsis.....70. *Bambusa*.  
 BB. Pericarp, crustaceous, separable from the seed, the fr. nut-like.....71. *Dendrocalamus*.

Other genera mentioned are: Cenchrus, Cephalostachyum, Cinna, Dactyloctenium, Deschampsia, Diandroyra, Distichlis, Imperata, Leptochloa, Melica, Melinis, Paspalum, Rottboellia and Trisetum.

## 210. LYCOPODIACEÆ.

One genus in cultivation..... *Lycopodium*.

## 211. SELAGINELLACEÆ.

One genus only..... *Selaginella*.

## 212. EUISETACEÆ.

- One genus only..... *Equisetum*.

## 213. OPHIOGLOSSACEÆ.

- A. Sporangia coherent, in 2 ranks, forming spikes: veins anastomosing..... 1. *Ophioglossum*.  
 AA. Sporangia free in compound spikes or panicles: veins free: lvs. mostly compound..... 2. *Botrychium*.

## 214. MARATTIACEÆ.

- A. Sori in double lines along the veins, not united..... 1. *Angiopteris*.  
 AA. Sori united in synangia.  
   B. Synangia oval, opening by a fissure..... 2. *Marattia*.  
   BB. Synangia elongate, each compartment opening by a terminal pore..... 3. *Danaea*.

## 215. HYMENOPHYLLACEÆ.

- A. Involucre 2-valved..... 1. *Hymenophyllum*.  
 AA. Involucre tubular or funnel-shaped..... 2. *Trichomanes*.

## 216. OSMUNDACEÆ.

- A. Sporangia borne in panicles formed either from certain pinnae or from whole lvs..... 1. *Osmunda*.  
 AA. Sporangia borne on the under surface of foliage lvs.  
   B. Ferns coarse with broad segms..... 2. *Todea*.  
   BB. Ferns finely cut, membranous..... 3. *Leptopteris*.

## 217. SCHIZÆACEÆ.

- A. Sporangia borne on under side of normal or altered lvs.  
   B. Lvs. twining; lfts. palmate or pinnate: sporangia borne singly under scale..... 1. *Lygodium*.  
 BB. Lvs. not twining.  
   C. Sporangia in sori on the under surface.... 2. *Mohria*.  
   CC. Sporangia in 2 ranks forming spikes..... 3. *Schizæa*.  
 AA. Sporangia borne in erect panicles formed on the elongate lowermost pinnae..... 4. *Anemia*.

## 218. POLYPODIACEÆ.

## I. Summary of Tribes.

- A. Indusium wanting or rudimentary (rarely developed in Monogramma).  
   B. Sporangium scattered in a stratum over the under surface of the lvs.: coarse ferns..... 1. ACROSTICHUM [TRIBE].  
 BB. Sporangium collected in round or linear sori.  
   C. Lvs. not jointed to the rootstock: sporangia in long lines following the veins..... 2. VITTARIA TRIBE.  
   CC. Lvs. not jointed to the rootstock: sori round. (See Phegopteris in Dryopteris Tribe.)  
   CCC. Lvs. jointed to the rootstock: sori mostly roundish..... 3. POLYPODIUM [TRIBE].  
 AA. Indusium present (exceptionally wanting in Phegopteris, Menisium, Notholena and Ceropteris).  
   B. Sori oblong or linear, at least twice as long as broad.  
   C. The sori marginal, covered with an indusium formed of the reflexed edge of the lf. (naked in Notholena, or naked and distributed along the veins in Ceropteris).... 4. PTERIS TRIBE.  
   CC. The sori dorsal, covered with a flap-like indusium..... 5. ASPLENIUM TRIBE.  
 BB. Sori roundish or at least less than twice as long as broad.  
   C. Indusia superior, attached by a central stalk or by a sinus (sori naked in Phegopteris and Menisium), normally dorsal: lvs. not jointed to the rootstock..... 6. DRYOPTERIS [TRIBE].  
   CC. Indusia extrorse or cup-shaped, normally marginal: lvs. jointed to the rootstock in most genera... 7. DAVALLIA TRIBE.

ccc. Indusia inferior, attached under the sorus and opening laterally or by splitting radially into lobes. 8. WOODSIA TRIBE.

## II. Key to the Tribes.

## 1. Acrostichum Tribe.

- A. Sporangia localized on definite areas of the lvs.: lvs. dimorphous, the sterile basal ones shield-like..... 1. *Platyceerium*.  
 AA. Sporangia covering entire lvs. or entire pinnae.  
   B. Lvs. simple..... 2. *Elaphoglossum*.  
   BB. Lvs. pinnate..... 3. *Acrostichum*.  
   BBB. Lvs. (sterile), dichotomously forked..... 4. *Rhipidopteris*.

## 2. Vittaria Tribe.

- A. Sori forming 1 or 2 continuous lines parallel to the midrib.  
   B. Sorus 1 or 2 lines..... 5. *Monogramma*.  
   BB. Sorus always 2 lines..... 6. *Vittaria*.  
 AA. Sori on lateral veins forming more or less interrupted lines..... 7. *Antrophyum*.

## 3. Polypodium Tribe.

- A. Lvs. distinctly dimorphous, compound, the sterile basal ones oak-like: plants large..... 8. *Drynaria*.  
 AA. Lvs. dimorphous, simple: plants very small.... 9. *Drymoglossum*.  
 AAA. Lvs. uniform.  
   B. Foliage covered underneath with stellate hairs..... 10. *Cyclophorus*.  
   BB. Foliage smooth or scaly, not stellate hairy.  
   C. Veins free..... 11. *Polypodium*.  
   CC. Veins anastomosing.  
     D. Corresponding veinlets from principal veins uniting and bearing a sorus at the end..... 12. *Goniophlebium*.  
     DD. Areole bearing 2 or more free veinlets extending outward, which bear a free sorus..... 13. *Phlebodium*.  
     DDD. Areoles containing free veinlets irregularly directed..... 14. *Phymatodes*.

## 4. Pteris Tribe.

- A. Sori dorsal, extending along all the veins, naked.  
   B. Veins copiously anastomosing.  
   C. Lvs. large, pinnate..... 15. *Coniogramma*.  
   CC. Lvs. smaller, palmate..... 16. *Hemionitis*.  
 BB. Veins free or only casually uniting.  
   C. Lvs. naked..... 17. *Anogramma*.  
   CC. Lvs. hairy..... 18. *Ceropteris*.  
 AA. Sori marginal, nominally covered with edge of lf.  
   B. The sori at the ends of veins unconnected at their apices.  
   C. Lvs. dimorphous.  
   D. Sori at the ends of veins only..... 19. *Cryptogramma*.  
   DD. Sori scattered the length of the veins... 20. *Onychium*.  
 CC. Lvs. uniform, smooth, on dark-colored stalks.  
   D. Veins free: lvs. pinnate..... 21. *Fellæa*.  
   DD. Veins usually anastomosing: lvs. palmate..... 22. *Doryopteris*.  
 CCC. Lvs. uniform, hairy, scaly or powdery.  
   D. Margins scarcely recurved..... 23. *Notholena*.  
   DD. Margins recurved to form a distinct indusium.  
   E. Indusia more or less continuous around the segm.  
     F. The lvs. pinnately divided..... 24. *Cheilanthes*.  
     FF. The lvs. palmately divided..... 25. *Adiantopsis*.  
   EE. Indusia in the form of more or less distant marginal lobes..... 26. *Hypolepis*.  
   BB. The sori inserted beneath the marginal indusium: stalks black or blackish..... 27. *Adiantum*.  
 BBB. The sori rising in a continuous line-like receptacle which joins the ends of the veins.  
   C. With an inner membranous indusium.... 28. *Pteridium*.  
   CC. With no inner indusium present.  
     D. Lvs. small, radiate-dichotomous..... 29. *Actinopteris*.  
     DD. Lvs. small, palmate: stalk black..... 30. *Cassiopea*.  
     DDD. Lvs. larger, pinnate..... 31. *Pteris*.

## 5. Asplenium Tribe.

- A. Sori parallel to the midrib.  
   B. Sterile lvs. with free veins: sori continuous... 32. *Blechnum*.

- BB. Sterile lvs. with anastomosing veins; sori interrupted.  
 c. The sori sunken in the lvs. . . . . 33. *Woodwardia*.  
 CC. The sori superficial in 1 or more rows. . . . . 34. *Doodia*.  
 AA. Sori partly parallel and partly oblique to the midrib; veins anastomosing. . . . . 35. *Camptosorus*.  
 AAA. Sori oblique to the midrib.  
 B. Veins free, united at the margins.  
 c. The sori double, extending along both sides of the vein. . . . . 36. *Diplazium*.  
 CC. The sori single on the veins.  
 D. Indusia opening toward each other, in pairs. . . . . 37. *Phyllitis*.  
 DD. Indusia all opening toward the end of pinnæ or segms. . . . . 38. *Asplenium*.  
 BB. Veins of lower (inner) series uniting; indusium extending both sides of veins. . . . . 39. *Callipteris*.

### 6. Dryopteris Tribe.

- A. Indusium present.  
 B. Veins free, or with a single row of areoles along the mid-veins.  
 c. Indusia on the ends of veins which project beyond the margin of the lf. . . . . 40. *Deparia*.  
 CC. Indusia dorsal.  
 D. The indusium cordate or reniform, attached by the sinus, sometimes wanting. . . . . 41. *Dryopteris*.  
 DD. The indusium orbicular, peltate, attached by a central stalk. . . . . 42. *Polystichum*.  
 DDD. The indusium oval, fixed to a central elongate receptacle. . . . . 43. *Didymochlæna*.  
 BB. Veins anastomosing.  
 c. The indusium cordate or reniform, attached by the sinus. . . . . 44. *Tectaria*.  
 CC. The indusium peltate, attached by a central stalk; veins forming small areoles. . . . . 45. *Cyrtomium*.  
 AA. Indusium wanting.  
 B. Veins free. . . . . 46. *Phegopteris*.  
 BB. Veins anastomosing.  
 c. The main veins joined by arches which bear the curved sori. . . . . 47. *Gymnopteris*.  
 CC. The sori round, attached dorsally.  
 D. Sori distinct at maturity. . . . . 48. *Meniscium*.  
 DD. Sori confluent at maturity. . . . . 49. *Leptochilus*.

### 7. Davallia Tribe.

- A. Indusium attached at base only.  
 B. Pinnæ jointed to the rachis; lvs. simply pinnate; indusium circular or reniform. . . . . 50. *Nephrolepis*.  
 BB. Pinnæ not jointed to the rachis; lvs. jointed to the rootstock.  
 c. The indusium thick, coriaceous. . . . . 51. *Humata*.  
 CC. The indusium membranous. . . . . 52. *Leucostegia*.  
 AA. Indusium attached at both base and sides.  
 B. Lvs. jointed to the scaly rootstocks.  
 c. Shape of indusium tubular. . . . . 53. *Davallia*.  
 CC. Shape of indusium broader than long, forming a boat-shaped cavity on the edge of the segm. . . . . 54. *Loxoscaphe*.  
 BB. Lvs. not jointed to the rootstocks.  
 c. Indusia near the end of unmodified lf.-lobes.  
 D. Sorus formed on receptacles containing vascular tissues. . . . . 55. *Microlepia*.  
 DD. Sorus not formed on a special receptacle. . . . . 56. *Odontosoria*.  
 CC. Indusium united with the modified lf.-lobe to form a complete cup. . . . . 57. *Dennstaedtia*.

### 8. Woodsia Tribe.

- A. Lvs. uniform, plane; veins free.  
 B. Indusium beneath the sorus, breaking up into linear lobes. . . . . 58. *Woodsia*.  
 BB. Indusium extrorse, opening laterally with a hood-like lobe. . . . . 59. *Cystopteris*.  
 AA. Lvs. dimorphous, the sporophylls closely rolled together.  
 B. Veins free; lvs. in crowns. . . . . 60. *Matteuccia*.  
 BB. Veins anastomosing; lvs. scattered. . . . . 61. *Onoclea*.  
 Brainea, Compteris, and Lonchitis are briefly described.

### 219. GLEICHENIACEÆ.

Single genus in cultivation. . . . . *Gleichenia*.

### 220. CYATHEACEÆ.

- A. Sori borne on the apex of the veins: indusium extrorse, formed of a more or less modified marginal tooth and an inner lid-like scale. . . . . 1. *DICKSONIA* TRIBE.  
 AA. Sori borne dorsally on the veins or at the fork: indusium inferior, or wholly wanting. . . . . 2. *CYATHEA* TRIBE.

#### 1. Dicksonia Tribe.

- A. Tooth of spore-bearing segm. scarcely modified, about the size of the inner scale. . . . . 1. *Dicksonia*.  
 AA. Tooth of the spore-bearing segm. strongly modified, coriaceous like the inner scale and usually larger. . . . . 2. *Cibotium*.

#### 2. Cyathea Tribe.

- A. Indusium present, inferior.  
 B. The indusium at first inclosing the globular sorus, remaining cup-shaped or irregularly splitting at maturity. . . . . 3. *Cyathea*.  
 BB. The indusium membranous, semi-circular, more fully inclosing the sorus. . . . . 4. *Hemitelia*.  
 AA. Indusium wanting. . . . . 5. *Alsophila*.  
 Thyrsopteris, of another tribe, may be expected in cultivation and is briefly accounted for in this work.

### 221. CERATOPTERIDACEÆ.

Habit aquatic: single genus. . . . . *Ceratopteris*

### 222. SALVINIACEÆ.

- A. Lvs. minute, numerous, closely imbricated: sporocarps of 2 kinds, the larger globose, the smaller ovoid. . . . . 1. *Azolla*.  
 AA. Lvs. larger, fewer, distinct: sporocarps uniform, globose. . . . . 2. *Salvinia*.

### 223. MARSILEACEÆ.

In cultivation . . . . . *Marsilea*.

## NOTE

The foregoing index comprises only the names in the Key, not all those in the Cyclopædia. It is not intended that the Key shall include every small or incidental generic entry or paragraph in the volumes, for that would make it more involved and complicated. (See page 79.) At the end of some of the families the names of other genera are sometimes given, so far as these small entries were positively determined when the Key was made, for the purpose of aiding the student to a completer knowledge of the family or of advising him of entries that he might overlook. In the progress of the work, other minor or outlying or very recently introduced genera will undoubtedly be inserted, and such new definitions of genera may be made as will necessitate some shifting of names. All such additional entries will be accounted for, under their proper families, in the General Index at the close of Vol. VI.

## NAME-LIST

### ENGLISH EQUIVALENTS OF LATIN NAMES OF SPECIES

The technical or botanical name of a plant is a combination of two words,—the generic word, common to the entire group or genus; the specific or particular word, designating the given species: as *Briza maxima*, the large briza, *B. minor*, the small briza, and *B. media*, the intermediate briza. The second or species-word usually is an adjective descriptive of some feature of the plant, although it is sometimes geographical, as *Abies sibirica*, the Siberian abies, or commemorative, as *A. Fraseri*, Fraser's abies. Although the species-word is not always designative and is sometimes even inapplicable, nevertheless the student is aided if he knows what the word means in English translation; and the following list is inserted to supply this knowledge for characteristic Latin or Latinized descriptive adjectives (in some cases nouns in the genitive or in apposition) applied to the species of plants. These words are likely to be used in differing meanings in different genera and as applied by different authors; in many cases, they do not follow the usages of classical Latin: therefore a list of this kind cannot be exact or give all the meanings in which the words may be applied as specific names. The generic names (the first word in the combination) need not be listed here, for they are not adjectives of description but made-up substantives; and, moreover, their origins are explained at the entries in the text.

The species-adjective is made to agree with its genus in gender: thus the Latin adjective *aureus* (golden) takes the regular masculine termination in *Calochortus aureus*, because *Calochortus* is masculine; the feminine termination in *Albica aurea*; the neuter in *Acrostichum aureum*; in *Sorbus* it is feminine (*S. aurea*) even though the generic name is masculine in form, because most trees are feminine whatever the termination of the name. In the following list, for convenience most of the adjectives are printed in the masculine form. The leading exceptions are those that terminate in *-fer* and *-ger*, meaning "bearing," these being given in the feminine form.

The above examples illustrate prevailing terminations of species-words. Other adjectives have other forms, as *niger*, *nigra*, *nigrum* (black); *asper*, *aspera*, *asperum* (rough); *acaulis*, *acaulis* (stemless); the termination *-ensis* (belonging to, citizen of), as in *canadensis*, *canadense* (not *-um*). Commemorative personal species-names may be in the genitive or in the form of an adjective; as *Stanhopea Lindleyi*, Lindley's *stanhopea*; *Selenipedium Lindleyanum*, Lindleyan *selenipedium*. If the person's name ends in a hard consonant, the termination (under the recent Vienna code) is in double *i*, as *Canna Lambertii*. If for a woman, the termination is feminine, as *Acacia Wayæ*. Substantive names in apposition hold their own termination, and the word in such cases should begin with a capital letter, if it is a proper name or an old generic name, as *Hibiscus Sabdariffa*, *Artemisia Absinthium*, *Begonia Rex*. Such words are usually old generic names or prominent vernacular substantives, and they commonly record some historical connection of the plant.

In all the regular entries in the Cyclopædia the pronunciation is indicated (see explanation p. xii); but it is also indicated again in the following lists: when the emphatic syllable is indicated as ending in a vowel and with a grave accent, the vowel is pronounced long, as *acutifidus*, *pumilus*; when it ends in a consonant and is marked with an acute accent, the vowel is short, as *maximus*, *arvensis*. There are differences of practice in the pronouncing of many of the names in this list, but the list represents the method in this Cyclopædia; and if it should so happen that there are any inconsistencies between the list and the text, it is desired that the list shall hold.

Very many names are compounded from generic or subgeneric names, representing similarity or likeness to. These the reader will be able to recognize at once, and they need not be entered in this list. Examples are: *achilleaefolius*, achillea-leaved; *achilleoides*, achillea-like; *acrostichoides*, acrostichum-like; *bellidiflorus*, bellis-flowered; *lamiifolius*, lamium-leaved; *xiphoides*, xiphium-like; *tremuliformis*, tremula-formed or -shaped; *calciopsis*, calcaia-like; *atriplexis*, atriplex-like; *scillarix*, scilla-like.

The glossary, beginning page 160, will be helpful in giving other botanical equivalents and in accounting for other words that are sometimes applied as species-names.

**abbreviatus**: abbreviated, shortened.  
**abortivus**: aborted, parts failing.  
**abruptus**: abrupt, suddenly changing in shape or character.  
**abyssinus**: Abyssinian.  
**acaulis**: stemless.  
**acephalus**: headless.  
**acerbus**: acerb, harsh or sour (taste).  
**aceroides**: acer-like, maple-like.  
**aceroides**: needle-shaped.  
**aciculatus**: needle-like.  
**acidissimus**: exceedingly sour.  
**acidus**: acid, sour.  
**acinatus**: scimitar- or saber-shaped.  
**acris**: acrid, sharp.  
**aculeatus**: prickly.  
**acuminatus**: acuminate, long-pointed, tapering.  
**acutangulus**: acutely or sharply angled.  
**acutifidus**: acutely or sharply cut.  
**acutifolius**: acutely leaved, sharp-leaved.

**acutifolius**: acutely lobed.  
**acutipetalus**: petals acute or sharp (pointed).  
**acutus**: acute, sharp-pointed.  
**admirabilis**: admirable, noteworthy.  
**adnatus**: adnate, joined to.  
**adpressus**: pressed against.  
**adscendens**: ascending.  
**adsurgens**: rising to an erect position, ascending.  
**adunatus**: hooked.  
**advenus**: newly arrived, adventive.  
**ægyptiacus**: Egyptian.  
**æmulus**: emulative, imitating.  
**æneus**: brazen, bronze-colored.  
**æquinoctialis**: pertaining to the equinox.  
**æquipetalus**: equal-petaled.  
**æruginosus**: rusty, rust-colored.  
**æstivus**: summer.  
**æstivus**: summer.  
**æthiopicus**: Ethiopian, African.  
**affinis**: related (to another species).

**africanus**: African.  
**agavoides**: Agave-like.  
**ageratoides**: ageratum-like.  
**aggregatus**: aggregate, clustered.  
**agrorius**: of the fields.  
**agrestis**: of or pertaining to the fields.  
**aizoides**: aizoon-like (*Aizoon*, an evergreen or tenacious plant).  
**alatus**: winged.  
**albescens**: whitish, becoming white.  
**albicans**: whitish.  
**albicaulis**: white-stemmed.  
**albidus**: white.  
**albiflorus**: white-flowered.  
**albifrons**: white-fronched, white-herbaged.  
**albispinus**: white-spined.  
**albicinctus**: white-girdled, white-crowned.  
**albospicatus**: white-spiked.  
**albus**: white.  
**albicornis**: elk-horned.

alép picus: of Aleppo (in Syria).  
 alià ceus: of the alliums, garlic-like.  
 aloi des: aloe-like.  
 alpés tris: alpine.  
 alpi nus: alpine.  
 altà icus: of the Altai Mts. (S. Siberia).  
 altér nans: alternating.  
 altér nus: alternating, alternate.  
 âl tifróns: tall-fronded or -herbaged.  
 altis simus: very tall, tallest.  
 âl tus: tall.  
 amáb ilis: lovely.  
 amà rus: bitter.  
 ambíg uus: ambiguous, doubtful.  
 amelloi des: amellus-like.  
 americà nus: American.  
 amethýs tinus: amethystine, violet-colored.  
 amœ nus: charming, pleasing.  
 amphib ius: amphibious, growing both in water and on land.  
 amplexicàù lis: stem-clasping.  
 amphis simus: most or very ample.  
 âm plus: ample, large, extended.  
 amurén sis: of the Amur River region (E. Siberia).  
 amygdál inus: pertaining to or like amygdalus.  
 anacân thus: without spines.  
 anatól icus: of Anatolia (Asia Minor).  
 ân ceps: two-headed, two-edged.  
 andíc olus: native of the Andes.  
 andi nus: Andine, Andian, pertaining to the Andes.  
 andróg ynus: with both staminate and pistillate flowers in one cluster.  
 anfractuò sus: twisted.  
 ân glicus: English, pertaining to England.  
 angui nus: snaky, pertaining to serpents.  
 angulà ris: angular, angled.  
 angulà tus: angular, angled.  
 angulò sus: angular, angled.  
 angús tus: narrow.  
 annòt inus: year-old.  
 annulà ris: annular, ringed.  
 annulà tus: annular.  
 ân nuus: annual, living but one year.  
 anóm alus: anomalous, out of the ordinary or usual.  
 antillà ris: of the Antilles (W. Indies).  
 antíp odum: of the antipodes.  
 antiquò rum: of the ancients.  
 anti quus: ancient.  
 apenni nus: pertaining to the Apennines (Italy).  
 apér tus: uncovered, bare.  
 apét alus: without petals.  
 apýl lus: leafless.  
 apiculà tus: apiculate, tipped with a point.  
 appendiculà tus: appendaged, bearing an extension or additional part or process.  
 applanà tus: flattened.  
 applicà tus: joined, attached.  
 âp terus: wingless.  
 aquát icus, aquát ilis: aquatic.  
 â queus: aqueous, watery.  
 aquil nus: aquiline, pertaining to the eagle.  
 aráb icus: Arabian.  
 arachnoi des: spider-like, cobwebby.  
 arborés cens: becoming tree-like, woody.

arbò reus: tree-like.  
 ârc ticus: arctic.  
 arcuà tus: bow-like, bowed.  
 arenà rius: of sand or sandy places.  
 areolà tus: areolate, pitted.  
 argentà tus: silvery, silvered.  
 argén tus: silvery.  
 argophýl lus: silver-leaved.  
 argù tus: sharp-toothed.  
 argyræ us: silvery.  
 âr idus: arid.  
 arietì nus: like a ram's head.  
 aristà tus: aristate, bearded.  
 aristò tus: bearded.  
 armà tus: armed (as with thorns).  
 aromát icus: aromatic.  
 arrect us: raised up, erect.  
 articulà tus: articulated, jointed.  
 arundinà ceus: reed-like.  
 arvén sis: pertaining to cultivated fields.  
 ascén dens: ascending.  
 asiát icus: Asian.  
 ás per: rough.  
 asperà tus: rough.  
 aspericàù lis: rough-stemmed.  
 aspér rimus: very rough.  
 assím ilis: similar, like to.  
 assúr gens: assurgent, clambering.  
 â ter: coal-black.  
 atlánt icus: Atlantic, growing in Atlantic regions.  
 atrà tus: blackened.  
 atropurpù reus: dark purple.  
 atrór ubens: dark red.  
 atrosanguín eus: dark blood-red.  
 atróv irens: dark green.  
 attenuà tus: attenuated, produced to a point.  
 ât ticus: pertaining to Attica or Athens, Greek.  
 augustís simus: very notable.  
 augúst us: august, notable, majestic.  
 aurantí acus: orange-red.  
 aurè olus: golden.  
 àu reus: golden.  
 auriculà tus: auricled, eared.  
 australièn sis: belonging to Australia.  
 austrà lis: southern.  
 austri acus: Austrian.  
 autumnà lis: autumnal.  
 axillà ris: axillary, borne in the axils, pertaining to the axils.  
 azù reus: azure, sky-blue.

baccà tus: berried.  
 baccíf era: berry-bearing.  
 baleár icus: Balearian, of the Balearic Islands.  
 balsà meus: balsamic, balsam-like, with balsam odor.  
 balsamíf era: balsam-bearing.  
 bambusoi des: bambusa-like, bamboo-like.  
 banát icus: of Banat (S. Hungary).  
 barbadén sis: of Barbadoes.  
 bár barus: foreign, from a strange country.  
 barbà tus: barbed, bearded.  
 barbíg era: bearing barbs or beards.  
 basilà ris: pertaining to the base or bottom.  
 bél lus: handsome.  
 benedic tus: blessed.  
 benghalén sis: of Bengal (E. India).  
 betuloi des: Betula-like, birch-like.

bicarinà tus: twice-keeled, with two keels.  
 bic olor: two-colored.  
 bicór nis: two-horned.  
 bicornù tus: two-horned.  
 bidentà tus: two-toothed.  
 bién nis: biennial, living only two years.  
 bif idus: twice cut, in two parts.  
 biflò rus: two-flowered.  
 bifurcà tus: twice-forked.  
 bigib bus: with two swellings or projections.  
 bigiù mis: two-glumed.  
 bij ugus: yoked two together, joined, fastened together.  
 bíl obus: two-lobed.  
 binà tus: twin, double, two-and-two.  
 binér vis: two-nerved.  
 binoculà ris: binocular, two-eyed, two-spotted.  
 biparti tus: two-parted.  
 bipét alus: two-petaled.  
 bipinnatíf idus: bipinnatifid, twice pinnately cut.  
 bipinnà tus: bipinnate, twice pinnate.  
 bipunctà tus: two-spotted.  
 biséc tus: cut in two parts.  
 bispinò sus: two-spined.  
 biternà tus: twice ternate.  
 blán dus: bland, mild.  
 bô nus: good.  
 borbón icus: of Bourbonne (in N. E. France).  
 boreà lis: northern.  
 botryoi des: cluster-like, grape-like.  
 brachià tus: brachiate, branched at right angles.  
 brachýp odus: short-stalked.  
 bracteà tus: bracteate, bearing bracts.  
 bracteò sus: bract-bearing.  
 brevicàù lis: short-stemmed.  
 brév ifrons: short-fronded, short-leaved.  
 brév ipes: short-footed, as with short pedicel or petiole.  
 breviròs tris: short-beaked.  
 brè vis: short.  
 brevisè tus: short-bristled.  
 brevis pathus: short-spated.  
 brevis simus: very short, shortest.  
 brilliantís simus: most brilliant, very brilliant.  
 brún neus: deep brown.  
 bucéph alus: ox-headed.  
 bufò nius: pertaining to the toad.  
 bulbíf era: bulb-bearing.  
 bulbò sus: bulbous.  
 bullà tus: inflated, swelling, puckered, bullate.  
 byzanti nus: Byzantine (of the Constantinople region).

cæulés cens: becoming or turning dark blue.  
 cærù leus: cerulean, dark blue.  
 cæ sius: bluish gray.  
 cæspitò sus: caespitose, tufted, growing in low dense clumps.  
 cáf fer, caffra: Kafir.  
 caláb ricus: from Calabria (in S. Italy).  
 calathi nus: basket-like.  
 calcarà tus: spurred, with spurs.  
 calcà reus, of or pertaining to lime.  
 callò sus: thick-skinned, with callosities.

**calvus**: bald, hairless.  
**calycinus**: calyx-like.  
**calyculatus**: calyx-like, calyx-bearing, fruit inclosed in a calyx.  
**cámbricus**: Cambrian, Welsh.  
**campanulatus**: campanulate, bell-shaped.  
**campes tris**: of the fields or plains.  
**canadensis**: Canadian.  
**canaliculatus**: channeled, grooved.  
**canariensis**: of the Canary Isls.  
**candidans**: white, hoary, particularly white-hairy or white-woolly.  
**candidissimus**: very white-hairy or hoary.  
**cantabricus**: from Cantabria (in Spain).  
**candidus**: white, white-hairy, shining.  
**canescens**: gray-pubescent.  
**caneus**: ash-colored, hoary.  
**capensis**: of the Cape (of Good Hope).  
**capillaris**: hair-like.  
**capreolatus**: winding, twining.  
**capsularis**: capsular.  
**cardinalis**: cardinal.  
**carinata**: keeled.  
**carneus**: flesh-colored.  
**carnosus**: fleshy.  
**carolinensis**: Carolinian, pertaining to North or South Carolina, or indefinitely to the Carolinas.  
**carpathicus**: of the Carpathian region (Europe).  
**cartilagineus**: like cartilage.  
**caryophyllaceus**: clove-like; perhaps also pertaining to the pink family.  
**cashmeria nus**: of Cashmere (Asia).  
**catharticus**: cathartic.  
**cathayanus**: of Cathay (China).  
**caucasicus**: belonging to the Caucasus (mountain region between the Black and Caspian Seas).  
**caudatus**: caudate, tailed.  
**caulescens**: caulescent, having a stem or stems.  
**cauliflorus**: stem-flowered.  
**cenisus**: of Mt. Cenis (between France and Italy).  
**cephalatus**: headed, bearing heads.  
**cerasiflorus**: cherry-formed.  
**cerefolius**: wax-leaved.  
**ceriferus**: wax-bearing.  
**ceruus**: bending forward, inclined, drooping, nodding.  
**ceylanicus**: of Ceylon; same as *zeylanicus*.  
**chalcedonicus**: of Chalcedon (on the Bosphorus).  
**chilensis**: belonging to Chile.  
**chinensis**: belonging to China.  
**chloranthus**: green-flowered.  
**chrysanthus**: golden-flowered.  
**chrysocarpus**: golden-fruited.  
**chrysophyllus**: golden-leaved.  
**chrysotomus**: golden-mouthed, golden-throated.  
**ciliaris**: ciliate, fringed with hairs on the margin.  
**ciliatus**: ciliate, hairy fringed.  
**cilicicus**: of Cilicia (in S. E. Asia Minor).  
**cinctus**: girded, girdled.  
**cinereus**: ash-colored.  
**cinnabarinus**: cinnabar-red.  
**cinnamomeus**: cinnamon-brown.  
**circinatus**: circinate, coiled.

**cirrhus**: tendrilled.  
**citratus**: citrus-like.  
**citrinus**: citron-colored or -like.  
**clandestinus**: concealed.  
**clavatus**: clavate, club-shaped.  
**clematideus**: pertaining to or like clematis.  
**clypeatus**: with a shield.  
**cocciferus**: berry-bearing.  
**coccineus**: scarlet.  
**cochlearis**: spoon-like.  
**cochlearatus**: spoon-like.  
**coelestis**: sky-blue.  
**celestis**: celestial, sky-blue.  
**collinus**: pertaining to a hill.  
**coloratus**: colored (other than green).  
**coma tus**: with coma or hair.  
**communis**: common, general, gregarious.  
**commutatus**: changed or changing.  
**comatus**: with long hair.  
**compactus**: compact, dense.  
**complexus**: circled, embraced.  
**complicatus**: complicate; page 162.  
**compressus**: compressed.  
**compositus**: adorned, ornamented.  
**concavus**: concave, hollowed out.  
**concinus**: neat, well made.  
**concolor**: colored similarly.  
**condensus**: condensed, crowded.  
**confertus**: crowded.  
**confertus**: similar, like to.  
**confusus**: confused, uncertain (as to characteristics).  
**congestus**: congested, brought together.  
**conglomeratus**: conglomerate, crowded together.  
**coniferus**: cone-bearing.  
**conjungatus**: connected, joined together.  
**conoides**: conoid, cone-like.  
**consolidus**: consolidated, solid, stable.  
**conspicuus**: conspicuous, marked.  
**constrictus**: constricted.  
**contiguus**: contiguous, near together.  
**contortus**: contorted, twisted.  
**contractus**: contracted.  
**coralliflorus**: coral-flowered.  
**corallinus**: coral-red.  
**cordatus**: cordate, heart-shaped.  
**cordifolius**: cordate-leaved, heart-leaved.  
**coriaceus**: leathery.  
**corniculatus**: horned.  
**cornigerus**: horn-bearing.  
**cornutus**: horned.  
**coronarius**: used for or belonging to garlands.  
**coronatus**: crowned.  
**corrugatus**: corrugated, wrinkled.  
**corsicus**: Corsican (island in the Mediterranean).  
**corticatus**: heavily furnished with bark.  
**coruscans**: vibrating, glittering.  
**corymbiferus**: corymb-bearing.  
**corymbosus**: corymbose.  
**costatus**: costate, ribbed.  
**crassicaulis**: thick-stemmed.  
**crassifolius**: thick-leaved.  
**crasipes**: thick-footed or -stalked.  
**crassus**: thick, fleshy.  
**crenatus**: crenate, scalloped.  
**crenulatus**: crenulate, somewhat scalloped.

**crepidatus**: sandaled, slippereq.  
**crepitans**: rattling, rustling.  
**cretaceus**: cretaceous, pertaining to chalk.  
**creticus**: of Crete (island in Eastern Mediterranean).  
**crinitus**: hairy, provided with hair.  
**crispus**: crisped, curled.  
**cristatus**: cristate, crested.  
**crocatus**: saffron-yellow.  
**croceus**: saffron-colored, yellow.  
**cruciatus**: cruciate, cross-like.  
**cruciferus**: cross-bearing.  
**cruentus**: bloody.  
**crystalinus**: crystalline.  
**cubensis**: Cuban.  
**cucullatus**: hooded.  
**cultratus**: cultrate, knife-shaped.  
**cuneatus**: cuneate, wedge-shaped.  
**cuneifolius**: wedge-leaved.  
**cuneiformis**: wedge-formed.  
**cupreus**: copper-like or -colored.  
**curvatus**: curved.  
**cuspidatus**: cuspidate, with a cusp or sharp stiff point.  
**cyaneus**: blue.  
**cylindricus**: cylindrical.  
**cylin dricus**: cylindrical.  
**cymbiflorus**: boat-formed.  
**cymosus**: cymed, having a cyme or cymes.  
**cypreus**: copper-like; see *cupreus*.  
**dactyliferus**: finger-bearing.  
**dahuricus**, **davuricus**: Of Dahuria or Dauria (in Trans-Baikal Siberia, near the frontier of China).  
**dalmaticus**: Dalmatian (on eastern side of the Adriatic).  
**damascenus**: of Damascus.  
**dasycarpus**: thick-fruited.  
**dealbatus**: whitened, white-washed.  
**debilis**: weak, frail.  
**decandrus**: ten-stamened.  
**decapetalus**: ten-petaled.  
**deciduus**: deciduous, with parts falling.  
**decepiens**: deceptive.  
**declinatus**: declined, bent downward.  
**decolorans**: discoloring, staining.  
**decompositus**: decompound, more than once compound or divided.  
**decorans**: adorning.  
**decorus**: elegant, comely, becoming.  
**decumbens**: decumbent, reclining at the base but the top or tips upright.  
**decurrens**: decurrent, as a leaf extending down the stem.  
**deflexus**: deflexed, bent abruptly downward.  
**deformis**: misshapen, deformed.  
**delicatus**: chosen.  
**delicatissimus**: most or very delicate.  
**delicatus**: delicate, tender.  
**deliciosus**: delicious.  
**deltoides**: deltoid, triangular.  
**demissus**: low, weak.  
**dendroides**: tree-like.  
**densiflorus**: densely flowered.  
**densus**: dense.  
**dentatus**: toothed.  
**denticulatus**: denticulate, slightly toothed.  
**dentosus**: toothed.  
**denudatus**: denuded, naked.

**depauperà tus:** depauperate, starved, dwarfed.  
**depén dens:** hanging down.  
**deprés sus:** depressed.  
**deús tus:** burned.  
**devastà tor:** (feminine *devastatrix*): devastating, laying waste.  
**diacàn thus:** two-spined.  
**diadè ma:** a diadem, crown.  
**dián drus:** with two stamens.  
**diàph anus:** diaphanous, very thin, transparent.  
**dichôt omus:** forked, two-branched equally.  
**dich rois:** of two colors.  
**dicóc cus:** with two berries.  
**díd ymus:** in a pair, as of anthers.  
**diffór mis:** of differing forms.  
**diffù sus:** diffuse, spreading.  
**digità tus:** digitate, compound in form like the fingers.  
**dilatà tus:** dilated, expanded.  
**dilà tus:** dilated, spread out.  
**dimidià tus:** halved, in two equal parts.  
**dimór phus:** dimorphous, two-formed.  
**dì odon:** with two teeth.  
**dioi cus:** dicecious.  
**dipét alus:** two-petaled.  
**diphýl lus:** two-leaved.  
**dipsà ceus:** of the teasel or Dipsacus.  
**discoíd eus:** discoid, rayless.  
**dís color:** of two or of different colors.  
**dís par:** dissimilar, unlike.  
**disséc tus:** dissected, deeply cut.  
**dissím ilis:** dissimilar, unlike.  
**dissitiflò rus:** remotely or loosely flowered.  
**distà chyus:** two-spiked.  
**dís tans:** distant, separate, remote.  
**dís tichus:** two-ranked, with leaves or flowers in ranks on opposite sides of stem.  
**dis tylus:** two-styled.  
**diúr nus:** day-flowering.  
**divaricà tus:** divaricate, spreading, widely divergent.  
**divér gens:** diverging, wide-spreading.  
**diversiflò rus:** diversely flowered, variable-flowered.  
**diversiflò lius:** variable-leaved.  
**divi sus:** divided, separated.  
**dodecán drus:** twelve-stamened.  
**dolabrifór mis:** hatchet- or ax-shaped.  
**dolò sus:** deceitful.  
**domés ticus:** domestic, domesticated.  
**drupà ceus:** drupe-like.  
**drupif era:** drupe-bearing.  
**dù bius:** dubious, doubtful.  
**dúl cis:** sweet.  
**dumetò rum:** of bushes or hedges.  
**dumò sus:** bushy.  
**dù plex:** double.  
**duplicà tus:** duplicate, double.  
**duráb ilis:** durable, lasting.  
**durác inus:** hard-berried.  
**duriús culus:** somewhat hard or rough.

**ebenà ceus:** ebony-like.  
**ebractea tus:** bractless.  
**ebúr neus:** ivory-white.  
**echinà tus:** bristly, prickly.  
**echinocáp pus:** prickly-fruited.  
**echinosér alus:** prickly-sepaled.  
**ecornù tus:** hornless.

**edù lis:** edible.  
**effù sus:** very loose-spreading.  
**elás ticus:** elastic.  
**elà tior:** taller.  
**elà tus:** tall.  
**él egans:** elegant.  
**elegantis simus:** most elegant, very elegant.  
**elephán tum:** of the elephants.  
**ellíp ticus:** elliptical.  
**elongà tus:** elongated, lengthened.  
**emarginà tus:** emarginate, with a shallow notch at the apex.  
**emét icus:** emetic.  
**ém inens:** eminent, prominent.  
**enneaphýl lus:** nine-leaved.  
**ensà tus:** sword-shaped.  
**ensiflò lius:** sword-leaved.  
**ensifór mis:** sword-formed or -shaped.  
**entomóph ilus:** insect-loving.  
**equés tris:** pertaining to the horse.  
**equi nus:** of horses.  
**eréc tus:** erect, upright.  
**erian thus:** woolly-flowered.  
**ericoi des:** erica-like, heath-like.  
**eriocár pus:** woolly-fruited.  
**eriocéph alus:** woolly-headed.  
**erò sus:** erose, jagged, as if gnawed.  
**errát icus:** erratic, unusual, sporadic.  
**erubés cens:** blushing.  
**erythrocar pus:** red-fruited.  
**erythroceph alus:** red-headed.  
**erythròp odus:** red-footed, red-stalked.  
**erythròp terus:** red-winged.  
**esculén tus:** esculent, edible.  
**estrià tus:** without stripes.  
**etuberò sus:** without tubers.  
**europæ us:** European.  
**exaltà tus:** exalted, very tall.  
**excavà tus:** excavated, hollowed out.  
**excél lens:** excellent, excelling.  
**excél sus:** tall.  
**exci sus:** excised, cut away.  
**exig uus:** little, small, poor.  
**exim ius:** distinguished, out of the ordinary.  
**exitò sus:** pernicious, destructive.  
**exolè tus:** mature, fully grown, dying away.  
**exòt icus:** exotic, from another country.  
**expán sus:** expanded.  
**exsculp tus:** dug out, carved out.  
**exsér tus:** exerted, protruding from.  
**exsúr gens:** rising up, standing up.  
**extén sus:** extended.  
**exù dans:** exuding.

**fabà ceus:** faba-like, bean-like.  
**falcà tus:** falcate, sickle-shaped or scythe-shaped.  
**falciflò lius:** falcate-leaved.  
**falcifór mis:** sickle-formed.  
**fál lax:** deceptive.  
**farinà ceus:** containing farina or starch, or like flour; perhaps also farinose.  
**farinif era:** farina-bearing.  
**farinò sus:** farinose, mealy, powdery.  
**fascià tus:** fasciate, abnormally flattened and broadened.  
**fasciculà ris:** fascicled, clustered, brought together.  
**fasciculà tus:** fascicled.  
**fascinà tor:** fascinating, charming.

**fastigià tus:** fastigiate, branches erect and close together.  
**fastuò sus:** proud.  
**febrif ugus:** febrifuge, fever-dispelling.  
**fenestrà lis:** with window-like openings.  
**fè rox:** ferocious; very thorny.  
**fér reus:** pertaining to iron.  
**ferrugin eus:** rusty, of the color of iron rust.  
**fér tilis:** fertile, fruitful.  
**festi vus:** festive, gay, bright.  
**fibrò sus:** fibrous, bearing prominent fibers.  
**ficoid eus:** fig-like.  
**filamentò sus:** filamentous, composed of threads or bearing threads.  
**filicà tus:** fern-like, ferny.  
**filiciflò lius:** fern-leaved.  
**filici nus:** fern-like.  
**filicoi des:** fern-like.  
**filif era:** bearing filaments or threads.  
**filiflò lius:** thread-leaved, with leaves cut into thread-like divisions.  
**filifór mis:** filiform, thread-like.  
**fil ipes:** with stalks thread-like.  
**fimbrià tus:** fimbriated, fringed.  
**firmà tus:** firm, made firm.  
**fír mus:** firm, strong.  
**fissiflò lius:** split-leaved.  
**fís silis:** fissile, cleft or split.  
**fís sus:** cleft, split.  
**fistulò sus:** fistular, hollow-cylindrical.  
**flabellà tus:** flabellate, with fan-like parts.  
**flabellifór mis:** fan-formed.  
**flác cidus:** flaccid, soft.  
**flagellà ris:** flagellate, whip-like.  
**flagellà tus:** whip-like.  
**flagellifór mis:** whip-formed.  
**flagél lum:** a scourge or flail.  
**flám meus:** flame-colored.  
**flavés cens:** yellowish, becoming yellow or yellowish.  
**flavic omus:** yellow-wooled or -haired.  
**fláv idus:** yellow, yellowish.  
**flavispi nus:** yellow-spined.  
**flavís simus:** very yellow, deep yellow.  
**flà vus:** yellow.  
**fléx ilis:** flexible, pliant.  
**flexuò sus:** flexuose, tortuous, zig-zag.  
**flocçò sus:** woolly.  
**flò re-ál bo:** with white flowers.  
**florenti nus:** Florentine.  
**flò re-plè no:** with full or double flowers.  
**floribún dus:** free-flowering, blooming profusely.  
**flór idus:** flowering, full of flowers.  
**flù itans:** floating.  
**fluviat ilis:** pertaining to a river.  
**fém ina:** female.  
**fœniculà ceus:** fennel-like.  
**fœtidis simus:** very fetid.  
**fœt idus:** fetid, bad-smelling.  
**folià tus:** with leaves.  
**foliolà tus:** with leaflets.  
**foliò sus:** leafy, full of leaves.  
**folliculà ris:** bearing follicles, follicled.  
**forficà tus:** shear-shaped.  
**formicæfór mis:** ant-shaped, ant-like.  
**formosis simus:** most or very beautiful.  
**formò sus:** beautiful, handsome.

**foveà tus:** pitted.  
**frág ilis:** fragile, brittle.  
**frà grans:** fragrant, odorous.  
**fragrantis simus:** very fragrant.  
**fraxín eus:** fraxinous, like *Fraxinus* or ash trees.  
**fríg idus:** cold, of cold regions.  
**frondò sus:** fronded, leafy.  
**fructif era:** fruit-bearing, fruitful.  
**fructig enus:** fruitful.  
**frutés cens:** shrubby, bushy.  
**fruticò sus:** fruticose, shrubby, bushy.  
**fucà tus:** painted, dyed.  
**fù gax:** swift.  
**fúl gens:** shining, glistening.  
**fulg idus:** fulgid, shining.  
**fuliginò sus:** black-painted or -colored, sooty.  
**fulvès cens:** fulvous or becoming fulvous.  
**fúlvus:** fulvous, tawny, orange-gray-yellow.  
**funà lis:** of a rope or cord.  
**fù nebris:** funereal.  
**fungò sus:** fungous, pertaining to a fungus, spongy.  
**funiculà tus:** of a slender rope or cord; with a funicle (stalk of an ovule or seed).  
**fúr cans:** forked.  
**furcà tus:** furcate, forked.  
**fús cus:** fuscous, brown, dusky.  
**fusifór mis:** spindle-shaped.  
**galericulà tus:** helmet-like.  
**gál licus:** of Gaul or France; also pertaining to a cock or rooster.  
**gandavén sis:** belonging to Ghent, Belgium.  
**gargán icus:** belonging to Gargano (Eastern Italy).  
**gél idus:** ice-cold.  
**geminà tus:** twin.  
**geminiflò rus:** twin-flowered.  
**gemmà tus:** gemmed, jewelled; also bearing buds.  
**gemmaf era:** bud-bearing.  
**genevén sis:** belonging to Geneva.  
**geniculà tus:** jointed, kned.  
**geoi des:** of the earth.  
**geomét ricus:** geometrical, in a pattern.  
**germán icus:** German, of Germany.  
**gibberò sus:** humped, hunchbacked.  
**gibbiflò rus:** gibbous-flowered.  
**gibbò sus:** swollen on one side.  
**gib bus:** gibbous, swollen on one side.  
**gigantè us:** gigantic, very large.  
**gigánt icus:** gigantic.  
**gi gas:** of giants, immense.  
**glabél lus:** smoothish.  
**glà ber:** glabrous, smooth.  
**glabér rimus:** most smooth, smoothest.  
**glabrà tus:** somewhat glabrous or smooth.  
**glabrés cens:** smoothish, or becoming so.  
**glacià lis:** icy, frozen.  
**gladià tus:** sword-like.  
**glandulif era:** gland-bearing.  
**glandulò sus:** glandular.  
**glastiflò lius:** with leaves like the dyer's woad (*Isatis*, once called *Glastum*).  
**glaucés cens:** glaucescent, becoming glaucous.

**glauciflò lius:** glaucous-leaved.  
**glaucophýl lus:** glaucous-leaved.  
**glau cus:** glaucous, with a bloom, grayish.  
**globò sus:** globose, spherical, nearly or quite globular.  
**globulà ris:** of a little ball or sphere.  
**globulif era:** globule-bearing, globe-bearing.  
**globulò sus:** globuled, like a little ball.  
**glomerà tus:** glomerate, clustered.  
**gloriò sus:** glorious, superb.  
**glumà ceus:** glumed, with glumes or glume-like structures.  
**glutinò sus:** glutinous, gluey, sticky.  
**gongylò des:** roundish.  
**gracilén tus:** slender.  
**grác ilis:** graceful, slender.  
**gracil limus:** graceful, very slender.  
**grà cus:** of Greece, Greek.  
**gramín eus:** grassy, grass-like.  
**graminiflò lius:** grass-leaved.  
**grán diceps:** large-headed.  
**grandicús pis:** with large cusps or points.  
**grandidentà tus:** large- or big-toothed.  
**grandiflò rus:** large-flowered.  
**grandiflò lius:** large-leaved.  
**grandifór mis:** on a large scale, of a big kind.  
**grandipunctà tus:** with large spots.  
**grán dis:** large, big.  
**granulà tus:** granulate, covered with minute grains.  
**granulò sus:** granulate, granulose.  
**grátis simus:** very pleasing or agreeable.  
**grà tus:** pleasing, agreeable.  
**gravè olens:** heavy-scented.  
**grœnlând icus:** of Greenland.  
**guianén sis:** of Guiana (South America).  
**guineén sis:** of Guinea (Africa).  
**gummif era:** gum-bearing.  
**guttà tus:** spotted, speckled.  
**gymnocár pus:** naked-fruited.  
**gy rans:** gyrating, revolving in a circle.

**hæmán thus:** blood-red-flowered.  
**hamà tus:** hooked.  
**hamò sus:** hooked.  
**harpophýl lus:** sickle-leaved.  
**hastà tus:** hastate, spear-shaped.  
**hastif era:** spear-bearing.  
**hastí lis:** of a javelin or spear.  
**hebecár pus:** pubescent-fruited.  
**hederà ceus:** of the ivy (*Hedera*).  
**helían thus:** sunflower.  
**helvét icus:** Swiss, of *Helvetia* (Switzerland).  
**hél volus:** pale yellow.  
**hemisphær icus:** hemispherical.  
**heptaphýl lus:** seven-leaved.  
**herbà ceus:** herbaceous, dying to the ground and not woody.  
**herbariò rum:** of the herbaria.  
**heteracán thus:** various-spined.  
**heterán thus:** various-flowered, variable in flowers.  
**heterocár pus:** various-fruited.  
**hetér odon:** various-toothed.  
**heteroglòs sus:** various-tongued.  
**heteromór phus:** various in form.  
**heterophýl lus:** various-leaved, with leaves of more than one shape.  
**hexagonóp terus:** six-angled-winged.

**hexagò nus:** hexagonal, six-angled.  
**hexapét alus:** six-petaled.  
**hi ans:** open, gaping.  
**hibernà lis:** of or pertaining to winter.  
**hibér nicus:** Hibernian, of or pertaining to Ireland.  
**hieroglýph icus:** hieroglyphic, marked as if with signs.  
**himalà icus:** Himalayan.  
**hirci nus:** of a goat, with a goat's odor.  
**hirsutis simus:** very hairy, most hairy.  
**hirsù tulus:** somewhat hirsute or hairy.  
**hirsù tus:** hirsute, hairy.  
**hirtél lus:** somewhat hairy.  
**hirtiflò rus:** hairy-flowered.  
**hír tipes:** hairy-stalked or -stemmed.  
**hír tus:** hairy.  
**hispán icus:** Spanish, of Spain.  
**hispidis simus:** most or very bristly.  
**hispid ulus:** somewhat hispid or bristly.  
**hís pidus:** hispid, bristly.  
**histrión icus:** histrionic, pertaining to the stage or to actors.  
**holoseríc eus:** woolly-silky.  
**horizontà lis:** horizontal.  
**hór ridus:** provided with spines or barbs, prickly.  
**hortén sis:** belonging to the hortus or garden.  
**hortic olus:** a little garden; of the garden.  
**hortò rum:** of gardens.  
**hortulà nus:** pertaining to a garden.  
**humiflò sus:** sprawling on the ground.  
**hù milis:** low-growing, dwarf.  
**hyacínth inus:** hyacinthine, sapphire-colored.  
**hyacinthoi des:** like the hyacinth.  
**hyál inus:** transparent, translucent.  
**hýb ridus:** hybrid, mixed, mongrel.  
**hyemà lis:** of winter; also *hiemalis*.  
**hygromét ricus:** hygrometric, taking up water.  
**hymenán thus:** membranaceous-flowered.  
**hymenò des:** membrane-like.  
**hyperbò reus:** far northern.  
**hypocraterifór mis:** salver-shaped, flower with a slender cylindrical tube and flat spreading limb.  
**hypogæ us:** underground, subterranean.  
**hypoglaù cus:** glaucous beneath.  
**hypoleù cus:** whitish, pale.  
**hypophýl lus:** under the leaf.  
**hýs trix:** porcupine-like, bristly.  
**ián thinus:** violet, violet-blue.  
**ibér icus:** of Iberia (the Spanish peninsula).  
**icosán drus:** twenty-stamened.  
**igné cens:** fiery.  
**íg neus:** fiery.  
**iliciflò lius:** ilex-leaved, holly-leaved.  
**illustrà tus:** pictured.  
**illús tris:** bright, brilliant, lustrous.  
**illýr icus:** of Illyria (*Grecian Peninsula*).  
**imbér bis:** without beards or spines.  
**im bricans:** imbricating.  
**imbricà tus:** imbricated, lapping over, shingled.  
**immaculà tus:** immaculate, spotless.

**immér sus:** immersed, under water.  
**imperâ tor:** commanding, imperious.  
**imperiâ lis:** imperial, kingly.  
**impléx us:** implicated, interwoven.  
**imprês sus:** impressed, sunken in.  
**inæqualifô lius:** unequal-leaved.  
**inæquâ lis:** unequal.  
**inæquilât erus:** unequal-sided.  
**incâ nus:** hoary.  
**incarnâ tus:** flesh-colored.  
**incér tus:** uncertain, doubtful.  
**incisifô lius:** cut-leaved.  
**inci sus:** incised, cut.  
**inclinâ tus:** inclined, bent downward.  
**incomparâb ilis:** incomparable, excelling.  
**incômp tus:** rude, unadorned, not attractive.  
**inconspíc uus:** inconspicuous, not prominent.  
**incurvâ tus:** incurved, bent inward.  
**incúr vus:** incurved.  
**indentâ tus:** indented, dented  
**în dicus:** Indian, of India or the East Indies.  
**indivî sus:** undivided.  
**inér mis:** unarmed, without thorns or spines.  
**infectô rius:** used for dying, pertaining to dyes.  
**infês tus:** dangerous, unsafe.  
**inflâ tus:** inflated, swollen up.  
**infortunâ tus:** unfortunate.  
**infrâc tus:** broken.  
**infundibulifôr mis:** funnel-shaped, trumpet-shaped.  
**infundib ulum:** a funnel.  
**inodô sus:** without odor, scentless.  
**inornâ tus:** without ornament, not showy.  
**în quians:** polluting, discoloring.  
**inscrip tus:** inscribed, written on.  
**insig nis:** remarkable, distinguished, marked.  
**insitî ius:** grafted.  
**intâc tus:** intact, untouched.  
**în teger:** entire.  
**intégér rimus:** very entire.  
**integrifô lius:** entire-leaved.  
**interjéc tus:** interjected, put between.  
**intermê dius:** intermediate.  
**interrûp tus:** interrupted.  
**intertéx tus:** interwoven, intertwined.  
**intricâ tus:** intricate, entangled.  
**intrôr sus:** introrse, turned inward.  
**intumés cens:** swollen, puffed up, tumid.  
**întybâ ceus:** pertaining to chicory (Intybus).  
**inver sus:** inverse, turned over, upside down.  
**invis sus:** unseen, overlooked.  
**involucrâ tus:** involucred, with an involucre.  
**involut sus:** involute, rolled inward.  
**ionân thus:** with flowers like the violet.  
**ionóp terus:** with wings like the violet.  
**iridês cens:** iridescent, changing color at different angles.  
**iridiflô rus:** iris-flowered.  
**irregulâ ris:** irregular.  
**isân drus:** with equal stamens.  
**isopét alus:** equal-petaled.  
**isophýl lus:** equal-leaved.  
**ital icus:** Italian.

**jamaicén sis:** of Jamaica.  
**japón icus:** Japanese, of Japan.  
**jasmin eus:** jasmine-like.  
**jasminiflô rus:** jasmine-flowered.  
**javân icus:** Javan, of Java.  
**jubâ tus:** crested, with a mane.  
**jucún dus:** agreeable, pleasing.  
**jugô sus:** joined, yoked.  
**jún ceus:** Juncus-like, rush-like.

**kashmiriâ nus:** of Cashmere or Kashmere.  
**kewén sis:** belonging to Kew (Kew Gardens, England).  
**koraiâ nus:** of Corea; also *coreanus*.

**labiâ tus:** labiate, lipped.  
**labiô sus:** lipped.  
**lâch ryma:** a tear.  
**laciniâ tus:** laciniate, torn, cut or slashed into narrow lobes.  
**lacinio sus:** laciniöse, laciniate.  
**lactâ tus:** milky.  
**lâc teus:** milk-white.  
**lactíc olor:** milk-colored.  
**lactíf era:** milk-bearing, milky-juiced.  
**lactiflô rus:** flowers milk-colored.  
**lacunô sus:** with holes or pits.  
**lacús tris:** pertaining to lakes.  
**ladanif era:** ladanum-bearing.  
**lâtev irens:** light green, vivid green.  
**lâe tus:** bright, vivid.  
**lævicaû lis:** smooth-stemmed.  
**lævigâ tus:** smooth.  
**læv ipes:** smooth-footed, smooth-stalked.  
**lâe vis:** smooth.  
**lævîus culus:** smoothish, somewhat smooth.  
**lanâ tus:** woolly.  
**lanceolâ tus:** lanceolate.  
**lân ceus:** lance-like.  
**lancifô lius:** lance-leaved.  
**lanig era:** wool-bearing.  
**lanuginô sus:** woolly, downy.  
**lappâ ceus:** pertaining to a globular hooked bur; Lappa-like.  
**lappón icus:** of Lapland.  
**laricifô lius:** larch-leaved.  
**laric inus:** Larix-like, larch-like.  
**lasiocâr pus:** rough-fruited, rough-hairy.  
**lasiopét alus:** with petals rough-hairy.  
**lateriflô rus:** lateral-flowered, with flowers on the side.  
**laterit ius:** brick-red.  
**latifô lius:** broad-leaved.  
**lât ifrons:** broad-fronded, broad-herbaged, broad-leaved.  
**latimaculâ tus:** broad-spotted.  
**lât ipes:** broad-footed, broad-stalked.  
**lâtis simus:** broadest, very broad.  
**lâ tus:** broad, wide.  
**laurifô lius:** laurel-leaved.  
**lauri nus:** laurel-like.  
**lavandulâ ceus:** lavender-like.  
**laxiflô rus:** loose-flowered.  
**laxifô lius:** loose-leaved.  
**lâx us:** lax, open, loose.  
**leian thus:** smooth-flowered.  
**leiccât pus:** smooth-fruited.  
**leiophýl lus:** smooth-leaved.  
**lenticulâ ris:** lenticular, lens-shaped.  
**iên tus:** pliant, tenacious, tough.  
**leontoglôs sus:** lion-tongued or -throated.

**leopardi nus:** leopard-spotted.  
**lepidophýl lus:** scaly-leaved.  
**leprô sus:** of leprosy, scurfy.  
**leptocaû lis:** thin-stemmed, slender-stemmed.  
**leptôc ladus:** thin-stemmed or -branched.  
**leptól epis:** thin-scaled.  
**leptophýl lus:** thin- or slender-leaved.  
**leptosép alus:** thin-sepaled.  
**lêp topus:** thin- or slender-stalked.  
**leucân thus:** white-flowered.  
**leucôb otry:** with white clusters.  
**leucocéph alus:** white-headed.  
**leuconeû rus:** white-nerved.  
**leucophýl lus:** white-leaved.  
**leucorhi zus:** white-rooted.  
**libîr nicus:** of Liburnia (west of Adriatic).  
**lignô sus:** woody.  
**ligulâ ris:** ligulate, strap-shaped.  
**lilâc inus:** lilac.  
**liliiflô rus:** lily-flowered.  
**limbâ tus:** bordered.  
**limô sus:** of muddy or marshy places.  
**linariifô lius:** linaria-leaved.  
**linearifô lius:** linear-leaved.  
**linearil obus:** linear-lobed.  
**lineâ ris:** linear.  
**lineâ tus:** lined, with lines or stripes.  
**lingulâ tus:** tongue-shaped.  
**linifô lius:** linum-leaved, flax-leaved.  
**linophýl lus:** flax-leaved.  
**lithospér mus:** with seeds stone-like.  
**littorâ lis:** of the seashore.  
**liv idus:** livid, bluish.  
**lobâ tus:** lobed.  
**lobulâ ris:** lobed.  
**loliâ ceus:** Lolium-like (Lolium comprises the rye-grasses).  
**longebractea tus:** long-bracted.  
**longepedunculâ tus:** long-pedunculate.  
**longicaudâ tus:** long-tailed.  
**longiflô rus:** long-flowered.  
**longifô lius:** long-leaved.  
**longihamâ tus:** long-hooked.  
**longilaminâ tus:** with long laminæ or plates.  
**longil obus:** long-lobed.  
**longimucronâ tus:** long-mucronate.  
**lông ipes:** long-footed, long-stalked.  
**longipét alus:** long-petaled.  
**longipinnâ tus:** long-pinnate.  
**longiracemô sus:** long-racemed.  
**longiscâ pus:** long-scaped.  
**longisép alus:** long-sepaled.  
**longis pathus:** long-spathed.  
**longispi nus:** long-spined.  
**longis simus:** longest, very long.  
**longis tylus:** long-stalked.  
**lôn gus:** long.  
**lorifô lius:** strap-leaved.  
**lû cidus:** lucid, bright, shining, clear.  
**ludovicîa nus:** of Louisiana.  
**lugdunén sis:** belonging to the region of Lyons.  
**lunâ tus:** lunate, moon-shaped, moon-like, crescent-shaped.  
**lunulâ tus:** somewhat moon-shaped.  
**lupuli nus:** Lupulus-like, hop-like.  
**lû ridus:** lurid, wan, sallow, pale yellow.  
**lutê olus:** yellowish.  
**lutes cens:** yellowish, becoming yellow.

**lù teus:** yellow.  
**luxù rians:** luxuriant, thrifty.  
**lyrà tus:** lyrate, pinnatifid with large terminal lobe.

**macilén tus:** lean, meager.  
**macrán drus:** with large anthers.  
**macrán thus:** large-flowered.  
**macrób otrys:** large-clustered.  
**macrocár pus:** large-fruited.  
**macrocéph alus:** large-headed.  
**macrodac tylus:** large-fingered.  
**macrodon tus:** large-toothed.  
**macropét alus:** with large petals.  
**macrophyl lus:** large-leaved.  
**macropléc tron:** large-spurred.  
**macróp odus:** large-footed or -stalked.  
**macróp terus:** large-winged.  
**macrospà dix:** with large spadix.  
**macrostà chyus:** large-spiked.  
**macrostè gius:** large-decked.  
**macrostè mus:** with large filaments.  
**macrós tylus:** large-styled.  
**macroù rus:** large-tailed.  
**maculà tus:** spotted.  
**maculò sus:** spotted.

**mæsi acus:** of Moesia, ancient name of Bulgaria and Servia.

**magellán icus:** Straits of Magellan region.

**magnif icus:** magnificent, eminent, distinguished.

**majà lis:** of May, Maytime.

**majést icus:** majestic.

**mà jor, mà jus:** greater, larger.

**malabár icus:** of Malabar (in British India).

**malifór mis:** apple-formed.

**malvâ ceus:** Malva-like, mallow-like.

**mammò tus:** breasted, with breasts.

**manicâ tus:** manicate, long-sleeved, covered densely as with thick hairs so that the covering can be removed as such.

**marcés cens:** withering but not falling.

**már cidus:** withering but not falling off.

**margaritâ ceus:** pearly, of pearls.

**marginâ lis:** marginal, marked in some way along the margins or edges.

**marginâ tus:** margined.

**marginél lus:** somewhat margined.

**marilánd icus:** of the Maryland region; also written *marylandicus*.

**marít imus:** maritime, of the sea.

**marmorâ tus:** marbled, mottled.

**marmò reus:** marbled.

**marmorophyl lus:** leaves marbled.

**maroccâ nus:** of Morocco.

**mâs:** male.

**masculâ tus:** masculine.

**mâs culus:** male, masculine.

**matronâ lis:** pertaining to matrons.

**mauritán icus:** of Mauretania (N. Africa).

**maxillâ ris:** maxillary, of the jaw.

**mâx imus:** largest.

**mediterrâ neus:** of the Mediterranean region.

**mè dius:** medium, intermediate.

**medullâ ris:** of the marrow or center or pith.

**megalân thus:** large-flowered.

**megaphyl lus:** large-leaved.

**megapotâm icus:** of the large river.

**megarrhi zus:** large-rooted.

**megaspér mus:** large-seeded.

**megastâ chyus:** large-spiked.

**megastig mus:** with large stigma.

**melanân thus:** black-flowered.

**melanchól icus:** melancholy, hanging or drooping.

**melanocaù lon:** black-stemmed.

**melanocóc cus:** black-berried.

**melanoleù cus:** black-and-white.

**melanóx ylon:** black-wooded.

**meleâ gris:** like a guinea-fowl, speckled.

**mél leus:** pertaining to honey.

**mellif era:** honey-bearing.

**melofór mis:** melon-shaped.

**membranâ ceus:** membranaceous, membranous, thin and more or less translucent.

**meniscifò lius:** crescent-leaved.

**mesoleù cus:** mixed with white.

**metál licus:** metallic (color or luster).

**mexicâ nus:** Mexican, of Mexico.

**mì cans:** glittering, sparkling, mica-like.

**micrán thus:** small-flowered.

**microcár pus:** small-fruited.

**míc rodon:** small-toothed.

**microglòs sus:** small-tongued.

**micròl epis:** small-scaled.

**micróm eris:** small-numbered, of small number of parts.

**micropé. alus:** small-petaled.

**microphyl lus:** small-leaved.

**micróp terus:** small-winged.

**microsép alus:** small-sepaled.

**microstè mus:** of small filaments or stemlets.

**milità ris:** military.

**millefoliâ tus:** thousand-leaved.

**millefò lius:** thousand-leaved, leaves or parts very many.

**mì mus:** mimic.

**mì nax:** threatening, forbidding.

**miniâ tus:** cinnabar-red.

**mín imus:** least, smallest.

**mì nor, mì nus:** smaller.

**minutis simus:** very or most minute.

**minù tus:** minute, very small.

**mirâb ilis:** marvellous, extraordinary, wonderful.

**mistassín icus:** of Lake Mistassini, (Quebec).

**mì tis:** mild, gentle.

**mitrà tus:** turbaned.

**míx tus:** mixed.

**modés tus:** modest.

**molдав icus:** of Moldavia (in Rumania).

**mól lis:** soft, soft-hairy.

**mollis simus:** very soft-hairy.

**moluccâ nus:** of the Moluccas (East Indies).

**monadél phus:** in one group or bundle.

**mongól icus:** of Mongolia.

**monilif era:** bearing a necklace.

**monacân thus:** once-spined.

**monocéph alus:** single-headed.

**monóg ynus:** of one pistil.

**monoi cus:** monocious.

**monopét alus:** one-petaled.

**monophyl lus:** one-leaved.

**monóp terus:** one-winged.

**monopyrè nus:** bearing one stone or pyrene.

**monosép alus:** one-sepaled.

**monospér mus:** one-seeded.

**monostâ chyus:** single-spiked.

**monspelién sis:** of Montpellier.

**monspessulâ nus:** of Montpellier.

**monstrò sus:** monstrous, wholly abnormal or deformed, teratological.

**montâ nus:** pertaining to mountains or mountainous regions.

**montevideén sis:** of Montevideo (Uruguay).

**montic olus:** native of mountains.

**moschâ tus:** musky, musk-scented.

**mucronâ tus:** mucronate, tipped with a short sharp point or mucro.

**mucronulâ tus:** with a small mucro or point.

**multibracteâ tus:** many-bracted.

**multicaù lis:** many-stemmed, with numerous stems.

**múl ticeps:** many-headed, many branched.

**multic olor:** many-colored.

**multif idus:** multifid, many times parted.

**multiflò rus:** many-flowered.

**multifurcâ tus:** much-forked, many times forked.

**multifj ugus:** many in a yoke, many times joined.

**multinér vis:** many-nerved.

**múl tipleus:** many-folded.

**multiradiâ tus:** many-radiate, with numerous rays.

**multiséc tus:** many times cut, much cut or dissected.

**mún dulus:** trim, neat.

**muni tus:** defended, fortified.

**murâ lis:** of walls, growing on walls.

**muricâ tus:** muricate, roughed by means of hard points.

**muscip ula:** a mouse-trap.

**mutâb ilis:** changeable, variable, mutant.

**mutâ tus:** changeable.

**mù ticus:** blunt, pointless.

**mutilâ tus:** mutilated.

**myriacân thus:** numberless spined, very many-spined.

**myriocár pus:** very many-fruited.

**myrmecoph ilus:** ant-loving.

**myrtifò lius:** myrtle-leaved.

**nâ nus:** dwarf.

**napifór mis:** turnip-shaped.

**narbonén sis:** of Narbonne (ancient region or province of S. France).

**nâ tans:** floating, swimming.

**naviculâ ris:** pertaining to a ship.

**neapolitâ nus:** Neapolitan.

**nebulò sus:** nebulous, clouded, indefinite, obscure.

**negléc tus:** neglected, overlooked.

**memorâ lis:** of groves or woods.

**memorò sus:** of groves or woods and shady places.

**nepalén sis:** of Nepal (Himalayan region).

**neriifò lius:** nerium-leaved, oleander-leaved.

**nervò sus:** nerved.

**nevadén sis:** of the Sierra Nevadas (in Spain or N. America).

**nfc titans:** blinking, moving.

**nì dus:** nest.

**nì ger:** black.

**nigrà tus:** blackish.  
**nigrés cens:** blackish, becoming black.  
**níg ricans:** black.  
**nigricór nis:** black-horned.  
**níg ripes:** black-footed or -stalked.  
**nilót ica:** of the Nile.  
**nì tens:** shining.  
**nít idus:** shining.  
**nivà lis:** snowy, pertaining to snow.  
**nív eus:** snowy.  
**nivò sus:** snowy, full of snow.  
**nobil ior:** more noble.  
**nób ilis:** noble, famous, renowned.  
**nobilis simus:** most or very noble.  
**nodiflò rus:** with flowers at nodes.  
**nodò sus:** with nodes, jointed.  
**nonscrip tus:** undescribed.  
**nootkatén sis:** of Nootka (Nootka Sound is by Vancouver Island).  
**notà tus:** marked.  
**nò væ-án gliæ:** of New England.  
**nò væ-cæsarè æ:** of New Jersey.  
**nò væ-zealánd iæ:** of New Zealand.  
**noveboracén sis:** of New York.  
**nò vi-bél gii:** of New Belgium or New Netherlands (i. e., New York).  
**nubic olus:** dwelling among clouds.  
**nucif era:** nut-bearing.  
**nudà tus:** nude, stripped.  
**nudicaù lis:** naked-stemmed.  
**nudiflò rus:** naked-flowered.  
**nù dus:** nude, naked.  
**numismà tus:** pertaining to money, coin-like.  
**nù tans:** nodding.  
**nyctic alus:** night-blooming.

**obcón icus:** inversely conical.  
**obcordà tus:** obcordate, inversely cordate.  
**obè sus:** obese, fat.  
**obfuscà tus:** clouded, confused.  
**oblí quus:** oblique, unequal and slanting.  
**obliterà tus:** obliterated, erased, not apparent.  
**oblongà tus:** oblong.  
**oblongiflò lius:** oblong-leaved.  
**oblón gus:** oblong.  
**obovà tus:** obovate, inverted ovate.  
**obscù rus:** obscure, hidden.  
**obsolè tus:** obsolete, rudimentary.  
**obtusà tus:** obtuse, blunt.  
**obtusiflò lius:** blunt-leaved.  
**obtusil obus:** blunt-lobed.  
**obtù tus:** obtuse, blunt, rounded.  
**occidentà lis:** occidental, western.  
**océan icus:** oceanic; perhaps of Oceanica.  
**ocellà tus:** eyeleted, with small eyes.  
**ochreà tus:** with an ochrea or boot-sheath.  
**ochroleù cus:** yellowish white.  
**octán drus:** with eight anthers.  
**octopét alus:** eight-petaled.  
**octophyl lus:** eight-leaved.  
**oculà tus:** eyed, with eye-like marks.  
**odonti tes:** tooth.  
**odontochi lus:** with toothed lip or margin.  
**odoratís simus:** most or very odorous, very fragrant.  
**odorà tus:** odorous, fragrant.  
**odò rus:** odorous, fragrant.  
**officinà lis:** officinal, medicinal, recognized in the pharmacopea.

**officinà rum:** of the apothecaries.  
**oleæfò lius:** Olea- or olive-leaved.  
**oleif era:** oil-bearing.  
**olerà ceus:** oleraceous, vegetable-garden herb used in cooking.  
**oligán thus:** few-flowered.  
**oligocár pus:** few-fruited.  
**oligospér mus:** few-seeded.  
**olitò rius:** pertaining to vegetable-gardens or -gardeners.  
**olivà ceus:** olive-like, olive-colored.  
**olivæfór mis:** olive-shaped.  
**olým picus:** of Olympus or Mt. Olympus (in Greece).  
**omniv orus:** omnivorous, of all kinds of food.  
**opà cus:** opaque, shaded.  
**operculà tus:** with a lid.  
**oppositiflò rus:** opposite-flowered.  
**oppositiflò lius:** opposite-leaved.  
**opuliflò rus:** flowers of Opulus (a Viburnum).  
**orbiculà ris:** round.  
**orbiculà tus:** round.  
**orchid eus:** orchid-like.  
**orchioi des:** orchid-like.  
**oregà nus:** of Oregon.  
**orgyà lis:** length of the arms extended, about 6 feet.  
**orientà lis:** oriental, eastern.  
**ornatis simus:** most showy or ornate.  
**ornà tus:** ornate, adorned.  
**ornithocéph alus:** like a bird's head.  
**ornithóp odus:** like a bird's foot.  
**ornithorhyn chus:** shaped like a bird's beak.  
**orthocár pus:** straight-fruited.  
**orthochi lus:** straight-lipped.  
**orthópt erus:** straight-winged.  
**ovaliflò lius:** oval-leaved.  
**ovà lis:** oval.  
**ovatiflò lius:** ovate-leaved.  
**ovà tus:** ovate.  
**ovif era:** egg-bearing.  
**ovig era:** egg-bearing.  
**ovi nus:** pertaining to sheep.  
**oxyacán thus:** sharp-thorned or -spined.  
**oxygò nus:** sharp-angled.  
**oxyphyl lus:** sharp-leaved.  
**oxysép alus:** with sharp sepals.

**pachyán thus:** thick-flowered.  
**pachyneù rus:** thick-nerved.  
**pachýp terus:** thick-winged.  
**pacif icus:** of the Pacific, of regions bordering the Pacific Ocean.  
**palæsti nus:** of Palestine.  
**paleà ceus:** with palea (bracts in grass flowers), or palea-like, chaffy.  
**pál lens:** pale.  
**pallés cens:** palish, becoming pale.  
**pallià tus:** palliated, cloaked.  
**pallidiflò rus:** pale-flowered.  
**pallidiflò lius:** pale-leaved.  
**pallidispl nus:** pale-spined.  
**pál lidus:** pale.  
**palliflā vens:** pale yellow.  
**palmatif idus:** palmately cut.  
**palmà tus:** palmate, divided or lobed like the hand.  
**paludò nus:** of marshes, marsh-loving.  
**pálús tris:** marsh-loving.  
**pandurà tus:** fiddle-shaped.  
**paniculà tus:** paniculate.  
**paniculif era:** panicle-bearing.

**pannón icus:** of Pannonia (Roman province on the Danube, now western Hungary).  
**pannò sus:** ragged, tattered.  
**papaverà ceus:** Papaver-like, poppy-like.  
**papilionà ceus:** butterfly-like, the form of the pea flower.  
**papillò sus:** papillate, with minute nipple-like projections or protuberances.  
**papyrà ceus:** papery.  
**papyrif era:** paper-bearing.  
**paradisi acus:** of parks or gardens.  
**paradox us:** paradoxical, strange.  
**parasit icus:** parasitical, of a parasite.  
**pardali nus:** leopard-like, spotted.  
**pardi nus:** leopard-spotted.  
**partì tus:** parted.  
**parviflò rus:** small-flowered.  
**parviflò lius:** small-leaved.  
**parvis simus:** smallest, very small.  
**pár vulus:** very small, very slight.  
**pár vus:** small.  
**patagón icus:** of Patagonia.  
**patellà ris:** circular, disk-shaped, like a knee-pan.  
**pà tens:** spreading.  
**pát ulus:** spreading.  
**pauciflò rus:** few-flowered.  
**pauciflò lius:** few-leaved.  
**paupér culus:** poor.  
**pavoni nus:** peacock-like.  
**pectinà ceus:** pectinate.  
**pectinà tus:** pectinate, comb-like, pin-natifid with very narrow close divisions or parts.  
**pectinif era:** comb-bearing.  
**pectorà lis:** shaped like a breast-bone.  
**pedà tus:** footed, of the foot or feet; also pedate, like a bird's foot, being palmately divided and the side parts 2-cleft.  
**pedemontà nus:** of Piedmont (northern Italy).  
**pedunculà ris:** peduncled, stalked.  
**pedunculà tus:** peduncled.  
**pedunculò sus:** with many peduncles.  
**pellù cidus:** pellucid, with translucent dots.  
**peltà tus:** peltate.  
**peltiflò lius:** peltate-leaved.  
**pelvifór mis:** pelvis-shaped.  
**penduliflò rus:** pendulous-flowered.  
**penduli nus:** somewhat pendulous.  
**pén dulus:** pendulous, hanging.  
**penicillà tus:** hair penciled, like a little brush; pinnate.  
**pennà tus:** feathered, as the veins or lobes standing off at right angles from a midrib; pinnate.  
**penninér vis:** feather-veined.  
**pennsylván icus:** of Pennsylvania.  
**pentagò nus:** five-angled.  
**pentág ynus:** of five pistils.  
**pentán drus:** of five stamens.  
**pentán thus:** five-flowered.  
**pentaphyl lus:** five-leaved.  
**perbél lus:** very beautiful.  
**peregrí nus:** exotic, foreign, from a strange country.  
**perén nans:** perennial.  
**perén nis:** perennial, living three or more years.  
**perfolià tus:** perfoliate, with leaf surrounding the stem.

perforà tus: perforated, with holes.  
 permix tus: much mixed or confused.  
 persicafò lius: peach-leaved.  
 pér sicus: of Persia; also the peach.  
 perspíc uus: clear, transparent.  
 pertù sus: thrust through, forced through, perforated.  
 peruvia nus: Peruvian, of Peru.  
 petaloíð eus: petal-like.  
 petiolà ris: petioled, with a leaf-stalk.  
 petiolà tus: petioled.  
 petræ us: rock-loving.  
 phlogifò rus: flame-flowered.  
 phœnic eus: purple-red.  
 phryg ius: of Phrygia (in Asia Minor).  
 phyllomani acus: running wildly to leaves, leafy.  
 picturà tus: painted-leaved, pictured, variegated.  
 pic tus: painted.  
 pilif era: bearing soft hairs.  
 pilosius culus: somewhat or slightly pilose.  
 pilò sus: pilose, shaggy, with soft hairs.  
 pilulif era: globule-bearing.  
 pinetò rum: of pine forests.  
 pín eus: of the pine.  
 pinifò lius: pine-leaved.  
 pinnatif idus: pinnatifid, pinnately cleft.  
 pinnát ifrons: pinnate-fronded or -foliated.  
 pinnatinér vis: pinnate-nerved.  
 pinnà tus: pinnate, with leaflets on the sides of a main leaf axis.  
 pisif era: Pisum-bearing, pea-bearing.  
 pisocár pus: pea-fruited.  
 placà tus: quiet, calm.  
 planifò rus: plane-flowered, flat-flowered.  
 planifò lius: flat-leaved.  
 plantagín eus: plantain-like.  
 plà nus: plane, flat.  
 platanoi des: Platanus-like, plane-tree-like.  
 platycán thus: broad-spined.  
 platycár pus: broad-fruited.  
 platyladus: broad-branched.  
 platyglòs sus: broad-tongued.  
 platyphýl ius: broad-leaved.  
 plenis simus: very full or double.  
 plè nus: full, used to designate doubleness in flowers (as in *flore-pleno*).  
 pleurós tachys: side-spiked.  
 plicà tus: plicate, plaited, folded lengthwise.  
 plumà rius: plumed.  
 plumà tus: plumed.  
 plúm beus: of lead.  
 plumò sus: feathery.  
 poculifór mis: deep cup-shaped.  
 podocár pus: with stalked fruit.  
 poët icus: pertaining to poets.  
 polifò lius: Polium-leaved, white-leaved.  
 poli tus: polished.  
 polyacán thus: many-spined.  
 polyán drus: of many stamens.  
 polyán thus: many-flowered.  
 polycéph alus: many-headed.  
 polydác tylus: many-fingered.  
 polyg amus: polygamous, having both perfect and imperfect flowers.

polymór phus: of many forms, variable.  
 polypét alus: many-petaled.  
 polyphýl ius: many-leaved.  
 polyspér mus: many-seeded.  
 polystà chys: many-spiked.  
 polystic tus: many-dotted.  
 pomà ceus: pome-like, resembling the apple or pear.  
 pomeridià nus: afternoon.  
 ponderò sus: ponderous, heavy, weighty.  
 pón ticus: of Pontus (in Asia Minor).  
 populifò lius: populus-leaved, poplar-leaved.  
 popúl neus: pertaining to poplars.  
 porci nus: pertaining to swine.  
 porrifò lius: Porrum- or leek-leaved.  
 præal tus: very tall.  
 præ cox: precocious, premature, very early.  
 præ stans: distinguished, excelling.  
 prætex tus: bordered.  
 prasinà tus: greenish.  
 prasi nus: grass-green.  
 pratén sis: of meadows.  
 precatò rius: praying, prayerful.  
 primúl inus: primrose-like.  
 prin ceps: princely, first.  
 prismát icus: prismatic, prism-shaped.  
 proboscíd eus: proboscis-like.  
 procè rus: tall.  
 procúm bens: procumbent, lying on the ground.  
 procúr rens: extended.  
 prodúc tus: produced, lengthened.  
 profú sus: profuse.  
 prolif era: producing offshoots, bearing abnormal supernumerary parts.  
 prolif icus: prolific, fruitful.  
 propén dens: hanging down.  
 propín quus: related, near to.  
 prostrà tus: prostrate, lying flat.  
 protrù sus: protruding.  
 provincià lis: provincial; or of Provence, southern France.  
 pruinà tus: pruinose.  
 pruinò sus: pruinose, with a hoary or frost-like bloom.  
 prunifò lius: plum-leaved.  
 prù riens: itching.  
 pseud- pseudo-: in combinations means *false, not genuine, not the true or the typical*, as *Pseudotsuga*, *false tsuga*.  
 psittaci nus: of the parrot.  
 pù bens: downy.  
 pubér ulus: puberulous, somewhat pubescent.  
 pubés cens: pubescent, downy.  
 pudí cus: bashful, retiring, shrinking.  
 pulchél ius: pretty, beautiful.  
 púl cher: handsome, beautiful.  
 pulchér rimus: very handsome.  
 púl lus: dark colored, dusky, almost black.  
 pulverulén tus: powdered, dust-covered.  
 pulvinà tus: cushioned, cushion-like.  
 pù milus: dwarf.  
 punctatis simus: most spotted, very spotted.  
 punctà tus: punctate, dotted.  
 pún gens: piercing, sharp-pointed.  
 punic eus: reddish purple.  
 purpurà ceus: purple.

purpurás cens: purplish, becoming purple.  
 purpurà tus: purple.  
 purpù reus: purple.  
 pusíl lus: very small, insignificant.  
 pycnacán thus: densely spined.  
 pycnán thus: densely flowered.  
 pygmæ us: pigmy.  
 pyramidà lis: pyramidal.  
 pyrenà icus: of the Pyrenees.  
 pyrifò lius: pear-leaved.  
 pyrifór mis: Pyrus-formed, pear-shaped.  
 quadrangulà ris: quadrangular, four-angled.  
 quadrangulà tus: four-angled.  
 quadrà tus: in four or fours, squared.  
 quadric olor: of four colors.  
 quadridentà tus: four-toothed.  
 quadrif idus: four-cut.  
 quadrifò lius: four-leaved.  
 quadripartì tus: four-parted.  
 quadrivál vis: four-valved.  
 quercifò lius: Quercus-leaved, oak-leaved.  
 quercì nus: of Quercus the oak.  
 quina nus: quinate, in fives.  
 quinquéc olor: five-colored.  
 quinquéfò rus: five-flowered.  
 quinquéfò lius: five-leaved.  
 quinqueloculà ris: five-loculed, of five cells or compartments.  
 quinquenér vis: five-nerved.  
 quinquepunctà tus: five-spotted.  
 racemifò rus: raceme-flowered.  
 racemò sus: racemose, flowers in racemes.  
 radià tus: radiate, rayed.  
 radì cans: rooting.  
 radicò sus: many-rooted.  
 radì cum: of roots.  
 radiò sus: radiate, with many rays.  
 ramentà ceus: bearing a hair-like covering.  
 ramifò rus: with branching inflorescence.  
 ramosis simus: most- or much-branched.  
 ramò sus: branched.  
 ranif era: bearing frogs.  
 rapà ceus: pertaining to rape or turnips.  
 rarifò rus: scattered-flowered, with flowers loose or few.  
 rà rus: rare, uncommon.  
 raù cus: hoarse, raw.  
 reclinà tus: reclined, bent back.  
 réc tus: straight, upright.  
 recurvâ tus: recurved.  
 recurvifò lius: recurved-leaved.  
 recúr vus: recurved, curved back.  
 redivì vus: restored, brought to life.  
 reduplicà tus: duplicated again, doubled again, redoubled.  
 refléx us: reflexed, bent back.  
 refrác tus: broken, broken in pieces.  
 refúl gens: brightly shining, reflecting light or color.  
 regà lis: regal, royal.  
 Regì na: Queen.  
 rè gius: regal, royal, kingly, pertaining to a king.  
 religió sus: used for religious purposes, venerated.

**remò tus:** remote, with parts distant.  
**renifór mis:** reniform, kidney-shaped.  
**repán dus:** repand, with margin wavy.  
**rè pens:** repent, creeping.  
**rép tans:** creeping.  
**reséc tus:** cut off, curtailed, pruned.  
**resinò sus:** resin-bearing, full of resin.  
**reticulà tus:** reticulate, netted. net-veined.  
**retór tus:** twisted back.  
**retrofléx us:** reflexed.  
**retù sus:** retuse, notched slightly at a rounded apex.  
**revér sus:** reversed, end-for-end.  
**revolù tus:** revolute, rolled backward from the margins.  
**Réx:** king.  
**rhamnifò lius:** Rhamnus-leaved, buckthorn-leaved.  
**rhizophýl lus:** root-leaved, acaulescent.  
**rhodán thus:** rose-flowered.  
**rhodochi lus:** rose-lipped or -margined.  
**rhodocínc tus:** rose-girdled.  
**rhodoneù rus:** red-nerved.  
**rhombóid eus:** rhomboidal.  
**ricinifò lius:** Ricinus-leaved, with leaves of castor-oil plant.  
**rigíd ulus:** somewhat stiff or rigid.  
**ríg idus:** rigid, stiff.  
**rín gens:** ringent, gaping, open-mouthed.  
**ripà rius:** of river banks.  
**rivà lis:** pertaining to brooks.  
**rivulà ris:** brook-loving.  
**robús tus:** robust, stout.  
**rosà ceus:** rose-like.  
**rosæfìò rus:** rose-flowered.  
**rò seus:** rose, rosy.  
**rostrà tus:** rostrate, beaked.  
**rosulà ris:** rosulate, in rosettes.  
**rotà tus:** rotate, wheel-shaped.  
**rotundifò lius:** round-leaved.  
**rotún dus:** rotund, round.  
**rubél lus:** reddish.  
**rù bens:** red, ruddy.  
**rù ber:** red, ruddy.  
**rubér rimus:** very red.  
**rubés cens:** reddish, becoming red.  
**rubiaëfò lius:** rubus- or bramble-leaved.  
**rubicún dus:** rubicund, red.  
**rubiginò sus:** rusty.  
**rubricaù lis:** red-stemmed.  
**rubrifò lius:** red-leaved.  
**rubronér vis:** red-veined.  
**rufés cens:** reddish, becoming red.  
**rufinér vis:** red-nerved.  
**rù fus:** red, reddish.  
**rugò sus:** rugose, wrinkled.  
**runcinà tus:** runcinate, retrorsely or backwardly incised or toothed.  
**rupés tris:** rock-loving.  
**rupic olus:** growing on cliffs or ledges.  
**rús ticus:** rustic, belonging to the country.  
**ruthén icus:** Ruthenian, Russian.  
**rù tilans:** red, becoming red.

**saccà tus:** saccate, bag-like.  
**saccharà tus:** containing sugar, sweet.  
**saccharif era:** sugar-bearing  
**sacchari nus:** saccharine.  
**sác charum:** sugar.  
**saccif era:** bag-bearing.

**sachalinén sis:** of Saghalien Isl. (N. Japan).  
**sagittà lis:** of the arrow, sagittate.  
**sagittà tus:** sagittate, arrow-like.  
**sagittifò lius:** arrow-leaved.  
**salicifò lius:** salix-leaved, willow-leaved.  
**salíc inus:** willow-like.  
**salíg nus:** of the willow.  
**sali nus:** salty.  
**sambù cinus:** sambucus- or elder-like.  
**sánc tus:** holy.  
**sandwicén sis:** of the Sandwich or Hawaiian Isls.  
**sanguín eus:** bloody, blood-red.  
**sáp idus:** savory, pleasing to taste.  
**sapién tum:** of the wise men or authors.  
**saponà ceus:** soapy.  
**sarcò des:** flesh-like.  
**sarmát icus:** of Sarmatia (an ancient territory in S. Russia and Poland).  
**sarmentò sus:** sarmentose, bearing runners.  
**sati nus:** cultivated.  
**saurocéph alus:** lizard-headed.  
**saxát ilis:** found among rocks.  
**saxic olus:** growing among rocks.  
**saxò sus:** full of rocks.  
**scà ber:** scabrous, rough.  
**scabrél lus:** somewhat scabrous.  
**scán dens:** scandent, climbing.  
**scapò sus:** with scapes.  
**scép trum:** of a scepter.  
**schizoneù rus:** cut-nerved.  
**schizopét alus:** cut-petaled.  
**schizophýl lus:** cut-leaved.  
**scholà ris:** pertaining to a school.  
**sclerocár pus:** hard-fruited.  
**sclerophýl lus:** hard-leaved.  
**scót ica:** Scotch, of Scotland.  
**scúlp tus:** carved.  
**scutellà ris:** salver- or dish-shaped.  
**scù tum:** a shield.  
**sebif era:** tallow-bearing.  
**sebò sus:** full of tallow or grease.  
**sechellà rus:** of the Seychelles (Indian Ocean).  
**secún dus:** secund, side-flowering.  
**securig era:** axe-bearing.  
**ség etum:** of cornfields.  
**semialà tus:** semi-winged, half or somewhat winged.  
**semicaudà tus:** semi- or partially tailed.  
**semicylín dricus:** semi- or somewhat cylindrical.  
**semipinnà tus:** half or imperfectly pinnate.  
**semperflò rens:** ever flowering.  
**sempér virens:** ever green.  
**seni lis:** senile, old, white-haired.  
**sensib ilis:** endowed with feeling, sensitive.  
**sensiti vus:** sensitive.  
**sepià rius:** pertaining to hedges.  
**sè pium:** of hedges or fences.  
**septangulà ris:** seven-angled.  
**septém lobus:** seven-lobed.  
**septempunctà tus:** seven-spotted.  
**septentrionà lis:** northern, belonging to the North.  
**sepúl tus:** sepulchered, interred.  
**seric eus:** silky.  
**serót inus:** late, late-flowering or late-ripening.

**sér pens:** creeping, crawling.  
**serpenti nus:** of snakes, serpentine, looping or waving.  
**serratifò lius:** serrate-leaved, saw-edge-leaved.  
**serrà tus:** serrate, saw-toothed.  
**serrulà tus:** serrulate, somewhat serrate.  
**sesquipedà lis:** one foot and a half long or high.  
**sessiflò rus:** sessile-flowered, without pedicel.  
**sessiflò lius:** sessile-leaved, without petiole.  
**sessilifò lius:** sessile-leaved.  
**sés silis:** sessile, stalkless, sitting.  
**setà ceus:** setaceous, bristle-like.  
**setig era:** bristly, bristle-bearing.  
**setò sus:** setose, full of bristles.  
**setulò sus:** full of small bristles.  
**sibír icus:** of Siberia.  
**signà tus:** marked, designated, attested.  
**sikkimén sis:** of Sikkim or Sikkim (N. India).  
**silíc eus:** pertaining to or growing in sand.  
**siliculò sus:** bearing silicles.  
**silvát icus:** pertaining to woods, sylvan; sometimes *sylvaticus*.  
**silvès tris:** pertaining to woods.  
**sím plex:** simple, unbranched.  
**simpliciaù lis:** simple-stemmed.  
**simplicifò lius:** simple-leaved.  
**simplicis simus:** simplest, very unbranched.  
**sím ulans:** similar to, resembling.  
**sinén sis:** Chinese, of China.  
**sín icus:** Chinese.  
**sinuà tus:** sinuate, wavy-margined.  
**sinuò sus:** sinuate.  
**sithén sis:** belonging to Sitka, Alaskan.  
**smarág dinus:** of emerald.  
**smilác inus:** of smilax.  
**sobolíf era:** bearing creeping rooting stems or shoots.  
**socià lis:** sociable, companionable.  
**socotrà nus:** of the Island of Socotra (south of Arabia).  
**solà ris:** solar, of the sun.  
**sól idus:** solid, dense, not hollow.  
**somníf era:** sleep-producing.  
**sór didus:** dirty, unclean, foul.  
**spadic eus:** with a spadix.  
**sparsiflò rus:** sparsely or few-flowered.  
**sparsiflò lius:** sparsely or few-leaved.  
**spár sus:** sparse, scattered, few.  
**spár teus:** pertaining to the broom.  
**spathà ceus:** with a spathe.  
**spathulà tus:** spatulate, spoon-shaped, narrowed toward the base from a rounded top.  
**speciosis simus:** very showy.  
**speciò sus:** showy, good-looking.  
**spectáb ilis:** spectacular, worth seeing, remarkable, showy.  
**spectán dus:** showy.  
**spéc trum:** an image, apparition.  
**sphacelà tus:** dead, withered, diseased.  
**sphær icus:** spherical.  
**sphærocár pus:** spherical-fruited.  
**sphærocéph alus:** spherical-headed.  
**sphæroid eus:** sphere-like.  
**sphærostà chyus:** spherical-spiked.

**spicâ tus:** spicate, with spikes.  
**spicig era:** spike-bearing.  
**spinosis simus:** most or very spiny.  
**spinô sus:** full of spines.  
**spinulif era:** bearing small spines.  
**spinulô sus:** somewhat or weakly spiny.  
**spirâ lis:** spiral.  
**spirêl lus:** a spiral, little spiral.  
**splên dens:** splendid.  
**splendîs simus:** very splendid.  
**splên didus:** splendid.  
**spumâ rius:** frothing, of froth or spume.  
**spû rius:** spurious, false, bastard.  
**squâ lens:** daubed, filthy.  
**squâl idus:** squalid, filthy.  
**squamâ tus:** squamate, with squamæ or small scale-like leaves or bracts.  
**squamô sus:** squamate, full of scales.  
**squarrô sus:** squarrose, with parts spreading or even recurved at ends.  
**stamin eus:** bearing prominent stamens.  
**stâns:** standing, erect, upright.  
**stauracân thus:** with spines cross-shaped.  
**stellâ ris:** starry.  
**stellâ tus:** stellate, starry.  
**stellulâ tus:** of little stars.  
**stenocéph alus:** narrow-headed.  
**stenóg ynus:** with a narrow stigma.  
**stenopét alus:** narrow-petaled.  
**stenophyl lus:** narrow-leaved.  
**stenóp terus:** narrow-winged.  
**stér ilis:** sterile, infertile.  
**stigmât icus:** marked, of stigmas.  
**stigmô sus:** much marked, pertaining to stigmas.  
**stipulâ ceus:** stipuled, with stipules.  
**stipulâ ris:** stipuled.  
**stipulâ tus:** stipuled.  
**stolonif era:** bearing stolons or runners that take root.  
**stramín eus:** straw-colored.  
**strangulâ tus:** strangled, constricted.  
**streptocâr pus:** twisted-fruited.  
**streptopét alus:** with petals twisted.  
**streptophyl lus:** twisted-leaved.  
**streptosép alus:** with sepals twisted.  
**striât ulus:** somewhat or faintly striped.  
**striâ tus:** striated, striped.  
**strictiflô rus:** strict- or stiff-flowered.  
**stric tus:** strict, upright, erect.  
**strigillô sus:** somewhat strigose.  
**strigô sus:** strigose, covered with sharp straight appressed hairs.  
**strigulô sus:** beset with small or weak appressed hairs.  
**striolâ tus:** striolate, somewhat or faintly striped.  
**strobilif era:** cone-bearing.  
**strumâ rius:** of tumors or ulcers.  
**strumâ tus:** with tumors or ulcers.  
**stylô sus:** with style or styles prominent.  
**styracif lius:** flowing with storax or gum.  
**suavè olens:** sweet-scented.  
**suâ vis:** sweet, agreeable.  
**suavis simus:** sweetest, very sweet-scented.  
**subacâ lis:** somewhat stemmed, nearly stemless.

**subalpi nus:** subalpine, nearly alpine.  
**subauriculâ tus:** somewhat or rather auricled or eared.  
**subcarnô sus:** nearly or rather fleshy.  
**subcordâ tus:** partially or imperfectly or somewhat cordate.  
**subedentâ tus:** nearly toothless.  
**suberculâ tus:** of cork, corky.  
**suberéc tus:** somewhat or rather erect.  
**suberô sus:** cork-barked, full of cork.  
**subfalcâ tus:** somewhat falcate.  
**subglau cus:** somewhat or to some degree glaucous.  
**subhirtêl lus:** somewhat hairy.  
**sublunâ tus:** somewhat, lunate or crescent-shaped.  
**submér sus:** submerged, under water.  
**subperén nis:** imperfectly or nearly perennial.  
**subpetiolâ tus:** somewhat or partially petioled.  
**subsés silis:** nearly sessile, not completely sessile.  
**subsinnuâ tus:** somewhat sinuate or wavy-margined.  
**subterrâ neus:** subterranean, underground.  
**subulâ tus:** subulate, awl-shaped.  
**subumbellâ tus:** somewhat or incompletely umbellate.  
**subvillô sus:** somewhat villose or soft-hairy.  
**subvolâ bilis:** somewhat twining.  
**succulên tus:** succulent, fleshy.  
**suéc icus:** Swedish, of Sweden.  
**suffrutés cens:** slightly shrubby, becoming somewhat shrubby.  
**suffruticô sus:** slightly shrubby.  
**sulcâ tus:** sulcate, furrowed.  
**sulphû reus:** sulfur-colored.  
**sumatrâ nus:** of the Isl. of Sumatra.  
**supêrb iens:** superb, proud.  
**supêr bus:** superb, proud.  
**superciliâ ris:** eyebrow-like.  
**supêr fluus:** superfluous, redundant.  
**surculô sus:** producing suckers.  
**surinamén sis:** belonging to Surinam (Dutch Guiana).  
**susiâ nus:** of the province of Susiana (Persia).  
**suspén sus:** suspended, hung.  
**sylvât icus:** sylvan, forest-loving (also written *silvaticus*).  
**sylvés tris:** of woods or forests.  
**sylvic olus:** growing in woods.  
**syphilît icus:** syphilitic.  
**syri acus:** Syrian, of Syria.  
**sfs tylus:** with styles joined.  
**tabulâ ris:** pertaining to tablets.  
**tabulifôr mis:** tablet-formed.  
**tædig era:** torch-bearing, resin-bearing.  
**taraxiciflô lius:** Taraxicum- or dandelion-leaved.  
**tardiflô rus:** late-flowered.  
**tardî vus:** tardy, late.  
**tatâr icus:** of Tartary (old name for Central Asia).  
**taû reus:** of oxen.  
**taû ricus:** Taurian, Crimean.  
**tauri nus:** bull-like.  
**taxiflô lius:** Taxus-leaved, yew-leaved.  
**tectô rum:** of roofs or houses.

**téc tus:** concealed.  
**temulên tus:** drunken.  
**tenacis simus:** most tenacious.  
**tê nax:** tenacious, strong.  
**tenebrô sus:** of dark or shaded places.  
**tenêl lus:** slender, tender, soft.  
**tén er:** slender, tender, soft.  
**tentaculâ tus:** with tentacles or short projecting parts.  
**tenuicâ lis:** slender-stemmed.  
**tenuiflô rus:** slender-flowered.  
**tenuiflô lius:** slender-leaved.  
**tenuifl obus:** slender-lobed.  
**tenû ior:** more slender.  
**tén uis:** slender, thin.  
**tenuis simus:** very slender, very thin.  
**terebinth inus:** of turpentine.  
**tê res:** terete, circular in cross-section.  
**teretiflô lius:** terete-leaved.  
**terminâ lis:** terminal, at the end of a stem or branch.  
**ternâ tus:** in threes, ternate.  
**terniflô lius:** with leaves in threes.  
**terrés tris:** of the earth, terrestrial.  
**tessellâ tus:** tessellate, laid off in squares or in dice-like pattern.  
**testâ ceus:** light brown, brick-colored; also testaceous, bearing a prominent testa or outer seed-coat.  
**testiculâ tus:** testiculated, testicled.  
**testudinâ rius:** like a tortoise-shell.  
**tetracân thus:** four-spined.  
**tetrâg nus:** four-angled.  
**tetrân drus:** four-anthered.  
**tetrân tus:** four-flowered.  
**tetrâphyl lus:** four-leaved.  
**tetrâp terus:** four-winged.  
**tetraquê trus:** four-cornered.  
**texâ nus, texén sis:** of Texas, belonging to Texas.  
**theif era:** tea-bearing.  
**thermâ lis:** warm, of warm springs.  
**thuyoi des:** like Thuja or arbor-vitæ.  
**thyrsiflô rus:** Thyrsé-flowered.  
**thyrsoid eus:** thyrsé-like.  
**tibic inis:** of a flute player.  
**tigrî nus:** tiger-striped.  
**tinctô rius:** belonging to dyers, of dyes.  
**tinc tus:** dyed.  
**tipulifôr mis:** of the shape of a daddy-long-legs.  
**tomentô sus:** tomentose, matted-pubescent.  
**terminâ lis:** useful against colic.  
**torô sus:** torose, cylindrical with contractions at certain places or at intervals.  
**tôr tilis:** twisted.  
**tortuô sus:** much twisted.  
**tôr tus:** twisted.  
**torulô sus:** somewhat torose.  
**toxicâ rius:** poisonous.  
**tôx icus:** poisonous.  
**toxif era:** poison-producing.  
**transpâ rens:** transparent.  
**trapezifôr mis:** trapezium-formed, a four-sided figure of which no two sides are alike.  
**trapezioides:** trapezium-like.  
**tremuloi des:** like Tremulus, the trembling poplar.  
**trém ulus:** quivering, trembling.  
**triacân thus:** three-spined.  
**triân drus:** with three anthers or stamens.

**triangulâ ris:** three-angled.  
**triangulâ tus:** three-angled.  
**triân gulus:** three-angular.  
**tricaudâ tus:** three-tailed.  
**trichophyl lus:** hairy-leaved.  
**trichosân thus:** hairy-flowered.  
**trichospér mus:** hairy-seeded.  
**trichôt omus:** thrice branched or forked.

**tríc olor:** three-colored.  
**trícór nis:** three-horned.  
**tricuspidâ tus:** three-cusped, three-pointed.

**tridâc tylus:** three-fingered.  
**tri dens:** with three teeth.  
**tridentâ tus:** three-toothed.  
**trifasciâ tus:** three-banded.  
**trif idus:** three-parted.  
**triflô rus:** three-flowered.  
**trifoliâ tus:** three-leaved.  
**trifoliolâ tus:** three-leafleted.  
**triflô lius:** three-leaved.

**trifurcâ tus:** trifurcate, thrice-forked.  
**trilineâ tus:** three-lined.  
**trilobâ tus:** three-lobed.  
**tril obus:** three-lobed.  
**trimés tris:** of three months.  
**tinér vis:** three-nerved.

**trinotâ tus:** three-marked or -spotted.  
**triparti tus:** three-parted.  
**tripét alus:** three-petaled.  
**triphyl lus:** three-leaved.  
**tríp teris:** three-winged.  
**tripunctâ tus:** three-spotted.  
**triquè trus:** three-cornered.  
**trís tis:** sad, bitter, dull.

**triternâ tus:** triternate, thrice in threes.  
**tríum phans:** triumphant.  
**triviâ lis:** common, ordinary, very frequent, found everywhere.

**tróp icus:** of the tropics.  
**truncât ulus:** somewhat or partially truncate.

**truncâ tus:** truncate, cut off square.  
**tuberculâ tus:** tuberculate, with tubercles or small tubers.  
**tuberculô sus:** tubercled, knotted.  
**tuberô sus:** tuberous.

**tubiflô rus:** tube-flowered, trumpet-flowered.

**tubís pathus:** tube-spathed.  
**tubulô sus:** tubulose, with tubes.  
**tulipf era:** talip-bearing.  
**tû midus:** swollen.

**turbinâ tus:** turbinate, top-shaped.  
**túr gidus:** turgid, inflated, full.  
**typhi nus:** smoky or dull; perhaps pertaining to fever.

**týp icus:** typical, conforming to the standard or norm.

**ulíc inus:** like the gorse or furze (*Ulex*).

**uliginô sus:** of wet or marshy places.  
**ulmiflô lius:** *Ulmus*-leaved, elm-leaved.

**umbellâ tus:** with umbels.  
**umbellulâ tus:** with umbellets.  
**umbonâ tus:** bossed, bearing at center an umbo or stout projection.

**umbraculif era:** umbrella-bearing, shade-producing.

**umbrô sus:** shaded, shade-loving.  
**uncinâ tus:** hooked at the point.

**undâ tus:** waved.  
**undecimpunctâ tus:** eleven-spotted.

**undulatiflô lius:** undulate-leaved.  
**undulâ tus:** undulated, wavy.

**unguiculâ ris:** clawed, narrowed to a petiole-like base.

**unguiculâ tus:** unguiculate, clawed.  
**unguipét alus:** petals clawed.

**uníc olor:** one-colored.  
**unicór nis:** one-horned.

**unidentâ tus:** one-toothed.  
**uniflô rus:** one-flowered.

**unilaterâ lis:** one-sided.  
**univittâ tus:** one-striped.

**urceolâ tus:** urn-shaped.  
**ù rens:** burning, stinging.

**urentis simus:** very burning, very stinging.

**urophyl lus:** tail-leaved.  
**urostâ chys:** tail-spiked.

**ursi nus:** pertaining to bears.  
**urticiflô lius:** nettle-leaved (*Urtica*).

**usitatís simus:** most useful.  
**ustulâ tus:** burnt, sere.

**ù tilis:** useful.  
**utilís simus:** most useful.

**utriculâ tus:** uttriculate, with a utricle or small bladder one-seeded fruit.

**utriculô sus:** uttricled.  
**uvif era:** grape-bearing.

**vâ gans:** wandering, vagabondish.  
**vaginâ lis:** vaginate, sheathed.

**vaginâ tus:** sheathed.  
**valdiviâ nus, valdiviân sis:** Valdivian,

of province of Valdivia (Chile).  
**valenti nus:** Valentian, of Valentia (in Spain).

**vâl idus:** strong.  
**variâb ilis:** variable, of many forms.

**vâ rians:** variable.  
**variâ tus:** variable.

**variegâ tus:** variegated.  
**variifór mis:** of variable or many forms.

**vâ rius:** various, diverse.  
**vastâ tor** (feminine *vastatrix*): rava-

ging, devastating.  
**vegetâ tus:** full of growth, vigorous.

**vég etus:** vigorous.  
**velâ ris:** pertaining to curtains or veils.

**velû tinus:** velvety.  
**venenâ tus:** poisonous.

**venô sus:** veiny.  
**ventricô sus:** ventricose, swelling or

inflated on one side or unevenly.  
**venús tus:** handsome, charming.

**verecún dus:** modest, blushing.  
**vermiculâ tus:** worm-like, or like

worm-tracks.  
**vernâ lis:** vernal.

**vernicif era:** varnish-bearing.  
**vér nus:** of spring, vernal.

**verrucô sus:** verrucose, warted.  
**versic olor:** variously colored.

**verticillâ ris:** verticillate.

**verticillâ tus:** verticillate, whorled, arranged in a circle about the stem.

**vê rus:** the true or genuine or standard.

**vês cus:** weak, thin, feeble.  
**vesiculô sus:** with little bladders.

**vespertî nus:** of the evening, western.

**vesti tus:** covered, clothed, as with hairs or pubescence.

**vêx ans:** puzzling, vexatious.  
**vexillâ rius:** of the standard petal (as

of pea-like flowers), with a standard.  
**villô sus:** villous, soft-hairy.

**viminâ lis:** of osiers, of basket willows.  
**vimín eus:** of osiers or wicker-work.

**vinif era:** wine-bearing.  
**vinô sus:** full of wine.

**violâ ceus:** violet.  
**violês cens:** somewhat violet-colored

or becoming so.  
**vi rens:** green.

**virês cens:** greenish, becoming green.  
**virgâ tus:** twiggy.

**virginâ lis:** virgin.  
**virgín eus:** virgin.

**virgín icus, virginién sis:** Virginian, of Virginia.

**viridiflô rus:** green-flowered.  
**viridiflô lius:** green-leaved.

**vîr idis:** green.  
**viridís simus:** greenest, very green.

**virid ulus:** greenish.  
**viscid ulus:** somewhat viscid.

**vís cidus:** viscid, sticky.  
**viscosís simus:** very sticky.

**viscô sus:** viscid.  
**vitellî nus:** dull yellow approaching

red.  
**vitiflô lius:** Vitis-leaved, grape-leaved.

**vittâ tus:** striped.  
**vittíg era:** bearing stripes.

**vivíp arus:** viviparous, producing the young alive (rather than oviparous).

**volgár icus:** Volgan, of the Volga river region (written also *volgáricus*).

**volû bilis:** twining.  
**volûp tas:** pleasure, delight.

**volû tus:** rolled-leaved.  
**vulgâ ris:** vulgar, common.

**vulgâ tus:** common.  
**vulpî nus:** of the fox.

**wolgár icus:** Volgan (see *volgáricus*).

**xanthacân thus:** yellow-spined.  
**xân thi nus:** yellow.

**xanthocâr pus:** yellow-fruited.  
**xantholeû cus:** yellow-white.

**xanthophyl lus:** yellow-leaved.

**yedoén sis:** of Yedo or Yeddo (Japan).  
**yunnanén sis:** of Province of Yun-nan,

China.

**zebrî nus:** zebra-striped.  
**zeylân icus:** Ceylonian, of Ceylon;

Cingalese; same as *ceylanicus*.  
**zonâ lis:** zonal, zoned.

**zonâ tus:** zoned, banded.

# GLOSSARY

## OF THE USUAL BOTANICAL AND HORTICULTURAL TECHNICAL WORDS

The following set of words includes many descriptive terms used in this Cyclopedia and elsewhere, with explanations of their meaning. In some respects, the Name-List (pages 148 to 159) is a glossary, and the consultant should search there when he fails to find the word in the present catalogue.

- Aberrant.** Unusual, or exceptional; a plant or structure that varies from customary structure or from the type; used mostly of variation.
- Abortive.** Defective; barren; not developed.
- Abrupt.** Changing suddenly rather than gradually, as a leaf that is narrowed quickly to a point, or a pinnate leaf that has no terminal leaflet; not tapering.
- Acaulescent.** Stemless, or apparently stemless; sometimes the stem is subterranean or protrudes only slightly.
- Accessory buds.** Buds more than one in an axil.
- Accessory fruit.** Fruit-like body composed of pericarp and other structure or structures seemingly a part of it, but not originally united with it, as wintergreen berry.
- Accrescent.** Increasing; becoming larger after flowering, as the calyx in some plants.
- Accumbent.** Lying against; said of cotyledons when the edges are placed against the radicle.
- Achene (akene).** A dry indehiscent one-seeded pericarp.
- Achlamydeous.** Lacking calyx or corolla; naked.
- Acinaciform.** Shaped like a scimitar; curved, round toward the point, being thicker on the outer side than on the convex or inner side.
- Acotyledonous.** Without cotyledons.
- Adnate.** Grown to, united with another part; as stamens with the corolla-tube or an anther in its whole length with the filament.
- Adventitious buds.** Buds appearing on occasion, rather than in regular places and order, as those arising about wounds.
- Adventive.** Said of an introduced plant not yet established; imperfectly or only partially naturalized.
- Æstivation.** The arrangement of floral envelopes in the bud (æstivus, summer, when flowers mostly appear. Vernation is leaf-arrangement in the bud).
- Affinity.** A plant or part closely related to another or much resembling it in structure.
- Agglomerate.** Piled together, heaped up.
- Aggregate fruit.** One formed by the coherence of pistils that were distinct in the flower, as blackberry.
- Albumen.** Starchy or other nutritive material accompanying the embryo; commonly used in the sense of endosperm, for the material surrounding the embryo.
- Alburnum.** The sapwood or younger wood of a tree.
- Alternate.** Any arrangement of leaves or other parts not opposite or whorled; placed singly at different heights on the axis or stem.
- Alveolate.** Honey-combed, or pitted with angular separated depressions.
- Ament.** Catkin.
- Amentiferous.** Bearing aments or catkins.
- Amorphous.** Formless; of no definite or constant form.
- Amphigean.** Of both worlds, the Old and New; said of distribution of plants.
- Amphitropous.** Said of a straight ovule or seed that is apparently turned a quarter way around, so that it is half inverted and with the scar or hilum on the side.
- Ampullaceous.** Said of plants bearing flask-like parts, as in certain aquatics such as Utricularia.
- Analogous.** Related in function or use, but not in origin. See *Homologous*.
- Anastomosing.** Netted; interveined; said of leaves marked by cross-veins forming a network.
- Anatropous.** Said of a straight ovule or seed that is inverted, with the micropyle next the hilum or scar.
- Ander.** Male; occurs in combinations as, *monandrous*, having one stamen.
- Andræceum.** The male or stamen-bearing part of a flower; the stamens spoken of collectively. See *Gynæcium*.
- Androphore.** The cylinder or column formed by monadelphous filaments, as in the mallow and bombax tribes.
- Angiosperms.** Plants that bear the seeds within a pericarp, in distinction from the gymnosperms which have naked ovules and seeds; having a closed ovary.
- Annual.** Of one season's duration from seed to maturity and death.
- Anterior.** Front; on the front side; away from the axis; toward the subtending bract.
- Anther.** The pollen-bearing part of the stamen, borne at the top of the filament or sometimes sessile.
- Antheriferous.** Anther-bearing.
- Anthesis.** Flowering; strictly, the time of expansion of a flower, but often used to designate the flowering period; the act of flowering.
- Anthocarpous.** Said of a body combined of flowers and fruit united into a solid mass, as in the pineapple or the mulberry.
- Anthodium.** Flower-head of the Composite; in common speech this flower-head is erroneously called a "flower."
- Antical.** Front, anterior.
- Apetalous.** No petals; petals missing.
- Apical.** At the apex or top.
- Apocarpus.** Carpels not united; see *Syncarpous*.
- Appendage.** An attached subsidiary or secondary part, as a projecting part or a hanging part or supplement.
- Appressed.** Closely and flatly pressed against; adpressed.
- Arachnoid.** Cobwebby, by soft and slender entangled hairs; also spider-like.
- Areole, areola.** A small more or less angular space on a surface, as between network of veins.
- Aril.** An appendage or an outer covering of a seed, growing out from the hilum or funiculus; sometimes it appears as a pulpy covering.
- Arillate.** Provided with an aril.
- Arillode.** An aril-like structure, or false aril; a coating or covering of the seed arising from its own surface, and not from the funiculus.
- Armed.** Provided with any kind of strong and sharp defence, as of thorns, spines, prickles, barbs.
- Articulate.** Jointed; provided with nodes or joints, or places where separation may naturally take place.
- Ascending.** Rising up; produced somewhat obliquely or indirectly upward.
- Asexual.** Sexless; without sex.
- Auricle.** An ear-shaped part or appendage, as the projections at the base of some leaves and petals.
- Awl-shaped.** Narrow and sharp-pointed; gradually tapering from base to a slender or stiff point.
- Awn.** A bristle-like part or appendage.
- Azil.** Upper angle that a petiole or peduncle makes with the stem that bears it.
- Azile.** Borne in or on the axis, or relating to it.

- Axillary.** In an axil.
- Axis.** The main or central line of development of any plant or organ; the main stem.
- Bacca.** A berry.
- Baccate.** Berry-like; pulpy or fleshy.
- Banded.** Marked with cross-bars or horizontal lines of color, or with very prominent ribs or other structure.
- Barb.** A short point or bristle; usually employed to designate points with reflexed or fishhook-like rarely ascending appendages.
- Barbulate.** With fine beards.
- Bark.** The word is often used in a general way to designate the softer outer envelope of a stem or root. In this sense, it includes all that peels readily, as the bark of the hemlock and oak, used for tanning leather. In a stricter sense, it is applied to the corky layers formed on the outer surface of woody plants. It is formed from an active layer of tissue,—the phellogen. The bark is developed in different ways on different trees. So distinct are the resulting tissues that species of trees may be readily recognized by their bark alone. Cork of commerce is the bark of the cork oak, a native of southwestern Europe. Inasmuch as the word covers so many structures, it is little used by botanists in technical descriptions.
- Bark-grafting.** A kind of grafting in which the cions are inserted between the bark and wood of a stub; often, but erroneously, called crown-grafting.
- Base.** The bottom or lower end of a part or structure or organ, even though this part may be uppermost as the organ hangs on the plant.
- Basifixed.** Attached or fixed by the base, as an ovule that is affixed to its support by its bottom rather than by its side or by an angle.
- Basin.** The depression at the apex or blossom-end of an apple or other pome fruit.
- Basinerved.** All the ribs or nerves of a leaf or petal starting from its base.
- Bast.** The soft part of the fibro-vascular bundles in plants, abundant in the inner bark. It increases in thickness simultaneously with the wood, but much less rapidly. The fibrous elements in the bast of basswood have been used in making cordage; also in making strong paper.
- Beak.** A long prominent and substantial point; applied particularly to prolongations of fruits and carpels.
- Beard.** A long awn or bristle-like hair.
- Berry.** Pulpy, indehiscent, few- or many-seeded fruit; technically, the pulpy fruit resulting from a single pistil, containing one or more seeds but no true stone, as the tomato.
- Bi- or Bis-.** In Latin compounds, signifying *two* or *twice*.
- Biauriculate, biaurite.** Having two ears.
- Bicallous, bicallous.** Furnished with two callosities, as the lip of some orchids.
- Bicrural.** With two tails, legs, or slender elongations.
- Biennial.** Of two seasons' duration from seed to maturity and death.
- Bifarious.** Arranged in two rows.
- Bifid.** Two-cleft or two-cut.
- Bifoliolate.** With two leaflets to a leaf.
- Biforate.** With two openings, pores or apertures.
- Bigener.** Plant arising from a cross between two genera.
- Bilabiate.** Two-lipped, double-lipped.
- Bilamellate.** Bearing or consisting of two plates.
- Bilobed.** Two-lobed; parted into two lobes.
- Bilocular.** Two-celled; with two locules or compartments.
- Bipartite.** Divided into two parts; separated nearly to base.
- Bipinnate.** Twice-pinnate; when the primary divisions are pinnate.
- Bipinnatifid.** Twice-pinnatifid; when pinnatifid primary parts are pinnately cut.
- Biplicate.** Bearing two plaits or folds.
- Bisepate.** Twice-divided; with two partitions.
- Biserial.** In two series or sets.
- Biserrate.** Doubly serrate; the serratures themselves serrate.
- Bisexual.** Two-sexed; with both stamens and pistils.
- Biternate.** Twice-ternate; when the divisions of a ternate leaf are divided into three.
- Bivalvular.** Two-valved.
- Bivittate.** With two vittae or oil-tubes.
- Bladdery.** Inflated; empty, and the walls thin like the bladder of an animal.
- Blade.** The expanded part of leaf or petal.
- Blanching.** A whitening or decoloring of the usually green parts of plants, as in celery or endive when it is prepared for use.
- Bole.** The trunk of a tree, particularly of a large tree.
- Boss.** A prominent center or projection on a flat and more or less circular surface.
- Bottom-heat.** A term used to designate the condition that arises when the roots of plants, or the soil in which they grow, are exposed to a higher temperature than that of the air in which the aërial parts are growing.
- Brachiate.** Branches or parts spreading at nearly right-angles and placed alternately.
- Brachys.** In Greek compounds, signifying *short*, as brachypodus, on a short foot or stalk.
- Bract.** A much-reduced leaf, particularly the small or scale-like leaves in a flower-cluster or associated with the flowers.
- Bracteal.** Concerning or pertaining to bracts.
- Bracteole.** Bractlet.
- Bractlet.** Bract born on a secondary axis, as on the pedicel or even on a petiole.
- Breaking.** Said when buds start to grow.
- Bristly.** Bearing stiff strong hairs or bristles.
- Bud.** An incipient or nascent shoot; the rudimentary or beginning state of a stem; particularly, in common speech, a thickened and condensed resting-stage of a shoot, or a flower or leaf before expanding; in propagating, a single bud used on a cutting or cion. See *Buds*, p. 586.
- Budding.** The operation of applying a single bud to the surface of the growing wood of the stock, with the intention that it shall grow. The bud is usually inserted underneath the bark of the cion, and is held in place by a bandage. Budding is a part of the general process of grafting. Called *inoculation* in old writings.
- Bulb.** A thickened part in a resting state and made up of scales or plates on a much shortened axis. See *Bulb*, p. 588.
- Bulbel.** A bulb arising from a mother-bulb.
- Bulbiferous.** Bulb-bearing.
- Bulblet.** Aërial bulb; a bulb borne above ground, as in the flower-cluster or a leaf-axil.
- Bulbo-tuber.** Corm.
- Bulbous.** Bulb-like; with the structure or the characteristics of a bulb.
- Bullate.** The surface blistered or puckered, as the leaf of a Savoy cabbage.
- Bursicle.** A little pouch-like or purse-like receptacle.
- Bush.** A low and thick shrub, without distinct trunk.
- Caducous.** Falling off early, or prematurely, as the sepals in some plants.
- Calcarate.** Spurred.
- Calcariform.** Spur-formed; shaped like a calcar or spur.
- Calceolate.** Slipper-like; having the form of a round-toed shoe.
- Callosity.** A thickened and hardened part or protuberance.
- Callus.** A hard prominence or protuberance; in a cutting or on a severed or injured part, the roll of new covering tissue.
- Calyxine.** Pertaining to a calyx, or calyx-like.
- Calyculate.** Calyx-like; bearing a part resembling a calyx; particularly, furnished with bracts against or underneath the calyx resembling a supplementary or outer calyx.
- Calyptra.** A hood or lid; particularly the hood or cap of the capsule of a moss.
- Calyptiform.** Hood-formed; like a cap pulled over.

- Calyx*. The outer circle of floral envelopes.
- Cambium*. The growing or nascent tissue lying between the xylem and phloem of the fibro-vascular bundle, and therefore on the outside of the woody trunk between wood and bast, or in trees and shrubs between wood and "bark." Its function is to increase the stem in diameter.
- Campanulate*. Bell-shaped.
- Campylotropous*. Said of an ovule or seed so curved or turned on itself as to bring the apex and base together.
- Canaliculate*. Grooved or channeled lengthwise.
- Canescent*. Gray-pubescent and hoary.
- Cap*. A convex removable covering of a part, as of a capsule; in the grape, the cohering petals fall off as a cap.
- Capillary*. Hair-like; very slender.
- Capitate*. Headed; in heads; formed like a head; aggregated into a very dense or compact cluster.
- Capitulum*. Head; a close body of sessile flowers.
- Capsular*. Pertaining to a capsule; formed like a capsule.
- Capsule*. Compound pod; a dry fruit of more than one carpel, opening at maturity.
- Carinate*. Keeled; provided with a projecting central longitudinal line or ridge on the lower or under surface.
- Carpel*. One of the foliar units of a compound pistil; a simple pistil contains one carpel.
- Carpophore*. Fruit-stalk; stem bearing the carpels; particularly, in the Umbelliferae, the slender extended axis that supports the ripe seed-like carpels.
- Cartilaginous*. Hard and tough, like parchment.
- Caruncle*. On a seed, a protuberance or growth at or around the hilum.
- Caryopsis*. An achene-like fruit, with the thin pericarp or covering grown fast to the seed; it is the characteristic fruit of the cereal grains and other grasses.
- Cataphyll*. An undeveloped leaf, as at the beginning of a growth.
- Catkin*. A scaly-bracted spike with declinuous flowers; ament; prominent in willows and poplars.
- Caudex*. Stem, trunk; used particularly to designate the persistent base of an herbaceous stem that is otherwise annual, and also for the stem of tree-ferns and palms.
- Caudicle*. Little stem, stemlet; stalk of pollinium in orchids.
- Cauliscent*. More or less stemmed or stem-bearing; having an evident stem above ground.
- Caulicle*. Stemlet of the embryo; radicle.
- Cauline*. Pertaining or belonging to the stem.
- Cavity*. The depression at the bottom or stem-end of an apple or similar fruit.
- Cell*. One of the ultimate compartments or vesicles of which plants are composed or made up; also, a cavity or compartment or locule of an ovary or anther.
- Cellular*. Tissue made up of short thin-walled cells, rather than of fibers or tubes.
- Centrifugal*. Away from the center.
- Centripetal*. Toward the center.
- Centrum*. The central part of any structure; particularly the large central air-space in hollow stems.
- Cephalanthium*. An old name for the flower-head of composites; anthodium.
- Cephalium*. The head-like stem-end of condensed cacti, bearing the flowers and fruits.
- Cernuous*. Drooping; inclining somewhat from the perpendicular.
- Cespirose*. Matted; growing in tufts; in little dense clumps; said of low plants that make tufts or turf of their basal growths.
- Chaeta*. A bristle; seta.
- Chaff*. A small thin dry and membranous scale or bract; in particular, the bracts in the flower-heads of composites.
- Channeled*. Deeply grooved lengthwise; canaliculate.
- Chartaceous*. Thin, hard and stiff; having the texture of writing-paper.
- Chrysos*. In Greek compounds, signifying *golden* or *golden yellow*.
- Ciliate*. Fringed with hairs; bearing hairs on the margin.
- Ciliolate*. Slightly or minutely ciliate.
- Cinereous*. Ash-colored; light gray.
- Cinnamomeus*. Cinnamon-colored.
- Cion*. The bud or branch used in grafting; also spelled *scion*.
- Circinate*. Coiled downward or inward from the top, as the young frond of a fern and cycas.
- Circumscissile*. Opening or dehiscing by a line around the fruit or anther, the valve usually coming off as a lid.
- Cirrhiferous*. Tendril-bearing.
- Cirrhiform*. Tendril-form.
- Cirrus*. *cirrus*. A tendril.
- Cladophyllum*. A flattened leaf-like branch, functioning as foliage, as in many acacias and in asparagus.
- Clados*. In Greek compounds, signifying a *branch*.
- Clasping*. Leaf partly or wholly surrounding stem.
- Clavate*. Club-shaped; said of a long body thickened toward the top.
- Claw*. The long narrow petiole-like base of the petals or sepals in some flowers.
- Cleistogamous flowers*. Small closed self-fertilized flowers, as in some violets and in many other plants.
- Close fertilization*. Fecundation by pollen from same flower; self-fertilization.
- Clove*. One of the separable parts of a composite bulb, as of the garlic.
- Clypeate*. With the form of an ancient buckler or round convex shield; shield-like.
- Coalescence*. The union of similar parts or organs, or of those in the same series as stamens with stamens and petals with petals.
- Coarctate*. Crowded together.
- Coccus*. A berry (plural *cocci*); in particular, one of the parts of a lobed fruit with one-seeded cells.
- Cochleariform*. Spoon-shaped.
- Coherent*. Two or more similar parts or organs joined.
- Cohesion*. The union of two or more organs of same kind.
- Collateral*. By the side; standing side by side.
- Column*. Body formed of union of stamens and pistil in orchids, or of stamens, as in mallows.
- Commissure*. The place of joining or meeting; as the face by which one carpel joins another.
- Comose*. Bearing a tuft or tufts of hair.
- Complete flower*. All parts present.
- Complete leaf*. Having blade, petiole, stipules.
- Complicate*. Folded over or back on itself.
- Compound*. Of two or more similar parts in one organ.
- Compound leaf*. A leaf with two or more separate leaflets; in some cases (as in Citrus) some of the leaflets may be obsolete and the compound leaf have only one leaflet.
- Compound pistil*. Of two or more carpels united.
- Compressed*. Flattened, especially flattened laterally.
- Conchiform*. Shell-form; like one valve of a bivalve shell.
- Conduplicate*. Two parts folded together lengthwise.
- Cone*. A dense and usually elongated collection of flowers or fruits borne beneath scales, the whole with scales and axis forming a detachable homogeneous fruit-like body; some cones are of short duration, as the staminate cones of pines, and others become dry and woody durable parts.
- Confluent*. Running together so as to form a single part or organ; blended.
- Conformed*. Of the same form or character as something else or as a related part or structure.
- Congested*. Crowded very closely together; collected into a mass or body.
- Conglobate*. Gathered into a ball or globe.
- Conglomerate*. Clustered; brought together.
- Coniferous*. Cone-bearing.
- Connate*. United or joined; in particular, like or similar structures joined as one body or organ.
- Connective*. The filament or tissue connecting the two cells of an anther, particularly when the cells are separated.

- Connivent.** Coming together or converging, but not organically connected.
- Conoidal.** Cone-like; nearly conical.
- Convolute.** Said of floral envelopes in the bud when one edge overlaps the next part or petal or sepal or lobe while the other edge or margin is overlapped by a preceding part; rolled up.
- Cordate.** Heart-shaped; with a sinus and rounded lobes at the base and ovate in general outline.
- Cork.** The name applied to the outer impervious mostly not-living part of the bark. Most bark develops a corky exterior, and in some cases it becomes very prominent. In *Evonymus Thunbergianus*, the English maple, the corky barked elm, and other trees and shrubs, it forms wings on the branches. The cork of commerce comes from the bark of *Quercus Ilex* (better known as *Q. Suber*), plantations of which grow in southwestern Europe. The cork tree of the catalogues, *Phellodendron amurense*, is a curious tree, cultivated for ornament.
- Corm.** A solid bulb-like part, usually subterranean, as the "bulb" of crocus and gladiolus.
- Cormel.** A corm arising from a mother-corm.
- Cormlet.** Aërial corm, or one borne in the inflorescence or in the leaf axils.
- Cormous.** With corms, or pertaining to corms.
- Corneous.** Horny; hard and very dense in texture.
- Corniculate.** Bearing or terminating in a small horn-like protuberance or process.
- Corolla.** Inner circle of floral envelopes; if the parts are separate, they are petals; if not separate, they are teeth, lobes or divisions.
- Corona.** Crown, coronet; any appendage or intrusion that stands between the corolla and stamens, or on the corolla, as the cup of a daffodil, or that is the outgrowth of the staminal part or circle, as in the milkweeds.
- Coroniform.** Crown-formed or crown-like; corona-like.
- Corticatè.** Having a cortex or hard bark; also having a rind, as the lemon and orange.
- Corymb.** Short and broad, more or less flat-topped indeterminate flower-cluster.
- Corymbose inflorescence.** Outer flowers opening first.
- Costa.** A rib; in particular a strong rib or line, as a midrib or mid-nerve.
- Costate.** Ribbed.
- Cotyledon.** Seed-leaf; the primary leaf or leaves in the embryo; in some plants the cotyledon always remains in the seed-coats and in others (as bean) it emerges on germination.
- Crateriform.** Deep saucer-shaped; cup-shaped.
- Creeper.** A trailing shoot that takes root in the ground throughout its length.
- Crenate.** Shallowly round-toothed or obtusely toothed.
- Crenulate.** Finely or shallowly crenate.
- Crested.** With elevated and irregular or toothed ridge.
- Cribrose.** Sieve-like; with numerous small apertures.
- Crop.** Produce of tilled, cared-for or protected plants.
- Croppage.** The whole subject of the producing of crops.
- Cross.** The offspring of any two flowers that have been fertilized. A cross-breed is a cross between varieties of the same species. Synonyms are half-breed, mongrel, variety-hybrid. Crossing is the operation of cross-pollinating. Cross-pollination is the transfer of the pollen of one flower to the pistil of another.
- Cross-fertilization.** Fertilization or fecundation secured by pollen from another flower.
- Cross-pollination.** Transfer of pollen from flower to flower.
- Crown.** Corona; also that part of the stem at the surface of the ground; also a part of a rhizome with a large bud, suitable for use in propagation.
- Cruciate.** Cross-shaped or cross-like.
- Crustaceous.** Said of bodies or coverings that are hard and brittle.
- Cryptogam.** Flowerless plant, as fern, moss, fungus, seaweed; less used than formerly as a technical term.
- Cryptos.** In Greek compounds, signifying *concealed*.
- Culm.** The stem of sedges and grasses, and similar plants.
- Cuneate.** Wedge-shaped; triangular, with the narrow end at point of attachment, as of leaves or petals.
- Cupular.** Cup-like or cup-shaped; the acorn nut sits in a cupule or little cup (whence the name Cupuliferæ).
- Cuticle.** The external rind or skin of a plant or part; usually applied to the thin waterproof membrane overlying the epidermis.
- Cutting.** A severed vegetative or asexual part of a plant used in propagation; as a cutting of root, of stem, or of leaf.
- Cyathiform.** Cup-shaped.
- Cymbiform.** Boat-shaped.
- Cyme.** A broad, more or less flat-topped determinate flower-cluster.
- Cymose inflorescence.** With central flowers opening first.
- Cypselæ.** An old term for the fruit of composites, being dry, one-celled and one-seeded.
- Deciduous.** Falling, as the leaves of non-evergreen trees.
- Decom pound.** More than once compound.
- Decumbent.** Reclining or lying on the ground, but with the end ascending.
- Decurrent.** Running down the stem, as the leaf of mullein.
- Decussate.** Opposite leaves in four rows up and down the stem; alternating in pairs at right angles.
- Definite.** Said of a constant or known number, not exceeding twenty; contrasted with indefinite, above twenty, when the parts are usually not counted in systematic descriptions.
- Deflexed.** Turned downward abruptly.
- Defoliation.** The casting or falling of the leaves.
- Dehiscence.** The method or process of opening of a seed-pod or anther.
- Deliquescent.** Trunk or leader lost in the branches; said of tree-top without a leader.
- Deltoid.** Triangular; delta-like.
- Dendroid.** Said of tree-shaped small plants.
- Dendron.** In Greek compounds, signifying a *tree*.
- Dentate.** With sharp spreading teeth.
- Depauperate.** Applied to a plant or part that is less perfectly developed than usual or normal; also said of very small members of a genus or family.
- Depressed.** More or less flattened endwise or from above.
- Descending.** The direction gradually downwards.
- Determinate.** Definite cessation of growth at the apex or in the main axis.
- Di-, Dis-,.** In Greek combinations, signifying *two* or *twice* as *diphyllus*, *two-leaved*.
- Diadelphous.** In two groups, as the stamens of some Leguminosæ, joined by their filaments.
- Diandrous.** With two stamens.
- Diaphanous.** Transparent or translucent.
- Dicarpellous.** Comprised of two carpels.
- Dichlamydeous.** Provided with both calyx and corolla.
- Dichogamy.** Stamens and pistils maturing at different times.
- Diclinous.** Imperfect; having either stamens or pistils but not both; unisexual. See *Monoclinous*.
- Dicoccous.** Separating into two cocci.
- Dicotyledonous.** With two cotyledons.
- Didynamous.** With four stamens in two pairs of different length.
- Diffuse.** Loosely branching or spreading; of open growth.
- Digitate.** Hand-like; compound with the members arising from one point.
- Dimerous.** The parts in twos.
- Dioecious.** Staminate and pistillate flowers on different plants.
- Dipterous.** Two-winged.
- Dippyrenous.** Having two stones or pyrenes.
- Disciform.** Flattish and circular like a discus.
- Discoid.** Disk-like; in particular, said of a head of Compositæ without ray-flowers.

- Disk, disc.* A more or less fleshy or elevated development of the receptacle about the pistil; receptacle in the head of Compositæ.
- Disk-flowers.* The tubular flowers in the center of heads of Compositæ, as distinguished from the ray-flowers.
- Dissected.* Divided into many slender segments.
- Dissepiment.* A partition, particularly in an ovary or fruit.
- Distinct.* Separate; not united with parts in the same series.
- Divided.* Separated to the base.
- Division.* Propagation by means of separating the root system or rhizome system into parts; cutting up the plant into several root-bearing parts or pieces, as when one rhubarb plant is made into two or more.
- Dorsal.* Back; relating to the back or outer surface of a part or organ.
- Dorsiferous.* Bearing anything on the back.
- Dorsifixed.* Attached by the back.
- Dorsoventral.* Literally, back-front; placed with reference to the back or front or to both.
- Double.* Said of flowers that have more than the usual number of floral envelopes, particularly of petals; full.
- Downy.* Covered with very short and weak soft hairs.
- Drupe.* A fleshy one-seeded indehiscent fruit, with seed inclosed in a stony endocarp; stone-fruit.
- Drupelet.* One drupe in a fruit made up of aggregate drupes, as in the raspberry.
- Dumose.* Low and branching, as a bush.
- E- or Ex-.* In Latin-formed words, usually denoting, as a prefix, that parts are missing, as exstipulate, *without stipules*, estriate, *without stripes*.
- Ecalcarate.* Without calcar or spur.
- Ecology.* Study of habits and modes of life of animals and plants.
- Ecostate.* Without ribs.
- Edentate.* Without teeth.
- Effuse.* Loosely spreading; very diffuse.
- Eglandulose.* Without glands.
- Elliptic.* A flat part or body that is oval and narrowed to rounded ends.
- Elongate.* Lengthened; stretched out.
- Embryo.* The plantlet in the seed.
- Endocarp.* The inner layer or part of a pericarp.
- Endogen.* Term applied to stems having scattered bundles, as of Indian corn, not appropriate, and now little used. See *Exogen*.
- Endosperm.* Starch or other food outside or around the embryo; albumen.
- Ensiform, ensate.* Sword-shaped; long, flat, 2-edged, nearly or quite straight, with a sharp point.
- Entire.* Margin not in any way indented; whole.
- Environment.* Surroundings; conditions in which organisms live and grow.
- Ephemeral.* Persisting for one day only, as flowers of spiderwort.
- Epi.* A Greek prefix signifying *on or upon*.
- Epicarp.* The outer layer or surface of the pericarp.
- Epichile.* The upper part of the jointed lip of an orchid.
- Epicotyl.* That part of the caulicle lying above the cotyledons.
- Epidermis.* Superficial layer of cells and underneath the cuticle.
- Epigeal.* Cotyledons rising into the air in germination.
- Epigeous.* Close upon the ground rather than underneath.
- Epigynous.* Borne on the ovary; used of floral parts when ovary is inferior and flower not perigynous.
- Epipetalous.* On a petal.
- Epiphyllous.* On a leaf.
- Epiphyte.* Air-plant; a plant growing on another or on some other elevated support.
- Equivalent.* Sitting astride; used for conduplicate leaves that stand inside each other in two ranks, as in *Iris*.
- Erostrate.* Without a beak.
- Essential organs.* Stamens and pistils.
- Evergreen.* Remaining green throughout the year.
- Exalbuminous.* Seeds without albumen or endosperm.
- Excentric.* Out of or away from the center.
- Excurrent.* The trunk or leader continuing through the top.
- Exfoliating.* Coming off in thin layers, as the bark of birch and other plants.
- Exocarp.* The outside part of a pericarp.
- Exogen, exogenous.* Growing and increasing in diameter by layers on the exterior of the woody cylinder, in distinction from endogens.
- Exserted.* Sticking out; projecting beyond, as stamens from a perianth.
- Exsiccated.* Dry or dried.
- Exstipulate.* Without stipules.
- Extorse.* Looking or facing outward.
- Eye.* The marked center of a flower; a bud on a tuber, as on a potato; a single-bud cutting.
- Facies.* The general appearance or "looks" of a plant; or the characteristic appearance of a plant society.
- Farinaceous.* Containing starch, or starch-like materials.
- Fasciated.* Much flattened; an abnormal or teratological widening and flattening of the stem.
- Fascicle.* A condensed or close cluster, as of flowers.
- Feminine.* Pistillate (in higher plants).
- Fertile.* Said of pollen-bearing stamens and seed-bearing fruits.
- Fertilization.* Impregnation of the ovule; the act of union of sperm and egg cells, in the higher plants taking place within the ovule: fecundation.
- Fetid.* Having a disagreeable odor.
- Fibrillose.* With fine fibers or threads.
- Fibrous.* Fiber-like; containing fibers or thread-like parts.
- Fibro-vascular.* Made up of both fibers and ducts; combination of fibrous and vascular structure.
- Filament.* Stalk of the anther.
- Filiform.* Thread-like; long and very slender.
- Fimbriate.* Fringed.
- Fimbrillate.* Minutely fringed.
- Fistular.* Cylindrical and hollow.
- Flaccid.* Soft; lax and weak; not rigid.
- Flagelliform.* Whip-form; long and slender like a lash.
- Flagging.* Wilting; said particularly of newly made cuttings and recently transplanted plants.
- Flexuous.* Having a more or less zigzag or wavy form; said of stems of various kinds.
- Floccose.* With tufts or flocks of soft wool or woolly hair.
- Flora.* The plant population of a given region; also a book describing this population.
- Florets.* Individual flowers of composites and grasses; also other very small flowers that make up a very dense form of inflorescence.
- Floriferous.* Flower-bearing.
- Foliaceous.* Leaf-like; said particularly of sepals and calyxlobes and of bracts that in texture, size or color look like small or large leaves.
- foliate.* In combinations, -leaved; having leaves; as trifoliate, *three-leaved*.
- foliolate.* Having leaflets; as trifoliolate, *of three leaflets*.
- Follicle.* Dry, dehiscent pericarp opening only on the front suture.
- Follicular.* With follicles; follicle-like.
- Foramen.* An aperture or opening.
- Forked.* Branching or divided into nearly equal parts or members.
- Fornicate.* Arched.
- Free.* Not joined to other organs; as petals free from the stamens or calyx.
- Froned.* Leaf of fern; sometimes used in the sense of foliage.
- Frosted.* With a more or less shining or crystallized white covering.
- Fructification.* The act or process of fruiting; also the fruiting organ or organs.
- Fruit.* The ripened pericarp or pericarps with the adnate parts; the seed-bearing organ.
- Fruiticose.* Shrubby or shrub-like in the sense of being woody.

- Fugacious.** Falling or withering away very early.
- Fumose.** Smoke-colored.
- Function.** What a plant or a part does; its vital activities.
- Funicle.** The stalk or stipe of an ovule or seed.
- Funnelform.** With tube gradually widening upward and passing insensibly into the limb, as in many flowers of *Convolvulus*; *infundibuliform*.
- Furrowed.** With longitudinal channels or grooves.
- Fusiform.** Spindle-shaped; narrowed both ways from a swollen middle, as *dahlia* roots.
- Galea.** A hood or a helmet-shaped part or structure, as found in the upper lip of some corollas.
- Gamete.** One of the sex-cells, either male or female.
- Gamopetalous.** Corolla of one piece; petals united.
- Gamophyllous.** Leaves united.
- Gamosepalous.** Calyx of one piece; sepals united.
- Geminate.** In pairs; twin.
- Gemma.** A bud; particularly a bud or bud-like structure by which a plant propagates.
- Gemmiparous.** Bud-bearing.
- Gemmule.** A little bud or bud-like structure.
- Generation.** Period from birth (impregnation) to death; the epoch from one 1-celled stage of a plant to the next 1-celled stage.
- Germination.** The unfolding of the embryo and becoming self-established of the plantlet.
- Gibbosity.** A swelling or bulging on one side or near the base.
- Glabrate.** Nearly glabrous, or becoming glabrous with maturity or age.
- Glabrous.** Not hairy.
- Gladiate.** Sword-shaped or sword-like.
- Gland.** Properly a secreting part or prominence or appendage, but often used in the sense of gland-like.
- Glandular.** Having or bearing secreting organs, or glands.
- Glandulose, glanduliferous.** Gland-bearing.
- Glaucous.** Covered with a "bloom" or a whitish substance that rubs off.
- Glochidiate.** Said of parts with summit barbed.
- Glomerate.** In dense or compact cluster or clusters.
- Glomerule.** Dense head-like clusters; properly a dense cyme.
- Glume.** A small chaff-like bract; in particular, one of the two empty bracts at the base of the grass spikelet.
- Graft.** A branch or bud inserted on another plant with the intention that it shall grow there; cion.
- Grafting.** The process of inserting a cion in a plant with the intention that it shall grow there. See *Budding*.
- Granular, granulose.** Covered with very small grains; minutely or finely mealy.
- Gymnos.** In Greek compounds, signifying *naked* or *not covered*: as *gymnosperms*, with *naked seeds* (not in a pericarp). See *Angiosperm*.
- Gynandrous.** With the stamens grown on the pistil, forming one organ, as in the orchids.
- Gynobase.** Stipe or stalk of an ovary, being an extension or prolongation of the receptacle; short gynophore.
- Gynæcium.** The female or pistil-bearing part of the flower. See *Andræcium*.
- Gynophore.** Stipe of an ovary prolonged within the calyx.
- Habit.** The looks, appearance, general style or mode of growth; as an upright, open, decumbent or strict habit.
- Habitat.** Particular place in which a plant grows; as a swamp, roadside, lawn, woods, ballast-heap, hillside.
- Hairs.** A general name for many kinds of small and slender outgrowths on the parts of plants; special kinds of hairiness are designated as *setose*, *villous*, *comose*, *pubescent*, *hirsute*, and others.
- Halberd-shaped.** Hastate.
- Hamate.** Hooked.
- Hastate.** Of the shape of an arrow-head but the basal lobes pointed or narrow and standing nearly or quite at right angles; halberd-shaped.
- Haulm.** Straw-like stems, as of the cereal grains; sometimes also applied to the stems of palms; usually a collective noun.
- Head.** A short dense spike; capitulum.
- Heart-shaped.** Cordate; ovate in general outline but with two rounded basal lobes; has reference particularly to the shape of the base of a leaf or other expanded part.
- Heel.** An enlarged or more or less transverse part on the lower end of a cutting secured from the older or larger branch from which the cutting is taken.
- Helicoid.** Twisted or coiled in snail-shell form.
- Heliotropism.** The characteristic of turning toward the light.
- Hemi-** In Greek compounds, signifying *half*.
- Hepta-** In Greek compounds, signifying *seven*.
- Herb.** Naturally dying to the ground; without persistent stem above ground; lacking definite woody firm structure.
- Herbaceous.** Not woody; dying down each year; said also of soft branches before they become woody.
- Hermaphrodite.** Bearing both stamens and pistil in the same flower; two-sexed; bisexual.
- Hesperidium.** The fruit of the orange-kind.
- Heterocarpous.** Various-fruited; with more than one kind or form of fruit.
- Heterogamous.** With two or more kinds or forms of flowers.
- Heteros.** In Greek composition, signifying *various*, or of *more than one kind* or *form*; as *heterophyllous*, with *more than one kind* or *form* of leaf.
- Hilum.** In the seed, the scar or mark indicating the point of attachment.
- Hip.** Fruit of the rose, being an urn-like or closed receptacle bearing the achenes inside. See *Hypanthium*.
- Hirsute.** With rather rough or coarse hairs.
- Hirtellous.** Softly or minutely hirsute or hairy.
- Hispid.** Provided with stiff or bristly hairs.
- Hispidulous.** Somewhat or minutely hispid.
- Hoary.** Covered with a close white or whitish pubescence.
- Homo-** In Greek compounds, signifying *alike* or *very similar*.
- Homocarpous.** All the fruits, as of a flower-head, alike.
- Homogamous.** Presenting only one kind of flowers.
- Homologous.** Related in origin or morphology. See *Analogous*.
- Homomorphous.** Uniform; all the given parts alike.
- Horny.** Hard and dense in texture; corneous.
- Hybrid.** A plant resulting from a cross between two or more parents that are more or less unlike.
- Hygroscopic.** Capable of absorbing moisture from atmosphere.
- Hypanthium.** A fruit-like body (as the rose-hip) formed by the enlargement of the torus and bearing the proper fruits on its upper or inner surface; literally "beneath the flower." Now commonly used to denote the cup-shaped receptacle on which calyx, petals and stamens are inserted in cases of perigyny, as in *plum*, *fuchsia*.
- Hypochil.** The lower or basal part of the lip in orchids.
- Hypocotyl.** That part of the caulicle lying below the cotyledons.
- Hypocrateriform.** Salver-form; that shape of the flower characterized by a cylindrical tube and a flat-spreading limb, as in *phlox*.
- Hypogaeal.** Cotyledons remaining beneath the ground in germination.
- Hypogynous.** Borne on the torus, or under the ovary; said of the stamens or petals.
- Immarginate.** Without a rim or edge.
- Immersed.** Entirely under water.
- Imparipinnate.** Unequally pinnate; odd-pinnate; with a single terminal leaflet.
- Imperfect flower.** Having either stamens or pistils, but not both.
- Implexed, implexuous.** Entangled, interlaced.
- Impregnation.** Fecundation or fertilization of the ovule by the pollen; also, the infiltration of substances.

- Impressed.* Deeply nerved; furrowed or grooved as if by pressure.
- Inarching.* The grafting together of two plants with the intention that, when they are severed, part of one plant will be growing on the other.
- Incanescent.* Hoary- or gray-pubescent; canescent.
- Incised.* Cut; slashed irregularly, more or less deeply and sharply.
- Inclining.* Looking or falling down from the horizontal.
- Included.* Not protruded, as stamens not projecting from the corolla.
- Incomplete.* Lacking some of its parts, as a flower deficient in stamens or calyx.
- Incrustate.* Crusted; with a hard or firm covering.
- Incumbent (cotyledons).* Of a seed so bent over that the back of one cotyledon lies against the radicle.
- Indefinite.* Very numerous, as above twenty; see *Definite*.
- Indehiscent.* Not regularly opening, as a seed-pod or anther.
- Indeterminate.* Growing on from the apex, particularly of the main axis.
- Indigenous.* Native to the region; not introduced from some other country.
- Indumentum.* A covering of hair.
- Induplicate.* With margins folded inward.
- Indurated.* Hard, hardened.
- Indusium.* The little growth covering or surrounding the sorus or fruit-dot in ferns.
- Inferior.* Beneath, lower, below; as an inferior ovary, one that is below the calyx-leaves.
- Inflated.* Blown up; bladdery.
- Inflorescence.* Mode of flower-bearing; technically less correct but much more common in the sense of a flower-cluster.
- Infra-* In combinations, signifying *below*.
- Infundibuliform.* Funnelform.
- Innate.* Said of an anther when attached by its base to the filament.
- Innovation.* An offshoot or departure from the axis.
- Inserted.* Attached; as a stamen growing on the corolla.
- Inter-* In composition, signifying *between*, particularly between closely related parts or organs.
- Interfoliaceous.* Between the leaves, particularly between two leaves of a pair.
- Internode.* The part or space of stem between two nodes or joints.
- Interrupted.* Not continuous; in particular, the interposition of small leaflets or segments between others.
- Intorted.* Twisted upon or around itself.
- Intramarginal.* Just within the margin or edge; between the margins.
- Introduced.* Brought from another region, either intentionally or otherwise; in horticulture, used to designate the intentional bringing of plants into cultivation either from another country or from the wild.
- Introrse.* Turned or faced inward or toward the axis, as an anther looking toward the center of the flower.
- Inverted.* Turned over; end-for-end; top-side down.
- Involucel.* A secondary involucre; small involucre about the parts of a cluster.
- Involucre.* A whorl of small leaves or bracts standing close underneath a flower or flower-cluster.
- Involute.* Said of a flat body (as a leaf) rolled inward or toward the upper side. See *Revolute*.
- Irregular flower.* Some parts different from other parts in same series.
- Jointed.* With nodes, or points of real or apparent articulation.
- Keeled.* Ridged like the bottom of a boat; also the two front united petals of a papilionaceous flower.
- Knaur.* An excrescence, bur or knot of woody tissue that will grow when removed and used as a cutting.
- Labellum.* Lip, particularly the lip of orchids.
- Labiata.* Lipped; a member of the Labiatae.
- Labyrinthiform.* With intricate winding lines or passages.
- Lacerate.* Torn; irregularly cleft or cut.
- Laciniate.* Slashed into narrow pointed lobes.
- Lactescent.* Containing milk or a milk-like substance.
- Lacunose.* Having holes or empty places, particularly in the anatomical structure.
- Lamella.* A thin flat plate or part.
- Lamina.* The blade of a leaf or petal or other expanded part or body.
- Lanceolate.* Lance-shaped; much longer than broad; widening above the base and tapering to the apex.
- Lapidose.* Found in stony places.
- Lateral.* On or at the side.
- Layer.* A branch that takes root and gives rise to an independent plant.
- Leaflet.* One part of a compound leaf; secondary leaf.
- Leaf-stalk.* The stem of a leaf; petiole; foot-stalk.
- Legume.* Simple pericarp dehiscing on both sutures; pod.
- Lemma.* In grasses, the flowering glume,—the lower of the two bracts immediately inclosing the flower.
- Lenticular.* Lentil-shaped; lens-shaped.
- Lepals.* Sterile stamens, particularly those nectaries or scales representing stamens; term little used.
- Lepidote.* Surfaced with small scurfy scales.
- Liana, liane.* A woody twining or climbing plant entangling a tropical forest.
- Life-history.* The sum of the events in the life of a plant.
- Ligneous.* Woody.
- Ligule.* A strap-shaped organ or body; particularly, a strap-shaped corolla, as in the ray-flowers of composites; also a projection from the top of the sheath in grasses and similar plants.
- Limb.* The expanded flat part of an organ; in particular, the expanding part of a gamopetalous corolla.
- Limbate.* Surrounded by an edging of another color; margined with color; also, provided with a limb.
- Line.* One-twelfth of an inch.
- Linear.* Long and narrow, the sides parallel or nearly so.
- Lineate.* Lined; bearing thin parallel lines.
- Linguiiform.* Shaped like a lingula, or with a projecting tongue-like part or process.
- Lip.* One of the parts in an unequally divided corolla or calyx; these parts are usually two, the upper lip and the lower lip, although one lip is sometimes wanting; the upper lip of orchids is by a twist of the stipe made to appear as the lower; a labium.
- Lobe.* Any part or segment of an organ; specifically a part of petal or calyx or leaf that represents a division to about the middle.
- Lobule.* A small lobe.
- Locule.* Compartment or cell of a pistil or anther.
- Loculicidal.* Dehiscence between the partitions into the cavity.
- Lodicule.* A small scale in a grass flower, between the lemma and stamens.
- Loment.* A legume with constrictions or articulations.
- Lorate.* Strap-shaped.
- Lyrate.* Pinnatifid but with an enlarged terminal lobe and smaller lower lobes.
- Medullary.* Relating to the pith; the medullary rays seen in cross-sections of woody trunks radiate from the medulla or pith.
- Meniscoidal.* Like a meniscus or disk; with the form of a watch-crystal.
- Mericarp.* The peculiar seed-like fruit of the Umbelliferae.
- merous.* In composition, referring to the numbers of parts; as flowers 5-merous, in which the parts of each kind or series are five or in fives.
- Mesocarp.* Middle layer or part of a pericarp; the part between the endocarp and exocarp.
- Mesochil.* The intermediate or middle part of the lip of orchids when the lip is separated into three parts.
- Micropyle.* The opening through which impregnation takes place; the point on the seed marking the orifice of the ovule.

*Midrib*. The main rib of a leaf or leaf-like part.

*Mitriform*. Mitre shaped, or like a cap.

*Monadelphous*. Stamens united in one group by their filaments as in many Leguminosæ.

*Moniliiform*. Suggesting a string of beads.

*Mono-*. In Greek compounds, signifying one.

*Monoclinous*. Hermaphrodite; perfect; the two sexes in the same flower. See *Diclinous*.

*Monocotyledonous*. With a single cotyledon.

*Monœcius*. Staminate and pistillate flowers on the same plant.

*Monogynous*. With only one style.

*Monopetalous*. One-petaled; all the petals united to form one body or organ, as a gamopetalous corolla.

*Monopodial*. Axial direction continued by growth from terminal bud or persistence of the leader.

*Monostichous*. In one row.

*Monstrosity*. Deformity; any unusual or non-typical kind of development.

*Morphology*. The science or subject that treats of forms or of the transformations of organs.

*Mucose*. With a slimy covering or secretion.

*Mucro*. A short and sharp abrupt tip.

*Mule*. An old word for a cross, particularly between different species; hybrid; cross-breed.

*Multifid*. Cut or cleft into many narrow lobes or parts.

*Multiple*. Of several or many distinct parts.

*Multiple fruit*. The united product (in one body) of several or many flowers.

*Multiseptate*. With many divisions or chambers, as some nuts.

*Muscariform*. In form of a brush or fly-brush.

*Mycelium*. Vegetative part of a fungus, composed of threads or thready tissue.

*Naked flower*. With no floral envelopes; without calyx and corolla.

*Napiform*. Turnip-shaped; more or less short-fusiform; broader than high and abruptly tapering both ways.

*Navicular*. Boat-shaped; cymbiform.

*Nectariferous*. Nectar-bearing.

*Nectary*. A structure or organ that secretes nectar.

*Nephroid*. Kidney-shaped; reniform.

*Nerve*. A vein or slender rib, particularly if not branched.

*Netted*. Marked with reticulated lines or nerves that project somewhat above the surface.

*Neuter, neutral*. Neither stamens nor pistils; sexless.

*Nidulate*. Nested; as if like or borne in a nidus or nest.

*Node*. A joint where a leaf is borne or may be borne; also incorrectly the space between two joints, which is properly an internode.

*Nucleus*. The kernel of a seed; the central denser structure of a cell.

*Nucule*. A small nutlet; any hard seed-like fruit or part.

*Nut*. An indehiscent 1-celled and 1-seeded hard and bony fruit, even if resulting from a compound ovary.

*Nutlet*. A small or diminutive nut; nucule.

*Ob-*. A Latin syllable, usually signifying inversion.

*Obconical*. Inversely conical; cone attached at the small point.

*Ob lanceolate*. Inversely lanceolate; with the broadest part of a lanceolate body away from the point of attachment.

*Oblique*. Slanting; unequal-sided.

*Oblong*. Longer than broad, and with the sides nearly or quite parallel most of their length.

*Obovate*. Inverted ovate.

*Obovoid*. An ovoid body attached at the smaller end.

*Obsolescent*. Nearly obsolete; becoming rudimentary.

*Obsolete*. Not evident or apparent; rudimentary.

*Obtuse*. Blunt, rounded.

*Ocellated*. Eyed; a circular spot of one color inside a larger spot or area of another color.

*Ochraceous*. Ochre-yellow, gradually changing to brown.

*Ocrea*. A boot-shaped or tubular stipule, as in Polygonum.

*Oculus*. An eye; a leaf-bud when used as a cutting.

*Offset*. A plant arising close to the base of mother plant.

*Oleaginous*. Fleshy and oily.

*Oligos*. In Greek compounds, signifying few.

*Opaque*. Dull; not translucent or shining.

*Operculum*. A lid, as of a circumscissile capsule.

*Orthos*. In Greek compounds, signifying straight.

*Orthotropous* (ovule or seed). An erect straight seed, with the micropyle at the apex and hilum at the base.

*Osseous*. Bony, hard, brittle; of very close texture.

*Ovary*. Ovule-bearing part of a pistil.

*Ovate*. With an outline like that of hen's egg cut in two lengthwise, the broader end downward.

*Ovoid*. A solid that is oval in outline.

*Ovule*. The body which, after fertilization, becomes the seed.

*Ovuliferous*. Ovule-bearing.

*Painted*. Said of colors that are in streaks of unequal brilliancy.

*Palate*. In personate corollas, a rounded projection or prominence of the lower lip, closing the throat or very nearly so.

*Palea, palet*. In the grass flower, the upper of the two inclosing bracts, the lower one being the lemma.

*Palmate*. Lobed or divided in a palm-like or hand-like fashion.

*Palmatifid*. Cut about half way down in a palmate form.

*Panicle*. A branching raceme; flower-cluster in which the branches are racemose, the flowers being pedicellate.

*Papilionaceous corolla*. Butterfly-like; pea-like flower, with a standard, wings, and keel.

*Pappiform*. Pappus-like.

*Pappus*. Peculiar calyx-limb of composites, being plumose, bristle-like, scales, or otherwise.

*Parasitic*. Growing and living on or in another organism.

*Parietal*. Borne on the paries or wall (inner surface) of a capsule.

*Parted*. Cleft or cut not quite to the base.

*Parthenogenetic*. Seed developing without fertilization or fecundation.

*Partial*. Of secondary importance or rank.

*Partite*. Divided very nearly to the base.

*Partitioned*. Divided in compartments or chambers by internal horizontal partitions.

*Pathological*. Diseased.

*Pedice*. Stem of one flower in a cluster.

*Peduncle*. Stem of a flower-cluster or of a solitary flower.

*Pellucid*. Clear, transparent; that can nearly be seen through.

*Peltate*. Attached to its stalk inside the margin; peltate leaves are usually shield-shaped.

*Penninerved*. Nerves arising along the length of a central midrib.

*Pentamerous*. In fives.

*Pepo*. Fruit of pumpkin, squash, and the like.

*Perennial*. Of three or more seasons' duration.

*Perfect flower*. One that has both stamens and pistil.

*Perfoliate*. The stem apparently passing through the part, as a leaf; united around the stem.

*Pergameneous, pergamentaceous*. Texture of parchment.

*Peri-*. In Greek compounds, signifying around.

*Perianth*. The floral envelope considered together; commonly used for flowers in which there is usually no clear distinction between calyx and corolla, as the lilies.

*Pericarp*. The ripened ovary.

*Perigynium*. The sac or utricle that incloses the ovary or achene in Carex; it is sometimes inflated.

*Perigynous*. Borne around the ovary and not beneath it, as when calyx, corolla and stamens are borne on the edge of a cup-shaped hypanthium; such cases are said to exhibit perigyny.

*Persistent*. Remaining attached; not falling off.

*Personate*. Said of a two-lipped corolla the throat of which is closed by a palate, as in toad-flax.

*Petal*. One of the separate leaves of a corolla.

*Petaloid*. Petal-like; of color and shape resembling a petal.

*Petiole*. Leaf-stalk.

- Petiolule*. Stalk of a leaflet.
- Phalanges* (plural of *phalanx*). The groups or bundles of stamens in diadelphous or polyadelphous flowers.
- Phenogam, phenogamous*. Flowering plants; seed-bearing plants (as distinguished from spore-bearing, or cryptogams).
- Phyllodium*. Leaf-like petiole and no blade, as in some acacias and other plants.
- Phyllotaxy*. Order of arrangement of leaves on the stem.
- Phytology*. The study of plants, particularly of the kinds or species; botany.
- Pileate, pileiform*. With the form of a pileus or rimless cap; in particular, pertaining to the cap of a mushroom.
- Pinna*. A primary division or leaflet of a pinnate leaf.
- Pinnate*. Feather-formed; with the leaflets of a compound leaf placed on either side of the rachis.
- Pinnatifid*. Cleft or parted in a pinnate (rather than palmate) way.
- Pinnatifid, Pinnately-parted*.
- Pinnatisect*. Cut down to the midrib in a pinnate way.
- Pinnule*. A secondary pinna or leaflet in a pinnately decompound leaf.
- Pip*. A perpendicular or upright small rootstock used in propagation, as of lily-of-the-valley.
- Pisiform*. Pea-shaped; pea-like.
- Pistil*. The ovule-bearing and seed-bearing organ.
- Pistillate*. Having pistils and no stamens; female.
- Pitted*. Having little depressions or cavities.
- Placenta*. Part or place in the ovary where ovules are attached.
- Plaited*. Folded lengthwise, as a closed fan.
- Plane*. Evenly flat, rather than wrinkled, folded, grooved or otherwise.
- Platys*. In Greek combinations, signifying broad or wide.
- Plumose*. Plumy; feather-like; with fine hairs, as the pappus of some composites.
- Plumule*. The bud in the embryo.
- Plur-annual*. Of one season's duration only because killed by frost.
- Pod*. A dehiscent dry pericarp.
- Pollen*. Spores or grains borne by the anther, containing the male element; sometimes it is not granular.
- Pollination*. The mechanical or physical operation of transferring pollen from stamen to pistil.
- Polliniferous*. Bearing-pollen.
- Pollinium*. A coherent mass of pollen, as in orchids and milkweeds.
- Poly-*. In Greek combinations, signifying numerous or many.
- Polyadelphous*. The stamens in many bundles or fascicles.
- Polygamous*. Bearing imperfect and hermaphrodite flowers on the same plant.
- Polymerous*. Of many parts or series.
- Pome*. Fruit of apple, pear, quince, etc.
- Porose*. With small holes, pores or perforations.
- Posterior*. At or toward the back; opposite the front; toward the axis; away from the subtending bract.
- Præfoliation*. Arrangement of leaves in the bud; vernation.
- Præmorse*. Jagged; as if bitten off.
- Prickle*. A small and weak spine-like body borne irregularly on the bark or epidermis.
- Prismatic*. Prism-shaped; with plane sides separated by angles, body of nearly uniform size throughout, and with similar end-sections.
- Process*. An extension of any surface or part beyond the main outline.
- Procumbent*. Trailing or lying flat, but not rooting.
- Proliferous*. Bearing offshoots or redundant parts; bearing other similar structures on itself.
- Proterandrous*. Anthers maturing before pistils.
- Proterogynous*. Pistils maturing before anthers.
- Pseud-annual*. Perennial by means of bulbs, corms, or tubers.
- Pseudo-*. In Greek compounds, signifying spurious or false.
- Pseudobulb*. The thickened or bulb-form stems of certain orchids, the part being solid and borne above ground.
- Puberulent*. Somewhat or minutely pubescent.
- Pubescent*. Covered with short, soft hairs; downy.
- Pulverulent*. Powdered or dusty.
- Pulvinate*. Cushioned; with a cushion-like enlargement or structure, as at the base of some petioles or leaflets.
- Punctate*. With translucent or colored dots or depressions or pits.
- Pungent*. Ending in a stiff sharp point or tip; also acrid (to the taste).
- Putamen*. The hard or bony shell of a nut or of a stone-fruit.
- Pyrene, pyrena*. Nutlet, particularly the nutlet in a drupe.
- Pyriform*. Pear-formed or -shaped.
- Pyzis*. Pod opening or dehiscing by a transverse ring.
- Quadrangular*. Four-angled.
- Quaternate*. In fours.
- Quincunx*. Five plants in a square, one of them being in the center.
- Quintupled*. Five times; multiplied by five.
- Raceme*. A simple elongated indeterminate cluster with stalked flowers.
- Rachilla, rhachilla*. A diminutive or secondary axis, or rachis; in particular, in the grasses and sedges the axis that bears the florets.
- Rachis*. Axis bearing flowers or leaflets; petiole of a fern frond (plural *rachides* or *rachises*).
- Radiate*. Standing on and spreading from a common center; also, with ray-flowers, as in the Compositæ.
- Radical*. Belonging or pertaining to the root.
- Radicle*. The inferior or downward part of the embryo below the cotyledons; caudicle.
- Radix*. Root.
- Rameal*. Pertaining to a branch or branches.
- Ramenta*. Chaffy loose scales borne on leaves and stems, as on the stems of ferns.
- Ramification*. The mode or style of branching of a plant.
- Raphe, rhaps*. The cord or ridge of fibro-vascular tissue connecting the hilum and chalaza on a seed (when the hilum and chalaza are separated).
- Ray*. Outer modified florets of some composites, with an extended or strap-like part to the corolla; also the branches of an umbel or umbel-like cluster.
- Receptacle*. Torus; the more or less enlarged or elongated end of the stem or flower-axis on which some or all of the flower-parts are borne; sometimes the receptacle is greatly expanded, as in the Compositæ; sometimes it assumes capsule-like forms, as in the hypanthium of the rose.
- Reclinate, reclining*. Bent down or falling back from the perpendicular.
- Recondite*. Concealed; difficult to make out; not easily recognized.
- Recurved*. Bent or curved downward or backward.
- Reflexed*. Abruptly recurved or bent downward or backward.
- Regular flower*. With the parts in each series or set alike; as stamens all like each other, petals all like each other.
- Reinforced fruit*. With other parts grown to the pericarp.
- Remote*. Separated by spaces longer than common.
- Reniform*. Kidney-shaped.
- Repent*. Creeping; rooting at the joints.
- Resupinate*. Upside down; turned over.
- Retorse*. Bent or turned over back or downward.
- Revolute*. Rolled backward, margin rolled toward lower side. See *Involute*.
- Rhachis*. See *Rachis*.
- Rhaps*. See *Raphe*.
- Rhizome*. Underground stem; rootstock.
- Rhizos*. In Greek compounds, signifying root.
- Rib*. In a leaf or similar organ, the primary vein; also any prominent vein or nerve.
- Rimose*. With cracks or chinks.
- Ringent*. Gaping; said of labiate flowers with an open throat or mouth.
- Rootstock*. Subterranean stem; rhizome.

- Rostellum.** A little beak; particularly a projection above the stigma in the orchid flower.
- Rosula.** A rosette, or dense more or less flat imbricated cluster of leaves.
- Rosulate.** In a rosula or rosette.
- Rotate.** Wheel-shaped; with short or obsolete tube and a flat and circular limb.
- Rotund.** Nearly circular; orbicular, inclining to be oblong.
- Rudimentary.** Incomplete; very little developed.
- Ruminated.** Chewed; particularly applied to wrinkled albumen in seeds that are irregularly channeled or pierced, as in nutmeg and in annona fruits.
- Runcinate.** Said of sharply lobed or cut leaves that have the segments directed backward.
- Runner.** A slender trailing shoot taking root at the nodes.
- Sabulose.** Growing in or pertaining to sandy places.
- Sagittate.** Like an arrowhead in form; triangular with the basal lobes pointing downward.
- Salver-shaped.** With a slender tube and an abruptly expanded flat limb, as that of the phlox; hypocrateriform.
- Samara.** Indehiscent winged pericarp, as of the maple.
- Sap.** The watery contents of a plant; an indefinite and undescriptive term little used by botanists.
- Sapid.** With a pleasant or savory taste.
- Scabrous.** Rough; feeling roughish or gritty to the touch.
- Scale.** A name given to many kinds of small mostly dry and appressed leaves or bracts; a vestige.
- Scape.** Leafless peduncle arising from the ground; it may bear scales or bracts but no foliage-leaves, and may be one- or many-flowered.
- Scarious.** Leaf-like parts or bracts that are not green, but thin, dry, and membranaceous, often more or less translucent.
- Scion.** See *Cion*.
- Scleroid.** Of a hard texture.
- Scorpioid.** Said of a cluster in which the flowers are 2-ranked and borne alternately at the right and the left.
- Seed.** The ripened ovule; the essential part is the embryo, and this is contained within integuments.
- Seedling.** A young plant raised from seed; a plant direct from seed without the intervention of grafting of any kind.
- Segment.** One of the parts of a leaf, petal, calyx or perianth that is divided but not truly compound.
- Self-fertilization.** Secured by pollen from same flower; close-fertilization.
- Self-pollination.** Transfer of pollen from stamen to pistil of same flower; close-pollination.
- Sepal.** One of the separate leaves of a calyx.
- Separation.** Multiplication of plants by means of naturally detachable asexual bodies or organs, as offsets, stolons.
- Septate.** Partitioned; divided by partitions.
- Septicidal.** Dehiscence along or in the partitions, not directly into the locule.
- Septum.** A partition.
- Sessile.** Not stalked; sitting.
- Set.** Applied loosely to vegetative parts used in propagation, as to offsets, layers, root-cuttings.
- Seta.** A bristle.
- Setiform.** Bristle-shaped.
- Sheath.** Any long or more or less tubular structure surrounding an organ or part.
- Shoot.** A new plant from the root of the old plant; also any growing twig or axis.
- Shrub.** A woody plant that remains low and produces shoots or trunks from the base.
- Silicle.** The short fruit of certain Cruciferae.
- Siliqua.** The long fruit of certain Cruciferae.
- Silky.** A condition produced by a covering of soft appressed fine hairs; sericeus.
- Silvery.** With a whitish metallic more or less shining luster.
- Simple pistil.** Of one carpel.
- Sinus.** The space or recess between two lobes of a leaf or other expanded organ.
- Slip.** A softwood cutting "slipped" off or pulled off; applied also to similar parts cut off.
- Smooth.** Said of surfaces that have no hairiness, roughness or pubescence, particularly of those not rough.
- Solitary.** Borne singly or alone.
- Sorus.** A heap or cluster. The fruit-dots or -cluster of ferns (plural *sori*.)
- Spadix.** A thick or fleshy spike of certain plants, as the Araceae, surrounded or subtended by a spathe.
- Span.** Nine inches; distance from tip of thumb to tip of little finger when the hand is spread out.
- Spathe.** The bract or leaf surrounding or subtending a flower-cluster or a spadix; it is sometimes colored and flower-like, as in the calla.
- Spawn.** The dried mycelium of mushrooms used in propagation.
- Spheroidal.** A solid that is nearly spherical.
- Spiciform.** Spike-form.
- Spiculate.** With a small, fleshy and erect point.
- Spike.** Compact, more or less simple indeterminate, mostly elongated cluster, with flowers sessile or nearly so.
- Spikelet.** A secondary spike; one part of a compound spike; particularly, one of the ultimate clusters in grasses.
- Spine.** A strong and sharp-pointed woody body mostly arising from the wood of the stem.
- Spinescent.** More or less spiny.
- Spinule.** A little or weak spine.
- Spontaneous.** Said of plants that have escaped from cultivation, but that do not permanently persist.
- Sporangium.** A spore-case; a sac or body bearing spores.
- Spore.** A simple reproductive body, usually composed of a single detached cell, and containing no embryo.
- Sporocarp.** A receptacle containing sporangia or spores.
- Sporophyll.** A spore-bearing leaf.
- Spreading.** Standing outward or horizontally.
- Spur.** A tubular or sac-like projection from a blossom, as of a petal or sepal; it usually secretes nectar.
- Squama.** A scale.
- Squamella.** Very small squama or scale.
- Stachys.** In Greek compounds, signifying a *spike*.
- Stalk.** The stem of any organ, as the petiole, peduncle, pedicel, filament, stipe.
- Stamen.** The pollen-bearing or "male" organ.
- Staminate.** Having stamens and no pistils; male.
- Staminode, staminodium.** A sterile stamen, or a structure resembling such and borne in the staminal part of the flower; in some flowers (as in *Canna*) staminodia are petal-like and showy.
- Standard.** The upper and broad more or less erect petal of a papilionaceous flower.
- Stem.** The main axis of a plant; leaf-bearing and flower-bearing as distinguished from the root-bearing axis.
- Sterile flower.** Without pistils.
- Stigma.** The part of the pistil that receives the pollen.
- Stigmatic.** Pertaining to the stigma.
- Stipe.** The stalk of a pistil or other small organ; also the petiole of a fern-leaf.
- Stipel.** Stipule of a leaflet.
- Stipule.** A basal appendage of a petiole; the three parts of a complete leaf are blade, petiole, stipules (usually 2).
- Stock.** The part on which the cion is grafted; the strain or parentage.
- Stolon.** A shoot that bends to the ground and takes root; more commonly, a horizontal stem at or below surface of the ground that gives rise to a new plant at its tip.
- Stone.** The "pit" or putamen of a stone fruit.
- Stool.** A clump of roots or rootstock that may be used in propagation; also an established low plant from which layers are taken.
- Stratification.** The operation or method of burying seeds to keep them fresh and to soften their integuments, or to expose them without injury to frost, that they may be more readily and successfully used in propagation.
- Strict.** Straight and upright, little if any branched, often rigid.
- Strobile.** Cone.
- Strophiole.** An appendage or protuberance at the hilum.

*Style*. More or less elongated part of the pistil between the ovary and stigma.

*Stylopodium*. Style-foot; an expansion at the base of a style, as in flowers of the Umbelliferae.

*Sub-*. As a prefix, usually signifying *somewhat, slightly* or *rather*.

*Subacute*. Somewhat or partially acute.

*Subcoriaceous*. Somewhat or approaching leathery in texture.

*Subligneous*. Partially or somewhat woody.

*Subterete*. Somewhat or imperfectly terete.

*Succulent*. Juicy; fleshy; soft and thickened in texture.

*Sucker*. A shoot arising from the roots or beneath the surface of the ground.

*Suffrutescent*. Partially or slightly shrubby.

*Suffruticose*. Pertaining to a low and somewhat woody plant; diminutively shrubby or fruticose; woody at base.

*Sulcate*. Grooved or furrowed lengthwise.

*Superior*. Said of an ovary that is free from the calyx.

*Supernumerary*. Said of buds when there is more than one in an axil.

*Suspended*. Hanging from the top, as an ovule attached in the top of the locule.

*Suture*. A line or mark of splitting open; a groove marking a natural division or union; the groove lengthwise a plum or similar fruit.

*Symmetrical*. Said of a flower that has the same number of parts in each series or circle, as five stamens, five petals.

*Symphysis*. Growing together; coalescence.

*Sympodial*. Axial growth continued by successive lateral shoots instead of by terminal bud.

*Syncarpium*. A fruit consisting of many cohering or consolidated carpels.

*Syncarpous*. Having carpels united. See *Apocarpus*.

*Syngenesious*. Anthers united in a ring, as in Compositae.

*Tapering*. Gradually becoming smaller or diminishing in diameter or width toward one end.

*Tap-root*. A strong nearly or quite perpendicular main root that carries the plant axis straight into the ground, all the other roots being secondary to it, rather than branching equally or diversely at the crown.

*Taxonomy*. Classification of species.

*Tendril*. A rotating or twisting thread-like process or extension by which a plant grasps an object and clings to it for support; morphologically it may be stem or leaf.

*Teratology*. The subject of monstrosities, or of abnormal and aberrant forms and malformations.

*Terete*. Circular in transverse section; imperfectly cylindrical because the object may taper both ways.

*Terminology*. The subject dealing with names.

*Ternate*. In threes.

*Testa*. The outer seed-coat, particularly when bony, hard or brittle.

*Tetradynamous*. Six stamens, four being long and two short.

*Tetragonal*. Four-angled.

*Thallus*. A flat leaf-like organ; in some cryptogams, the entire cellular plant body without differentiation as to stem and foliage.

*Throat*. The opening or orifice into a gamopetalous corolla, or perianth; the place where the limb joins the tube.

*Thyrse, thyrsus*. Compact and more or less compound panicle; more correctly a panicle-like cluster with main axis indeterminate and other parts determinate.

*Tip*. The plant arising at the end of a stolon, as in the black raspberry.

*Tomentose*. With tomentum; densely woolly or pubescent; with matted soft wool-like hairiness.

*Tomentulose*. Somewhat or delicately tomentose.

*Tortuous*. Twisted; with irregular bending and twining.

*Torus*. Receptacle.

*Tree*. A woody plant that produces one main trunk and a more or less distinct and elevated head.

*Tri-*. Three or three times.

*Tricarpous*. Of three carpels or fruits.

*Trichome*. A hair, particularly one that is strong or stiff.

*Tricostate*. With three ribs.

*Trifid*. Separated about halfway down into three parts.

*Trifoliate*. Of three leaves.

*Trifoliolate*. Of three leaflets.

*Trigonous*. Three-angled.

*Trimerous*. In threes.

*Trimorphous*. In three forms; as three lengths of stamens.

*Tripinnate*. Three times pinnate.

*Trisected*. In three deeply cut parts.

*Triternate*. Three times three; the leaflets or segments of a twice ternate leaf again in three parts.

*Truncate*. Appearing as if cut off at the end; the end nearly or quite straight across.

*Tuber*. A short congested part; usually defined as subterranean (as of a rootstock), although this is not essential.

*Tubercle*. A small tuber, or rounded protruding body.

*Tuberiferous*. Tuber-bearing.

*Tuberous*. With or resembling a tuber or tubers.

*Tumid*. Swollen.

*Tunicated*. Provided with concentric or enwrapping coats or layers, as bulb of onion.

*Turgid*. Swollen from fullness.

*Umbel*. Corymbose or indeterminate cluster with branches or rays arising from a common point and about equal in length, resembling framework of umbrella; umbels are characteristic of the Umbelliferae.

*Umbellate*. Umbelled; with umbels; pertaining to umbels.

*Umbellet*. Secondary umbel.

*Umbellule*. Umbellet.

*Uni-*. One.

*Unisexual*. Of one sex; staminate or pistillate only.

*Utricle*. A small bladder; a bladdery 1-seeded fruit.

*Valvate*. Opening by valves or pertaining to valves; meeting by the edges without overlapping, as leaves or petals in the bud.

*Valve*. A separable part of a pod; the units or pieces into which a capsule splits or divides in dehiscing.

*Vascular*. With vessels or ducts, or relating to them.

*Vein*. A branch of the evident woody framework of a leaf or similar organ; secondary member of the fibrovascular structure.

*Veinlet*. A small or slender vein; nerve.

*Venation*. Veining; arrangement or disposition of veins.

*Ventral*. Front; relating to the anterior or inner face or part of an organ; opposite the back or dorsal part.

*Vernation*. The disposition or arrangement of leaves in the bud.

*Versatile*. Hung or attached near the middle and usually moving freely, as an anther attached crosswise on the apex of filament and capable of turning.

*Verticil*. A whorl.

*Vesicle*. A little bladder or bladder-like cavity.

*Vexillary*. Pertaining to the vexillum, standard or banner of a papilionaceous flower.

*Villous*. Provided with long and soft, not matted, hairs; shaggy.

*Vitta*. An oil-tube, as in the fruits of Umbelliferae.

*Vittate*. With vittae; also striped lengthwise.

*Volute*. Rolled up.

*Watersprout*. A strong rapid-growing adventitious shoot in a tree-top or bush or on a trunk.

*Whorl*. Three or more leaves or flowers at one node, in a circle.

*Wing*. A thin dry or membranous expansion or flat extension or appendage of an organ; also the lateral petal of a papilionaceous flower.

*Woolly*. Provided with long, soft and more or less matted hairs; like wool; lanate.

*Wort*. Old word for a plant or herb; now used only in combination, as *motherwort, spiderwort, liverwort*.

V. *Anemone coronaria*, an old garden favorite.

# A

**ABACÁ**, or Manila hemp, is the fiber of *Musa textilis*, a native of the Philippine Islands, where it is grown for commerce. The plant is like the banana in general habit of growth, although it is seed-bearing. It is propagated by seeds or suckers or root-cuttings. When two to five years old it is at maturity, reaching a height of 6 to 15 feet and a diameter of trunk of 6 to 15 inches. The fiber is derived from the thick sheathing leaf-stems, the stems being cut between the flowering and fruiting stages. After seed-bearing, the top or "plant" dies and new suckers or shoots spring from the roots. The first stalks may be cut as early as twenty months after planting, and the plantation is cut over about once in eight months until it becomes unproductive, which will be fifteen to forty years. New stalks continue to arise as the old ones are cut. The fiber, as found in the market, is coarse and stiff and 6 to 12 feet long. In the better grades it is very strong. The fruit of *Musa textilis* is not edible. See Cyclo. Agric. II, p. 286, and I, p. 126.

**ABELIA** (bears the name of Dr. Clark Abel, physician and author in China, d. 1826). *Caprifoliaceæ*. Ornamental plants, cultivated chiefly for their handsome flowers.

Shrubs: lvs. opposite, short-petioled, small or medium-sized, entire or dentate: fls. in 1- to several-fl. cymes, axillary or terminal on short branchlets, sometimes forming panicles at the end of the branches; sepals 2-5, conspicuous, persistent; corolla tubular or campanulate, 5-lobed; stamens 4, paired; ovary 3-celled, only 1 cell fertile; style elongated: fr. 1-seeded leathery achene crowned by the persistent calyx.—More than 20 species in E. and Cent. Asia, 1 on the Himalayas and 2 in Mex. For a key to all the species, see Rehder, Synopsis of the genus *Abelia* (in Sargent, *Plantæ Wilsonianæ*, I, pp. 122-129). The genus is sometimes united with *Linnæa*.

The abelias are small or medium-sized bushy shrubs with deciduous or persistent foliage and rather small but numerous flowers varying from white to pink or purple; after the flowers have fallen, the persistent usually purplish sepals are attractive. The recently introduced *A. Graebneriana* and *A. Engleriana* are probably the hardiest; *A. triflora*, *A. chinensis* and *A. grandiflora* are hardy as far north as Philadelphia: the last-named is sometimes grown in sheltered situations as far north as Massachusetts, and, even if partly killed back, the young shoots flower profusely the same season; *A. floribunda* is hardy only south of Washington, D. C.

The cultivation of abelias presents no special difficulties. They do best in sunny, sheltered positions and prefer a well-drained soil enriched by peat or leaf-mold. *A. floribunda* is sometimes grown in pots and kept during the winter in the cool greenhouse; in this case a sandy compost of loam and peat or leaf-mold will be a suitable mixture.

Propagation is usually by greenwood cuttings in

summer under glass; also by cuttings of ripened wood taken in fall. Seeds are not often obtainable; they are sown in spring and germinate after a month or two; the seedlings begin to bloom usually in their third year.

## A. Sepals 2.

**Graebneriana**, Rehd. Shrub, 4-10 ft.: lvs. deciduous, ovate to oblong-ovate, acuminate,  $1\frac{1}{2}$ -2 in. long, remotely serrate, usually finely ciliate and hairy on midrib beneath, sometimes with scattered hairs above: fls. usually few at the end of short branchlets along last year's branches; sepals  $\frac{1}{2}$  in. long, oblong; corolla campanulate, 1 in. long, pink with yellow throat. Summer. China.

**Engleriana**, Rehd. (*Linnæa Engleriana*, Graebn.). Shrub, 3-6 ft.: lvs. deciduous, ovate to elliptic-ovate, acute or acuminate, about 1 in. long, with few small teeth: fls. in few-fl. clusters in the axils of fascicled lvs. along last year's branches, rosy purple or rosy pink, a little over  $\frac{1}{2}$  in. long. Summer. China.—Similar to the preceding but smaller in every part, flowering more profusely and therefore handsomer. Has proved hardy at the Arnold Arboretum.

**AA. Sepals varying from 2 to 5 on the same plant and often partly connate.**

**grandiflora**, Rehd. (*A. chinensis*  $\times$  *uniflora*, *A. rupestris*, Hort., not Lindl. *A. rupestris* var. *grandiflora*, André. *A. uniflora*, Hort., not Turcz. *Linnæa Spaethiana*, Graebn. *L. Perringiana*, Graebn.). Fig. 58. Lvs. ovate, rounded or attenuate at the base, acute,  $\frac{3}{4}$ -1 $\frac{1}{2}$  in. long, serrate, shining above, nearly glabrous, half-evergreen: fls. in terminal, loose panicles, white flushed pink, campanulate,  $\frac{3}{4}$  in. long; stamens not exerted. Of garden origin. Gt. 41:1366. Gn. 76, p. 528. J.H. III. 8:77.—One of the hardiest and most free-flowering abelias; it flowers continuously from June to Nov.

## AAA. Sepals 5.

**chinensis**, R. Br. (*A. rupestris*, Lindl.). Shrub, 3-6 ft.: lvs. ovate, rounded at the base,  $\frac{3}{4}$ -1 $\frac{1}{2}$  in. long, serrate, hairy on the midrib beneath and sometimes with scattered hairs above, deciduous: fls. in terminal dense panicles, funnel-form, white,  $\frac{1}{2}$  in. long; sepals oblong,  $\frac{1}{4}$  in. long; stamens exerted. Summer. China. B.R. 32:8. Gn. 27, p. 424. P.F.G. 2:201. G. 8:143.—*A. rupestris* is sometimes considered a distinct species, but the differences are very slight.

**triflora**, R. Br. Shrub, to 10 ft., branchlets with reflexed hairs: lvs. lanceolate or ovate-lanceolate, 1 $\frac{1}{2}$ -2 $\frac{1}{2}$  in. long, ciliate and sparingly hairy on both sides or nearly glabrous, entire or occasionally on vigorous shoots with a few coarse teeth, half-evergreen: fls. in terminal clusters, fragrant; sepals linear, hairy,  $\frac{1}{2}$  in. long; corolla tubular with spreading limb, white flushed pink,  $\frac{3}{4}$  in. long. Summer. Himalayas. P.F.G. 3:91. Gn. 10:29. G.C. II. 16:34. G. 29:483. R.H. 1870:511. J. F. 3, pl. 319.—A very handsome species; after the

58. *Abelia grandiflora*. ( $\times \frac{1}{2}$ )

flowers are gone the feathery sepals remain as an attractive feature.

**floribunda**, Decaisne. Shrub, 4 ft.: lvs. persistent, oval to oval-oblong,  $\frac{1}{2}$ –1 in. long, crenate-serrate, ciliate; peduncles axillary, 1–3-fld.; corolla carmine-purple, nodding, tubular,  $1\frac{1}{2}$  in. long; sepals oblong,  $\frac{1}{2}$  in. long. Summer. Mex. B.M. 4316. F.S. 2:5. R.B. 23:157. Gn. 13:120. B.R. 33:55. R. H. 1912:544.

*A. biflora*, Turcz. Lvs. ovate-lanceolate, hairy, coarsely serrate, deciduous: fls. white, tubular, in 2's; sepals 4. Manchuria, N. China.—*A. serrata*, Sieb. & Zucc. Similar to *A. biflora*. Fls. funnelform, pink, little over  $\frac{1}{2}$  in. long, in 2's; sepals 2. Japan. S.Z. 1:34.—*A. spathulata*, Sieb. & Zucc. Allied to *A. biflora*. Lvs. ovate: fls. over 1 in. long, white tinged yellow in throat; sepals 5. Japan. S.Z. 1:34. B.M. 6601. G. 27:345. G.M. 45:335 (as *A. serrata*).—*A. uniflora*, R. Br. (*A. serrata*, Nichols, not Sieb. & Zucc.). Lvs. persistent, ovate-lanceolate: fls. in loose terminal panicles, campanulate, 1 in. long, rosy white with yellow in throat; sepals 2. China. B.M. 4694. F.S. 8:824. J.F. 4, pl. 380. B.H. 3:338. G.C. III. 37:323. Gn.W. 21:933 (as *A. chinensis*). Gn. 27, p. 425.

ALFRED REHDER.

**ABELÍCEA**: *Zelkova*.

**ABELMÓSCHUS**: *Hibiscus*.

**ABÈRIA** (named from Mt. Aber, Abyssinia, where first species was found). *Dorydlis*, Arn. & E. Mey. *Flacourtiaceæ*. Small trees or shrubs, with alternate, simple exstipulate leaves and small inconspicuous flowers.

Flowers dioecious; staminate fls. with a 4–5-parted calyx and no petals, and with many stamens, arranged on a fleshy receptacle; pistillate fls. with a 5–7-parted, persistent calyx and no petals, the ovary free, sessile, 1–6-celled, on a lobed usually fleshy disk; fr. fleshy, indehiscent.—Eleven species in Afr. and Ceylon.

**caffra**, Hook. f. & Harv. Fig. 59. Thorny, glabrous: lvs. obovate, obtuse, cuneate at base, entire: fls. dioecious, apetalous. G.C. III. 18.737. R.H. 1904:256.—The kei apple of the Cape of Good Hope; a spiny plant grown S. for hedges; is considered promising for S. Calif. and S. Fla. as a fr. plant. Fruit acid, used as pickles or preserves. Proves quite hardy in S. Calif.

**Gárdneri**, Clos. A small, much-branched tree, 16–20 ft.: lvs.  $2\frac{1}{2}$ –4 in. long, lanceolate or oval, acute at both ends: fls. greenish, staminate fls. in umbellate clusters, the pistillate axillary in the branches: fr. 1 in. diam., pale purple, edible. June. India and Ceylon. N. TAYLOR.†

**ABIES** (derivation doubtful). *Pinææ*. FIR, but the name spruce is often erroneously applied. Tall, pyramidal trees of temperate and cool climates, planted for ornament and for shelter, and also for timber. The word àbi-es is pronounced in three syllables, the *e* being long.

Leaves lanceolate or oblanceolate, entire, sessile, persistent for many years; on young plants and lower sterile branches flattened, usually deep green and lustrous above and silvery white beneath from the presence of many rows of stomata, rounded and variously notched at the apex, appearing 2-ranked by a twist at their base; on upper fertile branches crowded, more or less erect, often incurved or falcate, thickened or quadrangular, obtuse or acute: fls. axillary, appearing in early spring from buds formed the previous summer on branchlets of the year, surrounded by involucre of the enlarged scales of the fl.-buds; staminate fls. pendent on branches above the middle of the tree; pistillate fls. globular, ovoid or oblong, erect on the topmost branches: fr. an erect ovoid or oblong cylindrical cone, its scales longer or shorter than their bracts, separating at maturity from the stout persistent axis. Northern and mountainous regions of the northern hemisphere, often gregarious. Twenty-three species are distinguished; greatest segregation on the Cascade Mts. of Ore., in the countries adjacent to the Medit., and in Japan. Many species which have been referred to Abies

are now included in *Picea*. S.S. 12. Heinrich Mayr, Monographie der Abietineen des Japanischen Reiches. Gn. 11, pp. 280, 281. See *Arboriculture*.

All the species of abies produce soft, perishable wood, sometimes manufactured into lumber, and balsamic exudations contained in the prominent resin vesicles in the bark characteristic of the genus. They are handsome in cultivation, but usually of short-lived beauty. The firs prefer moist, well-drained soil. As timber-producing trees, the species of abies are less valuable than the spruces (*Picea*) and in the United States they have not been planted except for ornament. In Europe, where this tree is sometimes planted as a forest crop, the wood of the European *A. Picea* is valued, and in the Pacific states the wood of *A. grandis*, *A. concolor* and *A. magnifica* is employed in the manufacture of fruit-boxes and woodenware.

In cultivation, firs are most beautiful while young, and usually lose their lower branches and become thin and unsightly as they grow older, and many of the species have little ornamental value for more than fifty years. In the northern and eastern states, the most valuable ornamental species are the Colorado form of *A. concolor*, with pale or bluish foliage, and the

Japanese *A. brachyphylla*, with leaves that are dark green and very lustrous above and silvery beneath. In the United States, *A. brachyphylla* assumes a compact pyramidal form of growth, but in Japan old trees become, unlike those of any other fir, round-headed. The other Japanese fir that

has been cultivated in the United States long enough to show its value as an ornamental tree, *A. Veitchii*, produces longer branches than *A. brachyphylla* and is of more open habit and is less valuable for ornamental use. After *A. concolor* and *A. brachyphylla*, the best fir trees for the eastern United States are *A. cilicica* from Asia Minor and *A. Nordmanniana* from the Caucasus. In its young state, *A. cilicica* forms a dense pyramid of gray-green foliage and as it grows in the Pinetum at Wellesley, Massachusetts, is an object of great beauty. *A. Nordmanniana* is one of the commonest fir trees cultivated in the eastern states, although it sometimes suffers from cold in New England, where it frequently becomes thin and unsightly. In the middle states, however, it is often an object of great beauty. The two eastern American species, *A. balsamea* and *A. Fraseri*, and the related species from the Rocky Mountains, *A. lasiocarpa*, grow badly in cultivation, and are short-lived and not handsome. Of the Pacific coast species, *A. grandis* can be kept alive in favorable situations in the eastern states, and *A. amabilis*, which grows slowly always in cultivation, is hardy but gives little promise of becoming of much value anywhere except on the mountains of northeastern America. The summers in the southern states are too hot for the successful cultivation of fir trees, and the climatic conditions of the Mississippi Valley are not favorable for their successful growth. In the parks and gardens of the Pacific states, fir trees grow better than in any other part of

59. *Abertia caffra*. (fr.  $\times \frac{1}{2}$ )

North America, and in the neighborhood of the Pacific Ocean can be grown successfully the firs of western North America, Mexico, Europe, India and eastern Asia.

Propagation is mostly by seeds. The percentage of fertile seeds produced by firs is much smaller than that yielded by spruces and pines, and small crops of seedlings are often secured from large sowings of the seeds. The seeds lose their fertility sooner than those of many conifers and cannot be safely kept more than one or two years; they should be planted in carefully prepared seed-beds and covered with soil to a depth equal to the thickness of the seed. Young plants begin to appear at the end of a few weeks, and, as they are extremely sensitive to the heat of the sun, they need the protection of lath or brush screens. Like other conifers, the different species can be propagated by side-grafting on other species of the genus. Grafted plants, however, are less valuable than seedlings and propagation in this way is slow and expensive, as the work must be performed in glass houses. The leading or other upright-growing shoot should be chosen for the graft, as trees obtained by the use of lateral branches for grafts do not often grow into erect or shapely trees. The species most commonly used for stocks are *A. Picea* and *A. balsamea*.

## INDEX.

amabilis, 4, 8.	falcata, 9.	nephrolepis, 10.
Apollinis, 12.	Fraseri, 7.	nobilis, 14.
aurea, 9.	glauca, 14.	Nordmanniana, 2.

cephalonica, 12.	hudsonica, 6.	Pinsapo, 13.
cilicica, 3.	Lowiana, 9.	shastensis, 15.
columnaris, 6.	lutescens, 6.	sibirica, 5.
concolor, 9.	magnifica, 15.	Veitchii, 10.

A. *Euabies*. Lvs. flat, grooved on the upper surface, only occasionally stomatiferous above on upper fertile branches.

B. *Lf. blunt*.

C. *Foliage essentially green*,—the lvs. green above and whitish only beneath.

D. *Cones usually upward of 4 in. long*.

1. *Picea*, Lindl. (*A. pectinata*, DC.). SILVER FIR. Fig. 60. Tree, 100–200 ft.: trunk 6–8 ft. in diam.: lvs. flat, distichously spreading, dark green and lustrous above, silvery white below: cones slender, cylindrical, light green to dark purple, 5–6 in. long; bracts slightly longer than their scales. Mts. of Cent. and S. Eu., often gregarious.—Wood esteemed and much used; yields Strasburg turpentine. Dwarf forms, with erect and pendulous and with much abbreviated branches, are common in gardens. Not perfectly hardy in New England.

2. *Nordmanniana*, Spach. Fig. 61. Tree, 100–150 ft.: trunk 4–6 ft. in diam.: lvs. flat, crowded, dark green and very lustrous above, silvery white below: cones oblong-cylindrical or ellipsoidal, dark orange-brown, 4–6 in. long; bracts as long as or slightly longer than their scales. Mts. south and southeast of the Black Sea, and western spurs of the Caucasus. B.M. 6992. G.C. II. 19:797.—Often hardy; one of the most desirable firs in the middle states. Var. *aureo-variegata*, Hort. Shoots colored a pure golden yellow.

3. *cilicica*, Carr. Tree, 45–60 ft.: trunk 2–3 ft. in diam.: lvs. narrow, flat, pale green above, silvery white below: cones stout, cylindrical, orange-brown, 5–6 in. long; bracts rather shorter than their scales. At high elevations on the Anti-Taurus of Asia Minor, and on the Lebanon. A.G. 16:255. Gng. 4:113.—Begins to grow early in the spring and is often injured by late frosts; hardy and desirable in the northern states.

4. *amabilis*, Forbes. WHITE FIR. Tree, 100–150 ft.: trunk 4–6 ft. in diam.: lvs. crowded, dark green and very lustrous above, silvery white below, occasionally

stomatiferous on the upper surface: cones oblong, dark purple, 3½–6 in. long; bracts much shorter than their scales. Cascade Mts. of Wash. and Ore., and Coast Ranges from Vancouver Isl. to Ore. S.S. 12:614. G.C. II. 14:721, 725; III. 30:191.—One of the handsomest of the genus, often forming groves at high elevations; in cult. grows slowly, and is not satisfactory.

DD. *Cones usually under 4 in. long*.

5. *sibirica*, Ledeb. (*A. pichta*, Forbes). Tree, 60–100 ft.: trunk 2–4 ft. in diam.: lvs. crowded, dark yellow-green: cones cylindrical, slender, brownish yellow, 2½–3 in. long; bracts much shorter than their scales. N. and E. Russia to Kamtschatka and Mongolia, gregarious on the Altai Mts.—Very hardy, the early growth often injured by late frosts; in cult. soon becomes thin and loose in habit.

60. Cones of *Abies*.—From bottom to top, *A. grandis*, *A. balsamea*, *A. Picea*.

6. *balsamea*, Mill. BALSAM FIR. BALM OF GILEAD FIR. Fig. 60. Tree, 50–80 ft.: trunk 17–30 in. in diam.: lvs. dark green and lustrous above, pale below, rounded or obtusely short-pointed and occasionally emarginate, acute or acuminate on fertile branches: cones oblong, cylindrical, purple, 2½–4 in. long; bracts shorter or rarely slightly longer than their scales. E. N. Amer. from Labrador and the valley of the Athabasca to Iowa and the mts. of Va. S.S. 12:610. G.C. III. 17:423, 425, 431.—Wood occasionally used for lumber; Cana-

dian balsam, or balsam of fir, is obtained from the bark; in cult. loses its beauty early. Var. *columnaris*, Hort. Branches very short, turned upward at the ends. Var. *hudsônia*, Engelm. (*A. hudsônica*, Hort.), is a dwarf form. Var. *lutescens*, Hort. Lvs. white, yellow or straw-colored when exposed to the sun.

7. *Fraseri*, Poir. SHE BALSAM. Tree, 30–50 or even 70 ft.: trunk reaching  $2\frac{1}{2}$  ft. in diam.: lvs. flat, obtusely short-pointed, twisted at the base so as to appear to be crowded on the upper side of the branches, dark green and lustrous: cones oblong-ovate or nearly oval, rounded at the slightly narrower apex, purple,  $2\frac{1}{2}$  in. long and 1 in. thick, the scales twice as wide as long, and at maturity nearly half covered by the ends of the pale reflexed bracts. Mts. of Va., Tenn., and N. C. S.S. 12:609. G.F. 2:475.—Too much like the balsam fir to be prized as an ornamental tree. Trees sold under this name are nearly always forms of *A. balsamea*. Very short-lived in cult.

61. Cones of Abies.—From bottom to top, *A. concolor*, *A. Nordmanniana*, *A. magnifica*.

8. *grândis*, Lindl. (*A. amabilis*, Murr., not Forbes. *A. Gordoniana*, Carr. *Picea grândis*, Loud.). Fig. 60. Tree, 200–300 ft.: trunk becoming 4 ft. in diam.: lvs. thin and flexible, deeply grooved, very dark green above and silvery white beneath: cones cylindrical, 2–4 in. long, rounded or retuse at the apex, the broad scales somewhat squarrose and irregularly serrate and furnished with a short point. Coast of N. Calif. to Vancouver Isl. and to the western slopes of the Rocky Mts. of Mont. S.S. 12:612. Gn. 38, p. 291. G.C. II. 15:179, 181. R.H. 1894, p. 274.—Occasional specimens are seen in choice grounds, but it rarely does well in the eastern states.

cc. *Foliage pale blue or glaucous.*

9. *côncolor*, Lindl. & Gord. (*A. Lowiana*, A. Murr. *A. Parsonsiana*, Hort., the Pacific form). WHITE FIR. Fig. 61. Tree, 100–250 ft.: trunk 4–6 ft. in diam.: lvs. elongated, stomatiferous on the upper surface, on fertile branches often falcate and thickened and keeled above: cones oblong, gray-green, dark purple or bright canary-yellow, 3–5 in. long; bracts shorter than their scales. W. N. Amer. from S. Ore. to Low. Calif.

and to Utah, S. Colo., New Mex., Ariz. and Sonora. S.S. 12:613. G.C. II. 13:649; II. 15:661; III. 8:748, 749; III. 35:59.—Of all fir trees, the Colorado form best withstands heat and drought; very hardy, grows rapidly, and the most desirable of the genus in the eastern states. The form from the Pacific coast is less hardy and less desirable in the E. as an ornamental tree. Seedlings of the Colorado form, with rather longer and more glaucous leaves, are found in nurseries as *A. côncolor violacea*. Var. *aûrea*, Beiss. Young shoots golden yellow in May, afterward becoming silver-gray. Var. *brevifolia*, Beiss. Lvs. short and obtuse, twice as broad as in typical form. Var. *falcata*, Niem. Lvs. sickle-shaped, curved upward. Var. *globosa*, Niem. Plant spherical, with symmetrical small branches.

BB. *Lvs. pointed, especially on main shoots, and usually rigid.*

10. *Veitchii*, Lindl. (*A. nephrolepis*, Maxim.). Tree, 80–100 ft.: trunk 3–4 ft. in diam.; branchlets slender, pubescent: lvs. crowded, dark green and lustrous above, silvery white below: cones cylindrical, slender, dark purple, 2– $2\frac{1}{2}$  in. long; bracts shorter than their scales. Mts. of Cent. Japan; gregarious and forming great forests, coast of Manchuria. G.C. II. 13:273.—Very hardy in the northern states, and when young is one of the most beautiful of fir trees.

11. *brachyphylla*, Maxim. Tree, 80–100 ft.: trunk 6 ft. in diam.; upper branches long and vigorous, ultimately forming a broad, round-topped head: lvs. elongated, sharp-pointed, dark green and very lustrous above, silvery white below: cones cylindrical, stout, dark purple, 3– $3\frac{1}{2}$  in. long; bracts much shorter than their scales. Mts. of Cent. Japan, singly or in small groves. B.M. 7114.—Very hardy, and when young one of the most desirable of the fir trees for the northern states.

12. *cephalônica*, Loud. Tree, 60–70 ft.: trunk 2–4 ft. in diam.: lvs. broad, rigid, sharp-pointed, standing out from the branches at right angles: cones cylindrical, slender, pointed, gray-brown, 5–6 in. long; bracts longer or rarely shorter than their scales. Mt. Enos, on the Isl. of Cephalonia. Gng. 6:49. G.W. 5, p. 15; 12, p. 399; 14, p. 538.—Doubtfully hardy in northern states.

Var. *Apollinis*, Boiss. (*A. Apollinis*, Link), with narrow and blunter lvs., is remarkable in its power to produce vigorous shoots from adventitious buds. Mts. of Greece and Roumelia; often gregarious; more hardy than the type in the northern states. Page 3565.

13. *Pinsâpo*, Boiss. SPANISH FIR. Tree, 70–80 ft.: trunk 4–6 ft. in diam.: lvs. short, broad, rigid, sharp-pointed, bright green, spreading from all sides of the stiff branchlets: cones cylindrical, slender, gray-brown,  $5\frac{1}{2}$ –6 in. long; bracts shorter than their scales. Mts. of Cent. and S. Spain; often gregarious. G.C. III. 21:407; 29:65; 31:407.—Not hardy north of the middle states.

AA. *Nobiles*. *Lvs. blue-green, often glaucous, stomatiferous on both surfaces, flat or 4-sided on sterile branches, 4-sided acute, incurved and crowded on fertile branches.*

14. *nôbilis*, Lindl. (*Picea nôbilis*, Loud.). RED FIR Tree, 150–250 ft.: trunk 6–8 ft. in diam.: lvs. on lower branches grooved above, rounded and emarginate at the apex: cones oblong-cylindrical, purplish or olive-brown, 4–6 in. long; bracts much longer, thin and covering the scales, strongly reflexed, pale green. Cascade and Coast Mts. of Wash. and Ore.; often gregarious. S.S. 12:617. G.C. II. 19:15; III. 20:275.—There is a var. *glauca* in the trade.

15. *magnifica*, A. Murr. RED FIR. Fig. 61. Tree, 200–250 ft.: trunk 6–10 ft. in diam.: lvs. quadrangular, bluntly pointed on sterile and acute on fertile branches: cones oblong-cylindrical, purplish brown, 6–9 in. long;

bracts much shorter than the scales. Sierra Nevada of Calif.; gregarious and forming great forests. S.S. 12: 618. Gn. 37, p. 591.—Wood occasionally manufactured into lumber. Less hardy in the eastern states than *A. nobilis*.

*Var. shastensis*, Lemm., of S. Ore. and N. Calif., cones somewhat smaller, with bracts as long as or longer than the scales. S.S. 12:620.

*A. Albertiana*, Murr.=*Tsuga heterophylla*.—*A. baborensis*, Let. Lvs. dark, silvery below, very numerous,  $\frac{1}{2}$ –1 in. long; cones 4 or 5 together, reaching 7 or 8 in. long, 1 in. diam. N. Afr. R.H. 1866, p. 106, desc.—*A. bifida*, Sieb. & Zucc.=*A. firma*.—*A. bracteata*, Hook. & Arn.=*A. venusta*.—*A. canadensis*, Michx.=*Tsuga canadensis*.—*A. Delavayi*, Franch. Tree, 20–50 ft.; lvs. rolled back along margin. W. China. G.C. III. 39:212.—*A. Farquhii*, Franch. Tree, to 200 ft.; lvs. very white on under surface; cones deep purple. Cent. and W. China. G.C. III. 39:213.—*A. firma*, Sieb. & Zucc.=*A. Mome*, Sieb. Lvs. thick and rigid, 1 in. long; cones cylindrical, often 6 in. long, with keeled scales.—*A. homölepis*, Sieb. & Zucc. Closely related to *A. brachyphylla* but less valuable as an ornamental tree; rare in cult. (Arnold Arboretum). G.C. II. 12:823. Japan. Promising for the southern states.—*A. Hookeriiana*, Murr.=*Tsuga Mertensiana*.—*A. lasiocarpa*, Nutt. Lvs. blue-green and glaucous; cones 3 in. long, with very broad spineless scales. W. U. S. G.C. II. 13:9. G.F. 4:380. Gng. 4:373. S.S. 12:611.—*Var. arizonica* is a form from the mts. of Ariz. with thicker, paler and more corky bark, the result probably of climatic influence.—*A. macrocarpa*, Vasey=Pseudotsuga macrocarpa.—*A. Mariessii*, Mast. Small tree with crowded branches and short, dark foliage which is pale below; cones large, dark purple. N. Japan. G.C. II. 12:789.—*A. Mentensiana*, Lindl.=*Tsuga heterophylla*.—*A. numidica*, Carrière=*A. baborensis*.—*A. Pindrow*, Spach. Himalayas. This now being recognized as distinct from *A. Webbiana*.—*A. Regina Amaliae*=*A. cephalonica* var. *Apollinis*.—*A. religiosa*, Lindl. Long, slender, drooping branches; lvs. silvery below; cones 5 in. long. Mex. B.M. 6753.—*A. sachalinensis*, Mast. Tall tree, with pale bark, white buds, and long, slender, dark green lvs.; cones 3 in. long. E. Asia. G.C. II. 12:589.—*A. subalpina*, Engelm.=*A. lasiocarpa*. G.C. II. 15:236, 237.—*A. venusta*, Koch. Lvs. acuminate, dark yellow, green above and silvery below; cones 4 in. long, with long, slender bracts. Calif. S.S. 12:615, 616. B.M. 4740.—*A. Webbiana*, Lindl. Lvs. 1–2½ in. long, flat, silvery below; cones cylindrical, 6 or 7 in. long. Himalayas. See *Picea* for *A. ajanensis*, *alba*, *Alcockiana*, *Engelmanni*, *excelsa*, *Gregoriana*, *miniata*, *Morinda*, *nigra*, *obovata*, *orientalis*, *pendula*, *Pseudotsuga*, *Schrenkiana*, *Smithiana*. See also, *Pseudotsuga* and *Tsuga*.

C. S. SARGENT.

**ABOBRA** (Brazilian name). *Cucurbitaceæ*. A monotypic genus allied to *Cucurbita*. The only species is a greenhouse climber, cult. for its numerous small, showy frs.; grows rapidly, and may be planted out in summer. The tuberous roots are stored like dahlias. Prop. by seeds or rarely by soft cuttings.

Flowers dioecious green, all axillary and solitary; staminate fls. with a tubular, cup-shaped calyx and a rotate 5-parted corolla, having oblong-lanceolate segms.; stamens 3, free, the anthers thick, and 1-celled, or sometimes 2-celled; pistillate fls. with a 3–4-celled ovary followed by an ovoid, indehiscent, 6-seeded, showy fr.

*tenuifolia*, Naudin (*A. viridiflora*, Naudin). Height 10–15 ft.; lvs. much divided; fls. small, pale green, fragrant; fr. a scarlet gourd. Trop. Amer. R.H. 1862:111.

**ABRÔMA** (from *a*, not, and *broma*, food). *Sterculiaceæ*. A genus of 2 or 3 species, closely related to the cacao; grown as evergreen greenhouse trees, but apparently not in cult. except in botanical collections. Fls. dingy purple, the calyx 5-parted; corolla lobes 5, clawed. Prop. by seeds or by cuttings in spring from half-ripened wood under glass. Probably not in cult.

*A. augusta*, Linn. f. Lower lvs. cordate, 3–5-lobed; upper lvs. ovate-lanceolate. Trop. Asia. B.R. 518.—*A. fastuosa*, R. Br. Lower lvs. cordate, 5-lobed; upper lvs. ovate; fls. dark purple. Trop. Asia, Austral. *A. sinuosa*, Nichols. Lvs. ovate pedately pinnatifid, on slender petioles. Madagascar.

N. TAYLOR.†

**ABRÔNIA** (from Greek *abros*, delicate, referring to the involucre). *Nyctaginaceæ*. SAND VERBENA. Trailing and upright annuals or perennials, with fragrant verbenalike flowers, suitable for baskets, rockeries or the open border.

Herbs, often viscid: lvs. opposite from swollen nodes, unequal, petioled and entire; fls. 1 to many in a bracted peduncled head, small, salver-form, red, yellow or white, showy in mass, fragrant; stamens mostly 5, unequal, joined to the corolla-tube and included within it; calyx tubular and corolla-like, 4–5-lobed, the base persistent over the 1-seeded ovary or fr. About 30 species in Amer. S. Watson, Bot. Calif. 2:3–5; P.C. Standley, Contr. U. S. Nat. Herb. 12:306.

Abronias are garden annuals, or treated as annuals, of secondary importance. They are low or trailing plants, rising from 6 to 18 inches high and spreading widely. They are best adapted to open sunny places and light soil. *A. umbellata* is the common garden species, the trailing stems often reaching a length of 3 to 5 feet, and the flowers appearing all summer and fall; in mild climates, the plant volunteers from self-sown seeds. It is useful for borders and for baskets and porch-boxes, when a change or variety is wanted from the use of verbenas. Under glass, the plant is nearly perennial.

Propagation is by seeds, sown in open ground after frost, or sown in late summer or early fall in mild climates. For early and continuous summer bloom, seeds may be sown in pots of sandy earth the previous autumn and wintered in a frame. Peel off the husk (calyx) before sowing.

A. Fls. yellow.

*latifolia*, Esch. (*A. arenaria*, Menzies). Fig. 62. Perennial: whole plant viscid-pubescent, prostrate; lvs. thick, ovate, orbicular or reniform, obtuse, stalked; fls. fragrant,  $\frac{1}{2}$ – $\frac{3}{4}$  in. long, lemon-yel-

62. *Abronia latifolia*. ( $\times \frac{1}{2}$ )

low. June, July. Seacoasts, Cent. Calif. and N. B.M. 6546. G.C. II. 16:365

AA. Fls. pink or rose.

*umbellata*, Lam. (*Tricratus admirabilis*, L'Her. *A. rosea*, Hartweg.) Fig. 63. Perennial: similar in habit and pubescence to the above, but lvs. stalked, the blade ovate, acute at both ends; fls. pink, about  $\frac{1}{2}$  in. May, June. Calif. seacoasts to Columbia R. F.S. 11:1095. P.M. 16:36. Var. *grandiflora*, Hort., has larger fls. and lvs.

*villösa*, Wats. Perennial: smaller and slenderer than *A. umbellata* and covered with a glandular-villous pubescence; lvs. rarely 1 in. long; fls. 5–15 in a cluster, rose. Calif., Utah.—Not common in cult., but well suited to sandy and dry situations. Intro. 1891.

AAA. Fls. white.

*mellifera*, Dougl. (*A. Suksdorfii*, Coult. & Fisch.). Perennial: stouter than *A. umbellata*; st. finely hairy; involucre larger, scarious; fls. 1 in. long, the tube

greenish and glabrous: lvs. long-stalked, in opposite pairs. Wash., Ore. B.M. 2879. Intro. 1891.

*fragrans*, Nutt. Erect perennial: lvs. ovate or elliptical, paler beneath than above: fls. night-blooming,  $\frac{3}{4}$ –1 in. long, the tube greenish, the white lobes bifid. Columbia R. to New Mex. B.M. 5544.

*A. puchella*, Nichols. Erect, 6 in.: fls. pinkish rose.—*A. Cruz-malte*, Kellogg, the handsomest of all the species is, *Tripterocalyx Cruz-malte*, which see.

N. TAYLOR.†

63 *Abronia umbellata*. ( $\times \frac{1}{4}$ ; fl.  $\times 1$ )

**ABROPHÝLLUM** (Greek combination signifying *delicate-leaved*). *Saxifragaceæ*. An endemic monotypic genus of New S. Wales: tall, handsome shrub: lvs. alternate, elliptic or ovate-lanceolate and acuminate, to 9 in. long, somewhat toothed: fls. small, yellowish, in dichotomous corymbose panicles terminating the shoots or arising from the upper axils; petals, stamens and calyx-lobes 5; fr. a 5-celled ovoid berry. *A. órnans*, Hook. f., was intro. to Calif. in 1911 by Franceschi.

**ÁBRUS** (from *abros*, delicate, referring to leaves). *Leguminósæ*. Deciduous greenhouse climber, or used South outdoors for screens. Roots a poor substitute for licorice, and the seeds are violently poisonous. Needs strong heat for indoor culture. Propagation is by seeds or by cuttings under glass in sand.

The genus consists of usually creeping or climbing woody herbs with primately compound lvs.: fls. small, in dense racemes on axillary peduncles or short branches; calyx bell-shaped, the teeth very short; corolla pea-like, much exserted; stamens 9, in a tube.

*precatórius*, Linn. CRAB'S-EYE VINE. WEATHER-PLANT. Fig. 64. Height 10–12 ft.; frequently trailing over the ground S.: lfts. oblong, in numerous pairs: fls. varying from rose to white: seeds bright scarlet, with a black spot, used by Buddhists for rosaries, in India as standards of weight, and in the W. Indies in bead work. Seeds irritant; also used as an abortive in U. S. A variety with a cream-colored bean is offered by Reasoner Bros.: Tropics generally.—The claims made for its weather-foretelling properties are exposed by Oliver in Kew Bull. Jan., 1890. It does, however, "go to sleep" during storms, but this is a feature of other legumes. Sometimes confounded with *Rhynchosia phaseoloides* (*R. precatória*), which has similar seeds, but is a very different plant with large, 3-foliate, bean-like lvs.

N. TAYLOR.†

**ABSINTH, ABSINTHE** (ab'sinth). A liquor made from plants of the wormwood group, particularly from the absinthium (*Artemisia Absinthium*). These are aromatic or bitter herbs. *A. Absinthium* yields a bluish or green volatile oil containing absinthol and other principles. Absinth is added to water as a beverage, and in excess produces peculiar intoxication, and may even prove fatal.

**ABÛTA** (native name). *Menispermææ*. Greenhouse evergreen climber: plant dioecious, fasciated or panicked: staminate fls. with 3 exterior and 3 interior larger sepals,

and 6 stamens; pistillate fls. with 6 staminodia and 3 carpels: fr. a drupe; 14 species in S. Amer. Prop. by cuttings under glass with bottom heat, and grown in peaty loam. *A. rufescens*, Aubl. Lvs. broad-ovate or suborbicular, coriaceous, brown or tawny beneath, 3-nerved: fls. small, dark purple within, the 3 large sepals obtuse. Little known in cult.

**ABÛTILON** (name of Arabic origin for a malvaceous plant). *Malvææ*. FLOWERING MAPLE. Attractive coolhouse shrubs and window-plants, and some kinds used for bedding. Sometimes called Chinese Bellflower. Fig. 65.

Leaves long-stalked, often maple-like: fls. mostly pendulous, with naked 5-cleft calyx, 5 separate cbovate petals, many stamens united in a column about the many-branched style, the anthers borne at the top of the column: fr. a collection or aggregate of 2-valved often beaked carpels that are deciduous from the central axis at maturity.—Natives of warm regions in both hemispheres, comprising herbs, shrubs and trees; about 80 species.

The abutillons oftenest seen in American gardens and conservatories are apparently hybrids and derivatives of pure species. The colors are mostly yellow, white and pink, with attractive veining. Well-known forms are: Arthur Belsham, red, shaded gold. Boule de Neige, pure white, very free. California, a group of free bloomers. Eclipse, foliage marbled green, and yellow fls. of fair size; sepals scarlet; petals orange-buff; suited for baskets and vases; a form of *A. megapotamicum* (another Eclipse is known). Erecta, pink, orange-veined, erect fls. Golden Bell, deep yellow, free-flowering. Golden Fleece, pure yellow, free-flowering. Royal Scarlet, rich, shining scarlet. Santana, deep red. Savitzii, dwarf, with white-edged foliage; useful for bedding. Snowstorm, semi-dwarf, pure white. Souvenir de Bonn, lvs. large, deep green, not mottled, but edged with a broad white margin; distinct and striking; a useful bedding plant. Splendens, bright red.

64. *Abrus precatorius*. ( $\times \frac{1}{4}$ )

The cultivation of abutilons is simple, under conditions suitable for the growing of geraniums and fuchsias. Some of the forms are grown primarily for bloom, and they are practically continuous-flowering when well handled; the variegated-leaved forms are grown for foliage and used more or less for bedding-out. Abutilons make good pot-plants if kept within bounds by pinching back so that they will branch. *A. megapotamicum* and some others are useful for baskets and vases. The showy *A. insigne* is an excellent rafter-plant.

65. A flower of Abutilon.

Propagation is by cuttings or seeds. Cuttings may be made in spring of new wood from old plants that have been cut back, or they may be taken in fall; as the abutilon is active practically all the year, the cuttings may be taken almost at will. Seeds grow readily; if started in March, blooming plants should be had by fall. Bedding material is raised from early-struck cuttings.

A. *Lvs. not lobed, cordate, but prominently toothed, sometimes angled.*

B. *Corolla wide open.*

1. *insigne*, Planch. (*A. igneum*, Hort.). Lvs. medium size, crenate-dentate, acuminate, villous pubescent underneath: fls. large, flaring-mouthed, under-color white but obscured by very heavy and rich veining and markings of purple and red, on slender hanging peduncles. Colombia. B.M. 4840. Gn. 18:624; 53, p. 300. F.S. 6:551.—Very showy; common. Often trained under the roof of the greenhouse or conservatory. St. green, brown-hairy.

2. *longicuspe*, Hochst. White-canescant much-branched shrub, with long-acuminate broad-cordate and blunt-toothed long-stalked lvs., felt-like below: fls. bluish purple, veiny, wide open, on mostly many-branched axillary peduncles. Abyssinia.—Intro. by S. Calif. Acclimatizing Assoc., from seed collected by Schweinfurth and distributed from Berlin in 1893.

3. *sinense*, Oliver. Lvs. large and broadly cordate-ovate, long-acuminate, notched but not lobed, somewhat tomentose beneath: fls. large (2 in. or more across), open-bellshaped, orange-yellow with large interior veins and marks of reddish brown. Cent. China, recently intro. to cult. Seed apparently not yet in the American trade. R.H. 1909:452.

BB. *Corolla long and narrow.*

4. *megapotamicum*, St. Hil. & Naud. (*A. vezillarium*, Morr.). Fig. 66. Drooping habit: lvs. rather small, lance-ovate, acuminate, sharp-serrate: fls. 2-3 in. long, on short drooping stalks, the long calyx bright red, the protruding petals lemon-yellow, the column of stamens conspicuously protruding. Brazil, etc. B.M. 5717. Gn. 37:274. J.H. III. 18:359.—A strikingly handsome species, particularly for baskets and vases, apparently less seen than formerly. There is a variegated-lvd. variety. Generally misspelled *mesapotamicum*. *Megapotamicum* means "big river," signifying here the Rio Grande.

AA. *Lvs. prominently lobed, mostly maple-like or vitis-like.*

B. *Foliage silky or tomentose, at least beneath.*

5. *Sellovianum*, Regel (*A. Selloanum*, authors, a correction of the published name, as the plant is named for Sello. *A. Sellowianum*, Hort.). Upright, thick-hairy plant: lvs. roundish deep-heartshaped, long-stalked, 3-lobed with long-pointed parts, 7-9-nerved, unequally toothed, the under side soft silky tomentose: fls. light purple, with erect petals. Brazil. Var. *marmoratum*, Hort., has lvs. variegated with golden yellow.—A good summer bloomer. The variegated form is sometimes used for bedding.

6. *Darwinii*, Hook. f. (*A. Hildebrandii*, Fenzl.). Strong pubescent shrub of dwarfish habit: lvs. velvety pubescent beneath, thickish, 5-9-ribbed, the lower ones lobed to the middle, the upper ones shallow-3-lobed: fls. 1-3 in an axil on short sts., 1½-2 in. across, orange-red with blood-red veins, widely open or spreading. Brazil. B.M. 5917. Var. *tessellatum*, Hort., has lvs. handsomely checkered with yellow.—Blossoms in both winter and summer. Much hybridized with other species. *A. grandiflorum* and *A. compactum* are garden forms; also *A. floribundum*, Hort., R.H. 1881:350. Gt. 23:794 (var. *trinerve*, Regel).

BB. *Foliage not tomentose or silky, glabrous or slightly pubescent.*

C. *Fls. blue (varying to white in cult.).*

7. *vitifolium*, Presl. Lvs. cordate in general outline, 3-5-, and sometimes 7-, lobed, the lobes long-pointed: fls. open bell-shaped or cup-shaped, large, lavender-blue, more or less veined (sometimes white), clustered, anthers yellow. Chile.—A hardy species, remaining out-of-doors in S. of England; height becoming 30 ft.: lvs. golden in autumn. B.M. 4227, 7328. Gn. 51:334; 66, p. 8 (clumps); 76, p. 415. J.H. III. 62:380. B.R. 30:57.

CC. *Fls. yellow or orange in ground color.*

D. *Blossoms very large: lvs. 7-lobed.*

8. *venosum*, Lem. Very strong, tall grower: lvs. large, deeply palmately 7-lobed and strongly toothed: fls. large, 3 in. long, on sts. 10-12 in. long, bell-shaped and not flaring, golden orange, with veins and over-colors of blood-red and brown. Mex. B.M. 4463.—A showy species.

DD. *Blossoms of ordinary size (2 in. or less long).*

E. *Lf.-blades 3-lobed, the side lobes often small (or the clefts shallow).*

9. *pictum*, Walp. (*A. striatum*, Hort., at least in part, not Dickson). Strong and hardy free-blooming species, with lvs. green or variegated and glabrous or thinly pubescent, the middle lobe usually about equaling or sometimes shorter than the undivided part of the lf. and wedge-shape or tapering from the base: calyx about 1 in. long, cleft about to its middle, brownish pubescent; corolla less than 1½ in. long, orange or yellow, veined crimson. S. Brazil to Buenos Ayres.—Has been confused with *A. striatum*.

66. Abutilon megapotamicum. (×¼)

10. *pleniflorum*, N.E. Br. Lvs. green, glabrous both sides, the middle lobe slightly narrowed at its base and half again as long as the undivided part of the blade: fls. double.—Perhaps of hybrid origin, with *A. pictum* a probable parent.

EE. *Lf.-blades 5-7-lobed, the middle lobe always more or less narrowed at its base.*

11. *striatum*, Dicks. A Guatemalan species perhaps not in cult. in its original form: middle lobe of lf. usually at least twice as long as undivided part of blade and twice longer than broad, green: calyx somewhat less than 1 in. long, the lobes about twice as long as tube, brown-pubescent; corolla  $1\frac{3}{4}$  in. or less long, orange, conspicuously dark crimson-veined. B.M. 3840 (as *Sida picta*).—Var. *Thompsonii*, Veitch. Fig. 67. Lvs. variegated with yellow, not pubescent; first exhibited by Veitch & Sons in 1868; said to be from Jamaica; perhaps not in general cult. at present.—Var. *spurius*, Lynch. Lvs. variegated with yellow, thinly pubescent above but thickly pubescent beneath with fine hairs, the calyx white-pubescent: corolla light reddish orange with redder veins; probably of garden origin.—The cult. forms of this species-group are imperfectly understood, particularly those passing as *A. Thompsonii*. In England, the form usually known as *A. Thompsonii*, and used for bedding, is the var. *spurius*. In N. Amer. several different things are called *A. Thompsonii*, some of them not variegated and at least one of the variegated forms having double fls. The Fig. 67 is inserted to distinguish the plant originally distributed as *A. Thompsonii*, and to which the name should be restricted. Probably some of the *A. Thompsonii* forms belong in the general *A. hybridum* group.

67. *Abutilon Thompsonii* as originally pictured in *Florist and Pomologist*, 1869, p. 21. Inserted to show the plant to which the name *Thompsonii* should be applied.

The confusion between the Brazilian *A. pictum* and the Guatemalan *A. striatum* is reduced by N. E. Brown, G. C. 1910 (2) pp. 427 and 488.

12. *hybridum*, Hort. Under this name have been placed the many garden forms and hybrids, most of which have many of the features of the *A. striatum* group. *A. Darwinii* has been one of the parents in some of them, as in *A. roseiflorum*, and Golden Fleece (Gn. 53:300), both of which are recorded as offspring of

*Darwinii* and Boule de Neige. Other varieties referable here are Fireball, Golden Bell, Gold Ball, Savitzii, Souvenir de Bonn, Caprice, Boule de Neige (Snowball). Fig. 68 shows one of the forms of this garden group, passing sometimes erroneously as *A. Thompsonii*.

*A. arboreum*, Sweet. Lvs. cordate, tomentose: fls. pale yellow. Peru.—*A. Bedfordianum*, St. Hil. Lvs. lobed: fls. yellow with red: very tall. Brazil.—*A. esculentum*, St. Hil. Lvs. cordate, acuminate, toothed, tomentose: fls. purple, solitary. Fls. said to be cooked and eaten by natives in Brazil under name of Bencade Deos.—*A. globiflorum*, Don. Fls. large, cream-colored. Mauritius.—*A. integririma*, Hook. & Jackson, Index Kewensis. (*Sida integririma*, Hook. B.M. 4360.) Lvs. entire, cordate, tomentose below: fls. large, yellow, flaring. Colombia.—*A. paoniflorum*, Walp. Fls. rather small pink. Brazil.—*A. pulchellum*, Sweet, and *A. pulchrum*, Don. = *Plagianthus pulchellus*. L. H. B.

#### ACACALLIS: *Aganisia*.

**ACACIA** (from word meaning a *point* or *thorn*, referring to the stipules often spinescent). *Leguminosæ*, tribe *Mimosæ*. Trees or shrubs grown out-of-doors in warmer parts of the United States and some of the species as cool greenhouse plants for the showy yellow bloom.

Leaves bipinnate or reduced to phyllodia with vertical edges (i.e., lf.-like petioles): fls. regular, orange-yellow, occasionally lemon-yellow or white, in cylindrical spikes or globular heads, solitary, or in pairs or clusters, or in axillary racemes; sepals and petals 5, 4 or 3, free or united; stamens many, long: pod a legume, opening by two valves (occasionally indehiscent): funicle of the seed filiform or ending in club-shaped aril, either twice encircling the seed or simply bent back upon itself. (The difference between *Acacia* and *Albizzia* lies in the stamens, which are free in the former and united at base in the latter.) A very large genus (said to be 450 species) dispersed throughout the tropical parts of the earth and even pushing their way into parts of the temperate zones. The phyllodine series is confined almost entirely to Australia and the Pacific Isls., while the bipinnate series is scattered over the warm parts of the remainder of the globe. The number of species reported from Amer. is large (about 70), of which at least 30 are Mexican. Acacias are said to be natives of the following states: Ariz., Ark., Calif., Fla., Okla., Kan., La., Mo., Nev., New Mex. and Texas. Those in the following account are Australian, unless otherwise stated. This list will undoubtedly be modified as botanists segregate the other genera from the *Mimosæ* group. Acacias vary greatly under cult., the variation affecting infl., size and shape of lf., and even the funicle. One should not expect to determine an unfamiliar species without lvs., fls. and fr., with its seeds in place.

Other species interesting because of their ant-inhabited thorns are described under *Bull-horn Acacias*. Other species referred to *Acacia* are to be found under *Albizzia*.

Acacias are quick-growing plants and are short-lived. Various kinds have been known to grow from 11 to 12 feet in four months and 25 feet in six years. These trees are thus in their full maturity at thirty years of age, and shortly afterward begin to deteriorate. While they may thus be used as street trees to secure immediate effects, more permanent trees should also be planted to take their places. The leaves of some species are used in cookery, the flowers of *A. Farnesiana* for perfumery, the bark of various species for tanning; *A. Senegal* furnishes most of the gum arabic of commerce; a drug or medicine is made from the wood of *A. Catechu*; a soap or hair-wash from *A. concinna*; several are used as forage plants, others for dyes, and still others for fiber. Many of them have scented wood, others make fine furniture wood, and are used for cabinetwork and fence-posts or fuel, still others for street trees (as *A. melanoxylon* and *A. dealbata*), and all are more or less ornamental. The Ark of the Covenant, as well as the furniture of the Tabernacle, are said to have been made

from timber of *A. Seyal*, which yields the Shittim wood of the Bible. Also on account of its incorruptible wood, this species for ages was used by the Egyptians to make coffins for the burial of their kings.

*Acacias out-of-doors* will not endure much frost. They seem to thrive very well in localities in which the winter temperature is as low as 20° F., or even 18°, and it is to be hoped that by careful selection strains may be secured that will withstand an even lower temperature. Some species are alkali-resistant as *A. cyclops*, *A. retinodes* and perhaps others. After the trees are once well established they do not ordinarily require further irrigation since they have a faculty of seeking water. However, if they are given plenty of water and good soil their growth is very rapid. Weevils sometimes ruin acacia seeds by laying their eggs in the flower-buds and appearing later in the pod. The cottony cushion scale and the black scale are also found to a limited extent, but so far have not proved troublesome.

Propagation is by seeds sown either under glass or out in the open ground, or by cuttings from half-ripened wood, taken with a heel. Seeds may be prepared for planting in two ways: First, place them in ashes among the dying embers of a fire and allow them to remain until cool. These do not require immediate sowing, but if they are sown they will not perish if rain does not fall very soon afterwards. Second, pour hot water over seed, let cool and soak from twelve to forty-eight hours. Sow without allowing seeds to become dry. Either method softens the hard seed-coats and hastens germination. They will then usually germinate in about seven days to three or four weeks, depending upon the species and the season in which they are sown. Seed may be sown in the propagating-house at any time throughout the year, though early spring is the natural time. For open ground, sow in March or April. After germination, the plants are pricked off into flats or pots and shifted into larger ones as occasion requires. They are thus kept in pots until they are ready to be transplanted to their permanent quarters, since if placed in the open ground at once the tap-roots will grow with too great rapidity and the tree will either have to be balled or transplanted with the greatest care to prevent its receiving a shock, from which it will take at least a year to recover. When buying seedlings from a nursery, therefore, reject all those whose roots have penetrated the pot. While several species (*A. pycnantha*, *A. melanoxylon*, *A. decurrens* var. *dealbata*, etc.) have been known to resow themselves in California, there is no danger of their becoming a pest (such as *A. armata* in Australia), since the seedlings are seldom able to live through the dry season without irrigation. Cuttings should be made from the half-ripened wood, of which the best are from the side shoots of the main stem, taken with a heel. No bottom heat is required, or very little, but they should be covered with a light frame and kept moist and cool by shading. They root slowly but freely and should be potted immediately after rooting, but should not be planted in the open soil until they have developed good roots.

*Cultivation in greenhouses as florists' plants* is confined to few species, perhaps not more than a dozen being commercially valuable. All of this most important section thrive in a winter temperature ranging from 40° to 50°; in fact, little above the freezing point is sufficient. They do not like heat, and consequently are not adapted for forcing. If wintered cool and allowed to come along naturally with the increasing heat and light of the spring, they will flower in March and April.

a season when their graceful beauty is appreciated in the private conservatory or is valuable to the commercial florist. The prevailing color of all the Australian species is yellow, varying from pale lemon to deep orange. The tall-growing kinds, or rather those inclined to make long, straight shoots, make excellent subjects for planting permanently against a glass partition of a conservatory, or against a pillar. There is scarcely a

more beautiful plant than *A. pubescens*, with its slightly drooping, yellow racemes. It deserves a favored place in every cool conservatory. The acacias are of easy culture. If planted permanently in the border, provision for drainage should be made. A good, coarse, turfy loam, of not too heavy texture, is all they want, with the addition of a fifth part of leaf-mold or well-rotted

spent hops. Few of our greenhouse pests trouble them. Water in abundance they like at all times, and in their growing season, which is the early summer months, a daily syringing is necessary. Several of the species of bushy habit are very much grown as pot-plants in Europe, and are now largely imported and sold for the eastern trade. *A. armata* and *A. Drummondii* are good species for this purpose. With our hot summers, the commercial man will do better to import than to attempt to grow them from cuttings. The acacias need pruning, or they will soon grow straggling and unshapely; more especially is this true of those grown in pots. After flowering, cut back the leading shoots rather severely. Shift into a larger pot if roots demand it, and encourage growth by a genial heat and syringing, giving at same time abundance of light and air. They should be plunged out-of-doors as soon as danger of frost is past, and removed to the greenhouse before any danger of early fall frosts. Cuttings root surely but not quickly. The best material is the side shoots from a main stem in the condition that florists call half-ripened—that is, not green and succulent as for *verbena*, nor as firm and hard as the wood of a hybrid perpetual rose in November. The wood or shoot will be in about the right condition in June. No bottom heat is needed, but the cuttings should be covered with a close frame and kept moderately moist and cool by shading. The following spring these young plants can be either planted out-of-doors, where there is a good chance to keep them well watered, or grown on in pots, as described above. A few of the finest species are *A. pubescens*, suitable for training on pillars; *A. Riceana* makes a bush or can be trained; *A. longifolia*, an erect species, deserves a permanent position in the greenhouse border. Of all the species best adapted for medium-sized, compact pot-plants, *A. armata* and *A. Drummondii* are the best. The former has small, simple, dark green leaves and globular, pure yellow flowers. *A. Drummondii* has drooping, cylindrical, pale lemon flowers. As both these flower in March without any forcing in our northern greenhouses,

they are very valuable acquisitions to our Easter plants. The acacia has two distinctive charms: the foliage is either small, simple and glaucous, as in *A. armata*, or much divided, graceful and fern-like, as in *A. pubescens*. All the acacias are among the freest-flowering of our hard-wooded plants. (William Scott.)

## KEY TO THE SPECIES.

- A. Lvs. reduced to phyll. (i. e., the petiole is flattened to resemble a simple l.).  
B. Fls. in globular heads.  
C. Phyll. terete or slightly flattened.  
D. The phyll. tapering into points.  
E. Funicle filiform to its end. . . . . 1. juniperina  
EE. Funicle ending in enlarged aril.  
F. Fls. cream-yellow; phyll. slender, broad at base. . . . . 2. tenuifolia  
FF. Fls. rich yellow; phyll. thick, narrower at base. . . . . 3. diffusa  
DD. The phyll. with innocuous points, not pungent.  
E. Peduncle usually more than 1-headed. . . . . 4. calamifolia  
EE. Peduncle mostly 1-headed.  
F. Phyll. obscurely nerved. . . . . 5. juncifolia  
FF. Phyll. prominently nerved, st. almost winged. . . . . 6. extensa  
CC. Phyll. vertically flattened.  
D. Veins of phyll. 1, or very rarely 2.  
E. Fl.-heads solitary or in pairs or clusters.  
F. Length of phyll. 1 in. or less.  
G. Stipules persistent as slender spines.  
H. Pods hirsute.  
I. Phyll. semioval. . . . . 7. armata  
II. Phyll. wedge-shaped. . . . . 8. cuneata  
HH. Pod glabrous; phyll. triangular or rhomboidal. . . . . 9. decipiens  
GG. Stipules deciduous, small or none.  
H. Peduncles shorter than phyll. . . . . 10. Meissneri  
HH. Peduncles longer than phyll.  
I. Nerve near one edge; phyll.  $\frac{1}{2}$  in. wide. . . . . 11. lineata  
II. Nerve central; phyll. over  $\frac{1}{2}$  in. wide.  
J. Phyll. orbicular. . . . . 12. obliqua  
JJ. Phyll. oblong. . . . . 13. acinacea  
FF. Length of phyll.  $1\frac{1}{4}$ –4 in.  
G. More or less spinescent. . . . . 21. sentis  
GG. Not spinescent. . . . . 14. dodonæifolia  
EE. Fl.-heads in axillary racemes (rarely reduced to a solitary head).  
F. Length of phyll. 2 in. or less.  
G. Racemes much exceeding phyll.  
H. Phyll. hoary or pubescent. . . . . 15. podalyriæfolia  
HH. Phyll. glabrous.  
I. The phyll. nearly as broad as long.  
J. Shape of phyll. obliquely olate. . . . . 16. cultriformis  
JJ. Shape of phyll. triangular. . . . . 17. pravissima  
II. The phyll. oblong-falcate, not so broad as long. . . . . 18. lunata  
GG. Racemes not or only slightly exceeding phyll. (except *A. linifolia* var. *prominens*).  
H. Phyll. obliquely obovate. 19. brachybotrya  
HH. Phyll. lanceolate (often 3 in. long in Calif.) . . . . . 20. myrtifolia  
HHH. Phyll. linear.  
I. Stipules spinescent. . . . . 21. sentis  
II. Stipules not spinescent.  
J. Gland at base. . . . . 22. linifolia  
JJ. Gland below middle. 22. linifolia var. *prominens*  
FF. Length of phyll. over 2 in. (except *A. salicina* var. *Wayæ*).  
G. Some of phyll. over 1 in. wide.  
H. Funicle encircling seed and bent back in double fold.  
I. Pod  $\frac{1}{4}$  in. wide. . . . . 23. falcata  
II. Pod over  $\frac{1}{4}$  in., nearly  $\frac{1}{2}$  in. wide. . . . . 24. penninervis  
HH. Funicle not encircling seed.  
I. Phyll. sickle-shape. . . . . 25. pyncnantha  
II. Phyll. not sickle-shape. 26. saligna  
27. cyanophylla  
GG. All phyll. under 1 in. wide.  
H. Phyll. linear-lanceolate, mostly widest above middle.  
I. Midrib much to one side, gland one-third from base, making a notch. . . . . 28. obtusata  
II. Midrib central or nearly so, gland  $\frac{1}{4}$ – $\frac{1}{2}$  in. from base.  
J. Funicle surrounding seed. . . . . 29. retinodes  
JJ. Funicle not surrounding seed. . . . . 30. neriifolia  
HH. Phyll. linear-oblong, not widest above middle.  
I. Seeds nearly transverse. . . . . 31. suaveolens  
II. Seeds longitudinal.  
J. Racemes compound. 32. macradenia  
JJ. Racemes simple, often reduced to 2 or 3 heads.  
K. Foliage pale. . . . . 33. salicina  
KK. Foliage dark green. . . . . 33. salicina var. *Wayæ*  
DD. Veins of phyll. several (rarely only 2), longitudinal.  
E. Fl.-heads in racemes.  
F. Phyll. 2-nerved. . . . . 34. binervata  
FF. Phyll. more than 2-nerved.  
G. Pod with narrow wing. . . . . 35. pendula  
GG. Pod not winged.  
H. Funicle encircling seed in double fold. . . . . 36. melanoxydon

- HH. Funicle folded at end of seed, not encircling it.  
 I. Width of pod  $\frac{1}{4}$  in. . . . . 37. *implexa*  
 II. Width of pod  $\frac{3}{4}$ –1 in. 38. *koa*
- EE. Fl.-heads solitary or in pairs or clusters.  
 F. Width of phyll.  $\frac{1}{2}$  in. or less, linear.  
 G. Phyll. viscid. . . . . 39. *viscidula*  
 GG. Phyll. not viscid. . . . . 40. *elongata*  
 FF. Width of phyll. over  $\frac{1}{2}$  in., not linear.  
 G. The fl.-heads sessile, or nearly so. . . . . 41. *Oswaldi*  
 GG. The fl.-heads not sessile.  
 H. Funicle short, half as long as seed. . . . . 42. *harpophylla*  
 HH. Funicle long, scarlet, encircling seed in double fold. . . . . 43. *cyclops*
- BB. Fls. in spikes.  
 C. Shape of phyll. narrow ( $\frac{1}{2}$  to less than  $\frac{1}{4}$  in.), pungent pointed.  
 D. Nerves 3 or 4; phyll. scattered. . . 44. *oxycedrus*  
 DD. Nerves 1.  
 E. Phyll. whorled. . . . . 45. *verticillata*  
 EE. Phyll. clustered: fls. mostly 3-merous . . . . . 46. *Riceana*
- CC. Shape of phyll. broader (except *A. aneura* and *A. longiflora* var. *floribunda*), less rigid, not pungent pointed.  
 D. Pod winged. . . . . 47. *aneura*  
 DD. Pod not winged.  
 E. Calyx and phyll. pubescent (*A. Maidenii* only slightly so).  
 F. Sepals velvet-like, bright orange-yellow. . . . . 48. *glaucescens*  
 FF. Sepals not velvet-like yet more or less pubescent.  
 G. Funicle encircling seed. . . 49. *Maidenii*  
 GG. Funicle folded and enlarged into cup-shaped aril . . . 50. *holosericea*  
 EE. Calyx and phyll. not pubescent.  
 F. Phyll. linear. . . . . 51. *linearis*  
 FF. Phyll. elliptical, lanceolate.  
 G. Width of phyll. over  $\frac{1}{4}$  in. . . 52. *longifolia*  
 GG. Width of phyll. less than  $\frac{1}{4}$  in. . . . . 52. *longifolia* [var. *floribunda*]
- AA. Lvs. all bipinnate.  
 B. Fls. in globular heads.  
 C. Stipules none or brown and scarious.  
 D. Pinnæ few, 2–10 pairs.  
 E. Rachis hirsute. . . . . 53. *pubescens*  
 EE. Rachis not hirsute.  
 F. Lfts.  $1\frac{1}{4}$ – $1\frac{1}{2}$  in. long. . . . 54. *elata*  
 FF. Lfts. less than  $1\frac{1}{4}$  in. long.  
 G. Length of pinnæ 1 in. . . . . 55. *Baileyana*  
 GG. Length of pinnæ over 1 in.  
 H. Funicle filiform. . . . . 56. *discolor*  
 HH. Funicle cup-shaped aril. 57. *pruinosa*
- DD. Pinnæ many, 8–25 pairs.  
 E. Plant a tree: lfts. 30–40 pairs, more or less tomentose-pubescent. . . . . 58. *decurrens*  
 F. Lfts. dark green, shining above, imbricate: fls. bloom in June, pale yellow. . . . 58. *decurrens* [mollis]  
 FF. Lfts. more or less gray, farther apart: fls. bloom in Jan. and Feb., deep yellow. 58. *decurrens* [dealbata]  
 FFF. Lfts. light green, distant: sepals as long as petals. . . 58. *normalis*  
 EE. Plant a shrub: lfts. 20–50 pairs, glabrous. . . . . 59. *filicina*
- CC. Stipules spinescent.  
 D. Pinnæ 1 pair. . . . . 60. *pulchella*  
 DD. Pinnæ more than 1 pair.  
 E. Pod round. . . . . 61. *Farnesiana*  
 EE. Pod moniliform. . . . . 62. *Cavenia*  
 EEE. Pod not moniliform. . . . 63. *arabica*  
 64. *eburnea*
- BB. Fls. in spikes.  
 C. Pinnæ 10–40 pairs. . . . . 65. *Catechu*  
 CC. Pinnæ 2–4 pairs.  
 D. Pod not exceeding 1 in. long. . . 66. *Drummondii*  
 DD. Pod  $1\frac{1}{2}$ –4 in. long. . . . . 67. *Greggii*

1. *juniperina*, Willd. (*A. echinula*, DC. *A. pungens*, Spreng.). A stiff shrub, 8 to 12 ft., with branchlets either pubescent or smooth: phyll. scattered, numerous and tapering into a sharp point,  $\frac{1}{2}$  to rarely  $\frac{1}{2}$  in. long, 1-nerved: fl.-heads solitary on peduncles longer than the phyll., 5-merous; petals ciliate; petals acute, with prominent midrib: pod more or less falcate, flat, 1–2 in. long, about  $\frac{1}{2}$  in. broad, usually contracted between the seeds; seeds longitudinal, the funicle but little folded and filiform to the end. May, June.—May be distinguished from *A. tenuifolia* by its funicle filiform the entire length, its petals with prominent midrib, and its 5-merous fls.

2. *tenuifolia*, F. v. M. Fig. 69. An everblooming shrub with a sticky exudation on sts. and over the young fl.-buds: branchlets slender and drooping: phyll. linear-subulate,  $\frac{3}{4}$ –1 in. long,  $\frac{1}{2}$  in. wide, 1-nerved, ending in a pungent point; gland at base: fls. lemon-yellow, with peduncles  $\frac{1}{4}$  in. long, solitary in axils of the phyll., 30 or more in a head: pods straight, slightly constricted between seeds, 2–3 in. long, nearly  $\frac{1}{4}$  in. wide, pointed at both ends and bearing two rough longitudinal marks over each seed, characteristic of this species; funicle silvery white, half as long as seed and enlarged into a cup-shaped aril over one end; ripe June–Nov. Fls. every month. F. v. M. Icon. 1:8.—This attractive shrub is easily grown from seed, germinating in about three weeks and growing steadily. It is delightful for situations that demand a low-branching habit. Its everblooming fls., honey-like odor and dust-resistant qualities also recommend it.

69. *Acacia tenuifolia*. ( $\times \frac{1}{2}$ )

3. *diffusa*, Lindl. (*A. genistæfolia*, Link). A shrub of 5 or 6 ft. with loosely scattered foliage: phyll. linear or subulate,  $\frac{1}{2}$ – $1\frac{1}{4}$  in. long (mostly  $\frac{3}{4}$  in.),  $\frac{1}{2}$ – $\frac{1}{8}$  in. wide, 1-nerved, ending in sharp point: fls. in pairs or reduced to a single head, either 4- or 5-merous; peduncles  $\frac{1}{4}$  in. long; sepals not half length of petals: pod stipitate, flat, acute, 3–4 in. long,  $\frac{1}{8}$  in. broad, valves convex over seeds; funicle much folded and thickened from the middle. Apr., May. B.M. 2417. B.R. 634. Var. *cuspidata*, Benth. (*A. cuspidata*, Cunn.). Phyll. more slender, from  $\frac{3}{4}$ –2 in. long, about as broad as thick.

4. *calamifolia*, Sweet. BROOM WATTLE. Fig. 70. A tall shrub or small tree with slender erect branches: phyll. narrow-linear to subulate, with oblique point at apex and narrowed to base,  $1\frac{1}{2}$ – $2\frac{1}{4}$  in. long,  $\frac{1}{8}$  in. wide, 1-nerved; gland near base (obscure in dried specimens): racemes short, of 3 or 4 heads, or reduced to a single one; fls. 20 to a head, 5-merous; sepals half as long as petals; peduncles  $\frac{1}{4}$  in. long: pods a rich brown, slightly contracted between the seeds,  $1\frac{1}{4}$ –3 in. long,  $\frac{3}{8}$  in. wide; funicle red, almost encircling the seed in a double fold, ending in a silvery club-shaped aril; ripe Aug. Fls. Feb.–Apr. B.R. 839.—An attractive ornamental at all times but especially so when in full bloom. An excellent tan-bark species, analysis showing as much as 20.63 per cent of tannin.

5. *juncifolia*, Benth. (*A. pinifolia*, Benth.). A tall shrub with terete branches, either glabrous or hirsute: phyll. from slightly flattened to tetraginous, 3-6 in. long or more, with a nerve on each side: fls. 5-merous, either solitary or in pairs, about 40 in a head; petals united; calyx spatulate and ciliate, not half so long as petals; peduncles  $\frac{1}{4}$  in. long (rarely  $\frac{1}{2}$  in.); pod flat, with nerve-like margins, 3-4 in. long, less than  $\frac{1}{4}$  in. wide; seeds oblong, longitudinal; funicle half as long as seed, filiform but slightly thickened at hilum. F. v. M. Icon. 2:8.

6. *extensa*, Lindl. (*A. pentandra*, Regel). A shrub 5 ft. tall, with more or less winged angular branchlets: phyll. linear-subulate or needle-like, 3-4 in. long (sometimes 8),  $\frac{1}{4}$  in. wide, 1-nerved, ending in sharp point; gland  $\frac{1}{2}$ -1 in. from base: fls. solitary or shortly racemose, 20 in a head, 5-merous; sepals short; peduncles  $\frac{1}{4}$  in. long: pods with nerve-

70. *Acacia calamifolia*. ( $\times \frac{1}{2}$ )

like margins, constricted between the seeds, 2-4 in. long,  $\frac{1}{4}$  in. wide; funicle straight and only slightly thickened at hilum end; ripe May. Fls. March.

7. *armata*, R. Br. (*A. undulata*, Willd. *A. paradoxa*, DC. *A. furcifera*, Lindl. *Mimosa paradoxa*, Poir.). KANGAROO THORN. Fig. 71. A spreading shrub 8-10 ft. wide, 7-11 ft. tall, with pendent finger-like branchlets: phyll. half-ovate, the straight edge hugging the st., the other edge more or less undulate; nerve excentric, ending in a pungent point; stipules reduced to slender spines about  $\frac{1}{4}$  in. in length: fls. solitary on peduncles  $\frac{3}{4}$  in. long; petals 5; sepals 5, more than one-half length of corolla: pods hairy, straight or slightly curled, in clusters of 2-5 or reduced to 1,  $1\frac{1}{2}$ -2 in. long,  $\frac{3}{8}$  in. wide; funicle silvery, as long as seed and enlarged to a cup-shaped aril; ripe Aug. Fls. Feb.-Apr. B.M. 1653.—A shrub with breadth often much greater than its height, sometimes 15-20 ft. across, hence suitable for large grounds and roomy corners. Makes a good hedge plant, and is also used to reclaim sand-dunes. It is a good rich green and withstands considerable dust and drought. There is a larger-ld. form with fissured bark and more straggling habit. The phyll. is greener and more tender in texture than the type, and the fls. are larger.

8. *cuneata*, Benth. A tall glabrous shrub: phyll.  $\frac{1}{2}$  to scarcely 1 in. long, wedge-shaped, truncate at the apex, nerve excentric, ending in sharp point at one angle while the other angle is tipped by a gland; occasionally a faint secondary nerve; stipules setaceous: fls. solitary; peduncles about as long as phyll., 8-15 in a head, 4-merous; petals separate; calyx turbinate, half as long as corolla and with broad lobes: pod hirsute, thick margins, 2-3 in. long and  $\frac{1}{6}$  in. wide. B.R. 1839.—An interesting ornamental species, somewhat resembling *A. pravissima*.

9. *decipiens*, R. Br. (*A. dolabriformis*, Colla. *A. incrassata*, Hook. *A. biflora*, Paxt.). A shrub either low and bushy or up to 10 or 12 ft. tall, glabrous or rarely hirsute: phyll. triangular or trapezoid,  $\frac{1}{3}$ - $\frac{3}{4}$  in. long and nearly as broad; principal nerve excentric, ending

in small point, gland on other angle; the occasional stipules are spinescent: fls. solitary or in pairs, 6-10 in a head: pod thick, hard, much incurved, 1-2 in. long,  $\frac{1}{3}$ - $\frac{1}{2}$  in. wide, narrowed at each end; seeds longitudinal; funicle ending in club-shaped aril. B.M. 1745, 3244.—The difference between this and *A. cuneata* seems to lie chiefly in fls. and phyll., which are about as broad as long in *A. decipiens*, and much longer than broad in *A. cuneata*, and wedge-shaped.

10. *Meissneri*, Lehm. Tall shrub: young branches glabrous, acutely angular: phyll.  $\frac{1}{2}$ -1 in. long,  $\frac{1}{6}$ - $\frac{1}{4}$  in. broad, obovate-oblong or obliquely cuneate, obtuse, or with a small, hooked point: peduncles shorter than the phyll.: pod flat,  $\frac{1}{4}$ - $\frac{1}{2}$  in. broad, the margins not thickened; seed oblong, longitudinal; funicle very long and much folded, the last fold almost encircling the seed and returning, but thickened only at the end.

11. *lineata*, A. Cunn. (*A. runciformis*, A. Cunn.). A bushy shrub: branches usually pubescent, terete and often slightly resinous: phyll. linear,  $\frac{1}{2}$ - $\frac{3}{4}$  in. long or more,  $1\frac{1}{2}$  in. wide, nerve near the margin and ending in small hooked point: fls. solitary, 5-merous, equal to or exceeding the phyll.; sepals distinct, linear-spatulate; peduncles  $\frac{1}{4}$ - $\frac{1}{2}$  in. long: pod curved or twisted,  $\frac{1}{6}$  in. wide; funicle not so long as seed, ending in a clavate fleshy aril. Fls. March. B.M. 3346 (as *A. runciformis*).—This differs from *A. acinacea* and *A. obliqua* in only its narrow phyllodia. Habitat in barren forest grounds in the interior of New South Wales.

12. *obliqua*, Cunn.

(*A. rotundifolia*, Hook.). A drooping shrub, with finger-like branches, angular and slightly pubescent: phyll. obliquely ovate to orbicular,  $\frac{1}{4}$ - $\frac{1}{2}$  in. long,  $\frac{1}{4}$ - $\frac{3}{8}$  in. wide; 1 excentric nerve ending in recurved point; stipules minute; gland, when present, one-third distant from base: fls. 5-merous, solitary or in pairs on peduncles  $\frac{1}{2}$  in. long; fls. 15-20 in a head; petals with midrib; sepals narrow, half as long as petals: pod more or less twisted and constricted between the seeds, 1-2 in. long,  $\frac{1}{6}$  in. wide, thin, with nerve-like margins; funicle club-shaped, half as long as seed; ripe July, Aug. Fls. Feb. B.M. 4041.

13. *acinacea*, Lindl. (*A. Latrobei*, Meisn.). A much-branched shrub: phyll. obliquely oblong,  $\frac{1}{2}$ - $\frac{3}{4}$  in. long,  $\frac{1}{4}$ - $\frac{1}{2}$  in. wide, obtuse, with a recurved point; gland one-third distance from base: fls. in pairs (rarely solitary), 5-merous; calyx spatulate, ciliate, half as long as petals; petals united; peduncles  $\frac{1}{2}$ - $\frac{3}{4}$  in. long: pod twisted or curved,  $\frac{1}{6}$  in. wide, more or less constricted between the seeds; seed longitudinal; funicle not so long as seed and thickened into fleshy clavate aril. Fls. March. F. v. M. Icon. 4:7.—F. v. Mueller proposed to unite this with the broad-ld. *A. obliqua*, since the only difference between them seems to be based upon shape of phyll. This group should be given further study to determine whether transition stages may be found between the narrow and the round forms and whether

71. *Acacia armata*. ( $\times \frac{1}{2}$ )

the supposed distinction of straight pods in *A. acinacea* can be traced into the curled pods of *A. obliqua*.

14. *dodoneifolia*, Willd. A tall, glabrous, very resinous shrub; phyll. lanceolate to linear-falcate, tapering to base, having the appearance of being encrusted with a brownish powder,  $1\frac{1}{2}$ –2, sometimes 4, in. long, about  $\frac{1}{4}$  in. wide, the lateral veins prominent and anastomosing; 1 central nerve ending in an oblique point; fls. solitary or in pairs, not exceeding the phyll.; peduncles  $\frac{1}{2}$  in. long; about 40 fls. in a head, 5-merous; calyx more than half as long as corolla; pod straight or falcate, about  $\frac{1}{4}$  in. wide; seeds longitudinal; funicle with last 2 or 3 folds dilated into an irregular cup-shaped aril. March.—Superficially this resembles the *A. retinodes* group, but the fls. are solitary or in pairs instead of in racemes, and it has an apparent incrustation on foliage.

15. *podalyriæfolia*, Cunn. (*A. Fraseri*, Hook. *A. Calayi*, Cunn.). Fig. 72. A tall, glabrous shrub with conspicuous gray branchlets covered with a soft pubescence: phyll. pinniveined, pubescent (rarely glabrous), ovate or oblong,  $1\frac{1}{2}$  in. long,  $\frac{1}{2}$ – $1\frac{1}{4}$  in. wide, nerve-like margins and prominent excentric midrib ending in oblique point, the margins and midrib ciliate; gland at middle or just below: racemes simple, longer than phyll., of numerous small heads; calyx turbinate, not half so long as corolla; petals hirsute, with prominent midrib; pod flat, either glabrous or pubescent, 1–3, or more, in. long,  $\frac{3}{4}$  in. broad; seeds longitudinal; funicle not encircling seed but in short folds at hilum end, the last fold slightly thickened. R.B. 33:105. G.C. III. 43:11. Gt. 54:1541. G.W. 9, p. 158.—Its neat gray ovate lvs. and abundant long yellow racemes at the end of the branches make it a very decorative and popular species.

16. *cultriformis*, Cunn. (*A. cultrata*, Ait.). A tall shrub with gray foliage thickly clothing the branches: phyll. with nerve-like margins, obliquely ovate to almost triangular,  $\frac{1}{2}$ –1 in. long,  $\frac{1}{4}$ – $\frac{1}{2}$  in. wide, with gland on upper edge one-third distance from base, the intervening edge straight and closely hugging the branchlets; vein excentric, much curved, ending in mucronate point; racemes axillary, much exceeding the phyll.; fls. 30–40 in a head; sepals half as long as petals; peduncles  $\frac{1}{4}$  in. long; pod a rich brown, with nerve-like margins,  $1\frac{1}{2}$ –3 in. long,  $\frac{1}{4}$  in. wide, occasionally constricted between the seed; seed oblong, longitudinal; funicle half as long as seed, silvery and enlarged into a cup-shaped aril almost from the beginning; ripe Sept., Oct. Fls. March, Apr. R.H. 1896, p. 503. J.H. III. 34:131.—If kept well pruned it makes a good hedge. Has been cult. in Calif. for many years in the open, and is considered a desirable plant.

17. *pravissima*, F. v. M. Fig. 72. A small tree, 15–20 ft. high with decurrent, pendulous, finger-like branchlets thickly clothed with short foliage: phyll.  $\frac{1}{4}$ –1 in. long,  $\frac{1}{4}$ – $\frac{1}{2}$  in. broad, cuneiform to trapezoid, one angle rounded, the other acute, indistinctly 2-nerved, the prominent nerve excentric and ending in a mucronate point; gland large, near middle of upper edge: racemes much longer than phyll., 10 to more fls. in a head; peduncles  $\frac{1}{8}$  in. long; pods, when ripe, once or twice twisted, with nerve-like margins and mucronate tip,  $1\frac{1}{2}$ – $2\frac{3}{4}$  in. long,  $\frac{1}{4}$  in. wide; seed small, longitudinal, with prominent central marking; funicle as long as seed, enlarged into club-shaped aril; ripe July, Aug. Fls. Feb., March.—A very graceful showy species that is becoming popular.

18. *lunata*, Sieb. (*A. oleæfolia*, Cunn.). A glabrous shrub with angular branches: phyll. oblong-falcate, obtuse, with sharp point,  $\frac{3}{4}$ –1 in. long,  $\frac{1}{4}$ – $\frac{1}{2}$  in. wide; vein excentric; gland one-third distance from base: racemes simple, longer than phyll.; fls. 4–15 in a head; calyx united, about one-third length of corolla; pod straight or curved,  $\frac{1}{3}$  in. wide, seeds longitudinal, near

upper suture, the last fold of the funicle thickened into a lateral club-shaped aril, the lower folds very small. Apr. B.R. 1352.—This resembles *A. linifolia* var. *prominens* in fls. and foliage; the fr. is necessary to distinguish them.

19. *brachybōtrya*, Benth. Tall shrub: phyll.  $\frac{1}{2}$ – $1\frac{1}{4}$  in., rarely, in luxuriant specimens, 2 in. long, obliquely obovate or oblong, firm, rather broad, obtuse or mucronulate: fl.-heads few, short, axillary racemes, about equaling the phyll., or rarely reduced to 1 head; fls. 20–50 in a head; pod flat, linear to narrow-elliptical.

Var. *argyrophylla*, Benth. (*A. argyrophylla*, Hook.). Silvery-silky, turning sometimes golden yellow: phyll. mostly  $\frac{3}{4}$ – $1\frac{1}{2}$  in. long: fl.-heads often solitary. B.M. 4334.

Var. *glaucophylla*, Benth. Glaucous and more or less pubescent: phyll. mostly  $\frac{1}{2}$ – $\frac{3}{4}$  in. long: fl.-heads mostly 2–5, shortly racemose.

Var. *glabra*, Benth. Quite glabrous: phyll. small and narrow: fl.-heads small.

20. *myrtifolia*, Willd. A tall shrub with angular branchlets, the angles, glands and margins of phyll. edged with light red or pink: phyll. oval to ovate-lanceolate, the apex either acute with oblique point or obtuse and rounded,  $1\frac{1}{4}$ –2 in. long,  $\frac{1}{3}$ – $\frac{1}{2}$  in. wide; gland  $\frac{1}{4}$  in. from base; nerve excentric: fls. in racemes nearly as long as phyll.; peduncles  $\frac{1}{2}$  in. long; fl.-heads few (3–5), though large, 4-merous; petals with prominent midrib; sepals short, united: pod with nerve-like margins, curved and contracted between the seeds and tough, 3 in. long,  $\frac{1}{2}$  in. broad; funicle short, thickened into cup-shaped aril. B.M. 302. Fls. Feb–Mar.

Var. *celastrifolia*, Benth. (*A. celastrifolia*, Benth.). Phyll. mostly  $1\frac{1}{2}$  in. long and often 1 in. broad. B.M. 4306.

Var. *normalis*, Benth. Phyll. mostly 1–2 in. long and about  $\frac{1}{2}$  in. broad.

Var. *angustifolia*, Benth. Phyll. mostly 2–4 in. long,  $\frac{1}{6}$ – $\frac{1}{3}$  in. broad.

21. *séntis*, F. v. M. A rigid shrub or small tree 30 or 40 ft. high, with terete branchlets and when young either glabrous or pubescent: phyll. various, either lanceolate-oblong with a short point or linear with a hooked point, in some specimens  $\frac{3}{4}$  in. long by  $\frac{1}{6}$  or  $\frac{1}{4}$  in. broad and in others again they may be 2 in. long and  $\frac{1}{3}$  in. broad; marginal gland near base or wanting; stipules reduced to spines, occasionally none: fls. solitary or in pairs or racemes, 20–30 fls. in a head; sepals linear, spatulate, ciliate: pod flat, 2–3 in. long,  $\frac{1}{2}$ – $\frac{3}{4}$  in. broad; seeds nearly oblique, the funicle gradually thickened and folded several times, fitting against seed like a cap. May. F. v. M. Icon. 4:9.—A desert species commonly growing in sandy soil. It thrives with scant rainfall but requires much light, although in its native country it is now and then found among large trees. It is a valuable fodder plant, cattle eating it greedily. A specimen in Calif. was growing on soil that was almost rock and consequently became shallow-rooted. The wind threw it down repeatedly but each time when set in place it continued its growth, apparently unharmed. In New S. Wales it is said that the presence of this tree is a sure indication of underground water. Its roots have been found 80 ft. from the surface.

22. *linifolia*, Willd. A tall shrub with a minute pubescence on the branchlets and at the base of the young phyll.: phyll. linear on young shoots to linear-lanceolate on more mature ones,  $\frac{3}{4}$ – $1\frac{1}{2}$  in. long,  $\frac{1}{8}$ – $\frac{1}{3}$  in. wide, 1-nerved, ending in mucronate point; gland below the middle small: racemes shorter than phyll., with 8–12 fls. in a head: pod flat, with nerve-like margins,  $2\frac{1}{2}$ –4 in. long,  $\frac{3}{8}$  in. wide; funicle half as long as seed, with club-shaped aril. B.M. 2168.

Var. *prominens*, Moore (*A. prominens*, Cunn.). Phyll. wider, oblong-lanceolate,  $1\frac{1}{2}$  in. long,  $\frac{1}{6}$ – $\frac{1}{3}$  in.

wide; very prominent gland, its position varying, sometimes above, sometimes below the middle: pod wider,  $1\frac{1}{2}$ –3 in. long,  $\frac{1}{2}$  in. wide; funicle short (not surrounding the seed), filiform and ending in fleshy aril. Fls. late Feb. and March. B.M. 3502.—This variety does not appear to seed in Calif.

23. *falcata*, Willd. (*A. plagiophylla*, Spreng.). Tree or tall shrub: phyll. distinctly pinniveined, lanceolate-falcate, much narrowed toward base, 3–6 in. long; nerve excentric; gland at base or none: racemes shorter than phyll., 20 fls. in a head; sepals free, narrow, ciliate, about half as long as petals; petals striate, with prominent midrib: pod flat, 2–3 in. long,  $\frac{1}{4}$  in. wide; seed longitudinal, close to the margin; funicle colored, extending around seed and bent back on itself in a double fold, enlarged at hilum end into a fleshy aril.—This may be distinguished from *A. penninervis* by its smaller pod (half the size), by its gland close to base instead of distant from it, and by its free, narrow, spatulate ciliate sepals.

24. *penninervis*, Sieb. MOUNTAIN HICKORY. A tall glabrous shrub or a tree, 40–80 ft. high: phyll. pinniveined, lanceolate-falcate, acuminate, much narrowed at the base, 3–4 in. long (sometimes twice that length) about  $\frac{1}{2}$  in. broad; nerve excentric with a short secondary nerve terminating in a marginal gland below the middle: fls. pale yellow, in short racemes, much shorter than phyll.; peduncles

25. *pycnantha*, Benth. (*A. petiolaris*, Lehm.). GOLDEN WATTLE. BROAD-LEAVED WATTLE. Fig. 72. A small tree with more or less pendulous branchlets: phyll. pinniveined, oblong-lanceolate to falcate-lanceolate or even broadly obovate,  $2\frac{1}{2}$ –6 in. long,  $\frac{3}{4}$ – $1\frac{1}{2}$  in. wide, 1-nerved, the nerve more or less excentric; gland  $\frac{1}{2}$ – $\frac{3}{4}$  in. from base: racemes either simple or compound, large-fl., fragrant and showy, often bending the tree with its weight of bloom; 50–60 fls. in a head with peduncles  $\frac{1}{2}$  in. long; sepals 5, ciliate, almost as long as petals: pods varying, 2– $4\frac{1}{2}$  or 5 in. long,  $\frac{1}{4}$  in. wide, contracted and slightly constricted between the seeds and with nerve-like margins; funicle whitish, club-shaped, not folded, half as long as seed or occasionally folded and transverse to the seed; ripe Aug. Fls. Feb., March. Maiden Wattles and Wattlebark, p. 39. R.H. 1896, p. 504 Brown, For. Flora of S. Austral.—The name “broad-leaved” is derived from its reference to the seedling lvs., which are of great size, sometimes 5 in. long and 4 in. wide. The bark contains the highest percentage of tannin of any of the species, but the tree does not attain the size of *A. decurrens*, and hence so great a quantity is not obtained from any one tree. It is made into perfume, exudes a good gum, and is used as a sand-binder.

26. *saligna*, Wendl. (*A. leiophylla*, Benth.). Fig. 72. A low tree or tall shrub with angular, rather drooping branches: phyll. lanceolate to linear-lanceolate, or even oblanceolate, 3– $8\frac{1}{2}$  in. or lower lvs. 1 ft. long,  $\frac{1}{4}$ – $1\frac{1}{4}$  or even  $1\frac{3}{4}$  in. wide, acute to obtuse, narrowed to base; 1 central nerve, often excentric, ending in a recurved point or obtuse; gland at base or none: fls. large ( $\frac{1}{2}$  in. in diam.), either in large racemes at the ends of the branches or reduced to 4 or 5 heads strung along the axils of the lvs. for 2 or 3 ft.; peduncles varying from  $\frac{1}{4}$ – $\frac{1}{2}$  in. in length: pods constricted between the seeds, flat with nerve-like margins, 3–5 in. long,  $\frac{1}{4}$  in. wide; funicle club-shaped, three-fourths length of seed; ripe Aug. Fls. March–May and to slight extent at various times.—Botanists do not find any well-marked differences between this species and the next and are therefore inclined to combine the two. Nurserymen base their distinction on the color of the phyll., a bluish-tinged one being called *A. cyanophylla*, while the green phyll., especially if it is smaller, is called *A. saligna*. Both forms are also said to have been secured from seed gathered from a single tree. Nurserymen should test this to satisfy themselves. Another so-called botanical distinction gives the funicle straight in one species and folded in the other. This does not hold, as such a combination can be seen in the same plant, and even in the same pod. This species is variable in other respects. Fls. may be in groups of 4 or 5 and strung along the axis of lvs. for 2 or 3 ft. This type may have either large or small or even mixed phyll., or the fls. may be in large clusters (either erect or pendulous) at the ends of the branches. In either case, the large or the small or the mixed types of phyll. may accompany them.

27. *cyanophylla*, Lindl. BLUE-LEAVED WATTLE. Tall shrub, 18 ft., stoloniferous: branches drooping; lower phyll. about 12 in. long; upper 6 in. or less and narrower, linear-oblong to lanceolate-falcate, much narrowed toward the base, glabrous and often glaucous: peduncles  $\frac{1}{4}$ – $\frac{1}{2}$  in. long; fls. 3–5, large, golden yellow. March. Gn. 52, p. 99.—Said to be the same as *A. saligna*, as they run into each other.

28. *obtusata*, Sieb. Tall, glabrous shrub: phyll.  $1\frac{1}{2}$ –3 in. long, oblong-linear, or almost spatulate, usually almost straight, rather obtuse, point not curved, thick, rigid, with thickened, nerve-like margins; marginal gland 1, distant from the base, not prominent: racemes about  $\frac{3}{4}$  in. long, with densely packed heads; fls. 30 or more. March.

72. *Acacia* leaves. 1, *A. longifolia*; 2, *A. praviissima*; 3, *A. cyclops*; 4, *A. binervata*; 5, *A. implexa*; 6, *A. pycnantha*; 7, *A. saligna*; 8, *A. podalyriifolia*; 9, *A. melanoxydon*. ( $\times\frac{1}{2}$ )

$\frac{1}{4}$  in. long; pod  $3\frac{1}{2}$ –5 in. long,  $\frac{1}{2}$  in. broad with nerve-like margins; seed longitudinal; funicle colored, extending around seed and bent back on same side so as to encircle in double fold. B.M. 2754. Maiden Wattles and Wattlebark, p. 35.—A variable species with very narrow phyll., often  $\frac{1}{4}$ – $\frac{1}{2}$  in. wide and 8–12 in. long, the average being 1 in. broad and 5 in. long.

Var. *falciformis*, Benth. (*A. falciformis*, DC.). A shrub 6–10 ft. high with young shoots and infl. minutely hoary or golden pubescent: phyll. broad, obliquely ovate-oblong, obtuse, smooth and feather-veined, 3–4 in. long, 1 in. broad; gland at base: fls. in racemes.—Larger and more falcate than the type.

29. *retinodes*, Schlecht. A tall shrub or small tree: phyll. lanceolate, with nerve-like margins and narrowed to base, acute, pinnately veined, 3-6 in. long,  $\frac{1}{4}$ - $\frac{3}{4}$  in. wide; gland  $\frac{1}{4}$  in. from base: fls. in racemes, mostly compound; peduncles  $\frac{1}{4}$  in. long; 30-40 fls. in a head: pod flat, with nerve-like margin, 3-4 in. long, about  $\frac{1}{4}$  in. wide; funicle colored red, encircling seed, bent back upon itself in a double fold and ending in club-shaped aril; ripe June-Oct. Fls. Feb.-Sept. F. v. M. Icon. 5:9.—Very closely resembling *A. neriifolia* in foliage and fls., but differs in pod, being narrower than that of *A. neriifolia*, while the funicle is red and encircles seed in double fold.

30. *neriifolia*, Cunn. A small tree with angular branchlets: phyll. lanceolate, acute, narrowed at both ends,  $1\frac{1}{2}$ - $5\frac{1}{4}$  in. long,  $\frac{1}{4}$ - $\frac{3}{8}$  in. wide, 1 central nerve; gland  $\frac{1}{2}$  in. from base: fls. about 40 in a head, 5-merous, in short racemes; sepals 5, separate, ciliate; peduncles  $\frac{1}{8}$ - $\frac{1}{4}$  in. long: pods with nerve-like margins, contracted between the seeds and often constricted, a rich brown, 3-6 in. long,  $\frac{3}{8}$  in. wide; funicle white, short, not encircling seed, but thickened into a club-shaped aril; seed longitudinal, oval, with central depression. Fls. July.

31. *suavæolens*, Willd. A glabrous shrub, 3-6 ft. tall: phyll. linear to lanceolate, apex acute, tapering to base; 1 central nerve; gland near base: fl.-heads in axillary racemes, at first inclosed by imbricate scaly bracts, which soon fall; fls. 6-10 in a head: pod oblong, rounded at both ends, flat, impressed between the seeds,  $1\frac{1}{2}$  in. long,  $\frac{1}{2}$ - $\frac{3}{8}$  in. wide; seeds transverse; funicle filiform and suddenly enlarged into fleshy aril at right angles to itself. Fls. Apr.—Superficially it resembles narrow-ld. *A. retinodes*, but note the imbricated bracts; the pods are shorter and wider and the funicle does not encircle the seed.

32. *macradènia*, Benth. A glabrous shrub, 10-12 ft. tall, or, in favorable situations, a tree 30-50 ft. high: phyll. lanceolate-falcate, narrowed to base,  $5\frac{1}{2}$ -12 in. long,  $\frac{1}{2}$  in. wide; veins fine, prominent and transverse; gland at base, large or often wanting: racemes compound, short; fls. small; petals pubescent; calyx more than half as long as corolla, turbinate, toothed and ciliate: pod with nerve-like margin, 2-4 in. long,  $\frac{1}{4}$  in. wide or more, slightly constricted between the seeds; seeds longitudinal; funicle not enfolding seed but bent upon itself and ending in club-shaped aril, about half as long as seed. F. v. M. Icon 5:7.—A beautiful close-grained wood that is capable of taking a high polish.

33. *salicina*, Lindl. Small tree; branches drooping: foliage pale; phyll. 2-5 in. long,  $\frac{1}{4}$ - $\frac{1}{2}$  in. wide, oblong-linear or lanceolate, narrowed at base, thick, rigid, with a curved point; midrib and marginal veins scarcely prominent: racemes short, often reduced to 2 or 3 heads, or even only 1; peduncles slender; fls. about 20 in the head: pods straight, 1-3 in. long,  $\frac{1}{4}$  in. broad, valves convex, hard and thick; seeds longitudinal; funicle thickened and usually scarlet almost from the base, forming several folds under the seed.—The timber is dark brown and tough, taking a high polish. It is a good forage plant and on this account is becoming scarce in the wild state.

Var. *Wàyæ*, Maiden. Fig. 73. A shrub 8 ft. tall, which blooms sparingly at various times during the year: phyll. somewhat thick (flat when dried) and succulent-looking, oblong-linear, narrowed at base,  $1\frac{1}{2}$ - $2\frac{1}{2}$  in. long, less than  $\frac{1}{4}$  in. wide; 1 central nerve ending in oblique point; gland below middle: fls. solitary or in pairs, or occasionally in short racemes of 3-5 fls.; sepals united, truncate; petals 5: pod 1-2 in. long, less than  $\frac{1}{4}$  in. broad, contracted between the seeds; seed longitudinal; funicle scarlet its entire length, folded several times at one end of seed; ripe June-Sept. Fls. Feb.-May.—A neat little shrub with bright green lvs. The pods must be picked as soon as ripe and

just before dehiscence, for the elastic opening of the pod will discharge the seed in every direction.

34. *binervata*, DC. (*A. umbròsa*, Cunn.). Fig. 72. TWO-VEINED HICKORY. A tall shrub or shrubby tree of 25 ft., with terete branchlets: phyll. falcate-lanceolate to triangular, with 2 distinct veins (occasionally 3-veined) and pinnately veined between,  $2\frac{1}{2}$ -4 in. long,  $\frac{1}{6}$ -1 in. wide; gland  $\frac{1}{2}$  in. from base: fls. in racemes shorter than phyll.; peduncles  $\frac{1}{4}$  in. long or more, 30 fls. in a head, 4- or 5-merous; calyx not half so long as corolla: pods straight, very thin, convex over seed, 4-5 in. long,  $\frac{1}{2}$  in. wide; seed oblong; funicle long, nearly encircling seed and bent back upon itself in double dark red fold, with light aril at hilum end. B.M. 3338. Maiden, Flowering Plants of New S. Wales, pt. 5, p. 53. Wattles and Wattlebarks, p. 50.—It inhabits dry, shaded woods in the mountainous district of the coast.

35. *péndula*, Cunn. WEEPING MYALL. A small tree with gray foliage and pendulous branchlets: phyll. covered with a minute pubescence, finely striate with 3-5 obscurely parallel veins, linear-lanceolate, often falcate, acuminate, ending in mucronate point,  $2\frac{1}{2}$ - $3\frac{1}{2}$  in. long,  $\frac{1}{4}$ - $\frac{1}{2}$  in. wide; gland less than  $\frac{1}{4}$  in. from base: fl.-heads in pairs or clusters, about 30 in a head; peduncles less than  $\frac{1}{2}$  in. long; petals with midrib; sepals spatulate, reticulately veined, half as long as petals: pods  $\frac{1}{2}$  in. broad, 2-3 in. long, bordered by a narrow wing along each suture. F. v. M. Icon. 6:8.—The ornamental value of this species lies rather in drooping foliage than in the fls.

36. *melanóxylon*, R. Br. BLACKWOOD ACACIA. Fig. 72. A good-sized evergreen tree of pyramidal form and dense foliage: phyll. oblanceolate to lanceolate, usually one edge straight, the other curved,  $2\frac{1}{2}$ - $4\frac{1}{2}$  in. long (average  $3\frac{1}{2}$  in. long by  $\frac{3}{4}$  in. wide), 3-6 parallel nerves, reticulately veined between; gland  $\frac{1}{6}$  in. from base: fls. cream-color, 40-50 in a head, with peduncles over  $\frac{1}{2}$  in. long, and in short racemes of 3-5 heads: pod reddish brown, with nerve-like margins, more or less twisted into shape of letter C or S, 3-5 in. long,  $\frac{3}{8}$  in. wide; seed longitudinal,  $\frac{1}{8}$  in. in length, encircled in double fold by a long red funicle which is very characteristic of the species, the seed hanging on the trees thus for months; pods ripe July-Nov. Fls. late Feb. and March. B.M. 1659.—Its wood is but little inferior to black walnut for furniture-making and grillwork; it makes a good street tree in Calif. and as a fuel it is equal to hickory.

37. *impléxa*, Benth. Fig. 72. A tall tree, 50 ft. high, with light green foliage and rough bark: phyll. falcate-lanceolate, acuminate, with a more or less hooked point, 4-7 in. long,  $\frac{3}{8}$ - $\frac{3}{4}$  in. wide, veins 3-5, with finer parallel veins between; no gland: fls. cream-yellow, in racemes much shorter than phyll., 40-50 in a head; peduncles  $\frac{3}{8}$  in. long: pod curved, often like an interrogation point, light brown with nerve-like margin, more or less constricted and contracted between the seeds, 4-6 in. long,  $\frac{1}{4}$  in. wide; seeds longitudinal; funicle

73. *Acacia salicina* var. *Wayæ*.  
( $\times \frac{1}{2}$ )

club-shaped, folded once or twice at end of seed. F. v. M. Icon. 8:2.—Distinguished from *A. melanoxylon* by the more pointed and hooked phyll., while the funicle is cream-colored and folded at the end of the seed instead of being scarlet and twice encircling it as in *A. melanoxylon*.

38. *kōa*, Gray. KOA. Tree of 50–60 ft., with spreading branches: phyll. falcate, acuminate and tapering to base, striate with 3–5 parallel nerves more prominent, 4–5 in. long,  $\frac{3}{8}$ – $\frac{1}{2}$  in. wide; gland at base prominent: fls. in short racemes or rarely solitary, or in pairs, 50–60 fls. in a head; peduncles  $\frac{1}{2}$  in. long, 5-merous; calyx united, ciliate edges: pod brown, flat, thin, reticulately nerved, more or less constricted between seeds, 5–6 in. long,  $\frac{3}{4}$ –1 in. wide; seed dark brown, nearly transverse, oblong, about  $\frac{1}{2}$  in. long by  $\frac{1}{4}$  in. wide; funicle light brown, filiform, not encircling seed but with 2 or 3 twists at hilum end. Hawaiian Isls.—A valuable timber tree, capable of receiving a high polish. It should be more largely grown in Calif.

39. *viscidula*, Cunn. A tall shrub, 12–15 ft. high, with terete branches covered by a glossy viscid gum: phyll. long-linear, with a small oblique point, sparingly pubescent, at least when young, 2–3½ in. long,  $\frac{1}{2}$  to less than  $\frac{1}{4}$  in. wide, with several obscure parallel veins; gland near base; fls. 40 in a head, solitary or in pairs, either 5- or 4-merous, with peduncles  $\frac{1}{4}$  in. long; calyx and corolla pubescent; pod hirsute, with nerve-like margins, 1¼–2 in. long,  $\frac{1}{6}$  in. wide, slightly depressed between the seeds; seed small, longitudinal; funicle silvery, twice or thrice twisted and thickened into cap at end of seed; ripe Aug. Fls. March, Apr.—At first glance easily mistaken for narrow-ld. *A. retinodes*, but its short-std. fls. in pairs, the resinous viscid substance on phyll. and its small narrow pods will at once distinguish it.

40. *elongata*, Sieb. A tall shrub with angular branchlets: phyll. distinctly striate, 3-nerved, or often obscured, long-linear, slightly falcate, narrowed to base, obtuse and ending in oblique point, 2–3½ or 4 in. long (or narrower and 5½ in. long), hardly  $\frac{1}{2}$  in. broad; peduncles  $\frac{1}{2}$  in. long, solitary or in pairs; pod thin, with nerve-like margins, 1½–2½ in. long,  $\frac{1}{6}$  in. wide, slightly impressed between seeds, pod convex over them; seed oblong, brown; funicle not folded about seed but with 2 or 3 folds fitting over end of seed like a cap. B.M. 3337.—Especially suitable for damp, sandy land.

41. *Óswaldii*, F. v. M. A stiff shrub, 8 to 10 ft. tall: phyll. linear to oblong-falcate, with numerous fine parallel veins ending in oblique mucronate point, 1–2 in. long, nearly  $\frac{1}{4}$  in. wide; gland near base; fl.-heads sessile, solitary or in pairs, about 15–20 in a head; sepals over half as long as petals: pods hard, curved into crescents about each seed; funicle filiform, half the length of seed and suddenly dilated into a cap nearly as long, which fits over and covers up one-third of seed. F. v. M. Icon. 6:10.—May be easily recognized by its finely striate, narrow, 2-in.-long phyll., its sessile yellow fls. that sit at base of phyll., nearly hiding st., by the pods twisted in lunar shape with valves convex over seed and by the cap covering one-third of seed. A small bushy tree in Australia, producing a scented timber; the natives make short weapons from it.

42. *harpophylla*, F. v. M. A tree with slightly angular branchlets: phyll. striate, 3–5-nerved, falcate-lanceolate, tapering to both ends, 6–8 in. long,  $\frac{1}{4}$ – $\frac{3}{8}$  in. wide: fls. in clusters with peduncles  $\frac{1}{2}$  in. long, or in short racemes, much shorter than phyll., 15–20 fls. in a head; sepals not half so long as petals: pod striate,

more or less constricted and contracted between seeds, 3–4, or even 5, in. long,  $\frac{1}{6}$  in. wide; seed elliptic; funicle half as long as seed and but slightly enlarged into aril. F. v. M. 6:9.

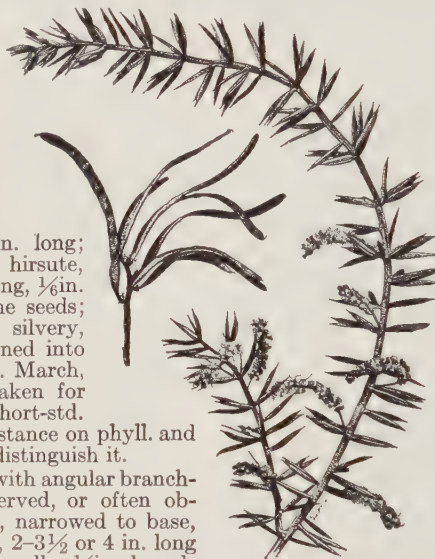

43. *cyclops*, Cunn. Fig. 72. A low spreading shrub, 8–10 ft. tall, with many sts.: phyll. narrow-oblong to lanceolate or even falcate-lanceolate, with oblique point, 1½–3½ in. long,  $\frac{1}{4}$ – $\frac{3}{8}$  in. wide, gland at base more or less obscure; 3–6 longitudinal nerves: fls. solitary or in pairs, or even in short racemes; peduncles  $\frac{1}{4}$  in. long; pods in clusters of 2–7 from one head, 2–2½ in. long,  $\frac{3}{8}$  in. wide, more or less curled; seeds transverse, with odor, when fresh, something like a leek, surrounded by conspicuous scarlet funicle in double fold; ripe Aug.–Nov. Fls. off and on from July–Dec. F. v. M. Icon. 8:3.—Young specimens are very compact and attractive, although in a few years they become spreading and unsymmetrical; but, as short-lived tub-plants for certain formal effects, they would be very effective. While

the seed-pods are at first charmingly artistic with the scarlet funicle surrounding the black seeds and the rich brown pods, in age they are unsightly, as they persist until they are ragged, ugly and black. The pods contain much tannin that is hard on the mucous membrane when the seeds are cleaned.

44. *oxycèdrus*, Sieb. A rigid shrub with terete and usually pubescent branches: phyll. striate, linear-lanceolate but broad at base and tapering to a pungent point,  $\frac{1}{2}$ – $\frac{3}{4}$  in. or even 1 in. long and 3–4-nerved on each side; small stipules, often spinescent: spikes 1 in. long; fls. 4-merous; calyx short with obtuse lobes: pods 3 in. long,  $\frac{1}{6}$  in. wide, striate, incurved and with convex valves; seed longitudinal; funicle thickened from the base and much folded. B.M. 2928.—Superficially resembles *A. verticillata*, but the phyll. are broader and the valves of the pods are thicker than in that species.

45. *verticillata*, Willd. (*Mimosa verticillata*, L'Her.). WHORL-LEAVED ACACIA. Fig. 74. A spreading shrub or small tree of graceful habit; branches more or less pubescent: phyll. in whorls or often scattered, linear-subulate, about  $\frac{1}{2}$ – $\frac{5}{8}$  in. long, or more, less than  $\frac{1}{6}$  in. wide, ending in a pungent point; 1-nerved; occasional gland near middle: spikes  $\frac{1}{2}$ –1 in. long, often concealing the phyll.: pods flat, straight or slightly curved, with nerve-like margins, 2–3 in. long,  $\frac{1}{6}$  in. wide, tapering to a point; seeds longitudinal,  $\frac{1}{4}$  in. long, with light-colored funicles of about same length thickened at end of seed into cup-shaped aril; ripe June and early July. Fls. March, Apr. B.M. 110.—Used for hedges and as ornamental; also to some extent as a street tree, in which case it may be trimmed to assume a pyramidal form, but can hardly be recommended for this purpose since it is short-lived and in age becomes straggling. It may be made to assume a pendulous habit by weighting its branches with a brick when young. There seem to be several types, some being soft to the touch while others are harsh and rigid. There is also much difference in the length of the fl.-spikes.

46. *Riceana*, Hensl. (*A. erythropus*, Tenore). A tall shrub or small tree, with graceful drooping branchlets: phyll. clustered, less than 1 in. long and  $\frac{1}{2}$  in. broad (or narrower and  $\frac{1}{2}$  in. long) linear-subulate, tapering into pungent point: spikes slender, 1½–2 in. long;

74. *Acacia verticillata*.  
( $\times \frac{1}{2}$ )

peduncles  $\frac{1}{2}$  in. long; fls. distant, acute in the bud, 3-merous, the petals with distinct nerve; calyx short, ciliate: pod usually curved, acuminate, often 2-3 in. long, scarcely  $\frac{1}{6}$  in. broad, slightly pubescent when young, but soon glabrous; valves very convex, coriaceous, contracted between the seeds; seeds longitudinal; funicle much folded and thickened nearly from the base. Fls. lemon-yellow, last of Feb. and March to Apr. Tasmania. N 1:7. This may be distinguished from *A. verticillata* by its phyll. in clusters rather than in whorls and by its distant, 3-merous fls. Its habitat is in moist shady places in its native country.

47. *aneûra*, F. v. M. MULGA. A shrub with terete branches lined with gum along the longitudinal fissures: phyll. rigid, with oblique point, varying from lanceolate-falcate to long-linear or almost terete on the same plant, 1-3 in. long,  $\frac{1}{4}$  in. wide; no prominent nerves, but distinctly striate under a lens: fls. in spikes (which may be single or in pairs),  $\frac{1}{2}$ - $\frac{3}{4}$  in. long, 5-merous; calyx narrow spatulate, not half so long as petals; peduncles less than  $\frac{1}{4}$  in. long: pods flat, oblique, with a narrow wing at suture and recurved point at apex, 1-1 $\frac{1}{2}$  in. long, nearly  $\frac{1}{2}$  in. wide; seeds nearly transverse, marked by a minute horseshoe; funicle not encircling seed but with 2 or 3 short thick folds. F.v.M. Icon. 10:8.

48. *glaucescens*, Willd. (*A. cinerascens*, Sieb. *A. homomilla*, Wendl. *A. leucadendron*, Cunn.). A tree up to 50 ft. high, with branchlets and phyll. covered with a gray pubescence which gives an ashy hue to the foliage, the young shoots yellowish: phyll. lanceolate to sickle-shaped, widest in center and tapering at both ends, striate, with 3 or 4 nerves more prominent,  $3\frac{1}{2}$ -6 in. long, from less than  $\frac{1}{2}$ - $\frac{3}{4}$  in. or even 1 in. wide; gland near base: spikes several, in the axils of the phyll., 1-2 in. long; fls. 4- or 5-merous; petals united and very narrow at base giving prominence to the short united sepals covered with a bright yellow pubescence like pile on velvet. According to J. H. Maiden, the pod, as originally described, was that of *A. Maidenii*, and the error seems to have been copied into subsequent publications. B.M. 3174.—This is often confused with *A. Maidenii*, but that species is less pubescent, has a much-twisted pod, and red funicles almost encircling seeds. It is known as the Coast Myall.

49. *Maidenii*, F. v. M. A tall shrub or tree 50 ft. high, with rough bark, fissured at intervals: phyll. lanceolate to lanceolate-falcate, narrowed at each end, striate with fine veins, several more prominent, more or less pubescent, 4-6 in. long,  $\frac{1}{6}$ - $\frac{1}{2}$  in. wide; gland about  $\frac{1}{4}$  in. from base: fl.-spikes in pairs about 1 in. long; fls. 4-merous, calyx not half so long as corolla: pod narrow,  $\frac{1}{2}$  in. wide, variously twisted into bow-knots and usually with one suture of the valves gaping open; seeds longitudinal, shining, black, funicle pale reddish, almost or quite encircling the seed and suddenly doubled back from the summit. Fls. Sept.

50. *holosericea*, Cunn. (*A. leucophylla*, Lindl. *A. neurocarpa*, Cunn.). A shrub or small tree 10 to 20 ft. high, clothed with a white, silky pubescence; branchlets with 3 much-raised angles: phyll. obliquely oval-oblong, obtuse or mucronate, 4-6 in. long, 1-3 in. wide, 3-4 nerves, pinnately veined between them: fls. 5-merous in spikes 2 in. long; calyx and corolla pubescent: pod more or less twisted; seeds longitudinal; funicle folded and enlarged into cup-shaped aril. Fls. March.

51. *linearis*, Sims (*A. longissima*, Wendl.). A straggly shrub with phyll. as long and slender as pine needles, 4-8 in. long, or twice that length,  $\frac{1}{2}$  in. wide; prominent longitudinal vein: fls. loose, slender in interrupted spikes, 1-2 in. long, 4-merous; calyx short, not half so long as corolla: pod 4 in. long,  $\frac{1}{2}$  in. broad, slightly impressed between seeds and convex over them; seeds longitudinal, oblong, shining; funicle not surrounding seed but bent back and forth into a cap-

shaped aril over one end. B.M. 2156. B.R. 680.—It may grow to 20 ft. in height, and the wood is useful for furniture and many small articles.

52. *longifolia*, Willd. SYDNEY GOLDEN WATTLE. Fig. 72. A tall shrub or small tree: phyll. oblong-lanceolate, either acute or obtuse, narrowed to the base, 2-3 in. or even 4-6 in. long and from  $\frac{1}{4}$ - $\frac{1}{2}$  in. wide; 3 or 4 longitudinal nerves, reticulately veined between; gland very near base: fls. in spikes  $\frac{3}{4}$ -2 $\frac{1}{4}$  in. long, 4-merous: pods  $1\frac{1}{2}$ -3 $\frac{3}{4}$  in. long or more, about  $\frac{1}{4}$  in. broad, coriaceous, terete until fully ripe when their valves flatten, separate, become dark and curled and persist on the tree; seeds longitudinal, black, fat and shining; funicle silvery, not enfolding seed but bent upon itself several times, dilated and fitted like a cap over one end of the seed; ripe Aug, Sept. Fls. Feb., March. B.R. 362. B.M. 2166. R.H. 1896, p. 504. Wattles and Wattlebarks, p. 51.—A valuable ornamental as well as a good tree for narrow streets; also used as a tan for heavy leathers.

Var. *Sophoræ*, F. v. M. (*A. Sophoræ*, R. Br.). Phyll. shorter, and with rounded apex,  $1\frac{1}{2}$ -3 $\frac{1}{2}$  in. long,  $\frac{3}{4}$ -1 $\frac{1}{2}$  in. broad: spikes generally shorter, 1-1 $\frac{1}{2}$  in.; blooms later and seed matures later than type. Brown, Fl. of S. Austral.—Under cult. it becomes difficult to distinguish this from the type, but in general its foliage is shorter and more rounded at apex.

Var. *floribunda*, F. v. M. A tall shrub or small tree, with the foliage all at the ends of the branches, giving the tree a thin, delicate appearance: phyll.  $2\frac{1}{2}$ -3 $\frac{1}{4}$  in. long,  $\frac{1}{8}$ - $\frac{1}{4}$  in. wide, or more, linear-lanceolate, ending in oblique point, acuminate, striate, several nerves more prominent than others: spikes  $1\frac{1}{2}$  in. long, flowering to base; fls. whitish yellow: pods contracted and long-constricted between seeds; seed longitudinal; funicle silvery, not encircling seed but folded like a cap; ripe July, Aug. Fls. Feb., March. B.M. 3203 (as *A. intermedia*).—This varies so much from the type that it is difficult to conceive of its relationship, but since all variations between this and the type can be traced, it can be given only varietal rank.

53. *pubescens*, R. Br. HAIRY WATTLE. A shrub, with drooping branches and hirsute petioles and rachis; pinnæ 3-10 pairs (mostly 3-8),  $\frac{1}{2}$ - $\frac{3}{4}$  in. long; lfts. 6-20 pairs (mostly 16), crowded, linear, smooth,  $\frac{1}{2}$ - $\frac{1}{6}$  in. wide: fls. in simple racemes longer than lvs., on long pubescent peduncles, 15-20 in a head; calyx short, sinuate-toothed; corolla smooth, protruding in bud, the petals united. Blooms in spring. B.M. 1263. F.R. 1:733.—This belongs to the series in which the pods are all flat, seeds longitudinal, last fold of funicle forming a short lateral or oblique aril, with very small folds below it. Much grown in greenhouses in the E. U. S., where it is a general favorite on account of its feathery lvs. and bright blossoms, which are in their full beauty at Eastertide, and are becoming very popular for church decorations at that time.

54. *elâta*, Cunn. A handsome tree of 50-60 ft. with dark green foliage and young shoots clothed with a yellow pubescence: lvs. compound, 1 ft. long by 8-10 in. wide; pinnæ 2-6 pairs, 5-7 in. long; lfts. 8-13 pairs, lanceolate, acuminate, pubescent,  $1\frac{1}{4}$ -1 $\frac{1}{2}$  in. long,  $\frac{1}{4}$ - $\frac{3}{8}$  in. wide, about  $\frac{3}{8}$  in. distant: fls. in compound racemes, about 40 in a head; sepals 5, united, half as long as petals; petals 5: pod a rich brown, with nerve-like margins,  $3\frac{1}{2}$ -6 in. long,  $\frac{3}{8}$  in. broad; funicle silvery, the club-shaped aril half as long as lenticular seed; ripe Aug. Blooms Sept., Oct., Dec. etc. F. v. M. Icon. 12:7. Wattles and Wattlebarks, p. 54.—Rich in tannic acid. Grows in shaded ravines in its native country.

55. *Baileyana*, F. v. M. An attractive shrub or small tree, with gray foliage arranged spirally around the branchlets and nearly concealing them: lvs. com-

pound, 1-2 in. long, with gland at base of each pair of pinnæ; pinnæ 2-3 pairs (occasionally 4), 1 in. long; lfts. about 20 pairs,  $\frac{1}{4}$  in. long, nearly  $\frac{1}{16}$  in. wide; racemes longer than lvs., 2-3  $\frac{1}{2}$  in. long; fls. 15 in a head, on peduncles  $\frac{1}{8}$ - $\frac{1}{4}$  in. long; pod  $1\frac{1}{2}$ -4 in. long,  $\frac{1}{2}$  in. wide, with nerve-like margins, occasionally constricted between seeds; seeds transverse,  $\frac{1}{4}$  in. long, with club-shaped funicle one-half its length; ripe July, Aug. Fls. Jan., Feb. F. v. M. Icon. 12:5. G.C. III. 15:37.—A much-prized ornamental and sometimes used as a street tree.

56. *discolor*, Willd. A tall shrub or small tree, either glabrous or pubescent: pinnæ 2-6 pairs; lfts. 10-15 pairs,  $\frac{1}{4}$ - $\frac{1}{2}$  in. long, 1-nerved, pale beneath; large gland on petiole and a few small ones on upper pairs of lfts.: fls. 6-15 in a head, in axillary racemes, 5-merous; petals with prominent midribs; calyx short, ciliate: pod flat, with nerve-like margins, 1-3 in. long,  $\frac{3}{8}$  in. wide; funicle enlarged at hilum end.

57. *pruinosa*, Cunn. A small tree with young foliage bronze-like: pinnæ 2-4 pairs,  $2\frac{1}{2}$ -4 in. long; lfts. 11-24 pairs,  $\frac{1}{2}$ - $\frac{3}{4}$  in. long, oblong to linear; nerve excentric, occasionally 1 or 2 short nerves; gland prominent, distant from base: fls. in racemes, 30 in a head, 5-merous; sepals united, half the length of petals: pods with nerve-like margins,  $2\frac{1}{2}$ -3 in. long,  $\frac{3}{8}$  in. broad, occasionally constricted between seeds; funicle short, filiform half its length, then enlarged into club-shaped aril. Fls. Feb.-Apr.

58. *decurrens*, Willd. GREEN WATTLE. A handsome tree, glabrous or more or less tomentose-pubescent with branches more or less prominently angled: pinnæ 8-15 pairs or more (sometimes reduced to 5 or 6); lfts. 30-40 pairs or more, linear, from under 2 to nearly 5 lines long, according to the variety: fls. 20-30 in a head, mostly 5-merous: pods 3-4 in. long, about  $\frac{1}{4}$  in. broad, more or less contracted between the seeds. Wattles and Wattle-barks, p. 55. Brown, For. Fl. of S. Austral.—

There is much confusion regarding this group among nurserymen and others.

Var. *normalis*, Benth. SYDNEY BLACK WATTLE. Lfts.  $\frac{1}{4}$ - $\frac{1}{2}$  in. long. Restricted range on the coast of Austral. According to Maiden, var. *normalis* differs from type in having sepals as long as petals and cilia on interior of lobe: in *A. decurrens*, the petals have a midrib and a short, broadly lobed ciliate calyx.

Var. *mollis*, Lindl. (*A. mollissima*, Willd.). BLACK WATTLE. A tree 20-50 ft. high, with reddish bark showing under the fissures: pinnæ 8-20 pairs, shining on upper surface, 2-6 in. long; lfts. 30-60 pairs, closely crowded, not  $\frac{1}{2}$  in. in length; gland between each pair of pinnæ and generally additional ones on internodes between: fl.-clusters in racemes, 30-36 in a head, 5-merous; peduncles  $\frac{1}{8}$ - $\frac{1}{4}$  in. long; pods dark, pubescent, 2-4 in. long, not  $\frac{1}{4}$  in. wide, constricted and contracted between the seeds; seed longitudinal; funicle filiform, enlarged to a light-colored cap over seed; ripe June-Oct. Fls. pale yellow, blooming profusely in June and intermittently at other times. B.R. 371.—Distin-

guished from var. *dealbata* by its later blooming period, by its lighter fls., its characteristic pubescent pods and smaller seeds and by the short lfts., shining above, which sit close together.

Var. *dealbata*, F. v. M. (*A. dealbata*, Link). SILVER WATTLE. Fig. 75. A tree 50 or more ft. high, with smooth bark and gray pubescent branchlets: lvs. silver-gray to light green, 3-6  $\frac{1}{2}$  in. long; pinnæ 13-25 pairs; lfts. 30-40 pairs; glands 1 between each pair of pinnæ: racemes often compound, 30 fls. in a head, 5-merous; sepals united; petals with faint midrib; peduncles  $\frac{1}{4}$  in. long; pods  $1\frac{1}{2}$ -4  $\frac{1}{4}$  in. long,  $\frac{3}{8}$ - $\frac{1}{2}$  in. wide, smooth, a rich brown; seeds longitudinal; funicle as long as seed, filiform half its distance and ending in silvery club-shaped aril; ripe July, Aug. Fls. Feb., March. A.F. 13:880. R.H. 1896 p. 502.—Mts. in its native country. It is sometimes given specific rank as *A. dealbata*, but intermediate forms occur.

59. *flicina*, Willd. (*Mimosa flicioides*, Cav.). TIMBE. Unarmed shrub: lvs. fern-like; pinnæ 5-30 pairs; lfts. 20-50 or more pairs (rarely 10-15), very small: fl.-heads globular, orange or yellow, in terminal panicles: pods broadly linear, straight or slightly curved, often irregular, flat not pulpy. Texas and Mex.—The astringent, bitter bark called *timbe* is used by the Mexicans in making pulque for precipitating mucilaginous matter. Safford, Science, Jan. 22, 1909: 160.

60. *pulchella*, R. Br. A handsome shrub, either glabrous or hirsute, with slender branches, mostly armed with subulate spines: pinnæ 1 pair; lfts. 4-7 pairs, obovate-oblong,  $\frac{1}{12}$ - $\frac{1}{4}$  in. long; gland on stipes between pinnæ, or none: peduncles solitary; fls. 5-merous; petals with prominent midrib; calyx half as long as petals and sinuate-toothed: pods flat, thick margins, 1-2 in. long,  $\frac{1}{6}$ - $\frac{1}{4}$  in. wide; seed longitudinal; funicle filiform and thickened into club-shaped aril. Fls. Apr.

Var. *grândis*, Hort. (*A. grândis*, Henfr.). Glabrous: lfts. 8-10 pairs, a little larger and more numerous than the type. Fls. Feb.-May. J.H. III. 35: 369 (1897).

Var. *hispidissima*, Hort. (*A. hispidissima*, DC.). Branches covered with long, spreading hairs: lfts. narrow and revolute: fls. white. B.M. 4588.

61. *Farnesiàna*, Willd. (*A. leptophylla*, DC.). POPANAC. OPOPANAX. CASSIE. HUISACHE. Much-branching shrub, 6-10 ft.: stipules straight, slender, sometimes minute spines; pinnæ 5-8 pairs; lfts. mostly 10-25 pairs, 1-2 lines long, narrow, linear, glabrous: peduncles 2 or 3 in the older axils; fl.-heads large, globular, deep yellow, very fragrant. pods almost terete, indehiscent, at length turgid and pulpy. Feb., March. Texas, Mex., Asia, Afr. and Austral. Grown in France for perfumery.—Its origin is probably American, but it is now naturalized in nearly every tropical country. It was intro. into the Hawaiian Isls. as an ornamental, but escaped from cult. and has now almost become a pest. A new variety of *A. Farnesiàna* has been discovered which is more hardy than the type and grows more rapidly. It produces two crops of fls. a year, which makes it very lucrative for the making of perfumery. The pods are said to contain a tannin.

62. *Cavènia*, Bert. ESPINO CAVAN. Height 20 ft.: spines stout: lfts. scabrous, scabrous-pubescent. Otherwise near to *A. Farnesiàna*, of which it is sometimes considered a mere variety. Chile.—A good hedge plant.

63. *arábica*, Willd. GUM ARABIC TREE. Fig. 76. Shrub or small tree with gray branchlets; stipules spiny: pinnæ 3-8 pairs,  $\frac{1}{2}$ -1  $\frac{1}{2}$  in. long; lfts. 10-20 pairs,  $\frac{1}{8}$ - $\frac{1}{4}$  in. long, glands several: fls. in groups of 2-5, calyx half the length of corolla: pods distinctly stalked, flat, mostly moniliform, gray-downy, 3-6 in. long. Arabia and Eu.—Some confusion exists between this species and *A. Farnesiàna*, but they are easily distinguished by means of the pod which in *A. arabica* is

75. *Acacia decurrens* var. *dealbata*. ( $\times \frac{1}{2}$ )

from slightly constricted between the seeds to moniliform or bead-like, while in *A. Farnesiana* it is round and smooth with the seeds arranged in 2 rows in a pulpy mass.

64. *ebúrnea*, Willd. A shrub with a reddish brown bark: lvs.  $1\frac{1}{4}$  in. long; phyll. 5 or 6 pairs,  $\frac{1}{4}$ – $\frac{3}{8}$  in. long; lfts. 5–9 pairs, less than  $1\frac{1}{2}$  in. long; stipules  $\frac{1}{4}$ – $\frac{1}{2}$  in. long; gland between each of the 2 lowest pairs: fls. 40 in a head on peduncles  $\frac{1}{2}$ –1 in. long with a circle of bracts at middle; petals 5; sepals united, half as long as petals; pod flat, 3–6 in. long,  $\frac{3}{8}$  in. wide; seeds longitudinal; funicle short.—A desert region species and also used as a forage plant.

76. *Acacia arabica*.

like margin, 2–3 (or 5) in. long,  $\frac{1}{2}$ – $\frac{3}{4}$  in. broad; seed orbicular, transverse; funicle flat, not curving around seed but leading directly to hilum with a twist or two. E. Indies.

66. *Drummondii*, Benth. Bush or small tree: pinnæ 2–4 pairs, each with 4–10 linear, very obtuse, glabrous lfts.: fls. pale lemon-yellow, in dense, solitary, drooping spikes 1– $1\frac{1}{2}$  in. long: pod not exceeding 1 in. long,  $\frac{1}{4}$  in. broad, flat, with thickened margins, glabrous or pubescent; seeds transverse; funicle short, thickened into small aril of about 2 folds under seed. B.M. 5191.—A favorite greenhouse species.

67. *Gréggii*, Gray. TEXAS MIMOSA. Sometimes a tree 20 ft. high, but usually a shrub of 4–5 ft., growing in thickets along river banks: compound lvs. 1 in. long, pubescent; pinnæ 2–3 pairs (occasionally reduced to 1 pair),  $\frac{1}{2}$ – $\frac{3}{4}$  in. long; lfts. 4–7 pairs (usually 5), oblong, pubescent and 2-nerved: spikes cream-yellow,  $1\frac{1}{2}$ – $2\frac{1}{2}$  in. long, including the peduncles, which are half the length of spikes; petals and sepals greenish, 5-merous; sepals united and half as long as petals: pods much bent and twisted, nerve-like margins and more or less constricted between the seeds,  $1\frac{1}{2}$ –4 or more in. long, about  $\frac{3}{4}$  in. wide; seed  $\frac{1}{2}$  in. long,  $\frac{1}{4}$  in. wide with an arrow-shaped depression in the center; funicle filiform its entire length. Fls. Aug., Sept. In dry or rocky places in Texas and N. Mex. and S. Known as Devil's Claws and Catsclaw from the short curved, spines; also as Paradise Flower.

In the following supplementary list, the heights given are those attained by the plants under glass in N. Eu.; in the open air in the S. W. U. S. they often grow much taller, and sometimes flower 2 months earlier. Except when otherwise stated, the fls. are yellow. Those marked (\*) are considered most desirable. Those marked "stove" need hothouse treatment; the others can be grown in a cool-house, or in the open in Calif. *A. abietina*, Willd.—*A. linifolia*—*A. acanthocarpa*, Willd.—*Mimosa acanthocarpa*.—*A. acapulcensis*, Kunth.—*Lysiloma acapulcensis*.—*A. accola*, Maiden & Betche.—*A. acicularis* (Needle-leaved Acacia). 4 ft.—*A. affinis*, Sweet.—*A. dealbata*.—*A. alata*, R. KATHERINE D. JONES.

ACACIA, FALSE: *Robinia Pseudacacia*.

ACACIA, ROSE: *Robinia hispida*.

**ACÆNA** (from Greek word signifying *thorn*). *Rosaceæ*. NEW ZEALAND BUR. Trailing, more or less evergreen plants used in rockwork and as ground cover under trees and between other plants.

About 40 species of sub-shrubs or herbs of the southern hemisphere, allied to *Agrimonia* and *Sanguisorba*: lvs. unequally pinnate, alternate, the lfts. toothed or cut: fls. small, crowded in erect terminal spikes or heads; petals none; calyx 5-7-lobed, usually armed

with spines; stamens 1-10, or even more: fr. an achene, 1 or 2 being enclosed in the hardened calyx.

Acænas are little grown in this country, but are prized in England as groundwork for dwarf spring-flowering bulbs, as trilliums; also useful in protecting native orchids and bog plants. Propagation is by cuttings, divisions and seeds.

**Buchananii**, Hook. f. Plant usually densely or silky pale gray, the numerous sts. and branches lying very close on the ground: lvs. 1 in. or less long, the lfts. 3-6 pairs, very broad, finely serrate: fls. in small sessile heads; spines or bristles 4, yellow and hairy or barbed, the fruiting calyx broader than long. New Zeal.

**microphylla**, Hook. f. Plant glabrous or only sparingly silky, often making very large patches: lvs. pale, 2 in. or less long; lfts. 3-6 pairs, broad, deeply cut: fls. in globose stalked heads; fruiting calyx broader than long, the red spines attractive all summer and autumn. New Zeal.—Grows well in either wet or dry soils.—Var. **inermis**, Kirk (*A. inermis*, Hook. f.), has longer lvs. and the fruiting calyx without spines or bristles.

**ovalifolia**, Ruiz & Pav. Lvs. a little larger than the last; lfts. oblong, subcuneate. Chile. Gn. 52, p. 46.

**adscendens**, Vahl. Plant usually glabrous bronzy, the sts. stout and prostrate, the leafy branches ascending at the tips: lvs. 2-4 in. long: lfts. 4-6 pairs, ovate or obovate, deeply toothed: fls. in stalked heads; calyx-tube longer than broad, the spines 4 and stout. New Zeal., S. Amer.—Apparently the plant in the trade under the name of *A. adurgens*.

*A. argentea*, Ruiz & Pav. Lvs. silvery. Chilean Andes.—*A. myriophylla*, Lindl. Fern-like: lfts. deeply cut: fls. green, Chile.—*A. nova-zealandica*, Kirk. Prostrate, silky: lfts. oblong, coarsely serrate: heads globose, stalked: bristles reddish purple: achene narrowed both ways. New Zeal.—*A. ovina*, A. Cunn. Said to be much like *A. ovalifolia*, but larger and less graceful: fls. purple, in long spikes. Austral.—*A. Sanguisorbæ*, Vahl. Prostrate, silky: lfts. broad, toothed or serrate: heads globose, stalked; bristles long and barbed, at each angle of calyx: achene broadest near base and narrowing upward; one of the troublesome sheep-burs. New Zeal.—*A. sarmentosa*, Carnich.=*A. Sanguisorbæ*.

L. H. B.

**ACALYPHA** (a name given by Hippocrates to a nettle). *Euphorbiaceæ*. COPPER-LEAF. THREE-SEEDED MERCURY. Brilliant tender foliage shrubs or herbs much used for greenhouse ornament, and especially for bedding-out; and in Florida and southward for lawn shrubs and hedges.

The acalyphas are erect shrubs or, in the native species, rather weedy herbs, with alternate stipulate lvs: fls. in spikes or spike-like racemes, the staminate cluster peduncled, each fl. in the axil of a minute bractlet, with a 4-parted calyx and 8-16 stamens; pistillate fls. subtended by a foliaceous bractlet, the calyx 3-5 parted; petals wanting in both kinds of fls., the long spike-like ament being the showy part of the fls.: fr. usually of 3-2-valved carpels, each 1-seeded.

For bedding, it is desirable to have strong, well-hardened plants in 4-inch pots, which should be set out the last week in May, and grown in a rich, moist soil without check. The leading horticultural species is *A. hispida*. The main point in the cultivation of this species is that it can be grown either to a single stem or in a spreading bush form, both of which ways are effective. Stock plants of acalypha do well in a mixture of three parts loam, one part well-decomposed manure, and, if the loam is heavy, also some sharp sand. In central Florida, none of the acalyphas is quite hardy. They should be banked late in the fall with dry sand, which must be removed when all danger of frost is over.

Propagation is by cuttings, chiefly in three ways: (1) in fall from outdoor bedded plants; (2) from plants lifted in fall, cut back, and kept for spring stock; (3) from stock plants in pots reserved from the previous season. The well-ripened wood of these last is a great advantage, and gives cuttings that may be taken with a heel. A mature stem will furnish several beside the

77. *Acalypha hispida* (A. Sanderi).

top one. This is the best method for general purposes. Cuttings may also be taken below the joints when the shoots are half mature. The cuttings require mild bottom heat. For greenhouse ornament in fall and winter, excellent specimens may be secured from cuttings made in summer from such stock plants.

78. *Acalypha Wilkesiana* var. *Macafeana*. ( $\times \frac{1}{2}$ )

The acalyphas are subject to mealy-bug, scale and red-spider. For the first two, fumigate with hydrocyanic acid gas. The red-spider can be kept in check by syringing or spraying.

*A. Annual.*

*indica*, Linn. An erect hairy plant 1-3 ft.: lvs. broad, ovate, the petiole longer than the blade; fls. greenish, the spikes 1-2 in. long. Old World tropics.—Not showy. The hort. name *A. Miltoniana* may belong here.

*A. Perennial.*

*B. Fl.-clusters much exceeding the lvs.*

*hispida*, Burm. f. (*A. Sanderi*, N. E. Br.). RED-HOT CAT-TAIL. Fig. 77. Cult. chiefly for its long red, amarantus-like spikes of fls. which are much longer than the lvs.: lvs. green. E. Indies. Burm. Fl. Ind., p. 303, t. 61, f. 1. A.F. 13:1285. A.G. 19:453, 827. F.E. 10:554. G.C. III. 23:248. Gt. 47:276; 48:1465. Gn. 54:62. Gng. 6:279. B.M. 7632. R.H. 1898:456.—A very striking garden plant. Called by various names, as Chenille Plant, Philippine Medusa, and others. Var. *ramôsa*, Hort., has upper spikes branched or compound. Var. *alba*, Hort., spikes creamy white.

BB. *Fl.-clusters shorter than, and usually half hidden by the lvs.: branches not spiny.*

*Wilkesiana*, Muell. Arg. (*A. tricolor*, Hort. ex Seem.). Lvs. ovate-acuminate, bronzy green, variously mottled with red; fls. usually some shade of red, inconspicuous. S. Sea Isls. Var. *Macafeana*, Hort. Fig. 78. Lvs. red, marked with crimson and bronze.—Perhaps the commonest variety. R.H. 1882:288. Var. *macrophylla* (*A. macrophylla*, Hort., not HBK.). Lvs. cordate, ovate, russet-brown. Var. *marginata*, Hort. Lvs. with marked crimson margin. F.M. 1875:156. Gn. 7, p. 521. I.H. 24:275. Var. *musâica*, Hort. Lvs. green, with orange and red markings. Var. *obovata*, Hort. Lvs. obovate, green, edged white when young, changing to bronzy green with rosy pink margins. Var. *triumphans*, Hort. (*A. triumphans*, Lind. & Rod.). Lvs. large,

spotted with crimson, green, and brown. I.H. 35:55 (1888).

*integrifolia*, Willd., not Bojer (*A. colorata*, Spreng. *A. Commersoniana*, Baill.). Shrub, 4-6 ft.: lvs. oblong-fiddle-shaped, variable in size, crenate or entire, green above, purplish beneath; fls. small, the clusters shorter than the lvs. Mauritius and Madagascar.

*Godseffiana*, Mast. Low-growing shrub of dense bushy habit: lvs. short-petioled, ovate or ovate-lanceolate, cordate, acuminate, coarsely toothed, green with a prominent cream-colored margin; fls. inconspicuous, greenish-yellow, the clusters shorter than the lvs. Apr., May. New Guinea. G.C. III. 23:242. Gng. 6:278. F.E. 10:554. A.F. 13:1286. Var. *heterophylla*, Hort. Lvs., especially the lower, linear-lanceolate, irregularly repand.

BBB. *Fl.-cluster as in BB, but branches spiny.*

Var. *eremôrum*, Muell. Of peculiar habit and with spiny branches: lvs. green, short-petioled, crenate: fls. in spikes, the clusters shorter than the lvs. Austral.—Coolhouse plant, chiefly interesting botanically.

*A. Chantrieri*, Hort. = *A. Hamiltoniana*  $\times$  *Wilkesiana* var. *macrophylla*.—*A. marginata*, Hort., not Spreng. = *A. Wilkesiana* var. *marginata*.—*A. obovata*, Hort., not Benth. = *A. Wilkesiana* var. *obovata*. Other trade names are *A. Hamiltoniana*, Hort. Bruant 1895. Lvs. bright green, the rounded teeth yellow-margined.—*A. Miltoniana*, Hort. Intro. 1911. *A. morfontanensis*, Hort. = *A. Hamiltoniana*  $\times$  *Wilkesiana* var. *marginata*. *A. torta*, Hort. Lvs. dark green, the margins cut into blunt oblong segms. Samoan Isls.

N. TAYLOR.†

**ACÂMPE** (named from the brittle nature of the flower). *Orchidaceæ*. Greenhouse epiphytes.

*A. longifolia*, Lindl. (*Vanda longifolia*, Lindl.). E. Indies. A plant of no decorative value, and rarely, if ever, seen in cult.

**ACANTHEPHÍPPÍUM:** *Acanthophippium*.

**ACANTHOCÈREUS** (Greek, *thorn* and *cereus*). *Cactacæ*. An erect or clambering night-flowering cactus, the sts. elongated, usually 3-angled, but young shoots very diverse and sometimes 8-ribbed, never producing aerial roots; areolæ remote, bearing prominent spines: fls. large, funnelform: fr. a berry, sometimes with spines; flesh red; seeds black.—Perhaps several species, but some authors recognize only one species.

*pentagônus*, Brit. & Rose (*Cactus pentagônus*, Linn. *Cereus princeps*, Pfeiff. *C. baxaniensis*, Karw. *C. variabilis*, Engelm.). Half erect, 3-20 ft. high: spines 4-6, the longer  $1\frac{1}{2}$  in. long; fls. 7-8 in. long. Trop. Amer.—This species grows wild in S. E. Texas and does well there as a garden plant. It is also a common greenhouse plant where it does well, often growing to considerable size. It blooms freely, but the fls. are not very attractive.

J. N. ROSE.

**ACANTHÔDIUM:** *Blepharis*.

**ACANTHOLIMON** (*akanthos*, spine, and *limon*, sea lavender). Syn., *Armeridstrum*. *Plumbaginacæ*. PRICKLY THRIFT. Hardy evergreen perennials, sometimes a little woody.

Leaves stiff, linear, round or slightly 3-angled, the angles channeled, the apex nearly always sharp-pointed: scape and peduncle nearly always simple, sometimes a little branched: fls. usually between and half hidden by the numerous bracts of the tightly compressed heads, spikes or racemes; corolla rose or white,

79. *Acantholimon glumaceum*

the petals at the base united to form a ring around the stamens; calyx tubular, the tube 10-ribbed. Boissier describes 74 species in the *Flora Orientalis*. See A. Bunge, *Die Gattung Acantholimon*, St. Petersburg, 1872.

The acantholimons are dwarf, tufted herbs, with sharp-pointed, rigid leaves; less common than *Statice* and *Armeria*, from both of which it is distinguished by its sharp-pointed leaves. An oriental genus of slow-growing and sun-loving plants for rockeries and sandy places. Most of them can be grown in the open border, *A. glumaceum* particularly, but they prefer warm, sunny situations in the rock-garden.

Propagation is best effected by cuttings taken in late summer and kept in a coldframe, protected from the frost, over winter. Layering is also a quicker method of propagation.

**acerðsum**, Willd. Woody, low perennial, with glaucous, spotted foliage: lvs. thick, 2-3 in. long, long-

80. *Acanthopanax ricinifolium*. ( $\times \frac{1}{3}$ )

pointed, flatly 3-angled, the margins rough: scape longer than the lvs., topped by a laxly many-spiked fl.-cluster; petals white. E. Medit. region.—Most suitable for rock-garden. Scarcely grown in Amer.

**glumaceum**, Boiss. (*Statice Ararátii*, Hort.). Fig. 79. Height 6 in.: lvs. green: fls. small, rose, on 1-sided spicate racemes, 6-9 in each short, dense racemelet. July-Sept. Armenia. F.S. 7:677. Gn. 31:350. R.H. 1891, p. 489.

**venustum**, Boiss. (*Armeriastrum dianthifolium*, O. Kuntze). About 8 in.: lvs. gray-green, very stiff: fls. larger than the last, rose, 12-20 in each long, loose spikelet. July-Sept. Asia Minor. R.H. 1866:450. Gn. 13:186. B.M. 7506. Gn. 53, p. 405.

*A. Kotschyi*, Boiss. Fls. white, rising well above the lvs. Cilicia. —*A. melananthum*, Boiss. Short dense spikes; sepals violet or blackish-margined. Persia.

N. TAYLOR.†

**ACANTHOMÍNTHA** (from Greek words for a *prickle* or *thorn*, and *mint*). *Labiatae*. THORNY MINT. A genus of only 2 species of tender annuals, with the habit of *Lamium*. Its chief interest is botanical, the nearest relative of the genus being the Brazilian genus *Glechom*. Calyx tubular-campanulate, 13-nerved, and with the

calyx teeth all spinulose-tipped; corolla exceeding the calyx. Prop. by seeds in spring under glass.

**ilicifolia**, Gray. Height 6 in.: lvs. petioled, ovate, coriaceous, coarsely crenate-dentate: fls. 3-8 in a whorl, chiefly rose or purplish rose, with yellow and white marks. Calif. B.M. 6750. Intro. 1891.—Less desirable than *Lamium*, which see. N. TAYLOR.†

**ACANTHONÈMA** (Greek combination referring to the spinous processes on the filaments). *Gesneriaceae*. A monotypic genus, comprising *A. strigðsum*, Hook. f., from Trop. Afr., closely resembling *Streptocarpus*: hothouse perennial with small fls. dark purple on the limb and otherwise white, in panicles 2 in. or less high arising from the base of the solitary prostrate narrowly oblong lf.

**ACANTHÓPANAX** (*acanthos*, thorn, and *panax*, a prickly panax-like plant). *Araliaceae*. Including *Kalopanax* and *Eleutherococcus*. Hardy trees or shrubs, cultivated chiefly for their ornamental foliage.

Branches and sts. usually prickly: lvs. alternate, long-petioled, palmately lobed or digitate, deciduous: fls. small, usually greenish, perfect or polygamous, in umbels, sometimes forming large terminal panicles; calyx-teeth minute; petals and stamens 5, rarely 4; ovary 2-5-celled; styles 2-5, free or connate: fr. a black, 2-5-seeded berry.—More than 15 species in Cent. and E. Asia and in the Himalayas.

The members of this genus are trees or large shrubs with stout, usually prickly branches and large, palmately lobed or digitate leaves, small greenish flowers in umbels, sometimes forming large terminal panicles, followed by small black berries.

For cultivation of *Acanthopanax*, see the genus *Aralia*. The species described below are hardy except *A. pentaphyllum*, which is tender north of Massachusetts, and *A. trifoliatum* and *A. setchuenense*, which are probably still more tender.

Propagation is by seeds, to be sown as soon as received, or stratified and sown in spring; they germinate irregularly and may lie two years; also propagated by root-cuttings with bottom heat, and by soft-wood cuttings taken from forced plants; *A. pentaphyllum* grows also from cuttings of ripened wood.

A. Lvs. simple, palmately lobed.

**ricinifolium**, Seem. (*Kalopanax ricinifolium*, Miq. *A. ricinifolium* var. *magnificum*, Zabel. *A. acerifolium*, Schelle). Fig. 80. Sparingly branched tree, to 80 ft.: branches and sts. with numerous stout prickles: lvs. 5-7-lobed, 9-14 in. in diam., lobes triangular-ovate, acuminate, serrate, glabrous or nearly so: infl. compound, terminal, large; styles 2, nearly connate. Japan. S.I.F. 2:56. G.W. 11:537. Var. **Maximowiczii**, Schneid. (*Aralia Maximowiczii*, Van Houtte). Fig. 81. Lvs. deeply 5-7-lobed, with oblong-lanceolate lobes, downy beneath. Japan. F.S. 20:2067. M.D.G. 1897:233.—Very ornamental trees of striking subtropical effect.

AA. Lvs. digitate.

B. Fls. short-pedicelled.

**sessiliflorum**, Seem. (*Panax sessiliflorum*, Rupr. & Max.). Shrub with stout upright branches, to 12 ft.: branches with only few prickles: lfts. mostly 3, obovate-lanceolate or oblong-lanceolate, cuneate, acuminate, 3-7 in. long, irregularly crenate-serrate, nearly smooth: fls. dull purplish, nearly sessile, in globular heads on stout, downy peduncles, usually several at the end of the branches. Manchuria, N. China. G.C. III. 22:339. Gt. 11:369.—The freely produced heads of black berries are decorative. Var. **párviceps**, Rehd. Lower and denser: lvs. elliptic, 2-3 in. long: heads smaller, usually solitary.

BB. *Fls. slender-pedicelled.*

C. *Lvs. usually 3-foliolate.*

**trifoliatum**, Schneid. (*Zanthoxylum trifoliatum*, Linn. *A. aculeatum*, Seem. *A. sépium*, Seem.). Climbing shrub, to 20 ft.: branches with few hooked spines: petiole 1-1½ in. long; lfts. stalked, ovate to ovate-lanceolate, acuminate, 1¾-3 in. long, remotely and finely serrate, glabrous, light green beneath: the slender-peduncled umbels in terminal whorls; pedicels slender; styles 2, connate to the middle. China, Himalayas. L.B.C. 10:977 (infl. abnormal; a better figure is found in Jacquin, Icon. Pl. Rar. 3:634). Recently intro. from China.

**setchuenense**, Harms. Upright shrub, to 10 ft.: branches yellowish, with few nearly straight prickles: petiole 2-4 in. long; lfts. stalked, ovate-oblong, acuminate, 2½-3½ in. long, serrate, glabrous, glaucous beneath: umbels several at the end of the branches, peduncles ½-1 in. long, pedicels slender; ovary 5-celled, styles connate into one. W. China.

CC. *Lvs. 5-7-foliolate.*

**senticosum**, Harms (*Eleutherococcus senticosus*, Maxim.). Shrub, to 15 ft.: branches upright, densely covered with slender prickles: lfts. 5, occasionally 3, stalked, elliptic-obovate to oblong, shortly acuminate, narrowed at the base, 3-5 in. long, sharply and doubly serrate, bright green; when young, with brown hairs on the veins beneath and with scattered hairs above: umbels long-peduncled, several at the end of the branches; ovary 5-celled, styles connate: fr. about ½ in. long. July. N. China, Manchuria. Gt. 12:393.

**pentaphyllum**, Marsh. (*A. spinosum*, Hort., not Miq. *Aralia pentaphylla*, Thunb.) Fig. 82. Shrub, 5-10 ft.: branches arching and slender, with few compressed, straight prickles: lfts. 5-7, oblong-obovate or oblong-lanceolate, cuneate, acute, ¾-1½ in. long, crenate-serrate, smooth: fls. green, in slender-peduncled umbels, solitary on spur-like branchlets along last year's branches; styles 5, connate. Japan.—A graceful shrub, with arching branches and bright green, shining foliage, excellent on rocky banks and slopes. Only the pistillate form seems to be in cult., but produces no fr. for want of pollen. Var. **variegatum**, Hort. Lvs. edged white. F.S. 20:2079.—Possibly a variety of *A. spinosum*. Also *A. quinquefolium variegatum*, Veitch Cat., may be the same.

*A. divaricatum*, Seem. Allied to *A. sessiliflorum*. Lfts. 5, downy beneath: fls. pedicelled. Japan. S.I.F. 2:56.—*A. Henryi*, Harms (*Eleutherococcus Henryi*, Oliver). Allied to *A. sessiliflorum*. Branches with few hooked prickles: lfts. 3-5, nearly sessile, cuneate at the base, oblong, 2-3 in. long; fls. pedicelled. Cent. China. B.M. 8316.—*A. innovans*, Franch. & Sav. Unarmed small tree: lvs. fasciated 3-foliolate, occasionally 2-foliolate or undivided and cordate; lfts. nearly sessile, glabrous: umbels paniculate. Japan.—*A. leucorrhizum*, Harms. Allied to *A. senticosum*. Branches only below the petiole with several straight reflexed prickles: lfts. oblanceolate, glabrous: umbels solitary or few. Cent. China.—*A. sciadophtyloides*, Franch. & Sav. Unarmed tree, to 40 ft.; lfts. 5, stalked, nearly glabrous: umbels forming large terminal panicles. Japan. S.I.F. 2:55.—*A. Simonsii*, Schneid. Allied to *A. senticosum*.

81. *Acanthopanax ricinifolium* var. *Maximowiczii*. (× ¼)

82. *Acanthopanax pentaphyllum*. (× ½)

spiny: infl. (spadix) twice branched, sometimes smooth, but often hairy or even spiny, hanging by a short, stout stalk; the secondary branches slender or sometimes thick and twisted: spathes 2, flattened, soon falling: fls. monœcious, in spirally disposed 3-fld. clusters, red, pinkish or orange; inner segms. of the perianth valvate in male fls., imbricate in female fls.; stamens 12, reduced in the pistillate fls. to a ring of functionless staminoidea: fr. black, about twice the size of a grain of wheat.—There are only 3 or 4 species confined

Branches with several prickles below the petiole: lfts. 5, prickly on both sides, oblong. China. M.D.G. 1910:25.—*A. spinosum*, Miq. Allied to *A. pentaphyllum*. Lvs. often sparingly appressed-setose above: peduncles shorter than petioles; styles 2, separate. China.

ALFRED REHDER.

**ACANTHOPHIPPIMUM** (meaning unexplained). Sometimes spelled *Acanthephippium*. *Orchidaceæ*. Stove terrestrial orchids.

Pseudobulbs conic or cylindric, of several internodes, with several large, plicate-veined, jointed lvs. at the apex: fls. borne on a lateral leafless scape, in a few-fld. raceme; the broad, fleshy sepals form an urn-shaped tube, which incloses the narrower petals and the lip; lip jointed to the apex of the short, thick column which is produced below into a foot to which the sepals and petals are attached; pollinia 8.—A genus of 4 species, natives of the E. Indies and Malay Archipelago.

These are very rarely seen in cultivation, but are warmhouse terrestrial orchids from the hottest moist shaded jungles of Java. A compost of fibrous loam and leaf-mold is best suited to them, keeping the plants in the warmest house in winter. Propagate by dividing the pseudobulbs in spring before growth has made much advancement. (Orpet.)

**javanicum**, Blume. Fls. yellow, flushed and striped with purplish red, the sepals and petals spreading at the tip. Java. J.F. 1:35. B.M. 4492.

*A. bicolor*, Lindl. Fls. yellow, tipped and marked with purple.—*A. Cürstisi*, Reichb. Fls. light rose, flushed and striped with purple. The 5 keels between the side lobes serve to distinguish this from related species. Malay Archipelago.—*A. sylhetense*, Lindl. Fls. about 2 in. long, white. Himalayas.

GEORGE V. NASH. †

**ACANTHOPHÆNIX** (*acantha*, thorn, and *phœnix*, a date palm). *Palmaceæ*, tribe *Arèceæ*. Very elegant greenhouse palms.

Leaves pinnate, finely dissected, more or less armed with long, slender, brown or black spines; lfts. narrow, linear-lanceolate, acute, rarely acuminate, prominently veined above, scaly beneath, the margins revolute; rachis 3-angled in sections; sheath long, smooth or

83. *Acanthophœnix crinita*.

exclusively to the Mascarene Isls., Mauritius and Bourbon. G.C. II. 22:426.

These are tall palms or sometimes of moderate stature, the spiny and often ringed trunks conspicuously swollen at the base. Horticulturally, they have not figured very prominently in the trade in this country, but they are among the finest of cultivated palms in the collections of fanciers and botanic gardens.

They should be grown in a warm house, from 70 to 90°, never less than a night temperature of 55 to 60°. They will root best in a soil composed as follows: loam three parts, peat one part, leaf-mold one part, mixed with a little sand or crushed charcoal. The drainage, so long as the plants are in pots and tubs, must be very good, as they require much water. If possible, when the plants are 6 feet or more, plant out permanently.

Propagation is only by seeds, which frequently require two to three years to germinate. The seeds should be placed in a seed-pan and kept in a warm, moist place.

**crinita**, H. Wendl. (*Arëca crinita*, Bory.). Fig. 83. Trunk 50–60 ft.: lvs. 7–13 ft. long; petiole densely tomentose, 4–8 in. long; lf.-sheath  $2\frac{1}{2}$ –4½ ft. long, thickly covered with short brown bristles and spines; segms. silvery white beneath; spadix 1–2 ft. long, brown, woolly and with slender brown spines; perianth reddish pink, or sometimes whitish: fr.  $\frac{1}{8}$ –½ in. long. F.S. 16:1706. F.R. 2:201.—Young plants have pale yellowish green lvs.

**rùbra**, H. Wendl. (*Arëca rùbra*, Bory. *Calamus Verschaffeltii*, Hort.). Trunk 60 ft.: lvs. 6–12 ft. long; petiole glabrous, 2–4 in. long; lf.-sheath  $2\frac{1}{2}$ –4½ ft. long, thickly covered with long, brown-black spines; pinnæ slightly glaucous beneath; spadix  $2\frac{1}{2}$ –3½ ft. long, armed with straight black spines; perianth reddish brown: fr. globose.  $\frac{1}{8}$ –¾ in. in diam., with a prominent ridge extending from the stigma to the base.—Young plants have dark green lvs. with red veins. N. TAYLOR. †

**ACANTHORHÏZA** (Greek *or* thorn, and *rhiza*, root). *Palmaceæ*, tribe *Corypheæ*. A genus of tropical American medium-sized palms.

Leaves crowded at the end of the trunk, palmate, 3 to many, divided to the base, but the segms. stalkless, and in age becoming typically 3–4 divided,

the segms. then wedge-shaped; lf.-stalk flattened, very persistent, slender and smooth, the sheath short and fibrous; as the lvs. unfold the margins are bent inward, the external faces applied together: infl. flattened at first, the short peduncle and thickening branches, white, bracteate, the bracts diminishing downward; fls. cream-white, in spike-like, dense clusters, these racemose; stamens quite free, differing from *Trithrinax*, where they are united to form a tube. It has never been known to fruit in cult.—Three or four species only, are known, all from Trop. Amer., but not so well known to the trade as their great beauty and stately dimensions deserve. G.C. II. 22:426.

These palms have spineless trunks, except at the base, where the aerial roots subsequently harden into stiff downward-pointing spines; differing in this from *Trithrinax*, the nearest relative.

They should be grown as stove palms, a night temperature not less than 60° being preferable. If possible, plant out the tall plants, as they do much better when not disturbed by subsequent repotting. A good mixture should contain good, fibrous loam and considerable sand.

Propagation is only by seeds, sown preferably in the spring, in fresh peat over bottom heat.

**aculeata**, H. Wendl. (*Chamærops stauracantha*, Hort.).

Fig. 84. St. 30–40 ft., spiny at base through the thickening of the aerial roots: lvs. orbicular, much cut in young trees, subsequently 3–4-divided and palmate in the older specimens, 5 ft. in diam., whitish beneath; lf.-stalk 3–4 ft.: infl. and fls. dark creamy pink; fls. spicate, thick and coriaceous; calyx lobes erect, oblong, equaling the roundish and concave petals. Mex. I.H. 26:367. B.M. 7302.—Succeds in an intermediate house.

**Chùco**, Drude (*Thrinax*

*Chùco*, Mart.). Trunk smooth, about 30 ft. high, usually not more than 5 in. in diam., slender, flexuous: lvs. orbicular, with a narrow sinus at the base, usually 10–25 in a cluster; petioles slender, 3–6 ft. long, smooth; blade 6 ft. in diam., divided to or beyond the middle; segms. 15–20, lanceolate, acute, 1–2 in. wide, dark green above, paler and glandular below: fls. and fr. unknown, except from a wild specimen in which the fr. is described as yellow and about 1 in. diam. Brazil.

The following species are rarely seen outside botanic gardens, and need stove temperature: *A. Wallisii*, H. Wendl. Gt. 28:977.—*A. Warszewiczii*, H. Wendl. Panama, Gt. 25:860.

N. TAYLOR. †

**ACÁNTHUS** (*akanthos*, thorn). *Acanthaceæ*.

BEAR'S BREECH. A genus of twenty species of temperate Old World, mostly hardy herbaceous perennials of vigorous growth and broad pinnatifid foliage, suitable for backgrounds of borders and sub-tropical effects.

Height 3–4 ft.: spikes 1–1½ ft. long; fls. dull white to rose or purplish, sessile, spicate, densely clustered; corolla 1-lipped, the lip 3-lobed; anthers 1-celled, ciliate. Mostly S. Eu.

They need a rich, light, well-drained soil and much sunshine. Excessive moisture is fatal, especially in winter and spring. Fall-planted stock should always be protected for the winter by long litter or evergreen boughs, even where established plants are hardy. Must be deeply mulched north in winter. Propagation is by division in spring or early autumn, and by seeds.

84. *Acanthorhiza aculeata*.

It is supposed that acanthus leaves afforded the suggestion for the foliage decoration on the capital of the Corinthian and other columns. Fig. 85 shows the conventionalized decoration, and Fig. 86 the form of leaf of *A. spinosus*. The leaves of *A. mollis* were probably also involved in variations of decoration.

*A. Lvs. spiny.*

**Cárolí-Alexándri**, Hausskn. Nine to 18 in.: lvs. few, radical, in a lax rosette, lanceolate, spiny, 16 in. long, 3-3½ in. broad: spike dense; fls. white or suffused rose-color. Summer. Greece.

85. The Acanthus decoration of an architectural column.

**spinosissimus**, Desf.

Fig. 87. Lvs. dark green, pinnately parted; spines glistening, whitish: fls. infrequent, rosy, sessile: autumn; spikes loose, pilose or glabrescent:

spines of the bracts recurved. S. Eu. Grows 3-4 feet.

**Péringi**, Siehe. About 1-1½ ft. high: lvs. sessile, 5-6 in. long, lanceolate tapering, deeply toothed and spiny: fls. very profuse, rosy red, its bracts spiny. Mts. of Turkey in Asia. June.—Suitable for alpine garden. Doubtfully hardy where summers are hot and dry.

**spinösus**, Linn. Fig. 86. Lvs. lanceolate, pinnatifid, pubescent; spines short, whitish: fls. smaller than in the last, purplish, summer; spikes dense, slightly villous. B.M. 1808. Gn. 8:147.

**montānus**, T. Anders. Lvs. pinnatifid or sinuate-spinose, 1 ft. or more long, olive-green, the lobes spine-pointed: fls. rosy white in a long spike. Trop. Afr.—Greenhouse.

*AA. Lvs. not spiny.*

**möllis**, Linn. Fig. 88. Lvs. 2 x 1 ft., cordate, sinuately pinnatifid, mostly radical: fls. summer; spikes loose, pubescent. Gn. 52, p. 239.—Also recommended as a window plant. Var. **latifolius**, Hort. (*A. latifolius*, Hort. *A. lusitanicus*, Hort.) is larger and hardier. Gn. 1, p. 303.

**longifolius**, Poir. Lvs. radical, longer and narrower than in *A. mollis*, bright green: fls. purple, June. Dalmatia.

86 Acanthus spinosus. From drawing by John Ruskin.

tings under glass. E. Asia.—*A. niger*, Mill. Lvs. not spiny, sinuate, glabrous: fls. purplish white. Portugal.

N. TAYLOR.†

**ÁCER** (classical Latin name). *Aceraceæ*. MAPLE. Native and foreign trees cultivated chiefly for shade and for the ornamental foliage.

Trees, rarely shrubs: lvs. opposite, petioled, simple and mostly palmately lobed, or 3-5 foliolate, deciduous, rarely evergreen: fls. small, polygamous or dioecious, in racemes, panicles or corymbs; petals and sepals 5, rarely 4, rarely sepals connate and petals wanting; disk usually annular, conspicuous, rarely lobed or wanting; stamens 4-10, mostly 8; styles 2, usually more or less connate: fr. consisting of 2 long-winged, compressed nutlets (samaras), each containing 1 seed.—About 110

species in N. Amer., Asia, especially Cent. and E. Asia, Europe and N. Afr. Monogr. by Pax in Engler, Pflanzenreich IV, fam. 163 (1903), quoted below as Pax; see, also, Rehder, The Maples of E. Continental Asia, in Sargent, Trees and Shrubs, 1:175 (1905), and Koidzumi, Revisio Aceracearum Japonicarum in Jour. College of Science, Tokyo, 32, Art. 1 (1911), both with many plates. Monogr. of the garden forms by Graf Schwerin in Gt. 1893; see also G.C. II. 16:75.

The maples are hardy ornamental trees or shrubs, with handsome large foliage which, in some species, shows a remarkable tendency to vary in shape and coloring. Numerous garden forms are in cultivation. Though the flowers are small, they are quite attractive in the early-flowering species as in *A. rubrum* and *A. saccharum*, since they appear in great profusion; in some species the young fruits assume a bright red color, particularly in *A. tataricum*, *A. ginnala*, *A. pseudoplatanus* var. *erythrocarpum*, and *A. rubrum*. The maples are among our most ornamental and valuable trees for park and street planting. Nearly all assume a splendid color in autumn, especially the species of North America and Eastern Asia, which surpass by far the European maples. Many species are valuable timber trees, and some American species, especially *A. saccharum*, produce sugar. For purposes of shade, the common sugar maple is best and most popular. The Norway maple makes a very dense and round head, and is excellent for lawns, but it is too low-headed for the streets. *A. pictum* is similar, but smaller in every part. The silver maple, *A. saccharinum* and its vars., is also popular where quick-growing trees are desired. The Japanese maples of the *Palmata* section are among the most striking and showy exotic small trees, and are adapted for fine grounds and for growing in pots.

The maples are not particular as to soil; some species, as *A. monspesulanum* and *A. campestre*, prefer drier situations, while *A. saccharinum* and *A. rubrum* prefer moist situations, the latter growing well even in swampy soil. Most of the species are hardy in the northern and middle states; among the hardest are *A. Negundo*, *A. saccharum* (Figs. 89, 90), *A. saccharinum*, *A. rubrum*, *A. nigrum*, *A. pennsylvanicum*, *A. spicatum*, *A. platanoides*, *A. tataricum*.

Propagation is by

87. Acanthus spinosissimus. (× 1/2)

88. Acanthus mollis. (× 1/2)

seeds, which soon lose their germinating power and must be sown soon after maturity or stratified and sown in spring; *A. saccharum* and *A. Negundo* keep their germinating power somewhat longer. The early-ripening species, like *A. saccharinum* and *A. rubrum*,

must be sown as soon as they are ripe and they will germinate the same year. *A. campestre*, *A. monspessulanum* and other species of this group do not usually germinate until the second year. The varieties and rare species may be budded in summer on the typical forms or on species of the same group; kinds belonging to different groups cannot, as a rule, be grafted on each other; e.g., va-

89. A pasture maple in autumn, showing the strong framework.

rieties of *A. platanoides* will not grow on *A. pseudoplatanus* and vice versa, but *A. insigne* will grow on *A. pseudoplatanus*, as they belong to the same group. Some shrubby species, as *A. palmatum*, also *A. cissifolium*, *A. ginnala* var. *Semenowii*, and *A. latum* var. *rubrum*, may be propagated by layers or half-ripened greenwood cuttings in summer, or, still better, by cuttings taken from forced plants in early spring in the greenhouse. *A. Negundo* grows also from hardwood cuttings. Fancy maples are readily winter-grafted by the veneer method, the stocks being grown in pots. The Japanese kinds are usually worked on imported stocks of *A. palmatum*.

#### KEY TO THE SPECIES.

- A. Lvs. simple, mostly palmately lobed (occasionally 3-foliolate in No. 11).
- B. Sepals and petals distinct (petals wanting in Nos. 27 and 35).
- C. Fls. appearing with or after the lvs. in corymbs, panicles, or racemes.
- D. Arrangement of infl. corymbose (broadly paniculate in No. 4).
- E. Winter-buds with several imbricate scales: lobes entire or coarsely toothed, rarely lvs. without lobes.
- F. Lobes obtuse or bluntly pointed.
- G. Lvs. 1-3½ in. across, usually 3-lobed; lobes usually entire or with few teeth.
- H. Corymbs glabrous: lobes entire, lvs. glaucous beneath . . . . . 1. monspessulanum
- HH. Corymbs pubescent, upright: lobes usually dentate, lvs. green beneath . . . . . 2. campestre
- GG. Lvs. 3-6 in. across, 3-5-lobed; lobes toothed.
- II. Infl. corymbose, many-fl. pendulous: lvs. glaucescent beneath; lobes obtuse or acute . . . . . 3. Opalus
- HH. Infl. paniculate, upright: lvs. green beneath and pubescent; lobes obtusely acuminate . . . . . 4. Miyabei
- FF. Lobes acuminate, finely pointed: corymbs glabrous.
- G. Lvs. glabrous beneath, 5-7-, rarely 3-lobed: corymbs stalked.
- H. Bark of mature branches ashy gray or light grayish brown, slightly fissured and marked with lenticels.
- I. The lobes coarsely toothed . . . . . 5. platanoides
- II. The lobes entire or rarely with few teeth.

- J. Wings about as long as nutlets: lvs. truncate at base: . . . 6. *truncatum*
- JJ. Wings about twice as long as nutlets: lvs. cordate or subcordate. . . . . 7. *pictum*
- HH. Bark remaining smooth and lustrous for several years, without or with few inconspicuous lenticels, greenish or purplish. . . . . 8. *cappadoci-*  
[cum]
- GG. Lvs. pubescent beneath, usually 3-lobed, occasionally 5-lobed or quite entire: corymbs nearly sessile, very large. . . . . 9. *longipes*
- FFF. Lobes none or not prevalent, the lvs. quite entire, ovate to ovate-oblong, rarely mixed with a few 3-5-lobed lvs.: corymb nearly sessile, very large. . . . . 10. *catalpifolium*
- EE. Winter-buds with 2 outer valvate scales: lobes serrate or doubly serrate: corymbs small.
- F. Lvs. 3-lobed or 3-foliolate, occasionally 5-lobed, pale or glaucous beneath, quite glabrous. . . . . 11. *glabrum*
- FF. Lvs. 5-11-lobed, green beneath.
- G. Petioles and peduncles glabrous: ovary glabrous.
- H. Sepals purplish; petals white: lvs. lobed nearly to the middle. . . . . 12. *circinatum*
- HH. Sepals and petals purplish: lvs. lobed beyond the middle. . . . . 13. *palmatum*
- GG. Petioles and peduncles pubescent, at least while young: ovary villous.
- H. Fls. yellowish: lvs. subcordate or cordate, sharply or doubly serrate. . . . . 14. *Sieboldia-*  
[num]
- HH. Fls. purple, larger: lvs. deeply cordate, incisely serrate. . . . . 15. *japonicum*
- DD. Arrangement of infl. paniculate or racemose.
- E. Infl. paniculate (nearly corymbose in No. 16).
- F. Lvs. dentate or serrate, usually lobed.
- G. Edges of lvs. sharply serrate.
- H. Panicle only little longer than broad.
- I. The lvs. 5-lobed, sharply and simply serrate. . . . . 16. *Oliverianum*
- II. The lvs. 3-lobed or without lobes, doubly serrate.
- J. Foliage dull green; lvs. ovate-oblong, not lobed. . . . . 17. *tataricum*
- JJ. Foliage shining dark green: lvs. 3-lobed. . . . . 18. *ginnala*
- HH. Panicle narrow, spike-like, upright: lvs. 3-5-lobed, doubly serrate: petals linear, much longer than the sepals.
- I. Foliage pubescent beneath: lvs. 3-, rarely 5-lobed. . . . . 19. *spicatum*
- II. Foliage glabrous or pubescent beneath: lvs. 5-, rarely 7-lobed. . . . . 20. *caudatum*
- GG. Edges of lvs. coarsely or crenately dentate, 5-lobed.
- H. Panicles pendulous, much longer than broad.
- I. Fr. hispid: lvs. 10-12 in. long, deeply lobed. . . . . 21. *macrophyllum*
- II. Fr. glabrous: lvs. 4-6 in. long. . . . . 22. *pseudoplat-*  
[anus]
- HH. Panicles upright, little longer than broad.
- I. Blade with middle lobe free nearly to the base. . . . . 23. *Heldreichii*
- II. Blade with lobes divided to the middle or little beyond.
- J. Lobes longer than broad: lvs. glaucous beneath. . . . . 24. *Trautvetteri*
- JJ. Lobes about as long as broad: lvs. green beneath. . . . . 25. *insigne*
- FF. Lvs. quite entire, generally oblong. . . . . 26. *oblongum*
- EE. Infl. racemose.
- F. Lvs. oblong, undivided, serrate, with about 20 pairs of parallel veins: winter-buds with many imbricate scales. . . . . 27. *carpinifolium*
- FF. Lvs. lobed or undivided, with about 10 pairs of veins or less: winter-buds with 2 outer valvate scales.
- G. Sepals and petals 5, racemes terminal: lvs. brownish pubescent beneath while young, at least on the veins.
- H. Outline of lvs. oblong, without lobes or with 2 lobes near the base.
- I. The lvs. undivided, crenately serrate. . . . . 28. *Davidii*
- II. The lvs. lobed.
- J. With lvs. green beneath, sharply serrate, long-acuminate, slightly lobed. . . . . 29. *laxiflorum*
- JJ. With lvs. glaucous beneath, unequally serrate, acuminate, often deeply lobed. . . . . 30. *cratægifolium*
- HH. Outline of lvs. ovate or roundish, 5-lobed. . . . . 31. *Tschonoskii*
- HHH. Outline of lvs. obovate, 3-lobed, with the lobes near or above the middle.
- I. Young branchlets bloomy: young lvs. densely brownish villous on the veins beneath: raceme pubescent. . . . . 32. *rufinerve*
- II. Young branchlets not bloomy: young unfolding lvs. brownish villous on the whole under side, primary veins glabrescent: raceme often glabrous. . . . . 33. *pennsylvan-*  
[icum]
- GG. Sepals and petals 4; staminate fls. from lateral leafless buds: lvs. doubly serrate, 5-lobed or without lobes.
- H. Lvs. undivided or incisely lobed, ovate to oblong. . . . . 34. *tetramerum*
- HH. Lvs. distinctly 5-lobed, roundish in outline. . . . . 35. *argutum*
- CC. Fls. appearing long before the lvs. in dense lateral clusters: lvs. 5-lobed, fr. ripening in May or June.

- D. Ovary and young fr. tomentose; short-stalked: lvs. deeply 5-lobed. . . . . 36. *saccharinum*
- DD. Ovary and young fr. glabrous: fls. on long pedicels: lvs. 3-5-lobed. . . . . 37. *rubrum*
- EE. Sepals connate and petals wanting at least in the staminate fls.; fls. on long, pendulous, mostly hairy pedicels.
- C. Pistillate and staminate fls. corymbose, terminal and lateral: fr. glabrous or villous. American species.
- D. Corymb sessile or nearly sessile.
- E. Lvs. glaucous or pale beneath.
- F. Lobes acuminate; lvs. glabrous beneath at maturity. 38. *saccharum*
- FF. Lobes obtuse; lvs. pubescent beneath. . . . . 39. *floridanum*
- EE. Lvs. green beneath; lobes acuminate.
- F. Bark of trunk dark: lvs. hirsute-pubescent, 5-6 in. across. . . . . 40. *nigrum*
- FF. Bark pale: lvs. soft-pubescent beneath, 2-3½ in. across. 41. *leucoderme*
- DD. Corymbs short-stalked: lvs. pubescent beneath; lobes obtuse or acute. . . . . 42. *grandi-dentatum*
- CC. Pistillate fls. racemose, with petals and distinct sepals, staminate corymbose, with connate sepals and without petals, both from lateral leafless buds. Japanese species. . . 43. *diabolicum*
- AA. Lvs. 3-5-foliolate: fls. diæcious.
- B. Fls. in terminal corymbs, after the lvs.: winter-buds with several imbricate scales: disk large, annular: lvs. 2-foliolate.
- C. Petioles, lvs. beneath and corymbs pilose; petioles short.
- D. Shape of lvs. elliptic-oblong, sparingly serrate, 2-5 in. long. . . . 44. *nikoense*
- DD. Shape of lvs. elliptic, coarsely dentate, 1-2 in. long. . . . . 45. *griseum*
- CC. Petioles, lvs. and corymbs glabrous; lvs. oblong-lanceolate; petioles slender. . . . . 46. *mandshuricum*
- BB. Fls., at least the pistillate, in lateral, long and slender racemes: winter-buds with 2 valvate scales.
- C. Petals present; fls. of both sexes in racemes, sometimes leafy at base, with the lvs.: lvs. 3-foliolate. . . .
- D. Petioles and lvs. pubescent beneath: sepals and petals 5. . . . . 47. *Henryi*
- DD. Petioles and lvs. glabrous at maturity: sepals and petals 4. . . . 48. *cissifolium*
- CC. Petals wanting; pistillate fls. in pendulous racemes, staminate corymbose, pendulous, both sexes from lateral leafless buds before the lvs.: lvs. 3-5-foliolate. . . . . 49. *Negundo*

## Section CAMPESTRIA.

1. *monspessulanum*, Linn. (*A. trilobatum*, Lam.). Shrub or small tree, 25 ft.: lvs. 3-lobed, coriaceous, 1-3 in. across, shining above, glaucous and glabrous beneath; lobes entire or with few obtuse teeth: corymbs erect: fr. with slightly spreading wings. S. Eu., N. Afr., W. Asia. Gt. 1893, p. 363. H.W. 3, p. 46. G.W. 8, p. 195 (habit).—Shrub or small tree of slow growth, with a dense, rounded head and, in temperate regions, nearly evergreen foliage, thriving well in dry situations. Var. *ibericum*, Koch. (*A. ibericum*, Bieb.). Lvs. larger, the inner lobes usually slightly 3-lobed, obtuse.

2. *campêtre*, Linn. Shrub or tree, occasionally 50 ft., with corky branches: lvs. 3-5-lobed, 1½-3½ in. long, green and pubescent beneath or nearly glabrous; lobes entire or the middle one slightly 3-lobed: corymbs erect, hairy: fr. with horizontally spreading wings. Eu., W. Asia. H.W. 3:46, p. 45. F.E. 20, pl. 108

(habit). Gt. 1893, p. 327.—Shrub or tree of moderate, dense growth, with dull green foliage, valuable for planting as undergrowth and on dry ground. Many varieties and garden forms: Var. *argenteo-variegatum*, Schwerin. Lvs. with large white blotches. Var. *pulverulentum*, Kirchn. Lvs. sprinkled with white. Var. *austriacum*, DC. Usually a tree: lvs. 5-lobed, with acute, nearly entire lobes: fr. glabrous. F.E. 19, pl. 95 (habit). Var. *tauricum*, Kirchn. Shrub: lvs. 5-lobed small, lobes 3-lobed. Var. *hebecarpum*, DC. Fr. and generally the lvs. pubescent beneath.

3. *Opalus*, Mill. (*A. latum*, Lauth). Small tree, 30 ft.: lvs. 5-lobed, 3-5 in. long, glaucous beneath and at length glabrous; lobes obtusely dentate, short and broad, the middle ones often 3-lobed: corymbs somewhat drooping: fr. with slightly spreading wings. S. Eu., Orient. W.D.B. 2:171.—A variable species, similar to a small-ld. sycamore maple. Var. *hyrcanum*, Pax (*A. hyrcanum*, Fisch. & Mey. *A. tauricum*, Hort. *A. trilobatum*, Hort., not Lam.). Petioles very slender, red, 2-4 in. long; segms. of the lvs. 3-lobed, longer than broad, with straight margins. Gt. 1893, p. 361.

91. *Acer Miyabei*.  
(×½)

## Section PLATANOIDEA.

4. *Miyabei*, Maxim. Fig. 91. Tree, to 40 ft.: branches corky: lvs. 5-lobed, lobes lobulate or coarsely dentate, obtusely acuminate, with obtuse teeth, at first pubescent on both sides, later only beneath, pale green beneath, 5-6 in. long: corymbs long-stalked, 10-15-fl. pubescent: fr. pubescent with horizontally spreading wings. Japan. G.F. 6:143 (adapted in Fig. 91). S.I.F. 2:45.—Handsome, vigorous tree, quite hardy at the Arnold Arboretum.

5. *platanoides*, Linn. NORWAY MAPLE. Fig. 92. Large tree, to 100 ft.: lvs. 5-lobed, cordate at base, glabrous, light green and lustrous beneath, lobes pointed, remotely dentate with pointed teeth: corymbs glabrous; fls. yellowish green: fr. glabrous, with horizontally spreading wings. Eu., Caucasus. H.W. 3:45. Pax 49. Gt. 42, p. 561, 584, 585.—Large, handsome tree, with round, spreading head, resembling somewhat *A. saccharum*. The lvs. turn pale yellow in autumn. Many garden forms, some of which are here arranged in two groups, the first being remarkable for the manner in which the lvs. are cut and for the habit; the second being chiefly remarkable for their coloring:

(1) Var. *cucullatum*, Nichols. Lvs. irregularly and shortly lobed, crimped, light green. Var. *dissectum*,

Jacq. Similar to var. *Lorbergii*, but with darker foliage and of slower growth. Var. *globosum*, Nichols. Forming a globose head. M.D.G. 1903:189. G.W. 5, p. 14. Var. *laciniatum*, Ait. Lvs. irregularly divided, the divisions bending downward; growth upright. Gt. 42, p. 584. Var. *Lorbergii*, Van Houtte. Lvs. divided nearly to the base, divisions deeply lobed. Gt. 1893, p. 584. Var. *columnare*, Carr. Habit columnar.

92. Upright tip shoot of Norway maple.—*Acer platanoides*.

(2) Var. *álbo-variegátum*, Nichols. Lvs. with large white blotches. Var. *áureo-marginátum*, Pax. Lvs. with yellow margin, somewhat irregularly lobed. Var. *rúbrum*, Herd. (var. *Reitenbachii*, Nichols.). Lvs. greenish red when unfolding, turning dark blood-red in late summer. Gt. 16:

545. B.H. 18:39. Var. *Genéva*, Ellwanger & Barry, is probably not much different. Var. *Schwédleri*, Koch. Lvs. bright red when young, changing to dark green. G.C. II. 15:565. Var. *Stöllii*, Spaeth. More upright-growing; lvs. usually 3-lobed, with entire lobes, purple when unfolding, later dark green. Gt. 42, p. 585. Var. *Wittmäckii*, Schwerin. Lvs. usually 3-lobed, with an irregularly dentate and undulate yellow margin, reddish brown when unfolding, later bright green with most of the tips transformed into peculiar reddish brown appendages becoming, finally, dark green. Gt. 52:1516. Var. *Drummondii*, Drum. Lvs. green with white margin, red when unfolding. M.D. 1910:1.

6. *truncátum*, Bunge. Tree, to 25 ft.: lvs. deeply 5-lobed and mostly truncate at the base,  $2\frac{1}{2}$ –4 in. across, glabrous, light green, purplish when unfolding; lobes acuminate. setosely pointed, entire or sometimes the middle ones 3-lobed: fr. with yellow, short and broad wings, spreading at right or obtuse angles. N. China. S.T.S. 1:76.—Hardy tree, with handsome, dense foliage.

7. *píctum*, Thunb. Tree, 60 ft.: lvs. 5- or 7-lobed, 3–7 in. across, usually pubescent beneath when young; lobes entire, acuminate, sometimes very broad and short: fls. yellow: wings of the fr. upright, brown or brownish yellow, hardly twice as long as the nutlets. Manchuria, Japan. S.I.F. 1:65.—Handsome round-headed tree, with bright green foliage, hardy. Var. *parviflórum*, Schneid. (*A. píctum* var. *Mono*, Pax. *A. Mono*, Maxim.). Wings of the frs. spreading: lvs. more cordate. China. J.H.S. 29:349, 350. The form intro. as *A. tenellum* belongs here; the true *A. tenellum*, Pax, is not in cult.

8. *cappadócićum*, Gled. (*A. lætium*, C. A. Mey.). Tree, to 50 ft.: lvs. 5–7-lobed, usually cordate, 3–6 in. across, glabrous, light green and lustrous beneath; lobes entire, acuminate: fls. greenish yellow, in upright peduncled corymbs: fr. with spreading wings, the wings usually 2–3 times as long as the nutlets. From the Caucasus to W. China and the Himalayas.—Resembles *A. platanoides*, but lobes of lvs. entire and branches smooth; not quite hardy N. Var. *sínicum*, Rehd. Smaller in every part: lvs.  $2\frac{1}{2}$ –4 in. across, usually 5-lobed, subcordate or truncate at the base: wings of fr. about twice as long as nutlet. W. China. J.H.S. 29:358 (as *A. lætium* var. *cultratum*).—Very similar to *A. píctum*, but always easily distinguished by the smooth greenish bark of the younger branches. Var. *tricaudátum*, Rehd. Similar to the preceding, but lvs.

3-lobed. J.H.S. 29:357, 358. Var. *hortícola*, Rehd. (*A. lætium* var. *rúbrum*, Schwerin; *A. colchicum* var. *rúbrum*, Hort.). Lvs. blood-red, when unfolding. Var. *tricolor*, Rehd. (*A. lætium* var. *tricolor*, Schwerin). Lvs. blood-red, sprinkled with rosy pink, when young. The last two beautiful forms usually remain shrubby. Var. *áureum*, Rehd. (*A. lætium áureum*, Hesse). Lvs. red and golden yellow.

9. *lóngipes*, Rehd. Tree, to 30 ft.: young branches with smooth greenish bark: lvs. 3-, rarely 5-lobed, or occasionally undivided and ovate, 5–7 in. broad, lobes entire, long-acuminate, light green and soft-pubescent beneath, purple when unfolding: corymb large and loose, short-peduncled or nearly sessile, glabrous: fr. with the wings spreading at right angles. W. China.—A very handsome maple, easily distinguished from all allied species by the large, 3-lobed lvs., pubescent beneath.

10. *catálpifólium*, Rehd. Tree, to 60 ft.: younger branches smooth, greenish: lvs. ovate to ovate-oblong, undivided, entire, sometimes with a broad rounded lobe near the base, 4–8 in. long and 2–5 in. broad, rarely mixed with a few 3–5-lobed lvs., light green and glabrous beneath: corymbs sessile, large and loose, to 8 in. across: wings of the fr. spreading at obtuse angles. W. China.—Very distinct and beautiful tree, but apparently not hardy N.

#### Section GLABRA.

11. *glábrum*, Torr. (*A. Douglasii*, Hook.). Shrub or small tree, 25 ft., quite glabrous: petioles bright red; lvs. deeply 3–5-lobed or 3-parted, 1–5 in. across, dark green and shining above, pale or glaucous beneath; lobes doubly serrate. W. N. Amer. S. S. 2:89.—

93. Japanese Maples.

a. *Acer palmatum* var. *reticulatum*; b. *A. japonicum*, type; c. *A. palmatum* var. *atropurpureum*; d. var. *ornatum*; e, var. *Thunbergii*; f, var. *dissectum*. ( $\times \frac{1}{2}$ )

Handsome shrubby maple, with graceful, shining foliage, contrasting well with the red petioles and branches: fr. often rose-colored. Var. *tripartitum*, Pax (*A. tripartitum*, Nutt.). Lvs. small, usually

3-foliolate. Var. *rhodocárpum*, Schwerin. Frs. bright red until fully ripe.

#### Section PALMATA

12. *circinátum*, Pursh. Small tree, rarely 40 ft.: branchlets, petioles and peduncles glabrous: lvs. 7–9-lobed, 2–7 in. across, glabrous; lobes acute, doubly serrate: fls. in drooping corymbs, with purple sepals. W.

N. Amer. S.S. 2:87.—Handsome, round-headed tree or shrub, beautiful with its delicate light green foliage, red fls., rose-colored fr., and its orange and scarlet fall coloring.

13. *palmatum*, Thunb. (*A. polymorphum*, Sieb. & Zucc.). JAPAN MAPLE. Shrub or small tree, 20 ft.: branchlets, petioles and peduncles glabrous: lvs. 5-9-lobed or divided, 2-4 in. across, glabrous, lobes oblong, acuminate, doubly serrate or incised: corymbs few-fl., glabrous, erect, with small purple fls.: fr. small, glabrous; the wings spreading at an obtuse angle. Japan. S.Z. 1:145, 146. S.I.F. 1:68. F.E. 19, pl. 92 (habit).—A.F.

94. *Acer japonicum*. ( $\times \frac{1}{2}$ )

12:11. J.H.S. 29:340.—This species and *A. japonicum* are known as Japanese maples. They are extremely handsome shrubs of dense though graceful habit, and with elegant foliage, beautiful especially in spring for its delicate shades of green and red, and again in autumn, when the lvs. assume the most striking tints. Some of the more vigorous-growing varieties, like *atropurpureum*, *dissectum*, *ornatum*, and the typical forms, are hardy even in New England, while most of the variegated forms are more tender. They grow best in partly shaded situations and in well-drained, rich soil. There are many varieties, mostly intro. from Japanese gardens, of which the following are some of the best. They may be divided into 5 groups, representing various degrees of dissection of the lvs.:

(1) *A. palmatum* var. *Thûnbergii*, Pax (*A. palmatum*, Thunb.). Fig. 93, *e*. Lvs. deeply 5-9-lobed or cleft; lobes oblong-lanceolate, coarsely and doubly serrate or incised. Var. *atropurpureum*, Van Houtte (var. *nigrum*, Hort.). Fig. 93, *c*. Lvs. dark purple, coarsely doubly serrate. F.S. 12:1273. J.H.S. 29:342. F.E. 14, pl. 42, 32:767 (habit). Var. *sanguineum*, Carr., is lighter red than var. *atropurpureum*. I.H. 14:526. Var. *bicolor*, Koch (var. *atropurpureum variegatum*, Hort.). Lvs. dark purple, with large carmine blotches, the lobes half purple and half carmine. Var. *aureum*, Nichols. Lvs. yellow. Var. *versicolor*, Schwerin (*A. polymorphum septemlobum versicolorum*, Van Houtte). Lvs. bright green, with large white spots. F.S. 14:1498. Var. *roseo-marginatum*, Schwerin (*A. polymorphum septemlobum marginatum*, Pynaert). Lvs. small, deeply cut, with narrow pink margin. F.S. 15:1566. I.H. 28:430. Var. *crispum*, André. Lvs. small, with involute margins; of distinctly upright growth. I.H. 17:43.

(2) Var. *septemlobum*, Koch (*A. septemlobum*, Thunb.). Lvs. mostly 7-lobed; lobes broad, equally doubly serrate. Gt. 42, p. 680. J.H.S. 29:345. Var. *rubrum*, Schwerin. Lvs. large, deep red when young, becoming almost green later. Var. *reticulatum*, André. Fig. 93, *a*. Lvs. greenish yellow, with green margin and dark green veins. I.H. 17:18. Var. *tricolor*, Nichols. Lvs. with red, pink and white spots.

(3) Var. *linearilobum*, Sieb. & Zucc. (var. *scolopendrifolium*, Hort., not Schwerin). Lvs. divided nearly to the base; lobes linear, remotely serrate or nearly

entire. Gt. 42, p. 681. Var. *atrolineare*, Schwerin (var. *linearilobum atropurpureum*, Nichols.; var. *pinnatifolium atropurpureum*, Hort.). Lvs. dark red.

(4) Var. *dissectum*, Koch (*A. polymorphum* var. *decompositum*, Sieb. & Zucc. *A. polymorphum palmatifidum*, Van Houtte). Fig. 93, *f*. Lvs. divided to the base in 5-9 pinnatifid lobes. S.Z. 1:146. F.S. 21:2156. J.H.S. 29:346. M.D.G. 1902:209. F.W. 1875: G.C. III. 31:46 (suppl.). Var. *ornatum*, Carr. (var. *dissectum atropurpureum*, Hort.). Fig. 93, *d*. Lvs. deeply cut, deep red. I.H. 17:46. R.H. 1867:391. F.E., pl. 49 (habit). Var. *Frederici-Guilémi*, Carr. (var. *pinnatifidum roseo-pictum*, Lem.). Lvs. finely cut, green, with white and pink spots. I.H. 14:523. R.H. 1867:391.

(5) Var. *sessilifolium*, Maxim. Lvs. deeply cut, with very short petioles. G.C. II. 16.—Of little decorative value.

14. *Sieboldianum*, Miq. (*A. japonicum* var. *Sieboldianum*, Franch. & Sav.): Small tree or shrub: branchlets, petioles and peduncles pubescent when young: lvs. 7-9-lobed, cordate or nearly truncate at the base, 2-3½ in. across, glabrous except on the veins beneath; lobes ovate-oblong, acuminate, sharply serrate: corymbs long-peduncled, nodding; fls. yellowish, small: fr. small, glabrous or slightly pubescent, the wings spreading at an obtuse angle. Japan. S.I.F. 2:45. Var. *microphyllum*, Maxim. Lvs. smaller, 1½-2½ in. across. S.I.F. 2:42.—This species is hardy at the Arnold Arboretum; it is similar to *A. palmatum*, but somewhat coarser.

15. *japonicum*, Thunb. Figs. 93, *b*, and 94. Small tree or shrub: branchlets, petioles and peduncles pubescent when young: lvs. 7-11-lobed, cordate, 3-6 in. across, light green, with silky hairs when unfolding; lobes ovate, doubly serrate: corymbs few-fl., pendulous; fls. large, purple: fr. finally glabrous; wings spreading at an obtuse angle. Japan. S.Z. 1:144. S.I.F. 1:66. Var. *macrophyllum*, Schwerin. Lvs. large, light green. Var. *aureum*, Schwerin. Lvs. yellow. Var. *Parsonsii*, Veitch (var. *filicifolium*, Hort.; var. *laciniatum*, Hort.). Lvs. large, divided nearly to the base in 9-11 pinnatisect segms. J.H.S. 29:334. R.B. 32:197.

#### Section SPICATA.

16. *Oliverianum*, Pax. Tree, to 30 ft.: branchlets glabrous: lvs. 5-lobed, truncate or subcordate at the base, glabrous, finely reticulate and lustrous beneath, 2½-4 in. across; lobes broad, ovate, long-acuminate, finely serrate: panicles nearly corymbose, long-peduncled, glabrous; fls. whitish, small: wings of fr. spreading nearly horizontally; wing with nutlet about 1 in. long. W. China. S.T.S. 1:77.—A graceful maple, resembling *A. palmatum*, but larger. In young plants, the lvs. are often deeply cut with narrow, elongated lobes. J.H.S. 29:356, 359 (as *Acer* sp.).

17. *tataricum*, Linn. Shrub or small tree, 20 ft.: lvs. roundish oval or oblong, cordate, sometimes slightly lobed, 2-4 in. long, doubly serrate, nearly glabrous: fls. in long-peduncled panicles, white: wings of fr. nearly upright or slightly spreading, bright red in summer. S.E. Eu., Orient. H.W. 3, p. 43.—Round-headed small tree, growing best in somewhat moist soil.

18. *ginnala*, Maxim. (*A. tataricum* var. *ginnala*, Maxim.). Fig. 95. Shrub or small tree, 20 ft.: lvs. 3-lobed, 1½-3½ in. long, glabrous, the terminal lobe elongated, doubly serrate: fls. in long-peduncled panicles, yellowish, fragrant. Manchuria, N. China, Japan. Gt. 1877:308. S.I.F. 2:44. F.E. 17, pl. 72 (habit). Var. *Semenowii*, Pax (*A. Semenowii*, Regel & Herd.). Shrub: lvs. smaller, deeply 3- or nearly 5-lobed. Turkistan.—Graceful shrub, with handsome foliage, turning bright red in autumn; may be used as a substitute for the Japanese maples where these are not hardy.

19. *spicatum*, Lam. (*A. montanum*, Ait.). MOUNTAIN MAPLE. Shrub or small tree, rarely 30 ft.: lvs. 3-,

or slightly 5-lobed, coarsely serrate, pubescent beneath,  $2\frac{1}{2}$ – $4\frac{1}{2}$  in. long: racemes rather dense, long, upright: fr. with diverging wings, bright red in summer. E.N. Amer. S.S. 2:82, 83. H.T. 328.—Valuable as undergrowth; lvs. turn yellow and scarlet in fall. Var. *laciniatum*, Jouin. Lvs. deeply and irregularly lobed and incised.

20. *caudatum*, Wall. Large tree: lvs. 5-, or sometimes 7-lobed, cordate, 3–5 in. long and about as broad, brownish pubescent on the veins beneath; lobes ovate, long-acuminate, incisely serrate: panicle upright, cylindric, with the peduncle 5–6 in. long: fr. small, in upright panicles; wings spreading at right angles. Himalayas. The type is not in cult., but the two following varieties are: Var. *ukurunduense*, Rehd. (*A. ukurunduense*, Fisch. & Mey. *A. spicatum* var. *ukurunduense*, Maxim.). Small tree: branchlets and petioles pubescent while young: lvs. glabrous above, pubescent beneath, sometimes only along the veins; lobes coarsely serrate: panicle pubescent: wings of the fr. often nearly upright; otherwise like the type. Japan, Manchuria. S.T.S. 1:82. S.I.F. 2:43. G.C. II. 15:172. Var. *multiserratum*, Rehd. (*A. multiserratum*, Maxim. *A. erodum*, Pax). Tree, to 30 ft.; very similar to the preceding variety, but glabrous or nearly glabrous. W. China.

21. *macrophyllum*, Pursh. LARGE-LEAVED MAPLE. Tree, to 100 feet high: lvs. cordate, deeply 3–5-lobed or cleft, pubescent when young, pale green beneath, 8–12 in. across; middle lobe mostly 3-lobed: panicles glabrous, narrow, pendulous, 4–5 in. long: fr. with yellow, bristly hairs, wings spreading at right angles or nearly upright, over 1 in. long. W. N. Amer. S.S. 2:86, 87. F.E. 14, pl. 44 (habit). Gn.M. 2:107 (habit).—Handsome round-headed tree, remarkable for its large foliage; not hardy in the N.

22. *pseudoplatanus*, Linn. SYCAMORE MAPLE. Tree, 70 ft. high: lvs. 5-lobed, coarsely crenate-serrate,  $3\frac{1}{2}$ –7 in. across, deep green above, glaucous and mostly glabrous beneath: racemes pendulous: fr. glabrous. Eu., Caucasus. Gt. 42:260, 261. H.W. 3:44, p. 39. F.S. R. 3, p. 181. F.E. 15, pl. 47 (habit).—Large tree of vigorous growth, with large, spreading head; thrives well even in exposed situations. Many varieties and garden forms: Var. *villosum*, Presl. Lvs. chartaceous, pubescent beneath. Var. *erythrocarpum*, Carr. Fr. bright red: lvs. smaller and more lustrous. R.H. 1864: 171. M.D. 1905:1. Gn. 76, p. 540. Var. *purpurascens*, Pax (vars. *purpureum* and *atropurpureum*, Hort.). Lvs. purplish red beneath; of robust growth. Var. *Handjeryi*, Spaeth (var. *Prinz Handjery*, Hort.). Lvs. purplish beneath, bright red when unfolding. Var. *Wörleei*, Schwerin (var. *lutescens*, Hort.). Lvs. yellow. Var. *albo-variegatum*, Kirchn. Lvs. with white blotches and spots, reddish while young. Var. *Leopoldii*, Lem. Similar to the preceding variety; bright rosy pink while young. I.H. 1864:411. R.B. 1906:197. Var. *bicolor*, Spaeth. Lvs. light green while young, with yellow, finally whitish, spots. Var. *tricolor*, Kirchn. Lvs. purplish while young, spotted with yellow. Var. *quadricolor*, Schwerin (var. *Simoni* Pax, var. *Simon-Louis freres*, Degen). Lvs. with large, white spots and also sprinkled with small dots; pink while young. Var. *nervosum*, Schwerin. Habit pyramidal, of slow growth: lvs. marked with yellow between the veins above, purplish beneath.

23. *Heldreichii*, Orph. Tree: lvs. 5-lobed, the middle lobe divided nearly to, the outer half way to the base, 3–5 in. across, glabrous, dark green and shining above, glaucous beneath; lobes coarsely and doubly serrate: panicle erect, long-stalked, ovate. S. E. Eu. Gt. 34:1185. G.C. II. 16:141. Var. *purpuratum*, Schwerin. Lvs. intensely red beneath.

24. *Trautvetteri*, Medw. (*A. velutinum*, Hort., not Boiss. *A. insigne*, Nichols., not Boiss. & Buhse). Lvs. slightly cordate, deeply 5-lobed, 5–7 in. across, glau-

cous beneath and pubescent when young; lobes coarsely crenate-serrate, longer than broad: panicle erect, ovate. Caucasus. Gt. 40, pp. 264–266. G.C. II. 16:75. B.M. 6697 (as *A. insigne*).—Similar to *A. insigne*, but hardier, with smaller lvs. and smaller panicle.

25. *insigne*, Boiss. & Buhse (*A. Van Vólxemi*, Mast.). Large tree: lvs. 5-lobed, deeply cordate, 5–10 in. across, bright green above, glaucous and at length glabrous beneath; lobes about as long as broad, coarsely crenate-serrate: panicles large, erect. Caucasus, N. Persia. G.C. II. 7:73; III. 10:9.—Remarkable for its large, handsome foliage; not hardy in the N. Var. *velutinum*, Boiss. Lvs. densely pubescent beneath. G.C. III. 10:189. Var. *Wölfii*, Schwerin. Lvs. red beneath.

#### Section INTEGRIFOLIA.

26. *oblongum*, Wall. Tree, to 50 ft.: lvs. coriaceous, oblong, entire, long but bluntly acuminate, rounded and 3-nerved at the base, glabrous, reticulate and usually glaucous beneath, 2–7 in. long: panicle short, pubescent; fls. small, greenish: wings of fr. at right angles or horizontally spreading. Himalayas, W. and Cent. China. Jacquemont, Voy. Inde 4:34. Var. *concolor*, Pax. Lvs. green beneath.—Not hardy in the northern states. In young plants, the lvs. are sometimes lobed at the base. J.H.S. 29:95. Recently advertised as *A. discolor*; the true *A. discolor*, Maxim., is not in cult.

#### Section INDIVISA.

27. *carpinifolium*, Sieb. & Zucc. HORNBEAM MAPLE. Tree, 30 ft.: lvs. oblong-ovate, acuminate, sharply and doubly serrate, nearly glabrous, 3–6 in. long: staminate fls. apetalous, in few-fl. racemes; pistillate with petals, in longer racemes. S.Z. 2:142. G.C. II. 15:564. Gt. 41, p. 174. S.I.F. 1:69. J. H.S. 29:75. G. W. 3:615.—Very distinct, hardy species; the lvs. are almost exactly like those of *Carpinus*. This is the only species of this section; the other species included here by Pax have been referred to other sections, mostly to the following (see Sargent, *Plantæ Wilsonianæ* 1:92).

#### Section MACRANTHA.

28. *Davidii*, Franch. Tree, to 50 ft.: branchlets glabrous: lvs. ovate or oblong-ovate,  $2\frac{1}{2}$ –8 in. long, acuminate, subcordate or rounded at base, unequally crenate-serrate, green beneath and rufously villous on the veins while young, finally glabrous or nearly so: racemes slender, pendulous, glabrous: wings of fr. spreading horizontally. Cent. China. S.T.S. 1:83. J.H.S. 29:86, 90.—Handsome tree; hardy at the Arnold Arboretum, the lvs. turning bright yellow or purple in autumn. In young plants, the lvs. are often lobed at the base.

29. *laxiflorum*, Pax. Tree, to 50 ft.: lvs. ovate-oblong, with 2 or 4 short lobes near the base,  $2\frac{1}{2}$ –4 in.

long, long-acuminate, cordate at the base, sharply serrate, green beneath, soon glabrous: racemes slender, pendulous, glabrous; fls. yellowish: wings of fr. spreading at right angles, rarely horizontally. W. China. Pax 35. Var. *longilobum*, Rehd. Lvs. distinctly 5-lobed, upper pair of lobes long-acuminate, floccose-tomentose on the veins beneath while young; fls. purple. W. China.—More graceful than the typical form.

30. *cratægifolium*, Sieb. & Zucc. Small tree, to 30 ft.: lvs. oblong-ovate, often with 2 or 4 lobes near the base, 2–3 in. long, acuminate, rounded or cordate at the base,

96. *Acer saccharinum* (or *A. dasycarpum*).—Silver or soft maple. ( $\times \frac{1}{3}$ )

lobes ovate, long-acuminate, sharply and doubly serrate, the middle one slightly lobed: racemes slender, few-fl'd.: fr. on slender, filiform stalks; wings spreading at about right angles. Japan. S.T.S. 1:17. S.I.F. 2:43.—Graceful shrubby tree; hardy at the Arnold Arboretum.

32. *rufinerve*, Sieb. & Zucc. Tree, to 40 ft., with striped bark: branches glaucous when young: lvs. rounded at the base, 3-lobed, 3–5 in. long, doubly serrate, ferrugineously pubescent on the veins beneath when young: racemes ferrugineously pubescent: fr. short-stalked; wings spreading at right angles. Japan. S.Z. 2:148. S.I.F. 1:67. Var. *álbo-limbátum*, Hook. Lvs. edged with white. B.M. 5793.

33. *pennsylvanicum*, Linn. (*A. striátum*, Dur.). STRIPED MAPLE. MOOSEWOOD. Tree, rarely 40 ft.: bark greenish, striped with white lines: lvs. slightly cordate, roundish-obovate, 3-lobed at the apex, 5–7 in. long, finely serrate, ferrugineously pubescent on the whole lower surface when young: racemes glabrous, drooping: fr. short-stalked, in long, drooping racemes; wings spreading at right angles. E. N. Amer. S.S. 2:84, 85. Michx. Hist. Arb. 2:17. Em. 566. H.T. 330.—Handsome medium-sized tree of upright, dense habit, with bright green, large foliage, turning clear yellow in autumn, and attractive even in winter from its smooth, greenish bark, striped with white. Var. *erythrócladum*, Spaeth. Shoots bright red during autumn and winter.

#### Section ARGUTA.

34. *tetrámerum*, Pax. Tree, to 25 ft: branchlets glabrous: lvs. ovate to oblong-ovate, 2–3½ in. long, acuminate, truncate or rounded and usually 3-nerved at the base, unequally incisely serrate or sometimes slightly lobed, light green and pubescent beneath, rarely nearly glabrous: staminate fls. in few-fl'd. sessile racemes from lateral leafless buds; stamens 4 or sometimes 6; disk lobed; pistillate fls. in elongated racemes, usually few-fl'd.: fr. slender-stalked; nutlet thick, strongly veined. Cent. and W. China. S.T.S. 1:85.—Graceful, hardy tree, very variable. Var. *lobulátum*,

Rehd. Lvs. distinctly lobed, nearly glabrous. J.H.S. 29:352, 355. Var. *betulifolium*, Rehd. (*A. betulifolium*, Maxim.) Lvs. not, or very slightly, lobed, rounded or cuneate at the base, glabrous or glabrescent. Var. *elobulátum*, Rehd. Lvs. not or scarcely lobed, long-acuminate, rounded and 3-nerved at the base, pubescent beneath. Intro. as *A. stachyophyllum*, but the true *A. stachyophyllum* is a Himalayan species, not in cult. Var. *tilifolium*, Rehd. Lvs. ovate, cordate at the base, and 5-nerved, pubescent beneath. Var. *longeracemósum*, Rehd. Lvs. like in var. *elobulatum*: racemes to 6 in. long, slender.

35. *argútum*, Maxim. Small tree, to 25 ft.: branchlets pubescent: lvs. broadly ovate in outline, 5-, or rarely 7-lobed, 2–3½ in. long, pale green beneath and grayish pubescent chiefly on the veins, finally nearly glabrous; lobes ovate, long-acuminate, sharply serrate: staminate fls. in short racemes from lateral leafless buds; stamens 4; pistillate fls. in slender many-fl'd. racemes: fr. slender-stalked, in pendulous racemes; wings spreading horizontally. Japan. S.I.F. 1:69. S.T.S. 66.—Graceful shrubby tree; hardy at the Arnold Arboretum.

#### Section RUBRA.

36. *saccharinum*, Linn. (*A. dasycarpum*, Ehrh. *A. eriocarpum*, Michx.). WHITE or SILVER MAPLE. Fig. 96. Large tree, 120 ft.: lvs. deeply 5-lobed to 5-cleft, 4–6 in. long, green above, silvery white beneath; lobes deeply and doubly serrate: fls. greenish yellow, apetalous: fr. pubescent when young. E. N. Amer. S.S. 2:93. G.C. II. 1:37. Em. 556. H.T. 332. F.E. 32:443 (habit); 29:983 (habit).—Ornamental tree, with wide-spreading, slender branches, growing best in rich and moist soil, but succeeds almost anywhere. Lvs. turn clear yellow in fall. Many garden forms: Var. *Wièri*, Schwerin (var. *Wièri laciniátum*, Hort.). Branches pendulous: lvs. deeply cleft, with dissected lobes.—A graceful variety, remarkable for its drooping branches and finely divided foliage. M.D.G. 1903:628 (habit). Var. *heterophyllum*, Pax (var. *heterophyllum laciniátum*, Hort.). Upright: lvs. deeply and unequally divided, with narrow lobes.

Var. *tripartitum*, Pax. Upright: lvs. 3-parted. Var. *lutescens*, Spaeth. Lvs. yellow, bronze-colored when unfolding. Var. *álbo-variegátum*, Spaeth (var. *Jühlkei*, Hort.). Lvs. spotted with white or rosy pink. Var. *crispum*, Schwerin. Lvs. deeply cut and crimped.—Linnaeus evidently supposed this species to be the sugar

97. *Acer rubrum*.—Red Maple. (Enlarged)

maple, and named it accordingly. He did not know the true sugar maple.

37. *rùbrum*, Linn. RED, SCARLET or SWAMP MAPLE. Fig. 97. Large tree, 120 ft.: lvs. 3–5-lobed, 3–4 in. long, green above, pale or glaucous beneath; lobes unequally and crenately serrate: fls. red or scarlet, rarely yellowish; petals 5; fr. glabrous. E. N. Amer. S.S. 2:94. Em. 557. G.C. II. 1:173. H.T. 334.—Very valuable tree for street and park planting; attractive at every season from its excellent habit, earliness of the scarlet fls., bright red frs. in late spring, and the beautiful foliage, which turns bright scarlet or orange in autumn. Var. *columnàre*, Rehd. Of upright, colum-

nar habit. Var. *globosum*, Rehd. Dwarf, compact: lvs. glaucous beneath: fls. bright scarlet. Var. *Drummondii*, Sarg. (*A. Drummondii*, Hook. & Arn.) Lvs. large, mostly 3-lobed, tomentose beneath: fr. bright scarlet. Southern states. S.S. 2:95. Var. *tomentosum*, Kirchn. (*A. tomentosum*, Desf. *A. rubrum* var. *fulgens*, Hort.). Of moderate growth: lvs. 5-lobed, pubescent beneath: fls. bright red. Var. *tridens*, Wood (*A. microphyllum*, Pax, *A. semiorbiculatum*, Pax). Lvs. 3-lobed, rather small, rounded or rarely cuneate at the base, usually pubescent below. On young plants and vigorous shoots, the lvs. are like those of the type. S.S. 13:626. Var. *magnificum*, Schwerin. Fall-coloring of the lvs. scarlet with green veins. M.D. 1910:1.—The form distributed as var. *Schlesingeri*, Schwerin, does not differ from the type.

#### Section SACCHARINA.

38. *saccharum*, Marsh. (*A. saccharinum*, Wang., not Linn. *A. barbatum*, Michx.). SUGAR or ROCK MAPLE. Fig. 98. Large tree, 120 ft., with gray bark: lvs. 3-5-lobed, cordate, 3-6 in. long, with narrow and deep sinuses; lobes acuminate, sparingly dentate, usually glaucous and glabrous beneath: corymb hairy: fr. with slightly spreading wings, glabrous. E. N. Amer. S.S. 2:90. Em. 558. H.T. 324. Gn. 65, p. 55 (habit).—An excellent street and shade tree of upright, dense growth, turning bright yellow and scarlet in autumn. It does well in almost every soil. Var. *Rugelii*, Rehd. (*A. Rugelii*, Pax, *A. saccharum* var. *barbatum*, Trel.). Lvs. 3-lobed, generally broader than long, 2-5 in. across, pale green or glaucous beneath, and at length mostly glabrous, coriaceous; lobes nearly entire. Central states. S.S. 2:91 (as var. *nigrum*). Var. *monumentale*, Schwerin (*A. nigrum* var. *monumentale*, Rehd.). Of upright, columnar habit.

39. *floridanum*, Chapm. (*A. barbatum* var. *floridanum*, Sarg.). Tree, rarely 50 ft., with pale bark: lvs. mostly truncate at the base, 3-lobed,  $1\frac{1}{2}$ -3 in. across, glaucous beneath, pubescent; lobes obtuse, entire or slightly 3-lobed: corymb sparingly hairy or nearly glabrous: fr. sparingly villous, finally glabrous. Gulf states. S.S. 2:91. G.F. 4:148.

40. *nigrum*, Michx. (*A. saccharinum* var. *nigrum*, Torr. & Gray. *A. saccharum* var. *nigrum*, Brit.). BLACK MAPLE. Fig. 99. Large tree, 120 ft., with black bark: lvs. cordate, with the sinus mostly closed, generally 3-lobed, 5-6 in. across, with broad sinuses, the sides of the blade mostly drooping, green and pubescent beneath; lobes acute, entire or obtusely toothed: fr. with diverging wings. Central states. S.S. 13:625. H.T. 326.—Similar to *A. saccharum*, but of duller appearance and less dense habit

41. *leucoderme*, Small (*A. saccharum* var. *leucoderme*, Sarg.). Tree, to 25, rarely to 40 ft., with light gray or grayish brown bark: lvs. 3-5-lobed, 2-3 $\frac{1}{2}$  in. across, truncate or slightly cordate at the base, bright yellow-green and soft-pubescent beneath; lobes acuminate, sinuately dentate: corymbs glabrous: fr. vil-

98. *Acer saccharum*.—Common Sugar Maple. ( $\times \frac{1}{2}$ )

lous, finally glabrous; wings wide-spreading. From N. C. to Ga. and La. S.S. 13:624.—Sometimes planted as a street tree in Ga. and Ala.; hardy at the Arnold Arboretum.

42. *grandidentatum*, Nutt. Tree, 40 ft., with dark brown bark: petioles comparatively short: lvs. slightly cordate, 3-5-lobed, with broad sinuses, 2-3 in. across, pubescent beneath, coriaceous; lobes acute or obtuse, entire or slightly 3-lobed: corymbs few-fl., hairy, short-stalked. Rocky Mts. S.S. 2:92.—Hardy at the Arnold Arboretum.

43. *diabolicum*, Koch. Tree, to 30 ft: branchlets pubescent: lvs. 5-lobed, cordate or subcordate, 4-6 in. across, pale green beneath and sparingly pubescent; lobes broadly ovate-acuminate, coarsely and remotely dentate with acute or obtusish teeth: fls. from lateral leafless buds; staminate on long and pendulous, hairy pedicels; sepals wholly or partly connate, petals wanting; pistillate in few-fl. racemes; sepals and petals distinct: pedicels of the fr.  $\frac{1}{2}$ -2 in. long; nutlets thick, strongly veined, bristly; wings upright or slightly spreading. Japan. G.C. II. 15:532. S.T.S. 1:67. Var. *purpurascens*, Rehd. (*A. purpurascens*, Franch. & Sav. *A. pulchrum*, Lavallé). Fls. purple: lvs. turning red in autumn. S.I.F. 1:65.—Hardy at the Arnold Arboretum; similar to *A. pseudoplatanus*, but lvs. larger; the var. *purpurascens* is to be recommended for its early-appearing purple fls.

#### Section TRIFOLIATA.

44. *nikoense*, Maxim. Fig. 100. Tree, 40 ft.: branchlets pubescent: lfts. ovate or oblong-elliptic, short-stalked, acute, entire or obtusely dentate, 2-5 in. long, villous-pubescent beneath, petioles hairy,  $\frac{3}{4}$ -1 $\frac{1}{2}$  in. long; corymb few-fl., pubescent: fr. on nodding pedicels  $\frac{1}{8}$ - $\frac{1}{2}$  in. long; nutlets thick, hairy; wings upright, curved inward. Japan, Cent. China. G.F. 6:155 (adapted in Fig. 100.) Gt. 41, p. 149. S.I.F. 1:68. J.H.S. 29:81. R.H. 1912:126, 127.—Very distinct; lvs. turning brilliant scarlet in autumn.

45. *griseum*, Pax (*A. nikoense* var. *griseum*, Franch.). Tree, to 25 ft., with cinnamon-brown bark separating in thin flakes: branchlets pubescent: lfts. short-stalked, elliptic or ovate-oblong, 1-2 in. long, acute, coarsely toothed with large bluntish teeth, the lateral ones

99. *Acer nigrum*.—Black Sugar Maple. ( $\times \frac{1}{2}$ )

unequal, deeply dentate on the outer margin, entire or nearly so on the inner, glaucous and pubescent beneath; petioles densely hairy: fls. rather large, in few-fl. hairy corymbs: fr. pendulous on short stalks, with the peduncle scarcely  $\frac{1}{2}$  in. long; nutlets thick, tomentose; wings spreading at an acute angle. W. China.—J.H.S. 29:98. R.H. 1912:127.—Remarkable for its flaky bark, resembling that of the river birch; hardy at the Arnold Arboretum.

46. *mandshuricum*, Maxim. Shrub or small tree: branchlets glabrous: lfts. oblong or oblong-lanceolate, 2-3½ in. long, short-stalked, acuminate, remotely and obtusely serrate, glabrous, glaucous beneath; petioles glabrous, red, 2-4 in. long; fls. in few-fl. glabrous corymbs: fr. on stalks  $\frac{1}{2}$ -¾ in. long; nutlets thick, glabrous; wings spreading at obtuse angles. Manchuria.—Graceful maple, hardy at the Arnold Arboretum; the red color of the slender lf.-stalks contrasts well with the dark green foliage.

#### Section NEGUNDO.

47. *Hénryi*, Pax. Tree, to 30 ft.: branchlets slightly pubescent: lfts. 3, elliptic, 2-3½ in. long, stalked, acuminate, entire or coarsely serrate, pale green and pubescent beneath; petioles finely puberulous: fls. nearly sessile, small, greenish in slender pendulous pubescent racemes, lateral, without lvs. or with small lvs. at the base: fr. glabrous, short-pediceled, in pendulous racemes with the stalk 4-7 in. long; wings upright or slightly spreading. Cent. China. J.H.S. 20:93, 96 (as *A. sutchuenense*).—Hardy at the Arnold Arboretum.—It has been concluded that this and the following species which have been hitherto referred to the preceding section are more closely related to *A. Negundo* and therefore better transferred to this section.

48. *cissifolium*, Koch (*Negundo cissifolium*, Sieb. & Zucc. *Crúla cissifolia*, Nieuwl.). Small tree: lfts. 3, stalked, ovate or elliptic, acuminate, coarsely serrate, sparingly ciliate, 2-3½ in. long, light green beneath and glabrous, or nearly so: racemes slender, many-fl., pu-

bescent; pedicels less than ¼ in. long; sepals and petals 4, small: fr. in pendulous racemes; wings slightly spreading. Japan. S.I.F. 2:41.—Handsome, round-headed tree, with slender, spreading branches and graceful bright green foliage, turning orange-yellow and scarlet in autumn; hardy at the Arnold Arboretum.

49. *Negúndo*, Linn. (*Negundo fraxinifolium*, Nutt. *N. aceroides*, Moench. *Rúlac Negúndo*, Hitchc.).

ASH-LEAVED MAPLE. BOX ELDER. Fig. 101. Large tree, 70 ft.: lvs. pinnate; lfts. 3-5, ovate or oblong-lanceolate, coarsely serrate or 3-lobed, mostly glabrous, 2-5 in. long: fls. before the lvs.; staminate fls. in pendulous corymbs, pistillate fls. in pendulous racemes. E. N. Amer. S.S. 2:96. Michx. Hist. Arb. 2:18. H.T. 336.—Large, rapid-growing tree of spreading habit, thriving best in moist and rich soil. Much prized in the W., where it withstands cold and dryness. Largely used for shelter-belts and for planting timber-claims. Var. *californicum*, Sarg. (*A. californicum*, Dietr. *Negundo californicum*, Torr. & Gray). Branches pubescent when young: lfts. 3, of firmer texture, densely pubescent beneath: fr. not constricted at the base. W. N. Amer. S.S. 2:97. Nutt. N. Amer. Sylv. 2:72. Var. *pseudo-californicum*, Schwerin (*A. californicum*, Hort. *A. Negundo* var. *californicum*, Kirchn.). Branches green, bloomy; of vigorous growth. Var. *violaceum*, Kirchn. (*A. californicum*, Hort.). A vigorously growing form: branches purplish with glaucous bloom or finely pubescent when young. Var. *argenteo-variegatum*, Bonamy. Lvs. with broad white margin. Probably the most effective of all variegated hardy trees. F.S. 17:1781. Gn. 68, p. 402 (habit). G. 2:37; 11:97 (habit). Var. *aureo-variegatum*, Booth (var. *aureo-maculatum*, Schwerin). Lvs. spotted with yellow. Var. *aureo-marginatum*, Dieck. Lvs. with yellow margin. Var. *auratum*, Spaeth (var. *californicum aureum*, Hort.). Lvs. yellow. R.B. 1906:197. Var. *crispum*, G. Don. Lfts. curled. These horticultural varieties may be grafted on common box elder seedlings, like the grape. Two new forms have been recently described as new species by Britton: *A. interior*, distributed from Alberta and Mont. to Ariz. and New Mex. (B.T. 655), and *A. Kingii* (B.T. 656), from Utah; they are closely allied to var. *californicum*, but differ in their glabrous foliage; in the first the wings of the samara are adnate to the nutlet only to or above the middle; in the second the wings reach the point of union of the nutlets.

*A. acuminatum*, Wall. (*A. caudatum*, Brandis, not Wall. *A. steruliaceum*, Koch, not Wall.). Allied to *A. argutum*. Tree: lvs. 3-lobed, 3-4½ in. long, glabrous and light green beneath; lobes long-acuminate, and doubly serrate: wings of fr. spreading at a right angle. Himalayas. G.C. II. 15:364 (as *A. caudatum*). Tender at the Arnold Arboretum.—*A. ambiguum*, Dippel. Allied to *A. pictum*. Lvs. pilose beneath: fls. and fr. unknown. Doubtful species of unknown origin.—*A. amplum*, Rehd. Allied to *A. longipes*. Tree, to 35 ft.: lvs. 5-lobed, 4-7 in. broad, glabrous: corymb nearly sessile, 5-6 in. across. Cent. China.—*A. barbinerve*, Maxim. Allied to *A. argutum*. Shrubby tree: lvs. 5-lobed, coarsely serrate: pistillate racemes usually 7-fl.: fr. larger. Manchuria. S.T.S.

101. Raceme of young fruit of box elder.—*Acer Negundo*. (Nat. size)

100 *Acer nikoense*. (× ½)

1:86.—*A. Boscii*, Spach. Probably hybrid. *A. monspessulanum* × *tataricum*.—*A. brevifolium*, Hesse=*A. parviflorum*.—*A. caesium*, Wall. Allied to *A. insignis*. Tree: lvs. 5-lobed, glabrous, whitish beneath, 6-8 in. across; lobes acuminate, obtusely crenulate-serrate. Himalayas. Not hardy N.—*A. capillipes*, Maxim. Allied to *A. rufo-nerve*. Tree, to 30 ft.: lvs. 3-lobed, glabrous beneath, red when unfolding,  $3\frac{1}{2}$ -5 in. long; fls. on slender stalks about  $\frac{1}{2}$  in. long. Japan. S.T.S. 1:16. Not perfectly hardy at the Arnold Arboretum.—*A. caudatum*, Brandis=*A. acuminatum*.—*A. cinerascens*, Boiss. Shrub or small tree: lvs. 3-lobed;  $\frac{1}{2}$ -2 in. long. Similar to *A. monspessulanum*. Persia.—*A. coriaceum*, Tsch. (*A. creticum*, Tratt.=*A. polymorphum*, Spach). Probably *A. creticum* × *pseudoplatanus*.—*A. crassipes*, Pax. Supposed to be a hybrid between *A. obtusatum* and *A. pennsylvanicum*.—*A. crassipes*, Hesse=*A. parviflorum*.—*A. creticum*, Linn.=*A. orientale*.—*A. creticum*, Tratt.=*A. coriaceum*.—*A. Dieckii*, Pax (*A. platanoides* var. *integrilobum*, Zabel). Similar to *A. platanoides*, but lobes entire; probably *A. Lobelii* × *platanoides*.—*A. distylum*, Sieb. & Zucc. Allied to *A. oblongum*. Tree: lvs. ovate, 5-7 in. long, cordate, crenately serrate, light green and lustrous beneath. Japan. G.C. II. 15:499. S.I.F. 2:41. J.H.S. 29:76.—*A. Duréti*, Pax. Probably *A. monspessulanum* × *pseudoplatanus*.—*A. erianthum*, Schwin. Allied to *A. caudatum*. Small tree: lvs. 5-lobed, 2-3½ in. long, lobes broad, unequally and simply serrate, nearly glabrous beneath; fls. with densely villous disk. W. China. S.T.S. 1:80.—*A. Fargesii*, Franch. (*A. laevigatum* var. *Fargesii*, Veitch). Allied to *A. oblongum*. Tree, to 30 ft.: lvs. coriaceous, lanceolate-oblong, 2-3½ in. long, narrowed at the base, pinninerved, glabrous, light green beneath, not reticulate. W. China. J.H.S. 29:91.—*A. flabellatum*, Rehd. Allied to *A. Oliverianum*. Tree, to 30 ft.: lvs. 7-lobed, deeply cordate, 3-5 in. across, light green beneath and villous along the veins. Cent. China. S.T.S. 1:81.—*A. Franchetii*, Pax. Tree, to 15 ft.: lvs. 3-lobed; slightly pubescent beneath or glabrous at maturity and light green, 3-4 in. long; lobes broadly ovate, acute, remotely toothed; fls. in short pubescent racemes from lateral leafless buds, with the lvs.: fr. with the wings spreading at right angles or less, nutlets thick, hairy; winter-buds with numerous imbricate scales. Cent. China. S.T.S. 1:87. Belongs to the section *Lithocarpa*.—*A. fulvescens*, Rehd. Allied to *A. pictum*. Tree, to 60 ft.: lvs. usually 3-lobed, 2-4 in. across, beneath covered with a yellowish or fulvous pubescence. W. China. Hardy at the Arnold Arboretum.—*A. heterophyllum*, Willd.=*A. orientale*.—*A. Hookeri*, Miq. Allied to *A. Davidii*. Tree, 60 ft.: lvs. cordate-oblong, serrate, 4-6 in. long, quite glabrous beneath. Himalayas.—*A. hybridum*, Spach. Probably *A. italum* × *pseudoplatanus*.—*A. hybridum*, Baudr.=*A. Boscii*.—*A. laevigatum*, Wall. Allied to *A. oblongum*. Small tree: lvs. oblong, nearly entire, attenuate at the base, pinninerved, green beneath. Himalayas, China.—*A. laevigatum*, Hort.=*A. acuminatum*.—*A. Lobelii*, Ten. Allied to *A. cappadocicum*. Branches glaucous: lvs. rounded at the base; lobes mostly undulate, abruptly pointed. Italy.—*A. Maximowiczii*, Pax (*A. urophyllum*, Maxim.). Allied to *A. Tschonoskii*. Small tree: lvs. 3-5-lobed, doubly serrate, the middle lobe much elongated, long-acuminate, glaucescent beneath, glabrous, 2-3 in. long; fr. slender-stalked; wings spreading at an obtuse angle. Cent. China. S.T.S. 1:84.—*A. Mayrii*, Schwin. Allied to *A. cappadocicum* and *A. amplum*. Tree with smooth bark: lvs. usually 3-lobed, glabrous, 3 in. across; lobes very broad, long-acuminate; wings of fr. upright, incurved. Japan.—*A. mexicanum*, Pax (Negundo mexicanum, DC. *A. serratum*, Pax). Allied to *A. Negundo*. Lifts. 3, pubescent beneath, densely serrate; fr. glabrous; wings spreading at an acute angle. Mex.—*A. micranthum*, Sieb. & Zucc. Allied to *A. Tschonoskii*. Shrub or small tree: lvs. 5-7-lobed; lobes incised and doubly serrate, glabrous; fls. and fr. small. S.Z. 1:141. S.I.F. 2:44.—*A. neapolitanum*, Ten.=*A. obtusatum*.—*A. neglectum*, Lange (*A. zoeschense*, Pax). Probably *A. campestre* × *Lobelii*. Var. Anne, Schwin. Young lvs. deep red, later olive-green. M.D. 1903:1.—*A. obtusatum*, Waldst. & Kit. (*A. neapolitanum*, Ten.). Allied to *A. Opalus*. Small tree or shrub: lvs. 5-lobed, pubescent beneath, about 4 in. across; lobes broad, often rounded, obtusely denticulate; wings of fr. spreading at a right angle or less. S. Eu., N. Afr. H.W. 3, p. 47. Tender at the Arnold Arboretum.—*A. orientale*, Linn. (*A. creticum*, Linn. *A. sempervirens*, Linn. *A. heterophyllum*, Willd.). Allied to *A. monspessulanum*. Shrub, 4 ft.: lvs. nearly evergreen, short-stalked, orbicular or oval, entire or 3-lobed,  $\frac{1}{2}$ -1½ in. long, glabrous. Orient.—*A. parviflorum*, Franch. & Sav. (*A. crassipes*, Hesse, not Pax. *A. brevifolium*, Hesse). Allied to *A. caudatum*. Tree: lvs. 3-5-lobed, pubescent beneath, 4-6 in. across; lobes broadly ovate, acute, doubly serrate; wings of fr. spreading at an obtuse angle. Japan. S.I.F. 2:42. Not quite hardy at the Arnold Arboretum.—*A. pectinatum*, Wall. Allied to *A. pennsylvanicum*. Tree: lvs. 3-lobed, setosely serrulate,  $2\frac{1}{2}$ -3½ in. across, the middle lobe elongated, acuminate. Himalayas. G.C. II. 15:365.—*A. Peronai*, Schwin. Supposed hybrid of *A. Opalus* × *monspessulanum*. Originated at Vallombrosa near Florence.—*A. robustum*, Pax. Allied to *A. palmatum*. Small tree: lvs. 7-9-lobed, cordate, 3-4 in. across, glabrous beneath except the tufts of hairs in the axils of the veins; lobes ovate, acuminate, sharply serrate; wings of fr. nearly horizontally spreading. Cent. China.—*A. rotundifolium*, Schwin. (*A. barbatum*, Booth, not Michx.). Possibly *A. obtusatum* × *monspessulanum*.—*A. Schvärinii*, Pax. Affinity doubtful. Lvs. coriaceous, ovate-oblong, cordate, undivided or 3-lobed, glaucous beneath, soon glabrous, 5-7 in. long; fls. and fr. unknown. Probably from the Himalayas. Var. *marmoratum*, Schwin, has the lvs. variegated with light green. Var. *monophyllum*, Schwin, has the lvs. 2-3½ in. long.—*A. sempervirens*, Linn.=*A. orientale*.—*A. serratum*, Pax=*A. mexicanum*.—*A. sikkimensis*, Miq. Allied to *A. Davidii*. Tree: lvs. cordate-ovate, coriaceous, long-acuminate, quite glabrous, entire or serrulate, 4-7 in. long; wings of fr. spreading at a right angle. Himalayas.—*A. sinense*, Pax. Allied

to *A. Oliverianum*. Tree: lvs. 5-lobed, cordate or sometimes truncate, glaucescent beneath, glabrous, 3-6 in. long; lobes ovate, acuminate, sparingly appressed-serrate; panicle elongated; wings of fr. spreading horizontally. Cent. China. S.T.S. 1:78. J.H.S. 29:92.—*A. sterculiaceum*, Wall. (*A. villosum*, Wall.) Allied to *A. Franchetii*. Tall tree: lvs. 3-5-lobed, cordate, 6-8 in. across, tomentose below, coarsely serrate; racemes from lateral leafless buds; fr. in long pendulous racemes, often branched at the base; wings of fr. nearly upright. Himalayas.—*A. sutchuenense*, Franch. (*A. sutchuense*, Pax). Allied to *A. mandshuricum*. Small tree. Lifts. 3, oblong-lanceolate, unequally serrate, glaucous beneath,  $1\frac{1}{2}$ -3 in. long; corymb many-fl., rather dense. Cent. China. S.T.S. 2:112.—Probably not in cult.; the plant figured by Veitch under this name is *A. Henryi*.—*A. tegmentosum*, Maxim. Allied to *A. pennsylvanicum*. Lvs. 3-4 in. long, glabrous beneath; lobes short; fls. small. Manchuria. G.C. II. 15:75.—*A. trifidum*, Hook. & Arn. Allied to *A. tataricum*. Small tree: lvs. coriaceous, cuneate-obovate, 3-lobed, glaucous beneath, glabrous, 2-3 in. long; lobes entire. China, Japan. S.Z. 2:143.—*A. urophyllum*, Maxim.=*A. Maximowiczii*.—*A. Veitchii*, Schwin. Possibly *A. cratægifolium* × *rufinerve*.—*A. villosum*, Wall.=*A. sterculiaceum*.—*A. Wilsonii*, Rehd. Allied to *A. Oliverianum*. Tree: lvs. 3-lobed, light green beneath, glabrous,  $3\frac{1}{2}$ -4 in. across; lobes ovate to oblong-ovate, acuminate, entire, or sparingly serrate; panicle elongated; wings of the fr. spreading at a right angle. Cent. China. S.T.S. 1:79.—*A. zoeschense*, Pax=*A. neglectum*.

ALFRED REHDER.

**ACERÁNTHUS** (*Acer*, maple, and *anthos*, flower, in allusion to the maple-like flowers). *Berberidaceæ*. **BARENWORT.** A genus of 4-6 species of slender, hardy, herbaceous perennials from Temp. Asia and Algeria, related to the native twin-leaf, *Diphylleia*. Fls. variously colored, racemose; sepals 7-8, petaloid, the

102. *Achillea Millefolium* var. *rubrum*. (× ½)

outer ones smaller than the inner; petals flat; lvs solitary.—Not commonly cult. and the following seen only in botanic gardens.

*A. diphyllum*, Morr. & Deene. (*Epimedium diphyllum*, Lodd.). Plant rhizomatous; lifts. obliquely cordate, green above, glaucous beneath; fls. small, bluish white. Japan. B.M. 3448. L.B.C. 19:1858.

N. TAYLOR.

ACHANIA: *Malvaviscus*.

**ACHILLÆA** (its virtues said to have been discovered by Achilles). *Compositæ*. Includes *Platnica*. About 100 species, some of which are hardy herbaceous border and alpine perennials of easy culture.

Leaves simple or compound, often ternate; fl.-heads small, corymbose or racemose; receptacle nearly flat

or convex, chaffy; ray fls. pistillate, fertile, the rays white or pink; disk fls. perfect, fertile.

Most of the achilleas can be grown in ordinary garden soil, preferring open sunlight and well-drained situations. Some are alpine or sub-alpine and require rock-garden conditions. These are indicated under the individual species. Dwarf kinds make carpets in dry, sunny places; large kinds suitable for wild gardens.

Propagation in spring by division, cuttings and seeds; chiefly by the first method and easily accomplished.

A. Rays about 5, except in double forms, half as long as the ovate-oblong involucre; fls. white, red, or yellow.

B. Fls. white or red.

**Millefolium**, Linn. **MILFOIL**. YARROW. Height 1-3 ft.: lvs. bipinnately parted, segms. linear, 3-5 cleft; fls. in flat corymbs. June-Oct. Eu., Asia, Amer. Common in pastures.—Less commonly cult. than vars. **rubrum** (Fig. 102) and **roseum**, with red or purple fls.

BB. Fls. yellow.

**Tournefortii**, DC. (*A. ægyptiaca*, Linn.). Height 12-18 in.: lvs. pinnatisect; segms. roundish, coarsely toothed; fls. pale yellow. June-Oct. Greece.

**filipendulina**, Lam. (*A. Eupatorium*, Bieb.). Fig.

103. Height 4-5 ft.: st. erect, furrowed, glandular spotted and almost hairy; fls. yellow in dense, convex compound corymbs, often 5 in. across. June-Sept. Orient.—Needs staking.

**holosericea**, Sibth. & Sm. Similar to preceding, but not glandular spotted; fls. as in *A. filipendulina*, but corymbs simple, terminal, and the petals scarcely as long as the bracts of the involucre. Mts. of Greece. Summer.—More suitable to semi-alpine situations than *A. filipendulina*.

**tomentosa**, Linn. A woolly, carpet-like plant for rockeries. Height 8-10 in. Eu., Orient, N. Amer. B.M. 498. Gn. 52, p. 421.

AA. Rays 6-20, as long as or longer than the rotund or campanulate involucre; fls. white.

B. Lvs. not divided.

**Ptarmica**, Linn. (*A. macrocephala*, Pill. & Mitterb.). **SNEEZEWORT**. Height 1-2 ft.: lvs. serrate; fls. in loose corymbs; all summer. North temperate regions.—Its full-double var. The Pearl (Fig. 104) is much used for cut-flowers and in cemeteries, and is one of the most popular of all hardy herbaceous plants. There are many other varieties.

**lingulata**, Waldst. (*A. buglossis*, Hort.). A stiff, simple-stemmed, perennial, simulating *A. Ptarmica*, but hairy: lvs. broadly spatulate, the petiole long-attenuate and dotted; heads corymbose, the fls. numerous; petals 3-4 times as long as the involucre. Sub-alpine. Hungary and southward. Summer.

103. *Achillea filipendulina*.  
(Plant  $\times \frac{1}{2}$ )

**sibirica**, Ledeb. (*A. mongolica*, Fisch. *A. Ptarmicoides*, Maxim.). Denser than the last, more erect and rigid; height 1½-2 ft.: fls. larger and in more compact corymbs. July-Sept.

**grandiflora**, Bieb. A smooth and erect perennial: lvs. narrowly linear, narrower than in any of the *Ptarmica* group, distinctly serrulate; corymbs simple or sometimes loosely branched, the peduncles 4-5 times longer than the head; fls. white, large and more showy than most of the genus, longer than the bracts of the involucre. Sub-alpine and scarcely good for ordinary garden conditions. Caucasus. June, July.

BB. Lvs. deeply divided.

**macrophylla**, Linn. Height 3 ft.: lvs. long, broad. July. Alps. Gn. 52, p. 421.—Better suited to shrubbery than to herbaceous border.

**Clavénæ**, Linn. (commonly spelled *A. Clavénæ*. *A. argentea*, Hort., not Lam.). Dwarf, tufted, hoary alpine plant; height 10 in.: lvs. dentate at apex; segms. obtuse; fls. spring and summer. Eu. B.M. 1287. Gn. 52, p. 421.—Thrives in sand.

*A. Ageratum*, Linn. Fls. yellow. Eu.—*A. ageratifolia*, Benth. & Hook. (Anthemis Aizoon). Tufted, woolly, silvery gray; fls. white. May, June. Alps.—*A. asplenifolia*, Vent. Lvs. pinnate, smooth; fls. white. There is a red-fl. form. N. Amer.—*A. atrata*, Linn. Dwarf, tufted, aromatic; radical lvs. petiolate; cauline lvs. pinnatisect; fls. white. Alps.—*A. aurea*, Lam. Fls. golden yellow, the seeds stipitate; lvs. woolly. Aug., Sept. S. Eu.—*Chrysanthemum achilleaeifolium* (which see).—*A. decolorans*, Schrad. Lvs. undivided; fls. pale yellow. July. Eu.—*A. Herbarota*, All. Dwarf, tufted, aromatic alpine; lvs. undivided, serrate; fls. white. May, June.—*A. ligustica*, All. Lvs. pinnatifid; fls. white. Eu., Orient.—*A. moschata*, Jacq. Lvs. smooth, pinnately parted, lobes uncut; fls. white. Eu.—*A. nana*, Linn. Dwarf, hairy, woolly, aromatic; lvs. pinnatisect; fls. white. Spring. Eu. Used in making Chartreuse.—*A. odorata*, Linn. Lvs. pinnatisect; lobes cut; fls. white.—*A. pectinata*, Willd. Fls. pale yellow.—*A. rupes-tris*, Huter. Lvs. ½ in. long, linear-spatulate, entire. S. Italy. B.M. 6905.—*A. santolinoides*, Lag. 1 ft.: lvs. pinnatisect, hairy-woolly; fls. white. July. Spain.—*A. serrata*, Retz. Lvs. pinnatifid, woolly; fls. white. Siberia(?).—*A. Siehiana*, Hort. Fls. golden yellow, fragrant. Asia Minor.—*A. umbellata*, Sibth. Very woolly rock plant, 4-5 in.: lvs. pinnatifid; lobes oblong, bluntish, entire or serrate; fls. white. June. Greece.—*A. valesiaca*, Stein. Lvs. pinnately parted; fls. white. June-Aug. Eu. Other trade names are *A. corymbosa*, *A. transylvanica* and *A. Hüteri*; none is known in hort. or botanical literature.

N. TAYLOR.†

**ACHIMENES** (Greek, *cheimaino*, to suffer from cold). Including *Scheeria*. *Gesneriaceæ*. Greenhouse herbs, allied to gloxinias, native to tropical America, grown for bloom in late spring and in summer.

Plant upright, erect, or drooping; lvs. opposite or whorled, serrate or toothed, mostly hairy; underground sts. scaly and catkin-like, and similar growths sometimes in the axils of the lvs; fls. axillary; 5 calyx-lobes narrow and short; corolla-tube cylindrical and limb spreading; anthers 4, connivent in the tube, and a rudiment of a fifth stamen; style long, usually exserted, the stigma dilated or obscurely 2-lobed.—Perhaps 40 species.

The garden achimenes are much confused by hybridization, and it is doubtful whether any of the pure species are in general cultivation in this country. Years ago, the small red-flowered types (of the coccinea section) were frequent, but modern evolution has proceeded from the broad-flowered purple species. The species

104. *Achillea Ptarmica* var. The Pearl.

described further on seem to have contributed most largely to the present garden forms. Some of the best species are *A. longiflora*, purplish blue; *A. longiflora* var. *alba maxima*, the best white kind; *A. patens* var. *major*, a large flower of purplish rose; *A. pedunculata*, orange; *A. heterophylla*, tubular, a fiery orange at one end and blazing yellow at the other. There are many named varieties, some of the names being Latin in form. In the grandiflora group the tubers or bulbs are clustered; in the longiflora group the tubers are pear-shaped bodies, growing on the ends of root-like rhizomes. The coccinea (Fig. 105) and hirsuta groups are late bloomers.

The rhizomes of achimenes should be removed from their winter quarters and spread out thinly in boxes, using a size some 3 inches deep, and a light open mixture of leaf-mold and sand to start them in. The lower inch in the box should be covered with some material that will act as drainage; then cover with an inch or so of the compost, and spread out the rhizomes on this and cover with half an inch of the mixture which has been passed through a half-inch mesh sieve. Place in a moist house in a temperature of 60° to 65° F. and water sparingly until the young growths appear. When these are some 2 inches high, they should be lifted from the boxes with the material that is attached to the roots and potted up into 5- or 6-inch pots or 8-inch pans, spacing them equally, and using some ten to fifteen growths for each pot or pan. The material used for this potting should be rich in humus and of a very open porous nature, so as to provide free access of air to the roots and at the same time allow any excess of water to pass away freely. A useful mixture for this purpose is equal parts of loam, leaf-mold and sand. About one-third the depth of the pots or pans should be occupied with drainage. All the rhizomatous forms of achimenes are shallow-rooting, so that there is no advantage in using large and deep pots. This method of starting the rhizomes first and then potting those that have been started together, is much to be preferred to potting them up directly into the flowering sizes, which method, however, is practised by many cultivators. The advantage of the method advised is that all the pots are filled regularly with growths of equal size and vigor, whereas in the other and older method the rhizomes often start irregularly and the pots are only partially filled with growths. After potting up, the pots should be replaced again in the same house as the rhizomes were started in, and kept shaded from all hot sun. From this period onward, growth is rapid and care must be taken not to allow any of them to suffer for want of moisture at the roots, or failure will ensue. When the plants are 6 or 8 inches high, feeding with weak liquid manure should begin, and should be continued regularly until the plants show signs of exhaustion after flowering. When the flowers appear, the plants should then be removed to a somewhat drier airy greenhouse, kept at a temperature of about 50° F., where they will remain until the flowering season is over. They may then be removed to a greenhouse or coolframe to ripen up. The water-supply should be gradually reduced until the plants die down. The best method of storing the rhizomes is to shake entirely out of the old soil, mix them up in a box

105. Achimenes; tubers of the coccinea section.

of sand, and keep them entirely dry in a shed which does not fall below a temperature of 45° F. until the time comes round for starting them again in March or April.—Propagation is readily effected by means of the rhizomes. Each of these may be used for forming one or many plants. Some of the kinds form numerous scaly buds or short rhizomes in the axils of the upper leaves; these may be saved and treated in exactly the same way as the underground rhizomes for propagation. Cuttings of any of the sorts root readily in a moist warmhouse in summer-time. Every node may be used for stock and the parts may be inserted without removing the leaves.—All members of the genus, including the numerous garden forms, are of the easiest possible culture, and there are few greenhouse plants that will furnish such a display of flowers at such a little cost in time and attention. Some of the forms of weak habit make charming subjects for growing as basket plants. (C. P. Raffill.)

A. Fls. colored, the tube usually not more than twice the length of the limb.

B. Blossoms small, red, scarlet, or orange the limb narrow and sometimes not much spreading.

*ocellata*, Hook. Rhizomes small and tuberous: st. 1-2 ft.: lvs. rich green above and purple beneath, ovate, strongly serrate, with conspicuous purplish petioles: fls. small, 1 in. long, broad-tubed, spotted with black and yellow, the lobes short and obtuse and well separated, drooping on reddish peduncles. Panama. B.M. 4359.—Fine for foliage.

*coccinea*, Pers. Fig. 105. Height 1-2 ft.: st. reddish: lvs. 3-whorled or opposite, green, ovate-acuminate, serrate: fls. small, scarlet, the corolla twice longer than the erect lanceolate parted calyx on short peduncles. Minute lvs. often borne in the axils. Blooms late. Jamaica.—One of the older types.

*heterophylla*, DC. (*A. ignescens*, Lem. *A. Ghiesbreghtii*, Hort.). Root fibrous: st. 1 ft. or less, dark purple, somewhat hairy: lvs. ovate-acuminate, stalked, serrate, the 2 of each pair usually unequal in size: fls. solitary, on peduncles somewhat longer than the lf.-stalks, long-tubular and slightly curved, with a narrow, nearly equal flaring limb, rich scarlet, yellow within. Mex. B. M. 4871.—This species has tubers like those of the grandiflora section.

*pedunculata*, Benth. Rhizomes scaly: st. 1½-2 ft., hairy, reddish, tuber-bearing: lvs. opposite, small, ovate, sharply serrate, green, hairy, on short reddish stalks: fls. medium size, drooping and dilated upwards, yellow-red with dark markings and a yellow throat, the limb comparatively short; on long (4-5 in.) bracted sts. Guatemala. B.M. 4077.

BB. Blossom large, with wide-flaring limb, mostly violet in main color.

*longiflora*, DC. (*A. Jaureguia*, Warscz.). Fig. 106. Rhizomes root-like and filiform, producing pear-shaped tubers at their ends: st. 1-2 ft., hairy: lvs. opposite or 3-4-whorled, ovate-oblong, serrate, hairy, paler and

106. Achimenes longiflora. (×½)

sometimes tinted beneath: fls. solitary, the corolla salver-shaped, with a long and graceful tube; the limb very large and widely spreading, violet-blue and whitish beneath, the lowest segm. sometimes divided. Guatemala. B.M. 3980. P.M. 9:151.—A popular blue type. Var. *alba máxima*, Hort. Fls. large, white.

**grandiflora**, DC. Fig. 107. Lvs. mostly larger than in last, rusty below: fls. often more than one from an axil, very large, distinctly red-tinged. Mex. B.M. 4012.—A popular red or wine-colored type.

**pätens**, Benth. Height 1-1½ ft.: lvs. unequal, ovate-acuminate, hispid and serrate: fls. violet-blue, with downy calyx, tube shorter than spreading crenate limb. Var. *major*, Hort. Large-flid. Mex.

AA. Fls. pure white, the tube 3-4 times the length of the limb.

**tubiflora**, Nichols., Suppl. p. 483 (*Gloxinia tubiflora*, Hook. *Dolichodeira tubiflora*, Hanst.). St. short, with opposite oblong-acuminate, crenate, short-petioled lvs.: fls. 4 in. long, curved, gibbous at the base, the tube downy, the pedicels opposite and 2 in. long. Argentina. B.M. 3971.—Tubers solid, much like a potato.

*A. amabilis*, Deene. = *Nægelia multiflora*. — *A. atrosanguinea*, Lindl. = *A. foliosa*. — *A. candida*, Lindl. = *Dicytra candida*. — *A. cupreita*, Hook. = *Episcea cupreata*. — *A. foliosa*, Morr. Lvs. cordate, unequal: fls. crimson, with sacate tube 1 in. long, with narrow limb. Guatemala. — *A. gloxiniflora*, Forkel. = *Gloxinia glabrata*. — *A. hirsuta*, DC. Loose grower: st. bulbiferous: fls. rather large, with swollen tube and oblique limb, rose, with yellow and spotted throat. Guatemala. B.M. 4144. P.M. 12:7. Once popular. — *A. Klei*, Paxt. Dwarf: fls. pink-purple. P.M. 16:289. Form of *A. longiflora*. — *A. lanata*, Hanst. (*Scheeria lanata*, Hanst.). Woolly or white-hairy: fl. pinkish or lilac, large and showy. Mex. B.M. 4963 (alt. to 4954). — *A. multiflora*, Gardn. Hairy: lvs. broad-ovate: fls. blue, fringed. Brazil. B.M. 3993. — *A. picta*, Benth. = *Tydaea picta*. — *A. rosea*, Lindl. Fls. pink or rose, the peduncles many-flid. Guatemala. — *A. Scheerii*, Hemsl. (*Scheeria mexicana*, Seem.). Erect, with purple or blue, large and showy fls. Mex. B.M. 4743. — *A. Skinneri*, Gord. = *A. hirsuta*. — Garden forms and hybrids are *A. floribunda*, *A. intermedia*, *A. Jayii*, *A. Mountfordii*, *A. nage-lio des*, *A. nana*, *A. venusta* (P.M. 15:121), *A. Verschaffeltii*.

L. H. B.

**ÄCHLYS** (the goddess of obscurity). *Berberidaceæ*. Hardy herbaceous perennial allied to the may-apple, and sometimes so called where wild. Lvs. all radical, with 3 lfts.: fls. minute, apetalous, numerous, spicate, on a slender scape: fr. very small, at first pulpy but becoming dry.—Species 2, one of them Japanese.

**triphylla**, DC. Rootstock terminated by a strong, scaly winter-bud: lvs. 1 or 2, on petioles 1 ft. or more long; lfts. fan-shaped, sinuate-dentate, 2½ x 5 in.: scape 1 ft. long: spike 1 in. long. Spring. Calif. to Brit. Col., in shady woods.—An interesting and delicate plant. Intro. 1881.

107. *Achimenes grandiflora*. (X¼)

**ÄCHRAS**: *Sapodillo*.

**ACHYRANTHES**: *Iresine*.

**ACIDANTHÈRA** (from *akis*, a cusp, and *anthera*, an anther, in allusion to cuspidate anthers). *Iridaceæ*. Tender herbaceous perennials.

Leaves many, linear, ensiform, 1-1½ ft. long: spikes 3-6-flid., simple, lax: fls. long-tubed, the tube slightly dilated upwards; stamens unilateral, inserted at or below the throat: corms roundish, flattened, covered with a matted fiber. Natives of Trop. and S. Afr., and intermediate between *Gladiolus* and *Ixia*.

The propagation is by seed or by the numerous corms.

**bicolor**, Hochst. Fig. 108. St. 15-18 in.: fls. creamy white, blotched chocolate-brown within, fragrant: corms ½-1 in. diam. Abyssinia. G.F. 1:486, 487 (adapted in Fig. 108). Gn. 47:343. G.C. III. 20:393. Mn. 8:11.—Requires a somewhat stiffer soil than the tender species of *gladiolus*. May be grown in a tub outdoors during summer, and flowered within during Oct. Several corms in a large pot give good results. Corms should be dried as soon as lifted, to prevent rot.

*A. equinoctialis*, Baker. St. 3-4 ft., stout, stiffly erect: lvs. strongly ribbed: fls. about 6 in. a distichous spike, the tube 5-6 in. long, white, blotched crimson or purple within: corms large. Sierra Leone. B.M. 7393. May be a stronger-growing and more tropical form of the above. Requires warmhouse culture.—*A. cándida*, Rendle. A slender, erect, leafy herb: fls. white, very sweet-scented. Trop. E. Afr. B.M. 7879.

N. TAYLOR.†

**ACINÈTA** (*immovable*, referring to the jointless lip). *Orchidaceæ*. Epiphytic hothouse orchids.

Pseudobulbs conic or ovate, with the large plicate-veined lvs. articulated to the summit: fls. fleshy, borne in pendulous racemes on lateral leafless scapes; sepals broad, equal, finally somewhat spreading; petals similar to the sepals but smaller; lip fleshy, continuous with the base of the column, the middle lobe continuous or articulated, entire or 3-lobed; pollinia 2.—About 10 species, distributed from Mex. to northern S. Amer.

These plants require a warm house and plenty of moisture during the growing season, with a decided rest, to make them flower. They need to be cultivated in wooden baskets and suspended from the roof of the house, as the flower-spikes are always produced from the base of the bulbs and there should be no hindrance in the way of crocks to prevent their egress. The rooting material may be peat fiber only, and not a great quantity under the plants, but plenty around them. With basket culture of orchids, it is very necessary, once a week in the growing season, to take the plants down and give a soaking by immersion, in addition to the ordinary spraying overhead from day to day; in this way alone can one be sure of the proper growing conditions. In winter, much less water is required. Propagation is by division of the plants in spring. (Orpet.)

**Bärkeri**, Lindl. (*Peristèria Bärkeri*, Batem.). Fig. 109. Pseudobulbs conic, 4-5 in. long, usually bearing 3 or more lvs. 2-3 ft. long: fls. yellow, striped with red-brown, 12 or more, in pendulous racemes. Mex. B.M. 4203. I.H. 2:44. Gn. 54, p. 332. P.M. 14:145. G.M. 40:697.

**Humboldtii**, Lindl. (*Peristèria Humboldtii*, Lindl. *A. superba*, Reichb.). Pseudobulbs ovate, about 3 in. long, bearing 3 or 4 lvs. about 1 ft. long: fls. chocolate, spotted with crimson, 6 or more, in pendulous racemes. Mts. of N. S. Amer. Gn. 3:11; 32, p. 157; 25, p. 482. Var. **Còlmanii**, Hort. Fls. profusely spotted with purple.

*A. chrysantha*, Lindl. Fls. golden yellow, the lip whitish, and the column purplish or crimson. Mex.—*A. densa*, Lindl. (*A. Warszewiczii*, Klotzsch). Fls. in a dense raceme, pale yellow, externally spotted with reddish brown, fragrant; lip yellow, marked with crimson. Costa Rica. B.M. 7143.—*A. Hrubyanæ*, Reichb. Fls. white, the lip spotted with purple. Colombia.—*A. Moorei*, Rolfe. Fls. straw-colored, sub-globose, thickly brown-spotted:

the lip fleshy, the lateral lobes obliquely reniform, the midlobe oblong, blunt. S. Amer. B.M. 8392.—*A. sulcata*, Reichb. f. Fls. yellow; otherwise similar to *A. Humboldtii*.

GEORGE V. NASH. †

**ACIPHÝLLA** (Greek for *sharp-leaved*). *Umbelliferae*. About a dozen or so herbs, all of New Zealand except 2 in the mts. of Austral., sometimes seen in rock-gardens but apparently not grown in N. Amer. Plant erect, and rigid, somewhat spiny, with thick pinnate lvs., and the small fls. in compound bracted umbels. Some of them are large plants. Allied to *Ligusticum*.

**ACIS:** *Leucojum*.

**ACOCANTHÈRA** (*mucronate anthers*). Sometimes spelled *Acocanthèra*. Syn., *Toxicophlœa*. *Apocynaceæ*. A genus consisting of 5 species of African shrubs, cult. in greenhouses N., and outdoors in Fla. and Calif. Fls. with the odor of jasmine, lasting; calyx 5-parted, glandless; corolla 5-parted, its 5 lobes twisted. In Cent. Fla., they require some protection during the winter. Prop. by cuttings taken early in the spring.

*spectabilis*, G. Don (*Toxicophlœa spectabilis*, Soud. *T. Thünbergii*, Hort., not Harv.). WINTER-SWEET. Lvs. 3-5 in. long, short petiolate, leathery, elliptic, acute, shining above; fls. numerous, in dense, axillary, branched cymes, which are sometimes 2 ft. long, pure white, very sweet-scented; fr. blackish purple, almost as large as an olive and of the same form; contains one large, nut-like seed. Natal. B.M. 6359. R.H. 1879:270. G.F.6:185. G.C. 1872:363.—Poisonous. The plants cult. under this name are said by trade catalogues to have pink or violet fls.

*venenata*, G. Don (*Toxicophlœa cestroides*, DC. *T. Thünbergii*, Harv., not Hort.). BUSHMAN'S POISON. Fls. white or rose. Differs from the above in the

marked venation of the lvs., its fls. a third smaller, its calyx not pubescent, and its corolla-limb less widely spreading. I. H. 32: 553. R.H. 1880:370.

N. TAYLOR. †

**ACCELORRHÂPHE** (name of uncertain origin). *Palmaeæ*, tribe *Corypheæ*. A genus of 2 species of American palms allied to *Brahea* and distinguished from it by technical characters of the albumen. *A. Wrightii*, Wendl., a graceful, slender palm with almost orbicular-bladed lvs.: trunk thin, scarcely exceeding 4-7 ft.: lvs. long-petioled, made up of about 50 narrow segms., all united at the base. Cuba and Honduras.—Has been cult. outdoors at the botanic gardens at Buitenzorg and Calcutta and in extreme S. Fla. Unique but little known outside of botanic gardens. Grows with great vigor in rich moist soil.

N. TAYLOR.

**ACONITE, WINTER:** *Eranthis*.

**ACONÏTUM.** *Ranunculaceæ*. ACONITE. MONKSHOOD. WOLFSBANE. A group of hardy ornamental, perennial herbs, much used in borders and masses for their showy flowers and effective foliage.

Root tuberous, turnip-shaped, or

thick-fibrous: st. tall or long, erect, ascending or trailing; lvs. palmately divided or cleft and cut-lobed; fls. large, irregular, showy; sepals 5, the large upper sepal in shape of a hood or helmet; petals 2-5, small; stamens numerous; carpels 3-5, sessile, many-ovuled, forming follicles when ripened. The number of species varies from 18-80, with different botanists. Native in mountain regions of Eu., Temp. Asia, and 5 in N. Amer. Reichenbach Monographia Generis Aconiti, Leipsic, 1820, 2 vols., folio; Illustratio Specierum Aconiti, Leipsic, 1822-7, folio. Many species are planted in European gardens, but only a few have been much used in Amer.

The aconitums yield important drugs, although none of them is grown for this purpose in this country. The officinal aconite is derived from the roots of *A. Napellus* from England and continental Europe. The leaves are also used for medicinal purposes. *A. japonicum* yields Japanese aconite; *A. chinense*, the Chinese aconite; and *A. ferox* the "bish" or Nepaul aconite. The poisonous alkaloid *aconitin* is secured from *A. Napellus*, and similar alkaloids from *A. ferox*, *A. luridum* and *A. palmatum*, of India. *A. Fischeri*, *A. Lycotomum*, *A. septentrionale*. Not all these species are described here, as they are not horticultural subjects.

These plants present a pleasing contrast to the yellow helianthus and rudbeckias, the white of *Phlox paniculata*, to *Chrysanthemum maximum* and *Anemone japonica*. They are also effective for mixing in on shrub borders. The first season, these herbs do not attain their full perfection. Aconitums should be left undisturbed as long as possible. They will survive the northern winters if kept under a leaf-covering, while for the central part of the country, straw or evergreen boughs are sufficient protection.

The following species do well in any garden land, but respond better if given very rich soil. They thrive in open sun, but flowers last longer in shaded places. Aconites should never be planted in or too near the kitchen-garden or the children's garden, as the roots and some of the flowers have a deadly poison. They are suited to the back of the border, as they are tall.

Propagation is effected easily by division of roots in either late fall or early spring; also by seeds sown as soon as mature, in warm spring, in the North, the seeds may be started in small seed-beds in the spring and then be transplanted when the seedlings are about 2 inches high. In the Central States and southward, a year is gained by sowing the seed in late summer or early fall.

A. Roots globular-tuberous.

B. Lvs. deeply cut, but not to the base.

*Fischeri*, Reichb. (*A. columbianum*, Nutt. *A. californicum*, Hort.). Sts. 4-6 ft.: lvs. large, smooth, 3-

108. *Acidanthera bicolor*. (× 1/4)

109. *Acineta Barkeri*. (× 1/6)

parted, attractive; segms. much cut and divided: fls. numerous, pale blue, panicle, pedicels pubescent; helmets hemispherico-conical. Autumn. N. Amer. and Asia. F.S.R. 1: 214. R.B.33: 205 (as *A. sinensis* var. *bicolor*). Var. *Wilsonii* (*A. Wilsonii*, Stapf), is a very tall form, with violet fls. R.H. 1910, p. 223. Gn. W. 21: 197. Gn. 64, p. 339. B.M. 7130 (as *A. Fischeri*).

**Cammàrum**, Linn. (*A. decorum*, Reichb. *A. exaltatum*, Bernh.). St. 3-4 ft.: lvs. with short, bluntish lobes: fls. purple or blue; panicles or loose spikes few-fl'd; helmet hemispherical, closed. July-Sept. Hungary. Intro. 1889.—*A. Storkianum*, Reichb., is a dwarf form of this, with fewer fls. and somewhat fibrous roots.

**uncinatum**, Linn. WILD MONKSHOOD. Fig. 110. St. slender, 3-5 ft., inclined to climb: lvs. thick, deeply cut into 3-5 cut-toothed lobes: fls. loosely panicle, but crowded at the apex, blue, pubescent, 1 in. broad; helmet erect, nearly as broad as long, obtusely conical: follicles 3. June-Sept. Low grounds of Pa., S. and W. Japan. Mn. 4: 81.—Much planted now.

BB. Lvs. divided to the base.

**variegatum**, Linn. Erect, 1-6 ft.: lvs. variously divided into usually broad lobes and cut divisions; lower petioles long, others short or none: fls. in a loose panicle or raceme, blue, varying to whitish, rather smooth; helmet higher than wide, top curved forward; visor pointed, horizontal or ascending. July. Eu.—*A. album*, Ait., is a pure white-fl'd. form of this, with rather fibrous roots. *A. volubile*, var. *latisectum*, Hort., is a twining form of *A. variegatum*. The plants are allowed to ramble naturally or to climb on arbors; height 8 ft. Var. *tensisectum*, Hort. Sts. slender though not twining: large blue fls. Manchuria.

AA. Roots long-tuberous.

B. Carpels usually 5.

**japonicum**, Decne. St. erect, 3-4 ft., smooth: lvs. dark green, shining, petioled; lobes 2-3 times cut, the parts blunt and deeply toothed: fls. large, deep blue or violet, tinged with red, on loose panicles with ascending branches; helmet conical; beak abruptly pointed: follicles 5. July-Sept. Japan. Intro. 1889. R.H. 1851, p. 475. Var. **cæruleum**, Hort. Fls. very abundant; panicles shortened.

BB. Carpels 3 or 4.

**Napellus**, Linn. (*A. turicum*, Jacq. *A. pyramidale*, Mill. *A. inunctum*, Koch). TRUE MONKSHOOD. OFFICIAL ACONITE. Fig. 111. The best known and most poisonous species, and used in medicine. Sts. erect, 3-4 ft.: lvs. divided to the base, and cleft 2-3 times into linear lobes: fls. blue, in a raceme; peduncles erect, pubescent; helmet broad and low, gaping, smoothish: fr. 3-4-celled. June, July. Gn. M. 4: 34. R.V. 8: 2. Gn. 12, p. 302.—Very many varieties, differing in shade of fls., often mottled or lined with white. Var. *album* is nearly white. Var. *bicolor* and var. *versicolor*, much used in gardens for the large blue and white fls. Reichenbach has divided this species into 20-30 species. *A. Halleri* is one of his divisions appearing in catalogues. B.M. 8152 (as var. *Emnicus*).

111. *Aconitum Napellus*.  
( $\times \frac{1}{2}$ )

110. *Aconitum uncinatum*. ( $\times \frac{1}{2}$ )

AAA. Roots in the form of a scaly, elongated bulb, or somewhat fibrous.

B. Sepals deciduous.

**autumnale**, Reichb. AUTUMN ACONITE. Fig. 112. St. 3-5 ft.: lvs. pedately 5-lobed: fls. in a simple spike, becoming a panicle, blue, lilac, or whitish; helmet closed. Sept.-Nov. N. China.

**Lycótonum**, Linn. (*A. barbátum*, Patr. *A. squarrósum*, *A. ochroleucum*, Willd.). PALE YELLOW WOLFSBANE. St. slender, simple, 3-6 ft.: lvs. deeply cut into 5-9 lobes; long petioles and under ribs pubescent: fls. yellow or whitish, in racemes; helmet a pinched elongated cone; middle sepals usually bearded: fr. usually 3-celled. June-Sept. Eu., Siberia. B.M. 2570. G.M. 34: 124.

BB. Sepals persistent.

**Anthòra**, Linn. (*A. pyrenæicum*, Pall.). St. 1-2 ft.: lvs. parted almost to the base, parts deeply cut and lobed, more or less hispid beneath, smoothish above; petioles long: fls. in lateral and terminal racemes, pale yellow, often large; racemes or panicles generally pubescent; spur bent back or hooked; helmet arched, but cylindrical at base: follicles 5. June, July. S. Eu. B.M. 2654. Var. **aureum**, Hort., and several other varieties.

*A. chinense*, Sieb. Deep blue spike of fls. from the axil of every lf.: foliage bold and handsome. B.M. 3852. P.M. 5: 3.—*A. delphinifolium*, DC. Allied to *A. Napellus*.—*A. gymnándrum*, Maxim., is a good species. B.M. 8113.—*A. Hemsleyanum*, E. Pritz. Sts. twining and rambling. China. R.B. 33, p. 328. G. 32: 39.—*A. heterophyllum*, Wall. Fls. yellow and violet. Used as a tonic medicine in India. B.M. 6092.—*A. noveboracense*, Gray. Probably=*A. paniculatum*.—*A. paniculatum*, Lam. (*A. toxicum*, Reichb.). Has blue fls. L.B.C. 9: 810.—*A. pyramidale*, Mill. Form of *A. Napellus*.—*A. reclinatum*, Gray, of the Alleghanies, with white fls. and large lvs., is worth cult.—*A. scapòsum* var. *pyramidale*, Franch. Lvs. broadly 5-lobed: fls. very numerous,  $\frac{3}{4}$ -1 in. long, heliotrope, greenish yellow at the throat. Cent. China.—*A. septentrionale* var. *capricum*, Sims, is a beautiful purple kind closely related to *A. Lycotonom*. B.M. 2196.—*A. Storkianum*, Hort., may be a form of *A. variegatum*, with the lvs. so much cut up as to give a pinnate form.—*A. tortuosum*, Willd. Once listed in the trade; not now found.

K. C. DAVIS.

**ÁCORUS** (ancient name of unknown meaning). *Aracæx*. Hardy, herbaceous water-loving plants. Lvs. sword-shaped, erect: spadix appearing lateral, with no true spathe; fls. inconspicuous. They thrive best in moist soil, and may be grown in shallow water or on dry land. Prop. easily in spring or autumn by division.

**Cálamus**, Linn. SWEET FLAG. Height 2 ft.: root-stock horizontal, pungent, aromatic: fls. early summer. N. Amer., Eu. V. 2: 198. Var. **variegátus**, Hort. Lvs. striped deep yellow when young, fading to a paler color later in summer. Eu.—Commoner in cult. than the type.

**gramíneus**, Soland. Height 8-12 in. Much smaller than *A. Calamus*, forming compact, grassy tufts. Japan. Var. **variegátus**, Hort. Lvs. striped white.—Used in hanging-baskets, vases, rockeries and for cutting. Often grown indoors.

*A. japonicus argenteò-striátus*, Hort., and *A. japonicus folia variegátus*, Hort., are catalogue names, and are referable, from description, to *A. gramineus*, Soland. var. *variegatus*, Hort.

GEORGE V. NASH.†

**ACRÍOPSIS** (Greek combination for *top* and *eye*). *Orchidaceæ*. A few epiphytic orchids from the E. Indies, with panicles of small fls. with colors in green, pink, yellow and purple, and little known in cult. *A. latifolia*, Rolfe, has very broad lvs. and very small whitish yellow red-striped and spotted fls.

**ACRÍSTA** (origin of name unexplained). *Palmaceæ*, tribe *Arécæ*. A tall palm suitable for planting S.

Leaves pinnate, usually very large, from 10–20 in a terminal crown: infl. usually maturing well below the lvs; the spadix 1-branched, the branches coarse, tapering.—Only 1 species, *A. monticola*, confined to Porto Rico, Cuba and St. Kitts. The nearest relative, the royal palm, differs in having a bulging trunk, and in having 2–3-branched infls. See Bull. Torrey Club, 28:555 (1901).

This palm is not as yet common, but well worthy of a wider cultivation. It resembles the royal palm but is shorter, and has a smooth trunk of uniform diameter. For cultivation see *Palms*.

**monticola**, O. F. Cook. Thirty-five to 45 ft.: trunk smooth, with many ring-like scars: lvs. about 6 ft., the lfts. lanceolate in one plane, equally spaced, and nearly at right angles to the rachis: infl. coming out between the lvs., and by the dropping of latter, appearing well below the lf.-crown at maturity; fls. not well known: fr. with lateral stigma, grayish brown, nearly smooth, obovate,  $\frac{1}{2} \times 1$  in. Bull. Torrey Club, 28, pl. 44 (as *Thrincoma alta*).

N. TAYLOR.

**ACROCLINIUM**: *Helipterum*.

112. *Aconitum autumnale*.  
( $\times \frac{1}{2}$ )

means a *tuft of leaves at the top*). *Palmaceæ*, tribe *Bactridinæ*. A showy genus of American palms. Not popular in the trade because of their spiny habit and rather unattractive young state. The adult plants, however, are very graceful.

Leaflets narrowly linear, long, usually obliquely acuminate, the margins naked and recurved, the midrib often spiny on lower sides of lfts.; rachis and petioles usually hairy, always more or less spiny: fls. yellowish, monœcious, the spathes ultimately becoming woody; calyx small, of 3 ovate sepals; corolla of 3 oblong-lanceolate or ovate petals: fr. usually about 1 in. diam., glabrous or sometimes prickly or tomentose.—There are only 8 species, all natives of Trop. Amer. except *A. Totai*. Most closely related to *Cocos*, from which the Amer. species differ in having spines. See G.C. II. 22:427. Bull. Torrey Club, 28:565.

These palms are usually spiny and have large, terminal, pinnate leaves. All except *A. Totai* should be grown in a greenhouse, with a night temperature not lower than 60°. They should be potted in soil similar to that for the coconuts, and, if possible, planted out directly. It has been found by some that overpotting the young plants is a danger likely to be incurred. The palms grow slowly and should not be transferred to a new pot until they become almost pot-bound.

Propagation is by suckers, which come freely in most species. Seeds are not known in cultivation for any of the species except *A. sclerocarpa*.

A. *Trunk greater in diam. a few ft. above the ground than elsewhere; spines 5–6 in. long.*

**mèdia**, O. F. Cook. Trunk 20–30 ft., conspicuously thickened above the ground; spines slender, black, mostly confined to the lower half of the internodes: lvs. opening about as they are pushed out, not spire-like, as in the royal palm, forming a dense crown; lfts. coming out from the rachis at all angles: fr. about  $1\frac{1}{2}$  in. diam., fibrous on the outside, yellowish.—A magnificent palm, known only from U. S. and not common outside of fanciers' collections and botanic gardens.

AA. *Trunks of essentially uniform diam. near base; spines 1–4 in. long.*

B. *Lvs. more or less spreading, and sometimes drooping; trunk predominately spiny throughout, 10–20 ft.*

**mexicana**, Karw. Trunk brown-woolly, and covered with stout spines 1–3 in. long: lvs. terminal. 6–8 ft. long, the sheathing bases armed with long black spines; rachis and petiole spiny; lfts. rather stiff, linear, and shining: spathe very spiny: fr. globose, about 1 in. diam. Mex.—This palm is said to be perfectly hardy at Santa Barbara, Calif.

BB. *Lvs. more or less stiff and erect: trunks predominately more spiny above than below, 30–40 ft.*

**sclerocarpa**, Mart. (*A. aculeata*, Lodd.). Fig. 113. Height 30–45 ft.: trunk cylindrical, about 1 ft. thick, with black spines 2–4 in. long, more common toward the summit than below: lvs. 12–15 ft. long, more or less erect; segms. in irregular groups of 2 or 3, 2–3 ft. long,  $\frac{3}{4}$ –1 in. wide, smooth and shining above, whitish, appressed-pilose below, entirely free of spines, except along the midrib on the under side; rachis tomentose, and bearing a few small spines: fr. yellowish, a little more than 1 in. diam. Brazil to W. Indies. I.H. 15:547.—Not hardy at Oneco, Fla. Cult. in Calif. but apparently not out-of-doors. "Gru-gru" and "corozo" are native names of this palm.

**Totai**, Mart. Trunk 30–40 ft., about 10–15 in. diam., clothed with stout spines, especially near the summit: lvs. not so large as in the preceding, green and glabrous on both sides; petioles tomentose and a little spiny: spathe very spiny, the fls. yellowish: fr. globose, yellow, a little less than 1 in. diam., scarcely known in cult. specimens. Paraguay and Argentine, perhaps in Brazil.—May be grown in coolhouse. Offered in 1912 by Reasoner Bros., Oneco, Fla.

*A. havanensis*, Hort. A slow-growing, thorny plant, of which little is known; a trade name.

N. TAYLOR.

**ACROPÈRA**: *Gongora*.

**ACROPHYLLUM** (Greek, *top* and *leaf*). *Cunoniaceæ*. A monotypic genus allied to *Cunonia*, containing the Australian evergreen shrub, *A. venosum*, Benth. (*A. verticillatum*, Hook.), excellent for spring flowering in the coolhouse. Prop. by cuttings in early summer. Let the plant rest during summer. Do not expose to frost. It produces many pinkish fls. in dense spicate whorls near the top of the branches. Lvs. in 3's, nearly all terminal and above the fls., sessile, dentate or serrate, cordate and acute: fls. with 5 petals and 10 stamens: 4–6 ft. B.M. 4050 (as *A. verticillatum*).

N. TAYLOR.†

**ACROSPIRA** (name of ambiguous application) *Liliacæ*. One species, *A. asphodeloides*, Welw., from Trop. Afr., with the habit of *Eremurus*, and white fls. in spikes; has been offered in Eu.

**ACRÓSTICHUM** (derivation uncertain). *Polyodiaceæ*. As properly delimited, a small genus of coarse tropical swamp ferns, sometimes grown under glass.

Stem stout, erect; lvs. clustered, erect, once-pinnate, 3-8 ft. high; sporangia completely covering the backs of some or all the pinnæ of the fertile lvs.

**aureum**, Linn. Fig. 114. Three to 8 ft. long, with pinnæ 6-10 in. long, short-stalked, coriaceous; sporangia only on upper pinnæ of fertile lvs. Fla. to Brazil and in the tropics of the Old World. S. 1:187.—Strong-growing. One of the best. Should be treated as an aquatic.

**excelsum**, Maxon (*A. lomarioides*, Jenman). Similar in size to preceding; sterile lvs. also similar. Distinguished by having sporangia on all the pinnæ of the fertile lvs. Fla. to Brazil.

*Acrostichum* has been considered to include a much larger array of species, including, as in the previous editions of the *Cyclopedia of Horticulture*, ferns of very diverse form and habit of growth. Fern students, however, are now united in distributing the species of *Acrostichum* as formerly understood among several genera. Thus the species included in *Acrostichum* in the former *Cyclopedia* are here grouped in several genera as follows: **Acrostichum**: (as above).

**Elaphoglossum**: *conforme*, *crinitum*, *flaccidum*, *gorgoneum*, *muscosum*, *pilosum*, *reticulatum*, *simplex*, *squamosum*, *ricosum*, *villosum*; **Leptochilus**: *alienum*, *nicotianæfolium*; **Olfersia**: *cervina*; **Polybotrya**: *osmundacea*; **Rhipidopteris**: *peltata*; **Stenochlæna**: *scandens*, *scrobifolia*.

R. C. BENEDICT.

**ACTÆA** (ancient name of the elder, transferred by Linnaeus). *Ranunculacææ*. **ACTEA**. **BANEERRY**. **COHOSH**. Native hardy herbaceous perennials. Sometimes offered in collections of hardy border plants. Not to be confounded with blue cohosh, which is *Caulophyllum*.

Leaflets of the twice- or thrice-ternate lvs. ovate, sharply cleft, and cut-toothed; fls. small, white, in terminal racemes; sepals 4 or 5, falling early; petals 4-10, clawed; stamens many; fr. a many-seeded berry.

*Acteas* are grown chiefly for the showy spikes of small white flowers in spring, and handsome clusters of berries in autumn. Useful for rockery and wild garden, or for clumps and borders. They thrive in rich woods and shade.

Propagation is by seeds sown in late fall to germinate the next spring or sown in spring. Old seed is said not to germinate well. A more satisfactory means of propagation is by root-division in spring.

**álba**, Mill. (*A. rubra*, Bigel.). **WHITE BANEERRY**. Height 1-1½ ft.: much like *A. spicata*, but the lfts. more cut, teeth and points sharper; plant smoother; fls. white, in an oblong raceme, and a week or two later; pedicels in fr. very thick, turning red; berries white, ovate-oblong, often purplish at the end. N. states.

**spicata**, Linn. **COHOSH**. **HERB-CHRISTOPHER**. Plant 1-2 ft.: lvs. bi- or triternate, serrated; fls. white or bluish, in ovate racemes in Apr. to June; berries purplish black, oblong. Eu., Japan.—Less cult. than the red-fruited variety. Figured as *A. racemosa* in G.W. 5:4 and 14:507. Figured as *A. japonica* in G.M. 50:28 and G.W. 5:3 and 15:173.

**Var. rubra**, Ait. (*A. rubra*, Willd.). **RED BANEERRY**. Rather taller than *A. álba*: lvs. bi- or triternate, serrated; fl.-cluster white, larger than in *A. spicata*; berries bright red, very handsome. Northern states.

**Var. arguta**, Torr. Sts. rather taller than *var. rubra*: lfts. very deeply incised; racemes elongated in age; berries either red or white. Neb., W., and N. W.

K. C. DAVIS.

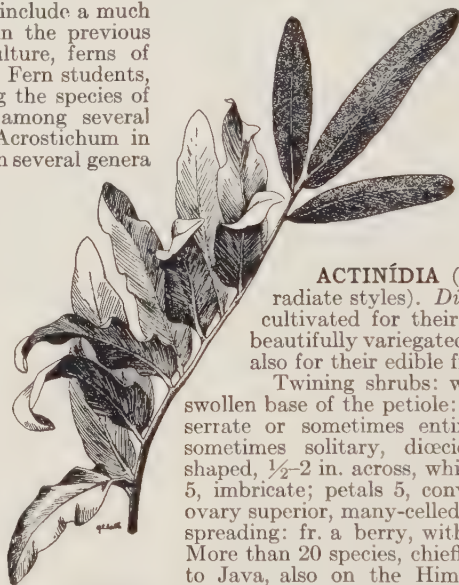

**ACTINÉLLA** (Greek, *small-rayed*). *Tetraneüris*, Greene. *Compósitæ*. Hardy perennials from W. N. Amer., for cult. in alpine gardens and the open border. Height 6-12 in.: fls. tubular and radiate, yellow; bracts of the involucre appressed; rays 3-toothed.—Of easy culture in light soil. Prop. by division of the roots in spring, or by seeds.

**grandiflora**, Torr. & Gray (*Rydbergia grandiflora*, Greene). Plant densely woolly; lower lvs. pinnately or bipinnately parted, with margined petioles from broad, scarious bases; upper cauline lvs. simple or sparingly divided; fls. 2-3 in. wide; summer.—A pretty alpine plant.

**scaposa**, Nutt. Plant villous: lvs. radical, linear-spatulate, 2-3 in. long, punctate, entire; fls. 1 in. wide; scapes single, leafless, 1-flid., 3-9 in. long.

*A. lanata*, Pursh=*Eriophyllum cæspitosum*.—*A. lanata*, Nutt. Short, densely hairy lvs. with scape 5-9 in. long. Summer.

N. TAYLOR.†

114. *Acrostichum aureum*. (×¼)

**ACTINÍDIA** (*aktis*, ray; referring to the radiate styles). *Dilleniaceæ*. Climbing shrubs cultivated for their handsome foliage which is beautifully variegated in some species, and a few also for their edible fruit.

Twining shrubs: winter-buds inclosed in the swollen base of the petiole; lvs. alternate, long-stalked, serrate or sometimes entire; fls. in axillary cymes sometimes solitary, diceious or polygamous, cup-shaped, ½-2 in. across, white or rarely reddish; sepals 5, imbricate; petals 5, convolute; stamens numerous; ovary superior, many-celled; styles numerous, ray-like spreading; fr. a berry, with numerous small seeds.—More than 20 species, chiefly in E. Asia from Saghalin to Java, also on the Himalayas. A revision of the genus has been published by Dunn in Jour. Linn. Soc. Bot. 39:394-410 (1911).

About 7 species are in cultivation; of these *A. Kolomikta* is the hardiest, growing as far north as eastern Canada; *A. arguta* and *A. polygama* are hardy in Massachusetts, while *A. chinensis*, which is the most beautiful of all, and *A. coriacea*, are hardy only south of Washington, but may be grown farther north if taken down in autumn and covered with leaves. *A. arguta* is excellent for covering arbors, trellises, walls and the like and is remarkably free from insects and fungi. *A. Kolomikta* and *A. polygama* show a very striking silvery white or pinkish variegation of the foliage, which is more pronounced in the staminate plant. *A. arguta* and *A. chinensis* are also worth cultivating for their edible fruits, particularly the latter, which has fruits up to 2 inches long, of a gooseberry-like flavor; to obtain fruit, it is necessary to plant both sexes or a plant with polygamous flowers. *A. polygama*, and, in a lesser degree, *A. Kolomikta*, attract cats and are often destroyed by them if not protected by screens.

The actinidias prefer somewhat moist and rich soil and grow as well in a sunny as in a half-shady position.

Propagation is by seeds, which are sown in spring and germinate readily; also by cuttings, of half-ripened wood in summer or by hardwood cuttings under glass, and also by layers.

- A. Branchlets glabrous: lvs. glabrous beneath or only pubescent on the veins, acuminate.  
 B. Lvs. dark green, shining above, chartaceous, never variegated: anthers dark purple.

**arguta**, Miq. (*A. polygama*, Lauche, not Miq. *A. volubilis*, Carr., not Miq. *A. rufa*, Miq.). Fig. 115. High-climbing: branches with brown lamellate pith: lvs. broad-elliptic or broadly ovate, 4-5 in. long, cuneate to subcordate at the base, setosely appressed serrate, glabrous beneath except the setose midrib:

115. *Actinidia arguta*. ( $\times \frac{1}{3}$ )

fls. 3 or more, white,  $\frac{3}{4}$  in. across; sepals elliptic-oblong, tomentulose; petals brownish at the base: fr. subglobose, greenish yellow, about an inch long, sweet. June. Japan, Korea, Manchuria. L.I. 25. R.H. 1874, p. 394. B.M. 7497 (as *A. polygama*). A.G. 1891:147. M.D.G. 1895:97; 1898:378. G. 29:503.

BB. Lvs. bright green, membranous, often variegated: anthers yellow: fls. 1-3.

**polygama**, Maxim. To 25 ft.: pith of branches solid, white: lvs. broadly ovate to ovate-oblong, 3-6 in. long, rounded or subcordate at the base, appressed serrate, mostly setose on the veins beneath, variegation white or yellowish: fls. white,  $\frac{3}{4}$  in. across; ovary bottle-shaped: fr. yellow, bitter. June. Japan, Korea, Manchuria to Cent. and W. China.—Known as silver vine on account of the beautiful silvery white color of the young lvs. of the staminate plant.

**Kolomikta**, Maxim. Climbing 15 ft. high: pith of branches lamellate, brown: lvs. ovate-oblong, 4-5 in. long, rounded or cordate, unequally setosely serrate, pubescent on the veins beneath, variegation white or pink: fls. white,  $\frac{3}{4}$  in. across; ovary cylindric: fr. oblong-ovoid, blue, sweet. June. Japan, Saghalin, Manchuria, Cent. and W. China. R.H. 1898:36. M.D.G. 1896:397. G.W. 3, p. 61.—The staminate plant is very striking with its beautifully white and carmine variegated young lvs.

AA. Branchlets densely hairy: lvs. tomentose beneath, usually rounded or emarginate at the apex.

**chinensis**, Planch. Climbing, to 25 ft.: hairs of young branchlets and lvs. bright red; pith of branches lamellate: lvs. orbicular or oval, cordate, firm, 3-5 in. long, ciliate-serrulate, finally glabrous above and dark green, whitish beneath: fls. several, creamy white,  $1\frac{1}{2}$ -2 in. across: fr. ovoid or subglobose, 1-2 in. long, hairy, edible. China. G.C. III. 46:77 and 79. R.H. 1909, p. 473. J.H.S. 1903:59. H.I. 16:1593.—The most beautiful of the actinidias with the largest fls. and a

promising fruiting vine; the frs. have the flavor of a gooseberry.

**A. callosa**, Lindl. Similar to *A. Kolomikta*. Branchlets with conspicuous lenticels, with lamellate pith: lvs. oval to oblong, 3-5 in. long, serrulate, quite glabrous: fls. white,  $\frac{1}{2}$  in. across: fr. ovoid, spotted, 1 in. long. China.—*A. coriacea*, Dunn. Allied to the preceding species. Lvs. coriaceous, oblong to lanceolate, remotely serrate, 3-4 in. long; petioles less than 1 in. long: fls. several, reddish: fr. ovoid, spotted,  $\frac{1}{2}$ - $\frac{3}{4}$  in. long. China. Recently offered under the name of *A. Henryi*, which is a totally different species, allied to *A. chinensis*.—*A. melanandra*, Franch. Allied to *A. arguta*. Lvs. ovate-oblong or oblong, closely serrulate: staminate corymbs many-fl.; petals greenish at the base: fr. purple. China.

ALFRED REHDER.

**ACTINÓLEPIS** (Greek, a scale-like ray). *Compositæ*. About 6-8 species of hardy annuals, mostly from Calif.; freely branching, and mostly yellow-fl. The fls. are in pedunculate heads at the tips of the branches; rays usually 2-3-toothed, in one series: lvs. opposite. Considered by de Della Torre and Harms to be a section of the genus *Eriophyllum*, and by Gray to belong properly to *Baeria*.

**coronaria**, Gray (*Shörtia californica*, Hort. *Baeria coronaria*, Gray). Fig. 116. Lvs. opposite, except the upper ones, 2 in. or more long, pinnately, or the lower ones bipinnately, parted into linear, narrow divisions: pappus of awned or of muticous, often erose paleæ, rarely wanting. B.M. 3828 (as *Hymenozys californica*).—One of the prettiest of annual fls., and deserving of greater popularity. Excellent for edging. An everlasting.

N. TAYLOR.†

**ACTINÓMERIS** (from Greek *aktis*, ray, and *meris*, part, alluding to the irregularity of the rays). *Compositæ*. Native hardy herbaceous perennials suitable for wild gardens and shrubbery.

Tall, branching, yellow-fl. herbs, with aspect of native sunflowers, but with smaller fls.: lvs. often decurrent on the stem: fls. in corymbose or solitary heads, composed of both ray and tubular fls.—Cult. like *Helianthus*. Prop. by division.

**squarrosa**, Nutt. (*Verbesina alternifolia*, Linn.). Height 4-8 ft.: lvs. lance-oblong, acuminate, toothed, subpetiolate, tapering to both ends: fls. numerous, corymbed, yellow, 1-2 in. across; rays 2-10, irregular. Autumn. E. N. Amer.

*A. helianthoides*, Nutt. (*Verbesina helianthoides*, Michx.). Lvs. silky villous underneath: rays about 8, usually more than in *A. squarrosa*. Mn. 4:129.—*A. procera*, Steud., is only a taller form of *A. squarrosa*.

N. TAYLOR.†

**ACTINÓPTERIS** (*aktis*, ray, and *pterus*, the leaves radiately cut). Syn., *Actinópteris*. *Polypodiaceæ*. Greenhouse ferns from India, resembling miniature fan-palms. The sori are linear-elongate and submarginal, and covered with indusia. *A. radiata*, Link (*A. australis*, Linn. f.) is the only recognized species. Apparently not in the horticultural trade.

**ACTINOSTÉMMMA** (ray and wreath or stems). *Cucurbitaceæ*. Three or 4 species of climbing or running plants from China and Japan, of which *A. paniculatum*, Maxim., has been grown in European collections. It is a hardy perennial in Cent. Eu., with tuberous roots, palmate lvs. and small fls.; said to thrive in dry and barren places.

116. *Actinolepis coronaria* flower.

**ÀDA** (a complimentary name). *Orchidaceæ*. Epiphytic coolhouse orchids.

Pseudobulbs elongated, bearing at the apex 1-3 coriaceous lvs.: fls. nodding, in a somewhat 1-sided raceme, terminating the lateral leafless scape; sepals nearly equal, free, usually spreading above; petals similar to the sepals but smaller; lip sessile, continuous with the base of the column, entire, shorter than the

sepals; pollinia 2.—Species 2, natives of the Colombian Andes.

*Ada aurantiaca* is a coolhouse orchid and will thrive well with the odontoglossums where they are cultivated; the bright orange-colored blooms add interest to the collection when in spring display. The culture is

117. *Ada aurantiaca*. *a* shows the lip and column. (Plant  $\times \frac{1}{4}$ )

simple if potted in peat fiber with plenty of drainage; sphagnum may be added if it can be made to grow, but if not it becomes sour and inert, and is best left out of the material for cool orchids. Adas are evergreen and should never be dried at the roots as they grow in boggy soil at 8,500 feet elevation in Colombia. There is another species, *A. Lehmannii*, which is very distinct, but since the unfortunate death of Consul Lehmann, it seems never to have been reintroduced to cultivation. (Orpet.)

*aurantiaca*, Lindl. Fig. 117. Pseudobulbs 2–3 in. long, usually somewhat compressed, tapering, bearing 1–3 lvs. up to 12 in. long; fls. cinnabar, the sepals and petals lanceolate, twice as long as the lip. B.M. 5435. C.O., pl. 1. G.C. III. 43:247. F.W. 1873:225. Var. *maculata*, Hort. Sepals and petals spotted with dark brown. C.O., pl. 1a. GEORGE V. NASH.

ADAM-AND-EVE: *Sempervivum tectorum*, and *Aplectrum hyemale*.

ADAMÀRA (from a personal name). *Orchidaceæ*. A name proposed by the Royal Horticultural Society of London to cover the multigeneric hybrids of the genera *Brassavola*, *Cattleya*, *Epidendrum* and *Lælia*, the name *Linneara* being proposed for combinations of certain other orchid genera. The International Congress of Horticulture held at Brussels in 1910 adopted *Linneara* for four genera named above, and legislated that "multigeneric hybrids receive a conventional generic name, preferably that of a distinguished man, to which is added the termination *ara*. A distinct generic name will be formed for each different combination of genera." See *Linneara*; also *Brasso-cattleya*.

ADÀMIA: *Dichroa*.

ADAM'S APPLE: *Citrus Limetta*, *Musa paradisiaca*, and *Tabernaemontana coronaria*.

ADAM'S NEEDLE: *Yucca*.

ADANSÒNIA (named after M. Adanson, French botanist). *Bombacaceæ*. A genus of 10 species of tropi-

cal shrubs and trees, closely related to *Bombax*: fls. large, pendulous; petals 5, white, obovate; stamens numerous, united in a column about the styles; ovary 5–10-celled: fr. oblong, woody, indehiscent, filled with a mealy pulp in which are numerous seeds.

*digitata*, Linn. BAOBAB TREE. Figs. 118, 119. Height not more than 60 ft.: diam. said to be sometimes 30 ft. or more and to have the thickest trunk of any tree in the world: lvs. palmate, with 3 lfts. in young plants, and 5–7 in older ones; fls. 6 in. across, with purplish anthers, on long axillary, solitary peduncles; stigma 7–10-rayed in full anthesis. Afr. B.M. 2791–2792. G.C. III. 27:57.—Rarely cult. in extreme S. Fla., where fr. is 9–12 in. long, and called "monkey's bread." Figs. 118 and 119 are from specimens growing in the American tropics. The fl. opens wide, something like a spreading hibiscus, and the petals soon roll back and wither, as shown in Fig. 119. The tree is very thick-boled, and the wood is soft and light. The tree is supposed to attain to vast age. The fr. of the baobab is a gourd-like structure, of which the pulp is said sometimes to be eaten and the juice used for the making of a beverage. The bark produces a very strong fiber.

N. TAYLOR.†

ADDER'S-TONGUE: *Erythronium*.

ADDER'S-TONGUE FERN: *Ophioglossum*.

ADÈLIA (Greek, *adelos*, obscure, from the small flowers). *Ricinella*, Muell. Arg. *Euphorbiaceæ*. Thorny, Trop. American trees, rare in cult. and probably of little horticultural value. Lvs. alternate, short-petioled, clustered on short side branches: fls. dioecious in axillary clusters or the pistillate single; stamens 8–15. *A. Ricinella*, Linn., is the best known. Those grown under the name of *A. acidotonis* should perhaps be referred to *Securinega buxifolia*.

J. B. S. NORTON.

ADÈLIA: *Foerstiera*.

ADENÁNDRA (from the glandular anthers). *Rutaceæ*. Small, summer-flowering, tender shrubs from the Cape of Good Hope.

Lvs. alternate, small, leathery, subsessile, entire, glandular-dotted: fls. white or rosy, solitary and usually terminal; petals obovate; stamens 5, alternating with 5

118. *Adansonia digitata*.—Baobab tree as grown in American tropics.

staminodia which are longer than the stamens.—About 20 species. Prop. by cuttings from the ripened wood.

*fràgrans*, Roem. & Schult. (*Diósma fràgrans*, Sims). BREATH OF HEAVEN. Height 2–3 ft.: lvs. oblong, obtuse, dark green above, whitish beneath, with a glandular, denticulate margin: fls. rosy. B.M. 1519.—A favorite in Calif.

The following are sometimes cultivated in botanic gardens: *A. amàna*, Bartl. & Wendl. 1–2 ft.: lvs. oblong or oval, obtuse, glabrous, dotted beneath: fls. white above, reddish beneath.—*A.*

*coriacea*, Lichtst. 1-2 ft.: lvs. oblong, obtuse, glabrous, revolute: fls. solitary, terminal, pink.—*A. umbellata*, Willd. 1-2 ft.: lvs. oblong or obovate, dotted beneath, fringed on the edges: fls. sessile or nearly so, terminal, pink, the petals fringed.—One of the best.

N. TAYLOR.†

**ADENANTHÈRA** (from the deciduous pedicellate gland on each anther). *Leguminosæ*. A group of 4 species of tender trees, allied to *Mimosa*. Lvs. bipinnate or decompound: fls. small, racemose, usually golden yellow or whitish.—The following unarmed evergreen tree is cult. in greenhouses only for its economic interest, and also in Calif. in the open air. Prop. by seeds, which should be softened in hot water previous to sowing.

**pavonina** Linn. RED SANDALWOOD TREE. Lfts. about 13, ovate, obtuse, glabrous on both faces: fls. in an axillary spike-like raceme, white and yellow in the same cluster. Trop. Asia, where it grows to a tree of great size.—The red lens-shaped "Circassian seeds" are curiosities with travelers, and are used for necklaces, and the like. Plant sometimes called "peacock flower fence."

N. TAYLOR.†

ADÈNIA: *Modocca*.

**ADENOCALÝMMA**, (*glandular covering*; referring to leaves, etc.). Sometimes but incorrectly, spelled *Adenocalymna*. *Bignoniaceæ*. More than 50, mostly Brazilian, species of tender climbing shrubs, closely allied to *Bignonia*. Fls. large, yellow or orange, bracteate, racemose, trumpet-shaped: lvs. ternate or bipinnate. Grown in hothouses, requiring considerable moisture. Prop. by cuttings in frames.

**comòsum**, DC. St. rough, punctate: lvs. opposite, trifoliate; petioles thickened at junction with the blades: racemes so densely clothed at first with large bracts as to suggest the aments of the hop-vine; fls. 2 in. across, brilliant yellow, trumpet-shaped; upper lip of 2, and lower lip of 3 rounded, waved lobes. Brazil. B.M. 4210.

*A. nitidum*, Mart. 10 ft.: lvs. trifoliate or unifoliate ten-drilled, the lfts. elliptic-oblong: fls. yellow in axillary and terminal racemes.

N. TAYLOR.†

**ADENOCÁRPUS** (*aden*, gland, *karpos*, fruit; easily distinguished from allied genera by its glandular pod). *Leguminosæ*. Ornamental woody plants cultivated chiefly for their yellow flowers.

Shrubs, rarely small trees, more or less pubescent: lvs. alternate, trifoliate, small: fls. papilionaceous, yellow, in terminal racemes; calyx 2-lipped, the 2 upper teeth free, the 3 lower more or less connate: fr. a glandular pod, oblong or linear, compressed.—About 14 species in S. Eu., Asia Minor, N. and W. Afr., Canary Is. This genus consists of low shrubs, rarely more than 3 ft., of spreading habit, with handsome fls. produced profusely in spring; very attractive when in full bloom.

They require a sunny position and well-drained soil. They are especially adapted for temperate regions, but do not bear transplanting well, and should be grown in pots until planted. They are also handsome greenhouse shrubs, and grow best in a sandy compost of peat and loam.

Propagation is by seeds and greenwood cuttings in spring; sometimes also by layers and grafting.

*A. Branchlets pubescent or tomentose: lvs. persistent, crowded.*

**viscòsus**, Webb & Berth. (*A. Anagýrus*, Spreng. *A. frankenioides*, Choisy). Branchlets pubescent: lfts. linear-oblong, folded: fls. crowded, in short racemes; calyx glandular, the lateral segm. of the lower lip longer than the middle one, exceeding the upper lip. Teneriffe.

**hispánicus**, DC. Shrub, about 6 ft. or more: branchlets velvety-pubescent: lfts. lanceolate, acute, tomentose

beneath: racemes dense, oblong, many-fl'd., short-peduncled; calyx pubescent and glandular; segms. very unequal, those of the lower lip nearly equal, but much longer than those of the upper lip. Spain.

**decòrticans**, Boiss. (*A. Boissieri*, Webb). Shrub or small tree, 15-25 ft.: branches tomentose: lfts. linear, pubescent: racemes short, compact; calyx villous, segms. nearly equal. Spain. R.H. 1883:156. G.C. II. 25:725. Gn. 30:498.—Resembles English gorse, but is thornless. Bark peels naturally. Thrives in poor, sandy soil.

*AA. Branchlets soon glabrous: lvs. deciduous.*

**complicátus**, Gay (*A. divaricátus*, Sweet. *A. parvifolius*, DC.). Much-branched shrub, 1-3 ft.: lvs. deciduous, fasciated; lfts. obovate or oblong-lanceolate, pubescent beneath, often folded: fls. in elongated racemes; calyx pubescent, usually glandular, middle segm. of the lower lip longer than the lateral ones, usually much

exceeding the upper lip. S. Eu., Orient. B.M. 1387 (as *Cytisus divaricátus*). Var. **interinèdius**, Aschers. & Graebn. (*A. intermèdius*, DC.). Branchlets villous: calyx glandular, with very unequal lips. Spain, Portugal, Madeira. Var. **commutátus**, Aschers. & Graebn. (*A. commutátus*, Guss. *A. telonénsis*, DC., not Robert). Racemes usually short; calyx not glandular, with the lips little differing in length. S. Eu., Orient.

*A. foliolòsus*, DC. Branches and lvs. crowded, villous: racemes compact, many fl'd.; calyx villous. Canary Is.—*A. grandiflorus*, Boiss.—*A. telonénsis*.—*A. uermèdius*, DC.—*A. complicatus*, var. *intermedius*.—*A. parvifolius*, DC.—*A. complicatus*, Gay.—*A. telonénsis*, Robert (*A. grandiflorus*, Boiss.). Branches and lvs. glabrous: racemes few-fl'd.; calyx pubescent. S. France, Spain.—*A. telonénsis*, DC.—*A. commutatus*.

ALFRED REHDER.

**ADENÓPHORA** (*gland-bearing*; referring to the cylindrical nectary which surrounds the base of the style). *Campanulacæ*. Campanula-like border perennials.

Herbs, differing from *Campanula* chiefly by the style being surrounded by a cylindrical gland: corolla ball-shaped, 5-lobed: stamens free from corolla, the filaments dilated and ciliate toward base; caps. 3-celled.—About 14 species of hardy herbaceous perennials in Siberia, China and Japan. Fls. blue, nodding, on short pedicels, produced freely in midsummer in slender but stiff, erect panicles or loose racemes.—For cult. see *Campanula*.

Propagation is by seeds or cuttings in spring. The

plants do not take kindly to division or other disturbance of the roots. Many other species than those in the trade are worthy.

**communis**, Fisch. (*A. liliflora*, Schur. *A. Fischeri*, Don. *A. lilifolia*, Ledeb.). Radical lvs. petiolate, ovate-rotund, cordate, crenate-dentate; cauline lvs. sessile, ovate-lanceolate, coarsely serrate; fls. numerous, in a pyramidal panicle; lobes of the calyx triangular; style exserted.

**Lamárckii**, Fisch. Lvs. ovate-lanceolate, sharply serrate, ciliate, otherwise glabrous; fls. racemose; lobes of the calyx lanceolate; style not exserted.

**Potaninii**, Hort. Shrubby; spikes 2-3 ft. high; fls.  $\frac{1}{4}$  in. across, light blue. July, Aug. Intro. 1899.

**polymorpha**, Ledeb. Three ft. lvs. verticillate, the whorls remote, and small fls. which are darker in color than *A. Potaninii*. Aug. Russia. Var. **stricta**, with more erect habit than the type, seems to be more common.

*A. coronopifolia*, Fisch. 1-3 ft.: radical lvs. petiolate, ovate-rotund, cordate, crenately toothed, hairy; upper lvs. sessile, entire or nearly so, glabrous, and linear lanceolate; fls. racemose, 3-10 in a cluster, blue, each fl. on a slender pedicel. June. Dahuria.—*A. denticulata*, Fisch. (*A. tricuspidata*, DC.).  $1\frac{1}{2}$ -2 ft.: upper lvs. sessile, ovate-lanceolate, the lower and radical ones petioled and more or less orbicular; fls. small, blue, pedicellate, in a terminal, loose raceme. July. Dahuria.—*A. Gmelinii*, Fisch. 1-2  $\frac{1}{2}$  ft.: lvs., or at least the upper ones, linear, narrow, entire or nearly so, and quite glabrous; fls. blue, 3-10 in a second racemose cluster which is axillary near the upper part of the st. Dahuria.—Suitable for dry and stony places.—*A. intermedia*, Ledeb., not Sweet (*A. coronata*, DC.). Plant 2-3  $\frac{1}{2}$  ft.: radical lvs. petiolate, cordate, toothed; upper lvs. acutish at base, serrate, crowded; fls. pale blue, racemose, small. May. Siberia.—*A. periplocifolia*, DC. A dwarf (3 in.) perennial suitable for rockeries, with ascending st.: lvs. petiolate, ovate, acute at the apex, slightly cordate at the base, crenately serrate; fls. usually solitary and scapose, pale blue. June. Siberia.—*A. stylosa*, Fisch. 1-2 ft., erect; lvs. petiolate, the lower obovate and sinuate, the upper ovate, acuminate, quite glabrous; fls. few, racemose, the raceme naked, and lax. May. E. Eu.—*A. verticillata*, Fisch. 2-3 ft.: st. simple; lvs. whorled, serrate, the upper ovate-lanceolate, the lower petiole, sub-orbicular; fls. pale blue, small, arranged in irregular clusters near the top of the st., some, along the lower part of the st., in whorls. June. Dahuria.

N. TAYLOR.†

**ADENÓSTOMA** (*aden*, gland, *stoma*, mouth; calyx with five glands at the mouth). *Rosaceæ*. Ornamental woody plants, cultivated chiefly for their handsome white flowers.

Evergreen, somewhat resinous shrubs, rarely small trees; lvs. linear, small; fls. white, about 1-5 in. broad, in terminal panicles; calyx-tube obconical, with 5 short teeth and 5 glands at the mouth; petals 5, stamens 10-15; pistil 1, with the lateral style strongly curved above the base; fr. a small achene, inclosed in the persistent calyx-tube.—Two species in Calif.

The adenostomas are heath-like evergreen shrubs; very handsome when in full bloom. They may be cult. in temperate regions in a sunny position and well-drained soil. *A. fasciculatum* stands many degrees of frost. Prop. is by seeds and greenwood cuttings in spring.

**fasciculatum**, Hook. & Arn. Shrub, 2-20 ft.: lvs. fasciculate, linear, about  $\frac{1}{4}$  in. long; panicles rather dense, 2-4 in. long; fls. nearly sessile. May, June. Ranges northward to Sierra Co.—The characteristic shrub of the chaparral or chamisal regions of the coast ranges of Calif. Hooker & Arnott, Bot. Beechey's Voy. 30. Intro. 1891.

**sparsifolium**, Torr. Shrub or small tree, 6-12 ft., rarely 30 ft., resinous; lvs. alternate; panicles loose; fls. pedicelled, larger,  $\frac{1}{2}$  in. across, fragrant. S. and Low. Calif. Emory Rep. U. S. and Mex. Bound. Surv. 20. Intro. 1891.

ALFRED REHDER.

**ADENÓSTYLES** (from *aden*, a gland, and *stylus*, a style, in allusion to warty glands of the stigmas). *Compositæ*. A little-known group of hardy perennials, grown for their purplish or whitish flowers, perhaps known in America only in botanic gardens.

Leaves alternate or radical, usually broad, the petiole frequently dilated into a stipule-like, st.-clasping base; fls. in medium-sized heads, the fls. all tubular, long, exserted; involucre cylindric or bell-shaped, its bracts small and unequal.—There are only 5 species, all natives of Cent. S. Eu. None is of horticultural importance. May be grown in the open border. Prop. is by seed and division.

**albifrons**, Reichb. A much-branched, hairy perennial, 2-3 ft.: lvs. on the lower surface cottony, bright green above, almost round and deeply cordate; basal lvs. long-stalked; the stalks eared; heads 15-20-fl., purple, rather attractively paniculate or corymbose. Woody mts., S. Eu. July, Aug.

*A. alpina*, Bluff. & Fingeruth. A lower, smooth perennial, with the heads 3-6-fl.; is scarcely known in Amer. It is not so showy as *A. albifrons*. S. Eu.

N. TAYLOR.

**ADÉSMIA** (*not bound*; referring to the free stamens). *Leguminosæ*. More than 100 species of tender herbs, shrubs or sub-shrubs from S. Amer., allied to the peanut. Lvs. abruptly pinnate, ending in a bristle; fls. axillary, solitary, or sometimes racemose and terminal. Some of them are showy.

*A. balsamica*, Bert. Lvs. 1-1  $\frac{1}{2}$  in. long; lfts. 10-16 in pairs; racemes 3-8-fl.; fls.  $\frac{3}{4}$  in. across, golden yellow. Chile. B.M. 6921.—Has the odor of balsam.—*A. boronioides*, Hook. A pretty shrub, warted all over, except the petals and lfts., with large balsamiferous glands; lvs. 1  $\frac{1}{2}$ -2 in. long, made up of from 10-13 pairs of sessile, orbicular, coarsely crenate, dark green lfts.; fls. bright orange-yellow, in terminal racemes. Patagonia. B.M. 7748.—*A. glutinosa*, Hook. & Arn. 2 ft., shrubby; the branches clothed with glutinous hairs; lvs. with 3-4 pairs of hairy elliptic lfts.; fls. yellow, racemose and terminal. Chile.—Neither is in the American trade, but both cult. in botanic gardens.

N. TAYLOR.†

**ADHÁTODA** (native name). *Acanthaceæ*. About 25 species of tender shrubs, distinguished from Justicia by the less-spurred anthers, and often by the habit and calyx, but considered by de Dalla Torre and Harms as a mere section of that genus. Fls. whitish or purplish; calyx 5-cleft, often exceeded by the bracts; corolla long-tubed, the limb prominently 2-lipped; stamens 2. For culture, see *Justicia*.

**cydoniæfolia**, Nees. BRAZILIAN BOWER-PLANT. Lvs. opposite on short petioles, ovate; lower lip broadly obovate, purple. Brazil. B.M. 4962. F.S. 12:1222. R.H. 1873:110.—Cult. in Calif.

*A. Vásica*, Nees. Lvs. ovate-lanceolate, acuminate; fls. white, streaked red or purple. Ceylon. B.M. 861 (as *Justicia Adhatoda*).

N. TAYLOR.†

**ADIANTÓPSIS** (Greek, *like Adiantum*). *Polypodiaceæ*. Like *Adiantum*, but differing in having the sori simple, one to each veinlet and not occupying the ends of several veinlets, as in *Adiantum*.—A small genus, little known in cult.

**pedata**, Moore (*Cheilanthes pedata*, R. Br.). Lvs. cespitose, on long (9-12 in.) sts., about 6 in. either way, the 3 divisions bipinnatifid; sori numerous, placed on both sides of the segm. Jamaica, Cuba.

R. C. BENEDICT.

**ADIÁNTUM** (Greek, *unwetted*). *Polypodiaceæ*. MAIDENHAIR FERN. A large, widely distributed genus of ferns, mainly of tropical countries, some of them popular greenhouse and conservatory plants.

The leaves have usually polished black or purplish stalks, the blades thin and delicate, simple or divided into usually fan-shaped segments, with the outer margins revolute, covering linear sori. Of the one hundred or more species, only one, *A. pedatum*, occurs, commonly in temperate North America. A few others are found in the southwestern states and in Florida. *A. cuneatum* is the most frequently cultivated of the exotic species.

The genus *Adiantum* furnishes some of the most useful and popular species of commercial ferns. They are easy of cult. They need a slightly shaded position, moderately moist atmosphere, and a temp. of 60-

65° F. The soil should be composed of rich loam and leaf-mold in equal parts, and should be kept moderately moist. Some of the most useful ones for general purposes (given under their trade names) are: *A. æmulum*, grows about 12–15 in. high, and has very graceful dark green fronds; *A. bellum*, a dwarf, very compact species, 6–8 in.; *A. cuneatum*, *A. cuneatum* var. *grandiceps*, with long, heavily crested, drooping fronds; *A. cuneatum* var. *variegatum* making a neat specimen; *A. concinnum*, gracefully drooping dark green fronds 15 in. long, with overlapping pinnae; *A. concinnum* var. *lætum*, of upright growth, is 24 in. high; *A. decorum* very useful, 12–15 in., and has young fronds of a pleasing metallic tint; *A. excisum* var. *multifidum*; *A. formosum*; *A. Fergusonii*; *A. fragrantissimum*; *A. pubescens*; *A. tenerum* and var. *roseum*; *A. Wiegandii*; *A. LeGrandii*, very dwarf; *A. mundulum*, a very neat, dwarf species; *A. rubellum*, a dwarf species with mature fronds light green, young fronds of a deep ruby tint. The above may easily be grown from spores, if sown on a compost consisting of half each of finely screened clean soil and leaf-mold or peat, and placed in a moderately moist and shady place in the greenhouse in a temp. of 60° F. To be grown most economically, they should be transplanted in clumps of 3 or 4 plants as soon as the first pinnae have appeared, and, as soon as strong enough, potted off, either in clumps or singly. Some very desirable species to grow into large, tall specimens are: *A. æthiopicum*, *A. Bausei*, *A. Collisii*, *A. Fergusonii*, *A. formosum*, *A. Lathomii*, *A. peruvianum*, *A. princeps*, *A. rhomboideum*, *A. Sanctæ-Catharinæ*, *A. trapeziforme*, and *A. Williamsii*. The following are also recommended for special purposes: for fern-dishes, *A. fulvum*; for cutting, *A. gracillimum*. The following kinds are economically prop. by division, temp. 65° F.: *A. Farleyense*, the different varieties of *A. Capillus-Veneris*, *A. rhodophyllum*, *A. assimile*. Some kinds, as *A. dolabriforme*, *A. cavatum* and *A. Edgeworthii*, form small plants on the ends of fronds, which may be detached and potted separately, and if kept in a close atmosphere will in a short time grow into choice little plants. Temp. 65–70° F. (Nichol N. Bruckner.)

The following directions (mostly for commercial growing) are prepared for this entry by James C. Clark:

Adiantums, when grown in large quantities, are best propagated from spores sown in pots or pans, 6-inch being a good size, pots being preferred to pans as they maintain a more constant and equal moisture. The pots should be filled with two-thirds good drainage (coal-ashes or potsherds are very suitable), top-dressed with one-third sterilized loam mixed with one-tenth part of sharp sand finely sifted and evenly pressed down in the pot, so that the top of the soil will be about  $\frac{1}{4}$  inch below the rim. The pots should then be placed on a greenhouse bench, under shaded glass, and where a temperature of 65° to 70° can be maintained. Then water until they are thoroughly soaked (and to make sure that they are wet, water again; it is impossible to make too wet). Allow to drain for an hour or so and then dust the spores evenly, and as thinly as possible, over the surface and cover immediately with glass. The glass should remain on, and no water should be required or given, unless by dipping, until the spores have developed to the prothallus stage, when it will be advantageous to give a slight watering, using a very fine rose, and raise the glass 8 inches above the pots, supporting so that a free current of air can pass directly over the pots.

At this stage of their development adiantums, like all other fern prothalluses, must never be allowed to become dry. At the same time, great care must be exercised so that there will be sufficient air to prevent damping and yet no direct draft either from the heating pipes or ventilators to cause wilting or drying out of the pots.

As soon as the first real fronds appear (generally in

eight to twelve weeks from time of sowing, according to season of year; eight weeks in spring and summer; twelve weeks in fall or winter), the seedlings should be transplanted in small clumps of three to five seedlings each, into flats or seed-pans, spaced about 1 inch apart, and placed in a close warmhouse, in a night temperature of 65° to 70°, until the seedlings show signs of taking root and making new fronds, when the temperature may be lowered to 60° at night and 65° to 70° in the day. This temperature will be found to suit all adiantums (except *A. Farleyense*), in all stages of their future development.

When the transplanted seedlings are about 1 inch high, they may be placed in small pots and repotted into larger ones as soon as they require it. In potting, a good compost consists of nine parts of loam and one part of well-rotted cow-manure, the pots being provided with good drainage, especially the larger sizes. In potting, the crown of the plant should be placed deep enough so that it will be covered with  $\frac{1}{4}$  to  $\frac{3}{4}$  inch of fresh soil, making the soil only moderately firm (never hard). Place the plants in a greenhouse, spaced so that there will be a free circulation of air all around the plants, the glass moderately shaded from March 15 to November 1, and all shade removed during the winter months, giving as much ventilation (without draft) as possible. The soil should be kept moderately moist at all times and a good atmospheric moisture maintained by wetting down the walks, but at no time should the foliage be wet more than possible. Well-drained, solid beds are better adapted to the growth of adiantums than tables, but, if grown on the latter, a  $\frac{1}{2}$ -inch overhead heating-pipe over each table, say 18 inches above the foliage, will be found of great assistance in overcoming the condensation that is so destructive to the foliage when the plants are grown on tables.

Treated as above, adiantums can be grown into 6-inch pot specimens in one year from time of sowing spores, and when grown rapidly are seldom troubled with insect pests, unless it be green-fly, which can be kept under control by a weekly application of nikoteen, using two ounces to five gallons of water, applied in as fine spray as possible.

Specimen adiantums, in 8-inch pots or larger, can be grown in the same-sized pots for several years, provided they are slightly rested during the winter months by being kept on the dry side and in a lower temperature, say 45° to 55°. In February the plants should be removed from the pots, the drainage examined, a little of the top-soil removed, and then top-dressed with old rotted cow-manure, and the plants returned to a growing temperature and given more water as required. Feed either with liquid manure or dust with pulverized animal manure every second week during the growing season. Some of the finest specimen adiantums in this country have been grown in the same-size pots for five to seven years.

Scale sometimes attacks old specimen adiantums, and there is only one remedy,—rest the plants by keeping to the dry side and in a cool temperature for about a month; then cut off all the fronds clear down to the crowns, and treat the same as old specimen plants.

For amateurs and small growers, all adiantums can be propagated by division of the crown and rhizomes. This is best done in January and February. Wash off all soil and cut the roots off as close to the crowns as possible. Then divide to single eyes. Place the eyes in sharp sand, merely covering them. Place in a situation such as advised for spores and cover with glass: when the first fronds appear, treat exactly the same as recommended for seedlings, when they will make plants about as quickly and equally as good as those grown from spores.

*Adiantum Farleyense*, being a sterile species, must be propagated by division. It requires the treatment recom-

mended for adiantums in general with the exception of a much higher temperature, 65° to 70° at night and 75° to 80° during the day. The variety *Glory of Moor-drecht* has the great advantage of producing fertile spores and it also thrives in the lower temperatures recommended for general adiantums. It gives promise of being one of the most useful varieties for decorations and cut-fronds use, as the fronds are very much hardier than typical *A. Farleyense* and will compare well with such kinds for standing as *A. cuneatum*, *A. hybridum* and *A. Croweanum*.

1. *lunulatum*, Burm. (*A. dolabrifforme*, Hook.). Lvs. 1 ft. long on blackish, wiry, polished stalks; lower lfts. nearly semicircular, all on hair-like stalks. India, Trop. Amer., Austral. G. 6:203.

2. *caudatum*, Linn. (*A. Edgeworthii*, Hook.). Lvs. 6–12 in. long, on short, brownish, densely hairy stalks; lfts. deeply cut into several spreading narrow lobes. Old World. Gn. 68, p. 315.

AA. *Lvs. with usually a single row of large lfts. on either side, not rooting at the apex.*

3. *peruvianum*, Klotzsch. Lvs. 1 ft. or more long, on polished stipes, with obliquely ovate pointed lfts. 2 in. long by 1½ in. wide, on slender stalks; sori 8–10 on either side of the lfts., twice as long as wide. Peru.

4. *macrophyllum*, Swartz. Lvs. 1 ft. long, on rather stout polished stipes, with 4–6 pairs of wedge-shaped sessile lfts. 1½–2 in. long by ¾–1 in. wide; indusium nearly continuous on either side of the lft. Trop. Amer.

5. *Kaulfussii*, Kunze. Lvs. 6–8 in. long, on slender black stalks; lfts. 5–11, 2 in. long, ¾–1 in. wide, with unequal base; indusia very long and narrow, forming an almost continuous marginal band on either side of the lfts. Mex., W. Indies.

6. *platyphyllum*, Swartz. Lvs. 1–2 ft. long, stalks black, glossy, lf.-blades 6–12 in. long, 2–4 in. broad, with a long terminal pinna and 3–6 pairs of lateral pinnae; lowest pinnae sometimes pinnately divided; segm. 3–4 in. long, 1½–2 in. broad; sporangia in nearly continuous line along the margin. Cent. Amer. to Brazil and Bolivia.

AAA. *Lvs. at least bipinnate, the segms. twice as long as broad, with the veinlets all springing from the lower side.*

B. *Lfts. 1½–2 in. long.*

7. *trapeziforme*, Linn. Lvs. 18 in. or more long, with the terminal lft. longer than the lateral; lfts. trapezoidal, ½–¾ in. wide, lobed, and with numerous sori.

A. *Sanctæ-Catharinæ* is a form with deeper lobes. Trop. Amer.

BB. *Lfts. smaller, an inch or less long.*

C. *Stalks polished, smooth.*

8. *polyphyllum*, Willd. Lvs. often tripinnate, with stout black stalks; pinnae 6–8, long, with closely set lfts. which are ¾–1 in. long, the upper margin curved, with 4–6 circular or oblong indusia. S. Amer.

9. *diaphanum*, Blume (*A. setulosum*, J. Smith). Lvs. simply pinnate or usually 2-pinnate at the base; lfts. ½ in. long, ¼ in. wide, with numerous sori placed in the sinuses of the inner and outer edges. Asia to New Zealand.

10. *affine*, Willd. Lvs. bipinnate, with a terminal pinna and several lateral ones; lfts. not exceeding ¾ in. long, ¼ in. wide, the upper edge parallel with the lower, and crenate, bearing numerous rounded sori on the upper and outer margin. New Zealand.

11. *fulvum*, Raoul. Lvs. 15–20 in. long, the stalks erect, dark brown, shiny, rough below with long hairs; the lf.-blades 9–12 in. long, 6–8 in. broad, deltoid, 2-pinnate, the segm. ¾ in. long, ¼ in. broad, dimidiate, lower edge straight, the upper edge parallel with sharp-tooth lobes; the sori uniform, numerous. New Zealand.

CC. *Stalks polished but somewhat woolly.*

12. *intermedium*, Swartz. Lvs. 1 ft. or more long, with a terminal pinna and 1–3 lateral ones on each side; lfts. 1 in. or more long, with interrupted sori on the upper and two-thirds of the outer margins. Trop. Amer.

CCC. *Stalks rough or hairy.*

13. *formosum*, R. Br. Lvs. 1–2 ft. long, two-thirds as broad, mostly tripinnate, with rough, scabrous stalks and rather small, deeply lobed lfts. ½–¾ in. long, with rounded and toothed outer margins. Austral. G. 20:769.

120. Fruiting pinnales of *Adiantum pedatum*. (×1)

14. *pulverulentum*, Linn. Lvs. often a foot long, with a large terminal pinna and several lateral ones, bipinnate; stalks purplish, hairy, as are also the rachises; lfts. ¾–1 in. long, ¼ in. wide, closely placed, the outer edge rounded or truncate. W. Indies.

15. *villosum*, Linn. (*A. rhomboideum*, Swartz). Lvs. large, with a terminal and several lateral pinnae 6–12 in. long, on stout, villous-hairy stalks; lfts. numerous, nearly 1 in. long, ½ in. wide, trapezoidal, with the inner side parallel to the rachis; indusia forming an almost continuous line along the upper and outer margins. W. Indies and S. Amer.

16. *novæ-caledoniæ*, Keys. Lvs. 6–8 in. long and wide, somewhat pentagonal, once pinnate with one or two secondary basal pinnae on the lower side at base; lfts. attached to the rachises by a broad base, nearly 1 in. long, pointed, irregularly incised, bearing 1–4 rounded sori next to the base. New Caledonia.

AAAA. *Lvs. forked, the two branches bearing pinnae from the upper side.*

B. *Stalks polished, smooth.*

17. *pedatum*, Linn. Fig. 120. COMMON MAIDENHAIR of our northern states, with circular lvs. on purplish stalks 1 ft. or more high.—Sometimes transplanted into gardens, requiring a shady, moist and protected place. G. 21:9.

18. *curvatum*, Kaulf. Lvs. forked and with the main divisions once or twice forked; lfts. 1–1½ in. long,

nearly  $\frac{1}{2}$  in. wide, the upper margin rounded and lobed. Brazil.

BB. *Stalks scabrous (or rough).*

19. *hispidulum*, Swartz (*A. pubescens*, Schk.). Lvs. forked, two divisions branching like a fan, with the

121. *Adiantum Farleyense*.  
( $\times \frac{1}{2}$ )

largest pinnae 6-9 in. long, made up of numerous lfts.  $\frac{1}{2}$  in. or more long, two-thirds as broad, covered with rather long, stiff hairs, and with numerous circular indusia on the upper and rounded outer margins. Old World.

AAAAA. Lvs. at least bipinnate, often tripinnate or quadripinnate, with numerous rather small, fan-shaped or wedge-shaped lfts. with veins radiating from the base.

B. *Lfts. an inch or less across.*

c. *Edges deeply cut into a series of narrow lobes.*

20. *Farleyense*, Moore. Fig. 121. Lvs. often reaching 15-24 in. in length, forming a rich profusion of closely overlapping pinnae, light green; lfts. more or less wedge-shaped at base, with curved sides and the outer margin rounded and deeply cut into 10-15 narrow lobes, which rarely bear sori. Barbadoes.—Said to be a garden variety of *A. tenerum*, but apparently a good species. G.C. III. 49:73.

cc. *Edges not laciniately cut.*

21. *tenerum*, Swartz. Lvs. deltoid, 12-24 in. long, two-thirds as wide, the terminal lfts. equally, the lateral unequally, wedge-shaped at base, all of them rhombic and deciduous when dry, with 10 or less small sori on the outer and inner margins. *A. Lathomii*, *A. Victorizæ*, *A. rhodophyllum*, *A. princeps*, *A. acutum*, and *A. Bausei* are horticultural forms. Fla. and Trop. Amer.

22. *Jordanii*, C. Muell. (*A. emarginatum*, D. C. Eaton, not Hook.). Lvs. 1 ft. or more long, 6 in. wide, mostly twice pinnate, with nearly semicircular lfts.; sori elongate, the indusium almost continuous around the margin of the lft. Calif. and Ore.

23. *Williamsii*, Moore. Lvs. triangular, nearly 1 ft. long; lfts. nearly semicircular, 3-4-lobed on the outer

margin, bearing 5-8 sori covered with oblong indusia. Peru.—Similar in habit to the last, but smaller and with more numerous sori.

BB. *Lfts. mostly less than a half inch across.*

c. *Lvs. at least quadripinnate, broader than long.*

24. *Cóllisii*, Moore. Lvs. 1 ft. or more long, very broad, the black rachises apparently repeatedly forking; lfts. rhombic-ovate or cuneate, those toward the outer portions longer and larger than those nearer the base.—Of garden origin, possibly a hybrid.

cc. *Lvs. mostly triangular or oblong, longer than broad.*

d. *Shape of lfts. rhombic, the indusia kidney-shaped or nearly circular.*

25. *concinnum*, HBK. Fig. 122. Lvs. 2-3 pinnate, 12-18 in. long, 6-9 in. wide, on rather stout black stalks; lfts. rhombic-oblong, slightly lobed; sori 4-8 on each lft., usually set close together. Mex. to Brazil. Var. *latum*, Moore. Differs from type by stiff upright habit, and lfts. twice as large and much separated.

26. *aneitense*, Carr. Rootstock wide-creeping, covered with minute dark brown linear scales; lvs. 2-2½ ft. long, the stalks castaneous, rusty hairy above; the lf.-blades deltoid, 1½-2 ft. long and broad, 3-4-pinnate, the segm. rhomboidal, the sori 4-6 to a segm. Aneiteum, New Hebrides.

27. *tinctum*, Moore. Lvs. on stalks 4-6 in. long, the blades 2-pinnate, deltoid, the stalks black, glossy, naked, the segms. rhomboid, 3-4 lines long, the lower edge straight, the inner parallel to the rachis or just overlapping it, the outer edge bluntly lobed, sori round, on ultimate lobes. Costa Rica to Peru.

DD. *Shape of lfts. roundish with obtuse base, small or medium size.*

28. *æthiopicum*, Linn. (*A. assimile*, Swartz). Lvs. 1 ft. or more long on slender stalks, 2-3-pinnate, rather narrow; lfts. roundish or obscurely 3-lobed, the margin finely serrulate; sori 2-3 to a lft., with oblong or kidney-shaped indusia. Afr. and Austral.

29. *excisum*, Kunze. Lvs. 2-3-pinnate, 6-12 in. long, 3-4 in. wide; lfts. about  $\frac{1}{4}$  in. wide, roundish, with the margin cut into small rounded lobes; sori large, 2-4 to each lft.; kidney-shaped or circular. Chile.

DDD. *Shape of lfts. distinctly cuneate at the base.*

E. *Indusia oblong or indistinctly lunate.*

30. *Capillus-Veneris*, Linn. (*A. Fergusonii*, *A. Mairisii*, Moore). Fig. 123. Lvs. 2-3-pinnate, 6-20 in. long, 3-8 in. wide; lfts. nearly  $\frac{1}{2}$  in. wide, more or less irregularly lobed, at the outer margin; sori 1-3 to each lft. with oblong or more or less elongate narrow indusia. Native southward, and widely distributed throughout the Old World.—Exists in many varieties, some of them deeply lobed, like *A. Farleyense*; a compact imbricated form is very effective.

31. *bellum*, Moore. Small, tufted, 3-8 in. high; lvs. bipinnate; lfts. with the outer margin erose and often divided into 2-3 shallow lobes; sori 2-3 to each lft., rather long and broad or somewhat lunate. Bermuda.—A greenhouse species.

122. Pinna of *Adiantum concinnum*. ( $\times \frac{2}{3}$ )

32. *Bessóniæ*, Jenman. Lvs. 11-16 in. long, the stalks in tufts, stiff, black, shiny, with a few pale scales; lf.-blades deltoid, 4-pinnate, the pinnulæ very densely imbricated so that many of them are covered over. Trinidad.

123. Pinna of *Adiantum Capillus-Veneris*.  
( $\times \frac{2}{3}$ )

segm., with rather small rounded indusia. Brazil.—Runs into many forms, of which *A. variegatum* is one. A.F. 18:508. *A. Bårdii* differs from the type in having the fronds 2 ft. or more long. Var. *grandiceps*, Moore. Robust: lvs. numerous from a tufted crown, elongated, with tassel-like growths at the ends. Var. *Croweanum*, Hort. A vigorous hardy form.

34. *Moðrei*, Baker (*A. amabile*, Moore, not Liebm.). Lvs. 2-3-pinnate on long, slender stalks, 6-15 in. long; lfts.  $\frac{1}{4}$ - $\frac{1}{2}$  in. long, rhomboidal, with wedge-like base, deeply lobed; sori of medium size, 4-6 to each lft. Peru.

35. *Wagneri*, Mett. (*A. decorum*, *A. Wiègandii*, *A. elegans*, *A. Owenii*, *A. cyclostrum*, Moore). Lvs. 2-3-pinnate, 6-9 in. long, 4-6 in. wide; lateral lfts. rhomboid, the terminal cuneate, slightly lobed or incised; sori 4-6 to each lft.; very large membranous circular indusia. Peru.—*A. Siebrechtii*, Hort., "supposed to be a cross between *A. decorum* and *A. Williamsii*," has strong, graceful lvs. thickly set with round pinnules of firm texture.

36. *rubellum*, Moore. Lvs. 4-6 in. long, deltoid, bipinnate; texture membranous, bright green, reddish when young; lfts.  $\frac{1}{2}$  in. wide, deltoid or the lower rhomboid, the outer margin deeply lobed and the lobes finely toothed; sori round at the apices of the lobes. Bolivia.

37. *monochlamys*, D. C. Eaton. Lvs. ovate-deltoid, 6-12 in. long, tripinnate; lfts.  $\frac{1}{4}$  in. wide, cuneate at the base, the upper edge rounded, and slightly toothed, with a single sorus or rarely two in a decided hollow at the upper edge. Japan.

38. *venustum*, Don. Lvs. ovate-deltoid, triquadripinnate, 6-12 in. long; lfts. cuneate at the base,  $\frac{1}{4}$  in. wide, with the upper edge irregularly rounded or with 3 indistinct lobes, finely toothed, bearing 1-3 sori in distinct hollows. India.

124. *Adiantum cuneatum*.  
(Frond  $\times \frac{2}{3}$ )

EE. *Indusia* nearly circular, with a narrow sinus.

33. *cuneatum*, Langs. & Fisch. (*A. æmulum*, *A. mindulum*, Moore. *A. versailleuse*, *A. fragrantissimum*, *A. hybridum*, Hort.).

Fig. 124. Lvs. 3-4-pinnate, deltoid, 6-15 in. long, 5-9 in. wide; lfts. numerous, obtuse or broadly wedge-shaped at base, the margin rounded and more or less crenately lobed; sori 3-5 to each

BBB. Lfts. minute, innumerable; lvs. 4-6-pinnate.

39. *gracillimum*, Moore (of horticultural origin). Lvs. 1 ft. or more long, nearly as wide, 4-6-pinnate, with innumerable very small lfts., which are  $\frac{1}{8}$ - $\frac{1}{4}$  in. wide and usually bear a single sorus or rarely two.—Dense, compact forms are in cult. under the name of *A. Le-Grândii*.

AAAAA. Lvs. 3-4-pinnate: st. climbing, several ft. long.

40. *digitatum*, Presl (*A. speciosum*, Hook. *A. palmatum*, Moore). Lvs. 2-3 ft. long on a stalk 18 in. or more long, with palmately lobed lfts. 1 in. or more wide. S. Amer.

*A. grössum*, Mett. Stove: lvs. lanceolate, to  $1\frac{1}{2}$  ft. and 4 in. broad, once-pinnate, leathery. Colombia. G.C.III. 45 51.—*A. roseum*, Backh., an undetermined horticultural name, probably referable to *A. rubellum*.—*A. scutum ramosum*, Hort. A distinct form with fan-shaped lvs. (properly *A. Ghiesbreghtii*, Moore).

L. M. UNDERWOOD.  
R. C. BENEDICT.†

ADLUMIA (from John Adlum). *Fumariaceæ*. A hardy biennial vine, which climbs over high bushes in moist woods: fls. with the petals united into cordate-ovate corolla which ultimately encloses the small, few-seeded pod.—Sow seed in spring in a damp, cool place. Transplant in fall, if possible, if transplanted at all. It does not flower the first season but remains low and bushy. It will not tolerate open sun or windy situation.

*fungosa*, Greene (*A. cirrhosa*, Raf.). CLIMBING FUMITORY. MOUNTAIN FRINGE. ALLEGHENY VINE. Figs. 125, 126. Climbs by the slender young lf.-stalks. Lvs. thrice pinnate; lfts. cut-lobed, delicate: fls. white or purplish, in ample panicles. G.W.F. 13. V. 2:76 and 4:22 (all as *A. cirrhosa*). N. TAYLOR.†

ADODENDRUM: *Rhodothamnus*.

ADONIS (a favorite of Venus, after his death changed into a flower). *Ranunculaceæ*. Hardy annual and perennial herbs planted for their showy flowers.

Flowers solitary, terminal; petals 5-16, yellow or red; carpels many: st. about 1 ft. high, very leafy: lvs. alternate, cut into very narrow divisions: fr. an achene.

The culture is simple in any good soil, light moist earth preferred. They thrive in full sun or partial shade; the perennial species well suited for rockwork and borders. Only a few well-known species, natives of temperate regions of Europe and Asia; perhaps 20 in the genus.

Annuals are propagated by the seeds, which are slow-germinating; the freshest seed is sown in autumn or earliest spring. Perennials may, in like manner, be grown from seed and come to flower the first season,

125. *Adlumia fungosa*.

but division of the roots is to be preferred as the flowers are then more abundant. Very early spring is the best time for dividing.

A. *Annuals: fls. crimson or scarlet.*

B. *St. simple except at top: center of fl. yellow.*

**æstivalis**, Linn. PHEASANT'S-EYE. SUMMER ADONIS. Sts. erect, often branched at top: fls. crimson; petals flat, obtuse, half longer than calyx. June, July. Var. *citrina*, Hoffm., is a garden variety with citron-yellow fls.

126. Flower of *Adlumia fungosa*. ( $\times \frac{3}{4}$ )

**parviflora**, Fisch. Allied to above; not well recognized as a distinct species. Differs in being smaller-fl. and less showy.

**microcarpa**, DC. Apparently a pale-fl. variation of *A. æstivalis*.

BB. *St. branched: center of fl. dark.*

**autumnalis**, Linn. FLOS ADONIS. AUTUMN ADONIS. St. branched: fls. small, crimson, with dark center, globose; petals 6-8, concave, slightly larger than calyx. June-Sept. Gn. 12, p. 131.—Sparingly naturalized.

AA. *Perennials: fls. yellow.*

B. *St. not branched.*

**vernalis**, Linn. (*A. apennina*, Jacq. *A. davurica*, Reichb.). SPRING ADONIS. Fig. 127. St. simple; lower lvs. scale-like, others with lobes numerous, entire: fls. large; petals 10-15, lanceolate, slightly toothed; sepals smooth. Early spring. Gn. 5, p. 519; 39:268. Gn.W. 23:153. G. 29:146; 9:122; 1:249. Var. *alba*, Hort. A form with white fls. J.H. 52:39 (desc.). *A. distorta*, Tenore, from Italy; a form with later fls.

**apennina**, Linn. (*A. vernalis* var. *sibirica*. DC. *A. sibirica*, Patr.). This species is much like *A. vernalis*: fls. larger: lower lvs. sheath-like. April. Siberia.

BB. *St. branched.*

**pyrenæica**, DC. St. branched: petals 8-10, obtuse, smaller than in *A. vernalis*: lower lvs. with long branched petioles; upper ones sessile, the numerous lobes always entire. July. Gn. 39, p. 269. Gn.W. 5:533. *A. Ircutiæna*, DC., a form with some radical lvs.; lobes dentate.

**volgensis**, Stev. (*A. wolgensis*, Hort.). Much like *A. vernalis*, but st. branched: lvs. scale-like at base, petioled or sessile above: fls. like *A. pyrenæica*, but sepals pubescent on under side. April. Volga region.

**amurénsis**, Regel & Radde. A beautiful species, with broad yellow fls.; not much cult. in Amer.; has many Japanese varieties. B.M. 7490. G.M. 40:169; 48:212. Gn. 52:6; 67, p. 207; G.C. III. 29:175 and III. 37:188; J.H. III. 50:299 (fl. pl.). K. C. DAVIS.

**ADÓXA** (Greek, *without glory*, i.e., *humble* or *obscure*). *Adoxææ*, but by some authorities placed in *Caprifoliaceæ* and formerly in *Araliaceæ*. **A. Moschatellina**, Linn., the Moschatel, is the only species. It is an inconspicuous herb 3-5 in. high, bearing tubers beneath the ground, with biterate lvs., and small greenish fls. It occurs in England, Cent. Eu., and northward, and in subalpine and arctic regions in N. Amer. It is scarcely cult. but may occur in rock-gardens, being grown for its musky scent.

**ÆCHMÊA** (from *aichme*, point; referring to the rigid points on the calyx). *Bromeliææ*. Epiphytic herbs, of about sixty species, natives of tropical South America, grown in choice greenhouse collections.

Flower-cluster arising from a cluster or rosette of long, hard lvs. which are serrate; petals 3, tongue-shaped, obtuse or pointed, 2-3 times the length of the spine-pointed calyx-lobes; stamens 6, shorter than the petals; ovary inferior, 3-celled. The fls. are subtended

by (in the axils of) fl.-bracts; the entire head or fl.-cluster is often reinforced or subtended by conspicuous lf.-bracts; in the compound-infl. types, the individual branches are usually subtended by branch-bracts. In some species, as *Æ. Lalindei* and *Æ. Mariæ-Reginæ*, the large colored lf.-bracts are the most conspicuous part of the plant. In others, as *Æ. Veitchii*, the entire head is the showy part. Monogr. by Baker, Journ. Bot. 1879:129, 161, 226. Includes *Canistrum*, *Echinostachys*, *Hohenbergia*, *Hoplophytum*, *Lamprococcus*, *Pironneava*, *Pothuava*; and some of the species have been referred to *Billbergia*, *Cryptanthus*, *Guzmania*, *Tillandsia*, *Chelidonia*, and others.

The æchmeas are closely allied to the billbergias, from which they are distinguished by smaller flowers, which are little exerted from the calyx and not widely expanding, short filaments and small anthers, sharp-pointed sepals and conspicuous sharp-pointed flower-bracts.

For culture, see *Billbergia*.

#### INDEX.

*cærulescens*, 8.  
*calyculata*, 6.  
*celestis*, 12.  
*discolor*, 10, 11.  
*distichantha*, 1.

*Mariæ-Reginæ*, 3.  
*miniata*, 11.  
*spectabilis*, 13.  
*Veitchii*, 4.  
*Weilbachii*, 9.

A. *Fls. 2-ranked on the branchlets.*

1. **distichantha**, Lem. Lvs. 2-3 ft. long, with a dilated base 4-5 in. long and half as wide, the blade rigid and channelled, edges prickly: scape 1-1½ ft.; fls. in a bipinnate panicle 4-7 in. long and half as wide, the petals tongue-shaped and red-purple, longer than the obtuse-cuspidate sepals; fl.-bract pocket-like, ¼ in. long. Brazil. B.M. 5447. J.F. 3:269.

AA. *Fls. multifarious, — in several or many rows on the spike or branchlets.*

B. *Infl. simple.*

C. *Ovary compressed or flattened.*

2. **Lalindei**, Lind. & Rod.

Large (3-4 ft.), with long and broad spine-edged lvs.: spike very dense, greenish white, from the color of the aggregated calices, the fls. subtended by many deflexed, showy red, long-pointed, entire bract-lvs.; corolla green, not exerted. Colombia. I.H. 30:481. —Striking.

3. **Mariæ-Reginæ**, Wendl. Smaller than the last in all its parts: petals blue-tipped when young, fading to crimson like the bracts, half as long again as the mealy cuspidate sepals; fl.-bracts entire, small, not showy: bract-lvs. toothed. Costa Rica. B.M. 6441. Gt. 49:1477. —One of the best species.

4. **Veitchii**, Baker. Lvs. spotted, serrate: petals pale, a little longer than the sepals; fl.-bracts con-

127. *Adonis vernalis*. ( $\times \frac{1}{2}$ )

spicuous, toothed, scarlet: bract-lvs. greenish, erect, serrate, not encompassing the infl. S. Amer. B.M. 6329. G.Z. 23, pl. 30.—Referred to *Ananas* by Bentham & Hooker.

cc. Ovary terete (cylindrical).

d. Head oblong.

5. *Lindenii*, Koch (*Hoplophytum Lindenii*, Morr.). Lvs. dilated and entire at base, the blade minutely toothed and 2-3 ft. long, the tip broad-rounded and short-cuspidate: petals lemon-yellow, twice as long as sepals. Brazil. B.M. 6565.

dd. Head globose.

6. *caliculata*, Baker (*Hoplophytum caliculatum*, Morr.). Lvs. about 1 ft. long, with an oblong, dilated base, the blade minutely toothed and rounded at the tip, but terminated with a minute cusp: scape shorter than the lvs., with several deciduous lanceolate bract-lvs.; petals tongue-shaped, not  $\frac{1}{2}$  in. long, bright yellow; fl.-bracts small, entire, reddish. S. Amer.

7. *fasciata*, Baker (*Billbergia fasciata*, Lindl. *B. rhodocyanea*, Lem.). Lvs. 1-2 ft. long, with an oblong entire clasping base, the blade strongly toothed and the back marbled with whitish cross-lines, the tip rounded

128. *Æchmea miniata* var. *discolor*. ( $\times \frac{1}{6}$ )

and mucronate: scape 1 ft. high, floccose, the several bract-lvs. pale red and erect; petals  $\frac{3}{4}$  in. long, pink. Brazil. B.M. 4883. B.R. 1130. F.S. 3:207.—Infl. sometimes forked.

BB. Infl. branched (or compound).

c. Fls. pedicellate.

8. *cæruleascens*, Baker. Lvs.  $1\frac{1}{2}$ -2 ft. long, with small prickles: panicle 4-5 in. long, 2-pinnate, with lax few-flid. crowded branches; petals bluish red,  $\frac{1}{2}$  in. long; fl.-bracts none or minute. S. Amer. Gt. 1871: 694.—Produces white berries.

cc. Fls. sessile.

d. Sepals blunt.

e. Floral bracts large.

9. *Weillbachii*, F. Dirr. Lvs. rather short, overtopped by the red-stemmed and red-bracted scape: panicle narrow, 1-pinnate, the fls. rather crowded, blue and red. S. Amer. R.H. 1871:170.

Var. *leodiensis*, André. Lvs. violet and spotted: fls. shorter. Brazil.

EE. Floral bracts minute or wanting.

10. *fulgens*, Brongn. (*Æ. discolor*, Hort.). Lvs. broad, with small distant teeth, with a broad cuspidate end: panicle large, simple above, branched below, glabrous, bearing numerous fls.; petals blue-tipped, ex-

ceeding the rich red calyx; fl.-bracts minute or none: branch-bracts yellowish. S. Amer. B.M. 4293.

11. *miniata*, Baker. Lvs. serrate with numerous close small teeth: panicle branched throughout; fls. numerous; petals blue; ovary red. Var. *discolor*, Hort., Fig. 128, has the lvs. purple or violet-brown on the back. Brazil.

DD. Sepals pointed or awned.

12. *cælestis*, Morr. Lvs. linear, the margins with few minute spines or almost smooth: panicle branched below, simple above; fls. about 10 lines long; sepals white; petals blue. Brazil.

13. *spectabilis*, Brongn. Lvs. linear, the margins armed with stout spines: panicle laxly pyramidal; fls. about  $1\frac{1}{4}$  in. long; sepals pale rose; petals white, purple at apex. Venezuela and Colombia. R.H. 1875:311.

*Æ. aurantiaca*, Baker=*Canistrum aurantiacum*.—*Æ. Bérleii*, Baker. Corolla pale yellow. Honduras.—*Æ. brasiliensis*, Regel. Lvs. much dilated at base, whitish below, black-toothed: petals light blue: calyx and rachis red; panicle branched. Brazil. Gt. 34:1202.—*Æ. bromeliæfolia*, Baker. Mex.—*Æ. miniata*, Hort.=*Billbergia thyr-oidea*(?).—*Æ. myriophylla*, Morr. Allied to *Æ. distichantha*. Lvs. narrow, 2-3 ft., spiny, silvery-sealy on the back: fls. red, the petals fading blue. Trop. Amer. B.M. 6939.—*Æ. nudicaulis*, Griseb. Lvs. long and straight, brown-toothed: bract-lvs. subtending: spike large, brilliant red; petals yellow. Trop. Amer. R.H. 1885:36 (as *Æ. Cornui*, which is a form with shorter and denser spike).—*Æ. paniculigera*, Griseb. Lvs. large and long: panicle 1-2 ft. long, with few-flid. branches; scape tall, reddish, downy; fls. purple. Trop. Amer.—*Æ. Schiedeana*, Schlecht. (*Æ. macracantha*, Brongn.). Lvs. large, rigid, strongly armed: panicle 3-pinnate, pubescent; fls. pale yellow. Mex. Gt. 43 p. 175.—*Æ. serrata*, Mez. Panicle very dense, bipinnate; fls. distichous, sessile; sepals spinulose; petals violet, mucronate. Martinique. R.H. 1307:129.—*Æ. zebrina*=*Billbergia zebrina*.

L. H. B.

GEORGE V. NASH.†

**ÆGLE** (from Latin *Ægle*, one of the Hesperides). *Rutaceæ*, tribe *Citrææ*. A small tree, often spiny, having hard-shelled frs.: lvs. deciduous: fls. pentamerous with numerous free stamens; ovary with 10 or more cells; ovules numerous in each cell; cells of the fr. without pulp vesicles, filled with gum; seeds woolly and in germination the cotyledons remain hypogeous: the first foliage lvs. are opposite.—Only one species is now recognized.

**Mármelos**, Correa (*Cratæva Mármelos*, Linn. *Bèrou Mármelos*, W. F. Wight). Fig. 129. The bael fruit of India. A handsome tree native to N. India, but widely cult. throughout the Peninsula as well as in Ceylon, Burma, Siam and Indo-China. The trifoliate lvs., borne on wingless petioles, are thin in texture, probably owing to the fact that they are deciduous. Although not so hardy as the deciduous trifoliate orange of China and Japan, the bael fruit tree is said to endure a considerable degree of cold (20° F. or lower) in the drier parts of N. W. India. The fr. is greenish yellow, globular, or nearly so, varying from 2-6 (usually 4-5) in. in diam. The fr. of the wild tree is considerably smaller than that of the cult. form. The hard shell,  $\frac{1}{2}$  in. thick, is filled with the pale orange, aromatic pulp in which occur 10-15 long, narrow cells containing the seeds imbedded in transparent tenacious gum. These cells correspond to the segms. of an orange, while the pulp is made up of the pith and the greatly thickened fleshy membranes separating the

cells. Ill. Roxb., Pl. Corom., pl. 143. Wight, Ic., pl. 16. Bedd., Fl. Sylv., pl. 161. Benth. & Trim., Med. Pl., 55. Bonav., Oranges and Lemons of India and Ceylon, Atlas, pl. 242, 243. The ripe fr. is much esteemed by the Hindus, many of whom consider it the best of the citrous frs.; the European residents in India often become very fond of it.

129. *Ægle Marmelos*. ( $\times \frac{1}{4}$ )

Watt says (Dict. of Econom. Prod. of India, 1:123): "The fruit, when ripe, is sweetish, wholesome, nutritious, and very palatable, and much esteemed and eaten by all classes. The ripe fruit, diluted with water, forms, with the addition of a small quantity of tamarind and sugar, a delicious and cooling drink." The famous botanist, Roxburgh, says (Flora Indica, 2:580): "The fruit is nutritious, warm, cathartic; in taste delicious, in fragrance exquisite; . . ."

On the other hand, W. R. Mustoe, Superintendent, Government Archeological Gardens, Lahore, India, writes (in a letter to D. G. Fairchild, dated Lahore, Dec. 3, 1908): "The fruit is greatly prized for eating by the natives, but can scarcely be looked upon as palatable to the white man except as a sherbet; . . ." Sherbet is made from the mashed pulp, which is diluted with a little water, and then strained into milk or soda-water and sugared to taste. Sometimes a little tamarind is added to give a subacid flavor. All Indian medical authorities agree that the bael fruit has a most salutary influence on the digestive system. The ripe fruit is mildly laxative and is a good simple remedy for dyspepsia. The unripe fruit is a specific of the highest value for dysentery, but so mild that it can be given to children without danger. The bael fruit tree is widely cultivated in India, and is found in nearly every temple garden. It is dedicated to Siva, whose worship cannot be completed without its leaves. This promising fruit tree is now being tested at several points in the warmer parts of the United States.

*Æ. Bārteri* Hook. f. = *Balsamocitrus paniculata*, Swingle. — *Æ. decandra*, Naves = *Chaetospermum glutinosa*, Swingle. — *Æ. glutinosa*, Merrill = *Chaetospermum glutinosa*, Swingle. — *Æ. sepäria*, DC. = *Poncirus trifoliata*, Raf.

WALTER T. SWINGLE.

130. *Æglopsis Chevalieri*. ( $\times \frac{2}{5}$ ; fl.  $\times \frac{7}{8}$ )

**ÆGLÓPSIS** (*Ægle*; *opsis*, appearance). *Rutaceæ*, tribe *Citreae*. A small spiny tree, having simple persistent lvs. with short, wingless petioles, and frs. with a thin rather hard shell; the fls. are pentamerous with 10 stamens; ovary 6–7-celled, ovules numerous in each cell; cells of the fr. without pulp vesicles, filled with gum. The seeds are smooth, and in germination the cotyledons remain hypogeous; the first foliage lvs. are opposite. Only one species is known.

**Chevaliëri**, Swingle. Fig. 130. A large shrub or small spiny tree growing near the coast in Côte d'Ivoire, Trop. W. Afr., probably occurring also in Liberia. The spines occur singly alongside of the axillary bud and are long, slender and straight. (See Fig. 130.) The fls. are borne in small, more or less branched panicles composed of 4–40 fls. The fruits are globose or slightly pyriform, deep orange, with a thin, hard shell  $\frac{1}{16}$  in. thick. Inside of this shell are 6 (rarely 5 or 7) cells filled with large sublenticular seeds imbedded in a fragrant mucilage. These cells correspond to the segms. of an orange and are triangular in outline, occupying almost the whole space, the separating membranes being very thin and the pith small. In this respect, the fr. is quite unlike frs. of *Ægle* and *Balsamocitrus*. Ill. Bull. Soc. Bot. Fr. v. 58. Mém. 8d. pl. 2, 3.—This species was only recently brought to light in the collections of the Muséum d'Histoire Naturelle at Paris. It is reported as growing in swamps near the sea. If it is able to resist brackish water it may prove to be a stock of value on which to graft citrous frs. as most, if not all, of the species of *Citrus* are very sensitive to salty soils (alkali). Trees of this species are growing in the greenhouses of the Jardin des Plantes at Paris and in those of the U. S. Dept. of Agric. Young seedlings are being grown for trial as stocks on which to graft other citrous frs.

WALTER T. SWINGLE.

**ÆGOPÏDIUM** (*aix*, goat, and *podion*, a little foot; probably from the shape of the lfts). *Umbelliferae*. GOUTWEED. Coarse, hardy herbaceous perennial, with creeping rootstocks, biternate lvs., sharply toothed, ovate lfts., white fls. in umbels: frs. ovate, glabrous, with equal filiform ribs, and no oil-tubes.

**Podogrària**, Linn., var. *variegatum*, Hort. Fig. 131. Twelve to 14 in.—A rapid-growing variegated form of this European weed, which makes attractive mats of white-margined foliage. Common in yards, and planted as edging and mats against buildings and in shady places. Prop. readily by division, and of simplest cult.

N. TAYLOR.†

**AËRÁNTHUS**: Certain species described under this genus are treated in *Angræcum*.

**AËRIDES** (Greek, *air*-plant). *Orchidaceæ*. Epiphytic hothouse orchids.

Stems leafy, without pseudobulbs: lvs. distichous, coriaceous or fleshy, the persistent sheaths covering the

131. *Ægopodium Podagraria* var. *variegatum*.

st.: fls. borne in simple or compound lateral clusters; sepals about equal, spreading, the dorsal broader than the lateral; petals similar to the dorsal sepal; lip erect, or bent in, attached to the foot of the column, spurred at the base, the spur hollow; pollinia 2.—Species about 30, distributed from Malay Archipelago to India, E. Asia and Japan.

Nearly all the species of this genus are from the East Indies and therefore require the warmhouse treatment, with a minimum of 65° F. in winter. As they have no pseudobulbs, but an erect, evergreen stem, they must never be allowed to become perfectly dry. Ample drainage of charcoal and broken pots is very essential, with a surfacing of moss, preferably sphagnum, renewed each year, the usual peat fiber being omitted. The best-known species is *A. odoratum* and is often seen in collections flowering freely. *A. Fieldingii* is also an interesting plant, as the spikes grow to the length of 18 inches, are dense-flowered, and known as the "fox-brush orchid," the color being a beautiful rose-pink. *A. Lawrenciæ* is another fine plant, from the Philippines but not yet common in gardens.—Propagation is effected only by cutting off the top of the plant and setting it down in another pot, and waiting for the other part to send out shoots. The roots are mostly aerial, and no attempt must be made to confine these to the pots. If the size pot used is large, it should be perforated at the sides to admit of a free circulation of air. (Orpet.)

## KEY TO THE SPECIES.

- A. Lvs. flat, keeled.  
 B. Middle lobe of the lip incurved between the larger lateral lobes.  
 C. Spur curved.  
 D. Fls. 1½ in. long or less.  
 E. Lateral lobes of the lip white.  
 F. Length of fls. 1 in. or more.  
 G. Lip not spotted or with few spots; fls. crowded, concealing the stem. . . . . 1. *odoratum*  
 GG. Lip usually much spotted; fls. not crowded, revealing the stem. . . . . 2. *virens*  
 FF. Length of fls. less than 1 in. . . . . 3. *quinquevulnerum*  
 EE. Lateral lobes of the lip lemon-yellow. . . . . 4. *suavissimum*  
 DD. Fls. exceeding 1½ in. long. . . . . 5. *Lawrenciæ*  
 CC. Spur straight.  
 D. Raceme much longer than the lvs.; middle lobe of the lip ovate-triangular. . . . . 6. *Leanum*  
 DD. Racemes as long as the lvs.; middle lobe of the lip linear-oblong. . . . . 7. *Savageanum*  
 BB. Middle lobe of the lip spreading, not incurved.  
 C. Sts. long: lvs. numerous, 5 in. or more long.  
 D. Lateral lobes of lip large, usually falcate or lunate.  
 E. Spur short, conic.  
 F. Sepals and petals white. . . . . 8. *falcatum*  
 FF. Sepals and petals tawny yellow. . . . . 9. *Houlletianum*  
 EE. Spur long, cylindric.  
 F. Shape of spur straight. . . . . 10. *Augustianum*  
 FF. Shape of spur recurved or hooked. . . . . 11. *crassifolium*

DD. Lateral lobes of lip smaller or wanting.

E. Racemes drooping or pendulous.

F. Middle lobe of lip entire.

G. The spur straight.

H. The middle lobe of lip cordate, obtuse. . . . . 12. *multiflorum*

HH. The middle lobe of lip deltoid, acuminate. . . . . 13. *Fieldingii*

GG. The spur incurved or hooked. . . . . 14. *maculosum*

FF. Middle lobe of lip serrate; lateral lobes small. . . . . 15. *crispum*

EE. Racemes erect or ascending. . . . . 16. *radicosum*

CC. Sts. short: lvs. few, 4 in. long or less. . . . . 17. *japonicum*

AA. Lvs. terete or semiterete, grooved on the upper surface.

B. Fls. few, white, 2 in. or more across. . . . . 18. *vandarum*

BB. Fls. numerous, less than 1 in. across, the lip violet. . . . . 19. *mitratum*

1. *odoratum*, Lour. (*A. cornutum*, Roxbg.). Fig. 132. Lvs. 6–8 in. long, up to 2 in. broad: racemes nodding, equaling or longer than the lvs.; fls. about 1 in. long, fragrant; sepals and petals white, with a carmine spot

132. *Aerides odoratum* (×½)

at the obtuse apex, the petals narrower than the sepals; lateral lobes of the lip erect, round-oblong, white, or faintly tinged with purple, and somewhat spotted; middle lobe of the lip linear-oblong, denticulate or entire, white, with a median purple line. India to Cochin China. B.M. 4139. Gn. 49, p. 158. F.C. 2:75. O.R. 6:273; 8:217. Var. *birmanicum*, Reichb. f. Fls. smaller, with lines instead of apical spots, and the narrow middle lobe of the lip with few marginal teeth. Var. *purpurascens*, Hort. Racemes larger, and the sepals and petals

tipped with dull amethyst. G.C. II. 16:597. Var. *majus*, Hort. Racemes and fls. larger.

2. *virens*, Lindl. Lvs. up to 10 in. long and 1¼ in. broad: racemes longer than the lvs.; fls. over 1 in. long, fragrant; sepals and petals white, with a bright purple apical spot, broadly oval, obtuse; lip deeply 3-lobed, the oblong lateral lobes much the larger, erect, white, purple-spotted below, the middle lobe oblong, small, incurved, purple, or white with a median purple stripe; spur green-tipped. Java. P.M. 14:197. B.R. 30:41. Var. *Ellisii*, Hort. (*A. Ellisii*, Hort.). Sepals and petals white, flushed with rose, the tips amethyst-purple. Var. *Dayanum*, Hort. Racemes longer, with large bright fls. Var. *Sanderæ*, Hort. A form in which the fls. are pure white.

3. *quinquevulnerum*, Lindl. Lvs. up to 1 ft. long and 1½ in. broad: racemes commonly longer than the lvs.; fls. usually less than 1 in. long; sepals and petals obtuse, oval-oblong, white, tipped with amethyst and with a few purple spots below; lip 3-lobed, the erect lateral lobes triangular-oblong, white, faintly purple-dotted, the middle lobe oblong, deep amethyst, the spur incurved green. Philippine Isls. P.M. 8:241. Var.

**Rœbelinii** (*A. Rœbelinii*, Reichb. f.). Differs in the denticulate petals which shade to green at the base, and in the rose-colored middle lobe of the lip. Philippine Isls.

4. **suavissimum**, Lindl. Lvs. up to 10 in. long and  $1\frac{1}{2}$  in. broad: racemes longer than the lvs.; fls. fragrant, somewhat crowded; sepals and petals white, flushed with lilac, tipped with rose-lilac, the dorsal sepal broadly oval, the lateral larger; lip 3-lobed, the erect lateral lobes rounded-oblong, lemon-yellow, purple-spotted, the middle lobe linear-oblong, paler than the lateral lobes. Malacca. C.O., pl. 6. J.F. 2, pl. 213. Var. **Bal-lantineanum**, Veitch. Blooms a little earlier: racemes shorter, the sepals and petals amethyst-tipped.

5. **Láwrenciæ**, Reichb. (*A. Lawrencianum*, Hort.). Lvs. up to 1 ft. long and 2 in. broad: racemes equaling or longer than the lvs.; fls. over  $1\frac{1}{2}$  in. long, fragrant; sepals and petals white, amethyst-tipped; lip deeply 3-lobed, the denticulate lateral lobes hatchet-shaped, white, the middle lobe oblong, amethyst, the spur green, incurved. Philippine Isls. Gn. 35:485. G.C. III. 20: 629; 30:435. Var. **Amesianum**, Kränzl. A more robust plant, with fls. of a more intense color. Var. **Sanderianum**, Hort. Differs in its narrow lvs. and yellowish fls.

6. **Leånium**, Reichb. f. Lvs. up to 10 in. long and  $1\frac{1}{2}$  in. broad: racemes longer than the lvs.; fls. less than 1 in. long; sepals and petals rose-purple with a white base; lip 3-lobed, the lateral lobes round, incurved, and nearly inclosing the small, ovate-triangular, deep purple middle lobe; spur straight, green-tipped. India.

7. **Savageanum**, Veitch. Lvs. up to 10 in. long and  $1\frac{1}{4}$  in. wide: racemes equaling the lvs.; fls. less than 1 in. long; sepals and petals with the white base dotted with purple, the upper portion crimson; lip crimson-purple, the erect lateral lobes round-oblong, the middle lobe linear-oblong, small, incurved; spur straight, greenish.

8. **falcatum**, Lindl. & Paxt. (*A. Larpéntæ*, Hort. *A. expánsum*, Reichb. f.). Lvs. up to 8 in. long and  $1\frac{1}{2}$  in. broad: racemes equaling or exceeding the lvs.; fls. about  $1\frac{1}{4}$  in. long; sepals and petals white, tipped with amethyst-purple; lip 3-lobed, the spreading lateral lobes falcate, light amethyst, the middle lobe deep amethyst, broadly obovate, notched, denticulate; spur short, greenish. Upper Burma. Var. **Leónæi** (*A. Leónæi*, Reichb. f.). Differs in having the middle lobe of the lip larger and of deeper color, and in the dotting of the lateral lobes and of the base of the sepals and petals. Rangoon.

9. **Houlletianum**, Reichb. f. Resembles *A. falcatum*, but differs in its smaller fls., arranged in shorter and denser racemes, the sepals and petals tawny yellow, tipped with purple, the lip white, striped and spotted with purple, the middle lobe fimbriate. Cochin China. C.O., pl. 3. I.H. 29:455. R.B. 21:205. R.H. 1891:324.

10. **Augustianum**, Rolfe. Lvs. up to 8 in. long and  $1\frac{1}{4}$  in. broad: racemes longer than the lvs.; fls.  $1-1\frac{1}{4}$  in. long; sepals and petals rose, round-oblong, obtuse; lip 3-lobed, the oblong lateral lobes falcate, rounded or truncate at the summit, the broadly oblong middle lobe crenulate, somewhat bilobed at the apex; spur straight. Philippine Isls. G.C. III. 7:233.

11. **crassifolium**, Par. & Reichb. f. Lvs. up to 8 in. long and 2 in. wide: racemes longer than lvs.; fls. loosely arranged,  $1-1\frac{1}{2}$  in. long; sepals and petals rose-purple, paler at the base; lip 3-lobed, the lateral lobes rose-purple, nearly lunate or crescent-shaped, the broadly ovate middle lobe deep rose-purple; spur curved, greenish at the tip. Burma. G.C. II. 8:493. C.O., pl. 1.

12. **multiflorum**, Roxbg. (*A. affine*, Wall. *A. roseum*, Paxt.). Lvs. up to 10 in. long, less than 1 in. broad: racemes longer than the lvs.; fls. about  $\frac{3}{4}$  in. long; basal portion of the oval-oblong petals and dorsal sepal white,

with a few purple spots, the remainder light amethyst, the nearly orbicular lateral sepals white, faintly flushed; lip light amethyst, deeper in the middle, cordate obtuse; spur straight, short. B.M. 4049. Gt. 8:267. J.F. 2:200. Var. **Lóbbii**, Veitch (*A. Lóbbii*, Hort.). Differs from the type in its much-crowded lvs., and in the fls. which are more numerous and more highly colored. I.H. 15:559. Var. **Godefroyanum**, Veitch (*A. Godefroyanum*, Reichb. f.). Lvs. longer: fls. a little larger and more highly colored than in the type. R.B. 17:169.

13. **Fiëldingii**, Lodd. FOX-BRUSH ORCHID. Lvs. up to 10 in. long and nearly 2 in. broad: infl. racemose, sometimes paniculate at the base, longer than the lvs.; fls. about  $1\frac{1}{2}$  in. long, crowded; petals and dorsal sepal white, suffused with rose, or the basal portion sometimes white and dotted with purple, obovate, the lateral sepals white, tipped with pale purple, broadly oval; lip white, suffused with rose, deltoid or trowel-shaped, acuminate, the small lateral lobes inrolled over the mouth of the small white spur which is amethyst, mottled with white. Sikkin and Assam. B.H. 1876:18, 19. A.F. 22:883.

14. **maculôsum**, Lindl. Lvs. up to 10 in. long and nearly 2 in. broad: infl. longer than the lvs., often paniculate at the base; fls. about  $1\frac{1}{2}$  in. long, the sepals and petals white, the upper portion stained and spotted with amethyst, oval-oblong; lip clawed, the blade amethyst, deeper in the middle, ovate-oblong, obtuse, with 2 small white tubercles at the base; spur incurved, short, green-tipped. India. Var. **Schröederi**, Veitch. Differs from the type in its more robust habit, its longer lvs., and the darker markings of the sepals, petals, and middle of the lip. G.C. II. 13:493; 17:341. J.F. 1:54.

15. **crispum**, Lindl. (*A. Broðkei*, Batem.). Lvs. up to 8 in. long and 2 in. broad: infl. several times longer than the lvs., racemose, or sometimes paniculate at the base; fls. about 2 in. long, the sepals and petals white, faintly flushed with rose-purple on the back and on the surface at the apex; lip 3-lobed, the erect, small lateral lobes white, streaked with rose-purple on the surface, round-oblong, the middle lobe deep amethyst, white at the base, broadly ovate, the sides reflexed, serrate; spur small, curved. S. India. B.M. 4427. F.S. 5:438. Gn. 4, p. 85. B.R. 28:55. F.S. 1:42. G.C. III. 36:134. Var. **Lindleyanum**, Hort. Infl. paniculate at the base; fls. larger than in the type, the lip with the lateral lobes greenish and the middle lobe rich amethyst bordered with white. Neigherry Hills. Var. **Wärneri**, Hort. Differs in having the lvs. shorter and narrower than in the type, and in its longer racemes of smaller fls., the middle lobe of the lip deep rose with a white border.

16. **radicôsum**, Reichb. (*A. rubrum*, Hort.). Lvs. up to 10 in. long and  $1\frac{1}{2}$  in. broad: infl. longer than the lvs., racemose, or sometimes paniculate at the base; fls. about  $1\frac{3}{4}$  in. long, the sepals and petals light rose-purple, deeper spotted; lip 3-lobed, the small erect lateral lobes round, rose-purple, the middle lobe deep rose-purple, oblong, acute; spur curved, short. India.

17. **japonicum**, Reichb. f. Lvs. up to 4 in. long, few: racemes longer than the lvs.; fls. about 1 in. long, fragrant; sepals and petals greenish white, the lateral sepals bordered with brownish purple; lip 3-lobed, the lateral lobes small, the middle lobe obovate-spatulate, crenulate, white, with a median dark violet ridge and a few paler spots; spur straight, obtuse. Japan. B.M. 5798. I.H. 29:461.

18. **vandârum**, Reichb. f. (*A. cylindricum*, Hook.). St. slender, round: lvs. terete, grooved on the upper surface, up to 8 in. long: fls. single or in few-fl. racemes, white, about 2 in. long; sepals and petals undulate, the former obovate-oblong, the latter nearly rhomboidal, lip 3-lobed, the lateral lobes linear-falcate, the middle

lobe broadly obcordate; spur subulate. Himalayan region. B.M. 4982. J.H. III. 34:417. O.R. 13:60.

19. *mitrātum*, Reichb. f. St. short, with a few semiterete lvs. 6–15 in. long, deeply grooved on the upper surface: racemes from below the lvs. and shorter than them, ascending or nearly erect; fls.  $\frac{3}{4}$  in. long; sepals and petals white, flushed with mauve at the apex; lip amethyst; spur miter-shaped, short. Burma. B.M. 5728.

*A. Micholitzii*, Rolfe. A recently intro. species, allied to *A. odoratum*. Light rose-purple fls. and a rather short spur. Annam. O.R. 1904:181.—*A. cylindricum*, Lindl. Resembles *A. vandarum* in habit and foliage. Fls. about  $1\frac{1}{2}$  in. across; the sepals and petals waxy white, sometimes tinged rose, the lip white, the side lobes purple-streaked, the middle lobe yellow with a crimson tip. India. G.C. III. 17:393.—*A. Duquesnei*, Hort. Fls. white dotted with rose.—*A. Emericii*, Reichb. Fls. 1 in. long, the sepals and petals white, amethyst-blotched at apex, the side lobes of lip purple-spotted, the middle lobe small, narrowly oblong, acute, amethyst; spur incurved. B.M. 6728.—*A. Thibautianum*, Reichb. Racemes longer than the lvs.: fls. rose with an amethyst lip; spur curved.

GEORGE V. NASH.

**ÆRUA** (said to be from the Arabic name). *Amarantaceæ*. A genus of 10 species of Trop. Asiatic and African herbs or shrubs, allied to *Achyranthes*, with perfect or imperfect fls., the perianth segms. short and hyaline; stamens 5 or 4, sterile filaments intervening; fls. very small, usually in clusters, white or rusty.

*sanguinolenta*, Blume (*A. sanguinea*, Hort.). Lvs.  $1\frac{1}{2}$ – $2\frac{1}{2}$  in. long, opposite or alternate, ovate-acuminate,

133. Opening foliage of *Æsculus Hippocastanum*.

soft-pubescent, pale beneath. Java.—Cult. for its dark red lvs. Not common and at present perhaps confined to botanic gardens.

N. TAYLOR.†

**ÆSCHYNÁNTHUS**: *Trichosporum*.

**ÆSCULUS** (ancient name of some oak or mast-bearing tree). Including *Pavia*. *Hippocastanaceæ*. HORSE-CHESTNUT. BUCKEYE. Trees or sometimes shrubs, cultivated for shade and for the conspicuous bloom of some species.

Winter-buds large with several pairs of outer scales: lvs. opposite, long-petioled, digitate, deciduous; lfts. 5–9, serrate; fls. symmetrical in terminal panicles; calyx campanulate to tubular, unequally 4–5-toothed; petals 4–5, with long claws; stamens 5–9; ovary 3-celled, with 2-ovuled cells: fr. a large 3-valved caps., usually with 1 or 2 large seeds; seeds large, brown, with a large pale hilum.—About 20 species in N. Amer., E. Asia, Himalayas and Balkan Peninsula.

The buckeyes are deciduous trees and shrubs, with large, digitate leaves and red, white or yellow flowers in showy terminal panicles. They are cultivated for their showy flowers and handsome foliage, and some species

make excellent shade trees. The large seeds are not edible.

Some species, as *Æ. Hippocastanum* and *Æ. carnea* are popular shade and street trees. They leaf early and soon give a dense shade. The shrubby species are well adapted for borders of larger groups or as solitary clumps on the lawn, particularly *Æ. parviflora*, with its slender panicles of white flowers; similar in habit and effect but with bright scarlet flowers, are *Æ. discolor*, *Æ. georgiana* and *Æ. splendens*. Most of the species are hardy North, but the Californian and Himalayan species are suitable only for the southern states. They grow best in loamy and moist soil.

Propagation is by seeds to be sown in autumn or stratified, or by side-grafting and budding on common species, and the shrubby forms also by layers; *Æ. parviflora* is propagated also by root-cuttings.

A. Winter-buds resinous: claws of petals not longer than calyx; stamens exerted.

B. Lfts. sessile: petals 5; calyx campanulate, 5-lobed; stamens 5–8: fr. globular. (*Hippocastanum*).

c. Lvs. glabrous beneath.

1. **Hippocástanum**, Linn. COMMON HORSE-CHESTNUT. Fig. 133. Large tree, 60–80 ft.: lfts. 5–7, sessile, cuneate-obovate, acuminate, obtusely serrate, nearly glabrous: panicles 8–12 in. long, very showy; fls. white, tinged with red,  $\frac{3}{4}$  in. long; fr. echinate. May. N. Greece, Bulgaria. H.W. 3:47. F.E. 13, pl. 13 (habit).—Many garden forms; the most important are: Var. *Baumanni*, Schneid. (var. *flore-pleno*, Lem.), with double white fls. I.H. 2:50. F.S. 7, p. 75. B.H. 4, p. 133. G.M. 44:613. A.G. 32:271 (habit). Var. *Schirnhoferi*, Rosenth., with double yellowish red fls. W.I.G. 1882:101. Var. *pumila*, Dipp., dwarf form. Var. *umbraculifera*, Rehd., with compact round head. M.D.G. 1903:188. Var. *pyramidalis*, Nichols., with compact, narrow, pyramidal head. Var. *laciniata*, Leroy (var. *dissecta*, Hort., var. *heterophylla*, Hort.), lfts laciniate. Var. *incisa*, Dipp. Lfts. short and broad, deeply and doubly serrate to incisely lobed. Var. *Henkeli*, Henkel, is little different, only the lfts. are narrower and the habit more pyramidal. Var. *variegata*, Loud., lvs. variegated with yellow. Var. *Memmingeri*, Bean. Lvs. sprinkled with white.—The horse-chestnut is one of the most popular of shade trees on the continent of Europe, and is also much planted along roads and in parks and private grounds in this country. It is particularly adaptable for bowers and places where seats are desired, as the top stands heading-in and makes a very dense shade. It is the first of all shade trees to burst into leaf. When smaller, more formal trees are desired, var. *umbraculifera* should be planted. The double-fl. forms are to be recommended for the longer duration of their fls. and for the absence of the fr. which is of great, often annoying, attraction to the small boy. In dry situations, the planting of the horse-chestnut should be avoided, as the foliage is likely to suffer, particularly in dry seasons, from drought and heat.

2. *carnea*, Hayne (*Æ. Hippocastanum* × *Pavia*. *Æ. rubicunda*, Loisel., *Æ. intermedia*, André). Tree, 20–40 ft.: lfts. mostly 5, nearly sessile, cuneate-obovate, crenate-serrate, nearly glabrous; panicles 5–8 in. long; fls. varying from flesh-color to scarlet: fr. with small prickles. Garden origin. B.R. 1056. L.B.C. 13:1242. F.S. 2229–30. F.E. 23:607 (habit).—Common in parks and on roadsides. Handsome and desirable; the foliage is darker and of firmer texture than that of the preceding species and resists drought better. Many garden forms, according to the different shades in coloring; one of the best is var. *Briottii*, Nichols. (*Æ. rubicunda* var. *Briottii*, Carr.), with bright scarlet fls. R.H. 1878: 370. Also var. *plantierensis*, Rehd. (*Æ. plantierensis*, André), with yellowish white fls. tinged with pink and fading to pink and with bluntly serrate lfts., is very handsome.

cc. *Lvs. pubescent beneath, at least while young.*

3. *turbinata*, Blume (*Æ. sinensis*, Hort., not Bunge). JAPANESE HORSE-CHESTNUT. Tree, 20 ft.: petioles and young branchlets pubescent; lfts. 5–7, cuneate-obovate, crenate-serrate, pubescent beneath when young; panicles 6–10 in. long, dense and rather narrow, pubescent; fls. yellowish white, with a red spot, less than  $\frac{1}{2}$  in. long; fr. verrucose. June. Japan. G.C. III. 5:717; 31:187. S.I.F. 1:71.—The lvs. are larger than those of the preceding species, but the individual fls. are smaller and less strongly marked with red. Hardy at the Arnold Arboretum.

BB. *Lfts. stalked: petals 4; calyx 2-lipped; stamens 7–9: fr. pear-shaped, smooth.* (*Calothyrsus*.)

c. *Petals nearly equal, oblong-obovate to oblanceolate.*

d. *Corolla about 1 in. long.*

4. *californica*, Nutt. CALIFORNIA BUCKEYE. Tree with broad top, 30–40 ft.: lfts. 5–7, petioled, oblong-lanceolate, cuneate or obtuse at the base, sharply serrate, glabrous, 4–6 in. long; panicles 3–8 in. long, rather dense; fls. white or pale rose-colored, 1 in. long; petals of equal length. Calif. B.M. 5077. R.H. 1855, p. 150. Gn. 49, pp. 490, 492. S.S. 2:71, 72. F.S. 13:1312. G.C. III. 31:186. G.M. 55:577 (habit).

DD. *Corolla much less than 1 in. long.*

5. *chinensis*, Bunge. Tree, to 60 ft.: lfts. 5–7, short-stalked, oblong-obovate to oblong-oblanceolate, acuminate, cuneate at the base, glabrous beneath, except sparingly hairy on the veins, closely serrulate, 4–7 in. long; fls. less than  $\frac{1}{2}$  in. long, white, in elongated cylindric panicles: fr. subglobose, slightly depressed at the apex, with thick walls; seeds 1 in. across or less with the hilum occupying about one-half of the seed. May, June. N. China. G.C. III. 52:346, 347.—Recently intro. by the Arnold Arboretum and probably hardy N.

6. *Wilsonii*, Rehd. Tree, to 80 ft.: lfts. 5–7, stalked, oblong-obovate to oblong-oblanceolate, acuminate, rounded or broadly cuneate at the base, densely grayish pubescent beneath while young, 4–9 in. long; fls. about  $\frac{1}{2}$  in. long, the upper petals with a yellow spot, in cylindric panicles 6–12 in. long; fr. ovoid, somewhat pointed at the apex, with thin walls; seeds  $1\frac{1}{2}$  in. across with the hilum occupying one-third or less of the seed. May, June. W. and Cent. China.—Recently intro. by the Arnold Arboretum, but proved tender in Mass.; probably hardy south of New York, and a tree highly to be recommended for its very large spikes of white fls.

CC. *Petals unequal, about 1 in. long, the upper ones marked red and yellow, oblanceolate, the lateral ones with oval or obovate blade.*

7. *indica*, Colebr. Tall tree, to 60 ft.: lfts. 5–9, obovate-lanceolate, short-stalked, finely serrate, cuneate at the base, glabrous or nearly so beneath, 6–10 in. long; panicle to 15 in. long, narrow; fls. about 1 in. long with white unequal petals, the upper with yellow

blotch, the lower tinged rose. Himalayas. B.M. 5117. G.C. 33:139; 36:206. Gn. 76, p. 399.—A handsome tree with large foliage and showy fls., hardy only in the southern states.

AA. *Winter-buds not resinous: claws mostly longer than the 5-toothed calyx.*

B. *Fls. yellow to scarlet; petals 4; stamens included or somewhat exerted: lfts. petioled.* (*Pavia*.)

C. *Petals villous at the margin (interspersed with glands in the hybrid).*

D. *Color of fls. yellow; margin of petals without glands.*

8. *glabra*, Willd. (*Æ. ohioensis*, Michx. *Pavia glabra*, Spach. *P. pallida*, Spach). OHIO BUCKEYE. Small tree, 15–30 ft.: lfts. 5, oval or cuneate-obovate, finely serrate, smooth; panicles 5–6 in. long; fls. greenish yellow; petals of nearly equal length, their claws as long as the calyx; stamens exerted: fr. echinate. May. Pa. to Ala. and Iowa. B.R. 24:51. S.S. 2:67, 68. F.E. 29:773 (habit). Var. *Bückleyi*, Sarg. (*Æ. glabra* var. *arguta*, Rob. partly). Shrub: lfts. 6–7, obovate-lanceolate, unequally serrate, more acuminate, finely pubescent beneath. Has been confounded with the true *Æ. arguta*, Buckl.

9. *octandra*, Marsh. (*Æ. flava*, Ait. *Æ. lutea*, Wang *Pavia lutea*, Poir.). SWEET BUCKEYE. Large tree, 40–90 ft.: lfts. 5, oblong-obovate or elliptical, cuneate,

134. *Æsculus georgiana*. ( $\times \frac{1}{2}$ )

equally serrate, smooth or pubescent beneath; panicles 4–6 in. long; petals yellow, very unequal, their claws longer than the calyx; stamens 7, shorter than the petals: fr. smooth. May, June. Pa. to Ga. and Iowa. L.B.C. 13:1280. S.S. 2:69, 70. G.W. 7, p. 145 (habit).

DD. *Color of fls. red or yellow tinged more or less with red.*

E. *Margin of petals without glands, villous.*

10. *georgiana*, Sarg. Fig. 134. Shrub, to 6 ft.: lfts. 5, stalked, oblong-obovate, long-pointed, finely and often doubly serrate, pale yellowish green beneath and quite glabrous: fls.  $1\frac{1}{4}$  in. long, in dense panicles 5–6 in. long; calyx narrow-campanulate, red; petals red and yellow; very dissimilar, the lateral ones broad, usually rounded at the base; stamens 7, shorter than the petals, villous below the middle. May, June. Ga. S.T.S. 2:197.—This is the only species of the *Æ. octandra* group with red and yellow fls.: it is very handsome and has proved perfectly hardy at the Arnold Arboretum.

11. *wœrlitzensis*, Koehne. Tree: lfts. obovate-oblong, yellowish green beneath, sparingly hairy along the midrib and bearded in the axils, otherwise quite glabrous, with 17–20 pairs of veins: fls.  $1\frac{1}{4}$  in. long, in

panicles 4-5 in. long; calyx tubular, wider above the middle; petals red, the lateral ones with an oblong-oval or oblong-obovate blade gradually narrowed at the base; stamens as long as the lateral petals. May. Of garden origin. Var. *Ellwangeri*, Rehd. (*Æ. Pavia* var. *Whitley*, Ellwanger & Barry, not Hort. Angl. *Æ. Pavia* var. *atrosanguinea*, Hort.). Lfts. slightly hairy on the whole under surface while young, with 20-27 pairs of veins: fls. darker red; calyx narrower, not widened above the middle. Origin unknown.—Very similar to *Æ. Pavia*, but easily distinguished by the villous margin of the petals.

EE. Margin of petals with hairs and glands: fls. yellow and reddish.

12. *hýbrida*, DC. (*Æ. octandra* × *Pavia*, *Æ. versicolor*, Wender. *Pavia hýbrida*, Spach. *Æ.* or *P. Lyonii*, Hort.). Intermediate between *Æ. octandra* and *Æ. Pavia*. Lfts. pubescent beneath along the veins, short-petioled, minutely crenulate-serrate; calyx narrow-campanulate, red or yellowish red; petals yellow or reddish; stamens shorter than petals, pubescent toward the base. May, June. Garden origin. W.D.B. 2:164 (as *Æ. Pavia*).—Several forms of this hybrid are in cult., varying in the color of the fls. from yellow, slightly tinged with red, to nearly red. Here belong also several forms cult. in gardens as *Æ. discolor* and *Æ. Pavia* var. *arguta*, Lindl., with red fls. (B.R. 993).

cc. Petals only glandular, not villous on the margin, red, or red and yellow.

d. Lvs. glabrous beneath or only slightly pubescent along the midrib.

13. *Pavia*, Linn. (*Pavia rubra*, Poir. *P. Michauxii*, Spach). RED BUCKEYE. Shrub or small tree, 4-20 ft.: lfts. oblong or elliptical, acute at both ends, finely serrate, smooth or pubescent beneath: panicles 4-7 in. long, loose; fls. purplish to dark red; calyx tubular; petals very dissimilar; stamens mostly 8, nearly as long as the petals: fr. smooth. May, June. Va. to Fla. and La. L.B.C. 13:1257. S.T.S. 2:199.—Many garden forms, as var. *humilis*, Mouillef. (*Æ. humilis*, Lodd. *Æ. Pavia* var. *nana*, Dipp. *Æ. Pavia* var. *péndula*, Hort. *Æ. rubra* var. *humilis*, Loud.). Low shrub, sometimes prostrate, 2-4 ft.: lfts. coarsely and unequally serrate, slightly pubescent beneath, chiefly along the veins: fls. red; calyx dark red. B.R. 1018. Var. *atrosanguinea*, Rehd. Fls. very dark red. Var. *sublaciniata*, Wats. (*Pavia atropurpurea*, Spach). Lfts. narrower oblong, deeply serrate: fls. dark red. W.D.B. 2:120. There are also forms with variegated lvs.

DD. Lvs. tomentose or densely pubescent beneath.

14. *discolor*, Pursh (*Æ. Pavia* var. *discolor*, Torr. & Gray. *Æ. octandra* var. *hýbrida*, Sarg., partly). Shrub or small tree, to 30 ft.: lfts. 5, elliptic to oblong-obovate, acuminate, finely crenately serrate, whitish tomentose beneath: panicles 6-8 in. long, rather narrow; fls. 1½ in. long; calyx tubular, deep scarlet like the axis of the panicle; petals very unequal, scarlet and yellow in the typical form; stamens at least longer than the shorter pair of petals: fr. smooth; seeds light yellowish brown. May-June. Ga. to Texas and S. Mo.

B.R. 4:310. S.S. 13:622. S.O.B. 1:39 (as *Æ. Pavia*). Var. *móllis*, Sarg. (*Æ. móllis*, Raf. *Æ. austrina*, Small). Fls. deep scarlet. A very handsome variety with its long and rather slender racemes of bright scarlet fls. It has proved hardy at the Arnold Arboretum. Var. *flavescens*, Sarg. Fls. yellow. This is the yellow-fl. Texan buckeye formerly referred to *Æ. octandra*.

15. *spléndens*, Sarg. A shrub, 8-12 ft.: lfts. 5, lanceolate to oblanceolate, acuminate, finely and often doubly crenulate-serrate, densely hoary pubescent beneath: fls. 1½ in. long in many-fl. panicles 4-8 in. long; calyx tubular, bright red; petals unequal, deep scarlet; stamens usually 7, longer or shorter than the petals: seeds dark chestnut-brown. May, June. Ala.—Apparently the handsomest in flower of all horse-chestnuts. S.F.S. 2:200.

BB. Fls. pure white, small; petals 4-5; stamens more than twice as long as the petals. (*Macrothyrus*.)

16. *parviflora*, Walt. (*Æ. macrostachya*, Michx. *Pavia alba*, Poir.). Fig. 135. Shrub, 3-10 ft.: lfts. 5-7, elliptical or oblong-ovate, nearly sessile, finely serrate, pubescent beneath: panicles 8-16 in. long, narrow: fr. smooth. July, Aug. Southern states. B.M. 2118. Gng. 7:81. G.C. II. 8:653; III. 31:189, 200; 45:123. Gn. 63, p. 299; 75, p. 568. M.D.G. 1897:305. Gn. M. 9:76. A.F. 24:533; 28:724 (habit); 34:190.—One of the handsomest plants for a lawn clump.

*Æ. arguta*, Buckl. (*Æ. glabra* var. *arguta*, Rob.). Allied to *Æ. glabra*. Shrub, 1-5 ft.: lfts. 7-9, lanceolate to obovate-lanceolate, sharply and often doubly serrate, pubescent beneath: fls. light yellowish green. Texas. S.T.S. 2:198.—Not in cult.; the plant that is cult. under this name is *Æ. glabra* var. *Buckleyi*.—*Æ. Bushii*, Schneid. Supposed hybrid of *Æ. glabra* and *discolor*. Tree, to 30 ft.: lfts. oblong-obovate, finely and bluntly serrate, pubescent below: calyx pink; petals pink and yellow, glandular and villous at the margin: fr. slightly tuberculate. Ark. Hardy at the Arnold Arboretum.—*Æ. glaucescens*, Sarg. Related to *Æ. octandra*. Shrub, to 10 ft. Lfts. larger, glabrous and glaucescent beneath: fls. larger: fr. smaller. Ga. S.T.S. 2:196.—*Æ. humilis*, Koehne, not Lodd. Related to *Æ. discolor* and possibly variety. Low shrub: lvs. tomentose beneath: fls. red and yellow. Of unknown origin.—*Æ. marylandica*, Booth. Supposed hybrid of *Æ. glabra* and *octandra*. Of unknown origin.—*Æ. neglecta*, Lindl. Near *Æ. octandra*, but petals veined with purple toward the base of the blade: the lfts. are glabrous beneath. Of unknown origin. B.R. 12:1009.—*Æ. Parryi*, Gray. Similar to *A. californica*. Lfts. small, obovate, canescent-tomentose beneath: calyx 5-lobed. Calif. G.F. 3:356.

ALFRED REHDER.

ÆTHEOPÁPPUS: *Centaurea*.

ÆTHIONÈMA (*aītho*, scorch, and *nema*, filament; probably referring to appearance of stamens). *Cruciferae*. Dwarf, shrubby herbs for the hardy herbaceous border, or rockery. Less common than Iberis.

The genus differs from *Iberis* in having all its petals equal, and from *Lepidium* in having its four stamens longer, winged and toothed. Fls. various shades of pink, purple, or red, in crowded terminal racemes. W. B. Hemslay, in Gn. 9, pp. 108, 109.

Æthionemas dislike moist or stiff soil or shady places; but in light, sandy loam, on dry and sunny slopes, they are compact and branchy, and when once fairly established will last for many successive years without replanting or renewal, while, under the opposite conditions, the plants grow feeble and lanky, and may die after a year

135. *Æsculus parviflora*. (× ¼)

or two. They keep fully as well as the candytufts in water, and can be cut with longer and straighter stems.

Propagation is by seeds in spring or by cuttings in summer; annual and biennial kinds by seeds.

#### A. Perennial.

**coridifolium**, DC. (*Iberis jucunda*, Schott & Kotschy). Branches numerous, thick, 4-6 in. high: lvs. crowded, short, nerveless, linear or linear-oblong, acute or obtuse: fls. rosy lilac, smaller and later than in the next, in dense, short, rounded racemes. Chalky summits of Lebanon and Taurus. B.M. 5952.—Good for edging. *Æ. pulchellum* was sold under this name for many years.

**grandiflorum**, Boiss. & Hohen. Branches 1-1½ ft., prostrate: lvs. usually longer than in *Æ. coridifolium*, more linear and more acute: fls. as large as those of *Arabis alpina*, rose-colored, in slender, elongated racemes; petals 4 times as long as the sepals. Persia. Gn. 9:108. Useful in the rock-garden.

**pulchellum**, Boiss. & Huet. Similar to *Æ. coridifolium*, but more diffuse and trailing. Fls. smaller and brighter-colored; petals 2½ times as long as the sepals. Persia. Gn. 25:320.

**iberideum**, Boiss. St. cespitose, ascending, rough: lvs. glaucous, bunched, oblong or linear-lanceolate, narrowly acute at the base: fls. large and showy, white, racemose, flowering from June to Sept. E. Medit. region.—Not well known in Amer.

#### AA. Annual.

**cappadocicum**, Spreng. (*Æ. Buxbaumii*, DC.). Six to 8 in.: lvs. oblong or linear-oblong, spatulate, glaucous: fls. racemose, the racemes crowded, corolla pale red. June. Orient.

*Æ. diastrophis* Bunge. 10 in. high: fls. pale, rosy lilac. Mts. of Armenia. GN. 63:109.—*Æ. persicum*, Hort. Stout, erect, shrubby, dwarf: fls. deep rose.—Best of dwarfs. Intro. 1892, by J. W. Manning.

N. TAYLOR.†

**ÆXTÓXICON** (Greek, *aix*, goat, and *toxicon*, poison). *Euphorbiaceæ*. Trees, rarely cult. Younger parts covered with deciduous scales: lvs. alternate, simple, leathery: fls. with petals and disk, in short clusters: fr. fleshy, 1-seeded. The single species from the Chilian coast (*Æ. punctatum*, Ruiz & Pav.), and known there as *tique*, *palo muerto*, *acietunillo* and *olivillo*, is listed once in the U. S. Dept. of Agric. inventories of seeds and plants intro.

J. B. S. NORTON.

**AFZÈLIA** (named for Adam Afzelius, of Upsala, and once resident in Sierra Leone). *Leguminosæ*. A small genus of unarmed trees, in Afr. and the Pacific Is.: fls. with vexillum much exceeding calyx and clawed, the lateral and anterior petals scale-like or wanting; perfect stamens 7, staminodia 2. **A. bijuga**, Gray. Tree: lvs. abruptly pinnate, the lfts. mostly in 2 pairs, ovate: fls. in small terminal panicles: pod oblong and flat, 5-8 in. long by 2 in. wide; seeds compressed-orbicular, 1 in. or more in diam. Described from the Fiji Is., but apparently widely distributed in Oceanica. Apparently not cult., but it is the "ift," used in Guam as a cabinet-wood and for general construction purposes.

**AGALLÛCHA**: *Ericacaria*.

**AGÁLMYLA** (*agalma*, ornament, and *kule*, wood; an ornament to the woods in which they grow wild). *Gesneriæ*. A genus of 3 species of tender climbers from Java and Sumatra which may be grown in a basket like *Æschynanthus* (*Trichosporum*). Fls. in axillary bunches, the corolla 5-lobed, oblique, but scarcely 2-lipped: lvs. simple, alternate.

*A. longistyla*, Carr., is considered a synonym of the next, but apparently has a longer style. R.H. 1873:270.—*A. staminea*, Blume. **SCARLET ROOT BLOSSOM**. St. rooting from the lower sur-

face: lvs. alternate, with an abortive one opposite the base of each: petioles 4-8 in. long; blade as long, ovate, serrate: fls. in large axillary sessile fascicles of 12-14; stamens exserted. B.M. 5747. P.M. 15:73. F.S. 4:358.

N. TAYLOR.†

**AGANÍSIA** (Greek, meaning *desirable*). *Orchidacæ*. Epiphytes grown on blocks.

Stems short, finally forming pseudobulbs, arising from a creeping rhizome: lf. 1: fls. few, in an erect raceme from the base of the pseudobulb; sepals and petals nearly alike, spreading; lateral lobes of the lip short or obsolete, the middle lobe broad, spreading, entire or 2- or 3-lobed; pollinia 4.—Species 2; natives of S. Amer. For culture and propagation, see article on Orchids.

**cyanea**, Reichb. (*A. tricolor*, N. E. Br. *Acacallis cyanea*, Lindl.). Pseudobulbs ovoid, up to 2 in. long, 1- or 2-lvd.: lvs. narrowed to a short petiole, up to 6 in. long: raceme of 4-7 fls. over 2 in. wide; sepals and petals pale mauve, especially the latter; lip with a rose-purple reniform limb and a fringed claw. Brazil. Lind. 1:45.—Very rare in cult. Needs a high temp.

**pulchella**, Lindl. Pseudobulbs ovoid, barely 1 in. long, 1-lvd.: lvs. 3-5 in. long, narrowed into a long petiole: raceme of 4-6 fls. about 1¼ in. broad; sepals and petals white; lip with the lower part nearly round, concave, spotted with red, the upper part larger, broadly ovate, yellow in the center. Guiana. B.R. 26:32.—Very rare in cult.

*A. ionóptera*, Nichols. Fls. blue, nodding, the sepals and petals tipped white, the white lip with the lateral lobes red-streaked, the middle lobe transversely oblong, with 2 red bars. Peru. B.M. 7270.

GEORGE V. NASH.

**AGAPÁNTHUS** (*agape*, love, and *anthes*, flower). *Liliacæ*. Conservatory plants, with tuberous rootstocks, blooming from late spring to fall, but mostly in summer.

Plant robust and tall (dwarf forms): scape simple, fls. in 2-bracted umbels, in shades of blue and varying to white; perianth with 6 wide-spreading divisions, nearly regular; stamens 6; pod many-seeded; seeds flat, winged above: foliage usually evergreen, but vanishing early in some of the forms. S. Afr.—Probably only one species, although several have been described.

In this country, agapanthus are usually grown in tubs (the roots are likely to burst pots), and are flowered in summer in the conservatory, window-garden, living-room, or set in protected places in the open. The plant is kept dormant during winter, as in a frame or light cellar, only enough life being maintained to prevent the leaves from falling. When in bloom, give abundance of water. Plants will bloom many years if given a large enough tub, not allowed to become overcrowded in the tub, and supplied with manure-water, sending up many clusters each year. Good results can also be obtained in single pots. It forces well. If kept dormant until spring, plants may be bedded in the open, or massed in vases, for summer bloom.—Propagation is effected by dividing the roots (and rarely by seeds). Old roots break up more easily if soaked in water a few hours. When dormant, the plant will stand a few degrees—usually 10° or less—of frost.

**umbellatus**, L'Her. **AFRICAN LILY**. **LILY-OF-THE-NILE** (although native to Cape of Good Hope region). Fig. 136. Lvs. 2 ft. long and numerous, thick, narrow: scape rising 2-3 ft. from the lf.-rosette, bearing an umbel of 10-30 handsome blue fls.; perianth funnel-shaped, 1½-2 in. long, with short tube. B.M. 500.—One of the best known of half-hardy liliaceous plants. Very variable in the wild, and many of the forms have been intro. to cult. Tall or giant forms: Var. **multiflorus**, Voss. (var. *máximus*, Hort. *A. multiflorus*, Willd.), taller than the prevailing forms, the bright blue large fls. as many as 30-60 in an umbel, the lvs. broader, Var. **giganteus**, Hort., a very robust form (to 4 ft.)

with 150–200 dark blue fls. Dwarf forms: Var. *minor*, Hort., very small, with slender narrow lvs. ( $\frac{1}{2}$  in. or less broad) and deep blue fls. which are 1 in. or less long; var. *Mooreanus*, Hort.,  $1\frac{1}{2}$  ft., lvs. short and upright, fls. dark blue, and as large as in *A. umbellatus* itself;

136. *Agapanthus umbellatus*.

hardy; var. *Leichtlinii*, Hort.,  $1\frac{1}{2}$  ft., fls. bright hyacinth-blue in a very compact umbel. Variegated forms: Var. *variegatus*, Hort., lvs. white with sparse green stripes, rather small; var. *aureus*, Hort., lvs. striped yellow. White-fl. forms: Var. *albidus*, Hort., fls. pure white, rather small but many, the lvs. usually not persisting; var. *Saintpaulii*, Hort., apparently similar to last: fls. smaller than in *A. umbellatus*. Blue-fl. forms of usual habit: Var. *pallidus*, Hort., fls. pale porcelain-blue; var. *Weillighii*, Hort., fls. lavender with indigo-blue lines and margins; var. *Saundersianus*, Hort., fls. dark blue; var. *atrocaeruleus*, Hort., fls. dark violet; var. *præcox*, Hort. (var. *minimus*, Lindl. *A. præcox*, Willd.), is an earlier form, blooming in June or even earlier and by some regarded as a distinct species, the lvs. narrower than in the type, fls. smaller and 30–40 in the umbel, pale blue, with narrow perianth segms., and the peduncle or scape short; var. *flöre pleno*, Hort., a double-fl. blue form, the fls. long-lasting. Very recent introductions are: Var. *globosus* (*A. globosus*, Bull), a dwarf-growing form, producing dense globular umbels on long scapes, the fls. about 1 in. across, the outer segms. lilac-blue shaded white and the inner ones emarginate and darker, the lvs. deciduous; var. *insignis* (*A. insignis*, Bull), tall, the basal part of the arching lvs. milk-white, the fls. very numerous on long slender pedicels and drooping in the very large umbel, pale lavender. Gn. 64, p. 67. G.M. 46, p. 423. G.W. 1903, p. 529, 531; var. *caulescens* (*A. caulescens*, Spreng.), fls. blue, lighter inside, long-pedicelled and the outer ones nodding, the root with thickened fibers; intro. by Carl Sprenger of Naples. Gt. 50:1487.

L. H. B.

**AGAPÈTES** (Greek *agapetos*, beloved or lovable, referring to the beauty of the plant). *Ericaceæ*, subfamily *Vaccinioidæ*. Shrubs sometimes cultivated for their handsome flowers and attractive foliage.

Evergreen plants, often epiphytic and with the sts. thickened at the base: lvs. alternate, or irregularly whorled, short-petioled or sessile, entire or slightly toothed: fls. in axillary fascicles or short racemes, rarely solitary; calyx-tube turbinate, with 5-lobed limb; corolla tubular to campanulate, with 5, usually curved lobes; stamens 10, with short filaments, anthers produced into 2 long beaks opening at the apex by a pore or slit; ovary 5-celled, inferior: fr. a juicy or dry berry with many seeds.—About 30 species from the southern Himalayas to N. Austral., chiefly in the humid mountain forests at elevations of 3,000–6,000 ft.

The several species in cultivation are highly ornamental shrubs with handsome lustrous foliage and showy usually scarlet or bright red clustered flowers. They are sometimes grown in warm greenhouses in Europe, but apparently none of them is in the American trade.

They grow best in a porous soil consisting of peat, leaf-mold, fibrous loam and plenty of sand; the smaller kinds are suitable for growing in baskets on account of

their epiphytic nature. Out-of-doors they could be grown only in warmer temperate regions, in localities in which the air possesses sufficient humidity and in partial shade.

Propagation is by cuttings of half-ripened wood under glass in the warm greenhouse.

*A. buxifolia*, Nutt. Branches and calyx hairy: lvs. obovate-cuneate, crenately serrate, glabrous, about 1 in. long; fls. axillary, 1–2, cylindric, bright red with spreading lobes. Himalayas. B.M. 5012. G.C. III. 27:197.—*A. glabra*, Clarke (Thibaudia glabra, Griff.). Glabrous lvs. oblong-lanceolate, rounded at the base, sometimes elliptic, obscurely crenate, about 5 in. long; fls. several, axillary, tubular, ventricose below the middle,  $\frac{3}{4}$  in. long, white, greenish toward the apex, pink at the base. Himalayas. Gn. 10, p. 539.—*A. macrantha*, Benth. & Hook. (Thibaudia macrantha, Hook.). Plant glabrous: lvs. lanceolate, long-acuminate, 3–4 in. long; fls. in 2–3-fl. clusters, outside of the axils, pendulous, urceolate, 5-ribbed, 2 in. long, yellowish white, marked with red wavy transverse lines. E. India. B.M. 4566. F.S. 6:646. J.F. 1:95. G.C. III. 15:501. R.H. 1852:81. R.B. 26:181.—*A. Moorei*, Hemsl. Lvs. oblong-lanceolate, usually whorled at the end of the branches, entire, glabrous, 2–3½ in. long; fls. in short axillary, 6–9-fl. racemes, cylindric, scarlet or orange-red, 1½ in. long, lobes reflexed, narrow, yellow within. Himalayas. B.M. 7928.—*A. setigera*, D. Don (Thibaudia setigera, Wall.). Lvs. oblong or lanceolate, about 4 in. long, usually whorled: fls. in lateral clusters, deep red, usually hairy,  $\frac{3}{4}$  in. long; pedicels and calyx hairy. Himalayas. Wight Icon. 1180, 1181 (as Vaccinium verticillatum and V. Wallichianum).—*A. speciosa*, Hemsl. Glabrous: lvs. ovate-oblong, subcordate at the base, slightly serrulate, 3–4 in. long; fls. 3–6, axillary, cylindric-urceolate, 5-ribbed, deep crimson, 1½ in. long. Probably from Burma. G.C. III. 41: 237.—*A. variegata*, D. Don (Thibaudia pulcherrima, Wall. A. pulcherrima, Benth. & Hook.). Tall shrub, glabrous: lvs. elliptic-lanceolate, 6–8 in. long; fls. on the old wood in many-fl. dense clusters, cylindric-campanulate, 5-angled, pale red marked dark red, 1 in. long. Himalayas. B.M. 4303. F.S. 3, pt. 7:1–2.

ALFRED REHDER.

**AGÁRICUS.** A genus of fleshy fungi, considered under *Mushroom*.

**AGARÍSTA:** *Leptosyne*.

**AGATHÆA:** *Felicia*.

**ÁGATHIS** (*agathis*, glome; the flowers in clusters). *Pinacæ*. Tender Australian diocious conifers, allied to *Araucaria*, yielding dammar resin.

Leaves coriaceous, not needle-like, usually broad, petioled or almost sessile, opposite or alternate: cones axillary, ovate or globular, composed of persistent, bractless scales. Distinguished from pines and firs by the broad-parallel-veined lvs.—Not uncommon in botanic garden collections where they are grown in the temperate house.

**robústa**, Hook. (*Dammara robústa*, C. Moore. *D. Brównii*, Hort.). Branches somewhat verticillate, horizontal: lvs. broad, ovate-lanceolate, obtuse, short-stalked,  $3\frac{1}{2}$ –4 in. long, 2–3 in. wide: cones oval, 3–4 in. long, 2–3 in. wide: tree reaching 130 ft. in Austral.—Cult. in Calif.

**austrális**, Salisb. (*Dammara australis*, Lambert.). The KAWRI PINE. Tree, 120–150 ft.: lvs. sessile, linear oblong, rarely elliptic, alternate, or opposite on the branchlets,  $1\frac{1}{2}$ –2 in. long,  $\frac{1}{2}$ – $\frac{3}{4}$  in. wide: staminate catkins solitary: cones almost spherical, 2–3 in. diam. New Zeal. G.F. 2:583. Lambert, Pinus 2:44.—Cult. outdoors in Calif., but not very successfully. Kawri gum, much used in the manufacture of varnish, is the partly fossilized resin of *A. australis*. It is found 5–6 ft. below the surface of the ground, in the northern part of New Zeal., where there were vast forests of this tree in ages past.

**orientális**, Lambert. Fig. 137. Tree, 100 ft.: lvs. opposite or alternate, entire, coriaceous, glaucous, 2–4 in. long,  $1\frac{1}{2}$  in. wide, sometimes a little falcate: staminate catkins 2 in. long: cones globular or turbinate, solitary, peduncled, and axillary. E. Indies. Lambert, Pinus 2:43. B. M. 5359.—Cult. outdoors in Calif. and in greenhouses elsewhere. Both this and the preceding intro. by Franceschi of Santa Barbara, Calif. (as *Dammara orientalis*.)

N. TAYLOR.

**AGÀVE** (Greek, *agauos*, admirable). *Amaryllidacæ*. Important decorative and economic plants from hot

VI. A good example of aquatic gardening, with water-lilies and Japanese iris.

American deserts, the most familiar of which is *A. Americana*, the CENTURY PLANT, or AMERICAN ALOE.

Stem short or wanting; lvs. mostly in a close rosette, usually stiff and more or less fleshy, persisting from year to year, the margins mostly armed with teeth and the apex tipped with a usually pungent spine: fls. in spikes (*Littæa*) or panicles (*Euagave*); perianth 6-parted, more or less funnel-shaped; stamens 6, mostly long-exserted; style 1; stigma capitate 3-lobed; ovary inferior, 3-celled; seeds numerous, flat, thin, black.—Some species flower but once and die, others occasionally, while others flower from year to year. The number of species is fully 300, and more than 325 have been described, largely from the Mexican tableland, although each island of the W. Indies possesses its peculiar species. One of the largest collections is at Kew, where there are 85 named species. The largest collections in the U. S. are at the Botanical Garden of Washington and the Missouri Botanical Garden, where there are about 75 species each. Amateurs often cult. a greater number of species than are described in this account.

The most complete monographs of the genus as a whole are by General von Jacobi, in the *Hamburg Garten Zeitung*, 1864–1865, of which a limited number of reprints with supplements were issued in book form, and by J. G. Baker in the *Gardeners' Chronicle*, 1877, with excellent small illustrations, which was amplified in his *Handbook of the Amaryllideæ*, 1888. Several of the natural groups composing the subgenus *Euagave* have been monographed and illustrated in the Reports of the Missouri Botanical Garden, one of which also contains a monograph of the species known to occur in Lower California. The half-hundreded West Indian species are figured and monographically treated in the eleventh volume of *Memoirs of the National Academy of Sciences*. Engelmann has published a monograph of the species of the United States, first classified on flower characters, in the *Transactions of the Academy of Science of St. Louis*, Vol. III.

Agaves are essentially fanciers' or amateurs' plants. This noble group of plants has never received the attention it deserves, and yet no genus of plants in America furnishes so many suitable decorative plants. Sir Joseph Hooker places it next to the palm and aloe, but

the former is a great family of 1,100 species. While in the United States one thinks of the agaves only as decorative plants, yet in Mexico, their native home, they are the most useful of plants. Many species furnish fiber, others soap, while still others produce the two great Mexican drinks, *pulque* and *mescal*. *Pulque*, which is a fermented drink,

is derived from several species, especially *A. atrovirens*. *Mescal*, which is a distilled drink, is usually not obtained from the same species as *pulque*, although there is a general belief to the contrary. The species from which is made most of the

137. *Agave thierii* (× $\frac{1}{6}$ )

*mescal* used in Mexico is unknown.—The species vary so much in size and form that they can be used in a great many ways. Some of the smaller species are suitable for the house, and even some of the larger species are so used. The larger species are well adapted for vases in large gardens and grounds, along walks, terraces, and the like. These plants, coming, as they do,

from arid or even desert regions, where they have a hard struggle to exist, can be grown with little or no care, but they respond very quickly to good treatment.—The species are propagated in various ways; some produce suckers at the base, or even underground shoots; others give off buds from the stem, which fall off and take root, or may be detached and planted; while not a few produce bulblets in the flower-clusters, and sometimes in great abundance. Nearly all may be produced from seed, but as most of the species flower only after a long interval, and many have not yet been known to flower in cultivation, this latter means of propagation cannot be relied upon. In cultivation, fruit is set very sparingly or not at all without artificial pollination, although this can be accomplished with very little trouble. (J. N. Rose.)

The agaves are not at all difficult to grow. The soil should be principally loam and sand, and if any vegetable soil be given it should be in small quantities. Good drainage and firm potting are necessary. To grow small plants of the large-leaved kinds into good-sized specimens quickly, they should be plunged out in a sunny spot in spring, taking care that the pots are large enough so that they will not require repotting in the fall. Nearly all of the large-growing kinds are easily increased from suckers, which, when the plants are grown in a pot-bound condition, are produced very readily. They should be taken off from the parent plant only when furnished with sufficient roots to give them a start. Some kinds are raised only from seeds, which, when freshly gathered, germinate in a few weeks. (G. W. Oliver.)

The classification of the agaves is very perplexing. This is partially owing to the number of species, to the scarcity of preserved study material, and to the infrequency of flowering in many species. In fact, many species have never been known to flower. The most usable characters for classification are to be found in the leaves, of which the end-spine and marginal prickles are very characteristic, and, although such an arrangement is more or less artificial, it is the most satisfactory in naming a collection. From a botanical point of view, however, the inflorescence shows the true relationship of the species. In this way the genus is usually divided into three groups or subgenera. These are: First, *Euagave*, having a paniculate inflorescence, with candelabra-like branches. Second, *Littæa*, having a dense spike of usually paired flowers. (The section *Littæa* has been considered by some a good genus, but it seems to connect with the first section through certain species.) The third section, *Manfreda*, is very different from the above, and is now considered as a distinct generic type, and so treated here. *Manfredas* are all herbaceous, appearing each year from a bulbous base: the leaves are soft and weak, dying down annually, while the inflorescence is a slender open spike, with solitary flowers from the axils of bracts.

prickles: infl. few-branched; fls.  $1\frac{1}{2}$ –2 in.; segms. and ovary  $\frac{3}{4}$  in. each, tube  $\frac{1}{2}$  in.: caps. subglobose, strongly stipitate and beaked. Cent. Amer. (?). Jacq., Obs. Bot. 4, pl. 1. Targioni Tozzetti, Ann. Firenze. 2, pl. 6. B.M. 5097, 5893. Wight, Icon. Pl. Ind. Or. 2024. Rep. Mo. Bot. Gard. 19, pl. 29–34. Proc. Amer. Phil. Soc. 49, pl. 32. Mem. Nat. Acad. 11, pl. 106–109. A form with white-margined lvs. is var. *marginata*, Trel. (*A. vivipara variegata* and *A. superba*, Hort.), Wiesner Festschr., pl. 8, and a variant of this with the body color gray-green is var. *Woodrowii*, Trel. (*A. Woodrowii*, Wats., and *A. Codkei*, Woodrow), Rep. Mo. Bot. Gard. 19, pl. 35. A dwarf form of the unvariegated type is var. *Sargentii*, Trel., Rep. Mo. Bot. Gard. 22, pl. 100–103.

2. *sisalana*, Perr. (*A. anacantha*, Terr. *A. brèves*, Hort. *A. Houlletiana* or *Houlletii*, Hort. *A. lavis*, Hort. *A. ixtli sisalana*, Hort. *A. rigida progressana*, Boyd. *A. rigida sisalana*, Auct. *A. sisala*, Perr. *A. sisalana inermis*, Rivière. *A. sisalana yashguia*, Perr.). Nearly trunkless: lvs. 4 x 60 in., becoming green, with shallow-grooved spine and typically no prickles: infl. ample; fls.  $1\frac{3}{4}$ –2½ in.; ovary, segm. and tube about equal: caps. rare. Yucatan or Chiapas (?). Perrine, Senate Doc. 300, pl. 1, 2, 4. Dodge, Rep. Fiber Invest. 3, 5, 9, with pl. Rep. Mo. Bot. Gard. 7, pl. 54–56. Proc. Amer. Phil. Soc. 49, pl. 32. Mem. Nat. Acad. 11, pl. 113–115.—The yaxci, green agave or sisal hemp most commonly cult. outside of Yucatan: largely distributed to growers from Trop. Fla. where Perrine intro. it about 1835 and, as in some of the W. Indies, it has become naturalize l. It has been crossed by Trabut with *A. vera-crux* under the name “potosina.”

3. *fourcroydes*, Lem. (*A. ixtli elongata*, Auct. *A. ixtlioides*, Lem. *A. longifolia*, Auct. *A. rigida*, *A. rigida elongata* and *A. rigida longifolia* of most writers). Trunk 3–6 ft.: lvs. 3–4 x 60–90 in., gray, with round-grooved spine and slender curved prickles: infl. ample; fls.  $2\frac{1}{4}$ –2½ in.; ovary 1–1¼ in., segm. and tube  $1\frac{3}{4}$  in. each: caps. obovoid, slightly stipitate and beaked. Yucatan. Proc. Amer. Phil. Soc. 49, pl. 32. Wiesner Festschr., 349. Mem. Nat. Acad. 11, pl. 110–112.—The sacci, gray agave or henequen, largely grown for fiber in Yucatan. A form with greenish white median variegation is var. *medio-picta*, Trel.—Wiesner Festschr., pl. 12. The shorter-lvd. but similar chelem of the Yucatan coast is *A. ixtli*, sometimes called *A. silvestris* or *A. prolifera*, and a related plant has been called *A. minima*. A large-lvd. poorer form of *A. fourcroydes* is known as chucumci, and a shorter-lvd. form of this as babi.

4. *decipiens*, Baker (*A. laxifolia*, Baker. *A. latifolia*, Auct. *A. spiralis*, Hort.). Trunk 6–8 ft.: lvs. 2–4 x 36–50 in., green, rather soft and somewhat outcurved, with round-grooved spine and slender prickles from green prominences: infl. ample; fls.  $2\frac{1}{4}$  in.; ovary  $1\frac{1}{8}$  in., segm. and tube  $\frac{3}{4}$  in. each: caps. pyriform. Yucatan. Dodge, Rep. Fiber Invest. 3, 5, 9, pl. Rep. Mo. Bot. Gard. 7, pl. 57–59. B.M. 7477.—The false sisal, extensively naturalized, if not indigenous, in Fla. This and *A. Karwinskii* deserve the name arborescent, in the genus Agave.

The tequila mescals (*A. tequilana*, Web., etc.), grown in W. Mex. for the preparation of a distilled beverage, and the zapupes (*A. Zapupe*, Trel., etc.), grown for fiber in E. Mex., are closely related to the preceding group.

cc. Fls. slenderer, not urceolate.

5. *Karwinskii*, Zucc. (*A. Corderoyi*, Hort. *A. Bakerei*, Ross). Trunk 9–12 ft.: lvs. 1–1½ x 15–30 in., green, with openly grooved spine and stout upcurved prickles: infl. rather ample; fls. 2–2¼ in.; ovary 1 in., segm. and tube about  $\frac{3}{4}$  in. each: caps. oblong, brown, stipitate and beaked. S. Mex. Ross, Icon. Panorm. pl. 2. Rep. Mo. Bot. Gard. 18, pl. 29–31. MacDougal, N. A. Deserts, pl. 23.

#### A. Infl. a candelabrum-like panicle. (1–26.) Subgenus EUAGAVE.

B. Lvs. dagger-like or sword-shaped: spine not decurrent: fls. rather large, greenish, long-lobed, ill-smelling, often followed by bulbils; seeds very large. Trunk often developed.

c. Fls. urceolately contracted in throat.

1. *angustifolia*, Haw. (*A. livida*, Jacq. *A. Jacquiniiana*, Schult. f. *A. ixtlioides*, Hook. *A. Wrightii*, Prain. *A. vivipara*, Auct.). Short-trunked: lvs. 3 x 16–24 in., gray-green, with flat spine and slender-cusped

6. *macroacantha*, Zucc. (*A. macroacantha*, Auct. *A. Bessereriana*, Jacobi. *A. Besseriana*, Auct. *A. pugioniformis*, Zucc. *A. flavescens*, Salm. *A. subfalcata* and *A. linearis*, Jacobi. *A. paucifolia* and *A. oligophylla*, Baker. *A. integrifolia*, Baker?). Nearly trunkless: lvs. 1 x 8-20 in., yellowish gray-green, glaucous, with flat-grooved spine and slender-cusped heavy-based prickles: infl. rather sparse; fls. 2 in.; ovary 1 in., segm. and tube  $\frac{3}{4}$  in. each: caps. oblong, gray, stipitate and beaked. S. Mex. Rep. Mo. Bot. Gard. 18, pl. 18-26.—At one time a great favorite and, like *A. Verschaffeltii*, collected in a large range of forms designated by descriptive varietal names: *viridis*; *candida*, *candicans*, *glauca*; *nigrispina*; *elongata*, *longifolia*; *hystrix* (B.M. 5940), *nana*; *latifolia*, *gigantea*, *major*, *concinna* or *sudburyensis*.

BB. Lvs. lanceolate, large, rather firm than fleshy, scarcely repand: spine not decurrent: fls. rather large, greenish, fetid, often followed by bulbils. Nearly trunkless.

7. *neglecta*, Small (*A. vivipara*, Bartram. *A. recurvata* and *A. rigida recurvata*, Hort.). Lvs. gracefully outcurved, 6 x 36 in., glaucous, with slender round-grooved spine and very minute prickles: infl. ample; fls. 2 in.; ovary 1 in., segm.  $\frac{3}{4}$  in., tube  $\frac{1}{2}$  in.: caps. obovoid, scarcely stipitate or beaked. Trop. Fla. Rep. Mo. Bot. Gard. 7, pl. 60, 61. Dodge, Rep. Fiber Invest. 5, 9. ff. G.C. III. 31, supp. Feb. 1. Bartram, Travels. Map.

8. *miradorensis*, Jacobi. Lvs. rather straight, 3-4 x 30-35 in., glaucous, with slender narrowly grooved spine and, toward the base, very minute prickles: infl. ample; fls.  $2\frac{1}{4}$  in.; ovary 1 in., segm.  $\frac{3}{4}$  in., tube  $\frac{1}{2}$  in. E. Mex. G.W. 5, p. 143.—*A. ananassoides*, *A. Desmettiana*, *A. pallida* and *A. Regeliana*, not now recognized, were based by Jacobi apparently on specimens from Sartorius' ranch, El Mirador, in the state of Vera Cruz, from which, though ascribed to Brazil, *A. miradorensis* is believed to have come. All are close to if not quite the latter, over the accepted name of which *A. Desmettiana* has priority.

9. *vera-crux*, Mill. (*A. bulbifera*, Bonpl. *A. Manguai*, Desf. *A. mexicana*, Lam., which in part is *Furcraea cubensis* and the uses of which in large part pertain to *A. atrovirens*. *A. vera-crucis*, Haw., sometimes spelled *vera-crucis*. *A. vera-crux*, Mill.). Lvs. nearly straight, 6-7 x 50 in., glaucous, somewhat cross-banded, rather fleshy, concave, with short heavy gray spine and oblique rounded deltoid prickles somewhat raised on green prominences: infl. ample; fls.  $2\frac{3}{4}$ -3 in.; ovary  $1\frac{1}{4}$ - $1\frac{1}{2}$  in., segm.  $\frac{3}{4}$ -1 in., tube  $\frac{3}{4}$  in.: caps. oblong, prominently stipitate, scarcely beaked. Mex.(?). G.C. II. 19, p. 149.—The blue aloe, extensively planted and more or less established in Amoy, India, Mauritius and Peru, and, as *A. mexicana*, in Italy. It has been hybridized with *A. sisalana*.

10. *lurida*, Ait. (*A. lepida*, Dietr. *A. lucida*, Schiede). Lvs. thinner, flatter and more curving, with slender spine and smaller scarcely elevated prickles: infl. slighter and sparser. Mex.(?). Zuccarini, Act. Acad. Carol. Leop. 16, pt. 2, pl. 49-51. B.M. 1522(?). Ref. Bot. 307(?).—Less frequently seen than the preceding, with which it is confused. Perhaps including the now scarcely recognized *A. Beaulieuiana*, Jacobi, *A. cyanea*, Hort., *A. cyanophylla*, Jacobi, *A. Haworthiana*, Roem., and *A. polyphylla*, Koch.

BBB. Lvs. short and broad, fleshy rather than hard, repand: spine somewhat decurrent: fls. rather large, yellowish, with lobes often shorter than the tube, and followed by bulbils. Nearly trunkless.

11. *Verschaffeltii*, Lem. Lvs. obovate-oblong, acuminate, 3 x 6-8 in., glaucous, with flexuous or twisted, flat-grooved, red-brown spine and long rusty teeth on large fleshy prominences: infl. rather slight and sparse: fls. about  $2\frac{1}{4}$  in.; ovary  $1\frac{1}{4}$  in., segm.  $\frac{1}{2}$  in., tube

$\frac{3}{4}$  in.: caps. oblong, very stoutly stipitate, beaked. S. Mex. Ref. Bot. 306, 328. Lyon Hort. 1880, 267. Gt. 346. J. Verschaf., Cat. 1866-7, 1869. f. I. H. 15: 564.—Extremely variable, the original introducer announcing "as many varieties as there are plants," and 33 named forms having been catalogued once in the Lyon garden. The more distinct, which have received mostly descriptive specific names, are var. *crenata* (*amiena*, *cochleata*, *elegans*), var. *cucullata* (*Croucheri*, *Simsii*), var. *Leopoldii*, var. *pulverulenta*, var. *quadrata*, var. *Saundersii* (*virginica glauca*), etc., and such minor forms as *albida*, *auricincta*, *compacta*, *lanceolata*, *orbicularis*, *ovalifolia*, *rhomboidea*, *rotundifolia* and *streptacantha*. *A. tehuacanensis*, Karw., is the earliest published name for the species but no description was given. *A. Bonnetii*, Hort., seems to be this, but *A. Bonnetiana*, Hort., is referred to *A. mitriformis*, which accompanies *A. Verschaffeltii* about Tehuacan.—Extensively tried in hybridization, and crosses are reported with *A. attenuata* ( $\times$  *A. Guignardii*), *A. densiflora*, *A. micracantha* or *micrantha*, *A. schidigera*, *A. Tonelliana* or *Tonneliana* or *heteracantha Tonnelliana*, *A. Vanderwinii*, or *Vanderwinneni* ( $\times$  *A. Simonii*  $\times$  *A. grandibracteata*) and *A. xylonacantha* or *xylinacantha*.

12. *Scölymus*, Karw. (*A. coccinea*, Roezl? *A. flaccida*, Jacobi?). Lvs. oblanceolate, rather acute, 3-4 x 12-15 in., green or (when it is *A. potatorum*) slightly glaucous, with nearly straight, flat-grooved, dull brown

138. *Agave Franzosinii*. (No. 20.)

spine and small prickles on moderately low, fleshy prominences: infl. fairly large but loose; fls. 2 in.; ovary  $1\frac{1}{4}$  in., segm.  $\frac{1}{2}$  in., tube  $\frac{1}{2}$  in.: caps. oblong, somewhat stipitate. S. Mex. G.W. 2, p. 603.—Much of the "coccinea" of gardens is *A. macroculmis*, Tod., a member of the subgenus *Littaea*.

BBBB. Lvs. rather oblong, very rigid, gray or glaucous, scarcely repand: spine decurrent: fls. rather large, yellow, rarely followed by bulbils. Nearly trunkless.

13. *applanata*, Jacobi. Lvs. lance-oblong, acute, 4-6 x 40-60 in. when mature but commonly seen of much smaller size, glaucous, with broad open gray or purplish spine and rather large more or less connected prickles: infl. 25-30 ft.; fls.  $2\frac{1}{2}$  in.; ovary  $1\frac{1}{4}$  in., segm.  $\frac{3}{4}$  in., tube  $\frac{1}{2}$  in. E. Mex. G.C. II. 7, p. 717. D.G.Z. 1903, p. 528. Tod., Hort. Pan. pl. 30. Rep. Mo. Bot. Gard. 22, pl. 73, 74.

14. *Párryi*, Engelm. (*A. applanata Párryi*, Mulford. *A. Marcusii*, Hort.). Lvs. oblong, acute, 2-4 x 10-12

in., glaucous, with nearly straight openly grooved spine and smaller prickles: infl. 10–15 ft.; fls.  $2\frac{1}{4}$  in.; ovary  $1\frac{1}{8}$  in., segm.  $\frac{1}{2}$ – $\frac{3}{4}$  in., tube  $\frac{1}{2}$  in.; caps. oblong, beaked but scarcely stipitate. Ariz., New Mex. and adjacent Mex. G.C. II. 12, p. 237. Rep. Mo. Bot. Gard. 22, pl. 91–93. D.G.Z. 18, p. 3.—Closely related species are *A. huachuensis*, Baker, Rep. Mo. Bot. Gard. 22, pl. 87–89, of the Huachuca Mts., with broad lvs.; *A. Havardiana*, Trel., Rep. Mo. Bot. Gard. 22, pl. 84–86, of the great bend of the Rio Grande, with deep-seated filaments, and *A. gracilipes*, Trel., Rep. Mo. Bot. Gard. 22, pl. 98, 99, of W. Texas, with slender pedicels and small seeds, etc. *A. Couësii*, Engelm., Rep. Mo. Bot. Gard. 22, pl. 94–97, on flowering proves scarcely separable.

139. *Agave americana* in flower. (No. 21.)

BBBBB. Lvs. similar, somewhat repand: spine decurrent and the large teeth often confluent: fls. in compact clusters, large, yellow, not followed by bulbils. Trunk elongated but leafy.

16. *Sháwii*, Engelm. Lvs. ovate or lance-ovate, acuminate, 3–5 x 8–20 in., green, glossy, with slender, flexuous, openly grooved spine and large, hooked, connected, garnet-red prickles: infl. 10 ft., congested; fls.  $2\frac{1}{2}$ – $3\frac{1}{2}$  in.; ovary  $1\frac{1}{4}$ – $1\frac{1}{2}$  in., segm. and tube  $\frac{3}{4}$  in.; caps. oblong, thick-walled. S. W. Calif. and adjoining Low. Calif. Trans. Acad. St. Louis 3, pl. 2–4. Rep. Mo. Bot. Gard. 7, pl. 44; 22, pl. 19–21.—Related Low. Calif. species are *A. Orcuttiana*, Trel., Rep. Mo. Bot. Gard. 22, pl. 22, with similar spine and *A. Sebastiania*, Greene, Rep. Mo. Bot. Gard. 22, pl. 23–26, with straight spine; and *A. pachyacantha*, Trel., Rep. Mo. Bot. Gard. 22, pl. 27, 28, and *A. Goldmaniiana*, Trel., Rep. Mo. Bot. Gard. 22, pl. 29–31,—with heavier-based teeth and thin-walled caps. in all.

BBBBBB. Lvs. large, fleshy rather than firm, usually repand: fls. openly paniced, large, yellow, rarely followed by bulbils. Nearly trunkless.

c. Spine large and long-decurrent.

17. *férox*, Koch. Lvs. broadly oblanceolate, wavy, suberect with outcurved concave acuminate tip, 12 x 48 in., green, deeply repand, with large grooved spine and great prickles on high green prominences: infl. 20 ft.; fls.  $3\frac{1}{4}$  in.; ovary  $1\frac{1}{2}$  in., segm. 1 in., tube  $\frac{3}{4}$  in. Cent. Mex. G.C. III. 15, p. 328; III. 20, p. 525; III. 43, p. 379. G.W. 2, p. 603.

18. *mitraefórmis*, Jacobi (*A. coarctata*, Jacobi? *A. Bonnetiana*, Hort.). Lvs. obovate-oblanceolate, acuminate, 12 x 30 in., grayish-zoned, rather repand, with large grooved spine and moderately large gray chestnut-tipped prickles on green prominences: infl. 15–20

ft.; fls.  $2\frac{1}{2}$  in.; ovary  $1\frac{1}{2}$ – $1\frac{3}{4}$  in., segm.  $\frac{1}{2}$  in., tube  $\frac{1}{2}$  in. S. Mex. Karsten & Schenck, Veg. Bilder, pl. 47. Anales Mus. Nac. Mex. 2, pl. j. Publ. Carnegie Inst. 99, pl. 20.—This is *A. tehuacanensis*, Koch, Karwinski's plant of that name being apparently a form of *A. Verschaffeltii*. A yellow-margined, variegated agave, listed under *A. mitraefórmis* by the Belgian dealers about 1876, appears to be *A. atrovirens marginata*. A cross with *A. densiflora* is said to have been effected.

19. *atróvirens*, Karw. Becoming enormous: lvs. lanceolate, 12 x 80–100 in., dark green or (when it is *A. Salmiana*, Jacobi) gray, outcurved-ascending, with large, narrowly grooved spine and moderate gray prickles from low widened bases: infl. 20–30 ft.; fls.  $3\frac{1}{2}$  in.; ovary 2 in., segm. 1 in., tube  $\frac{1}{2}$  in. S. Mex. D. Gart. Mag. 1867, p. 28., f. Contr. U. S. Nat. Herb. 5, pl. 31–33. S.H. 4, p. 281. Pop. Sci. Monthly, 70, p. 210–216. Österr. Gart. Zeit. 1911, p. 252. Prometheus 20, p. 24. Journ. N. Y. Bot. Gard. 8, p. 10. Modern Mex. 17, p. 26–28. Proc. U. S. Nat. Mus. 33, p. 577, etc.—The principal pulque species cultivated on the plains of Apam. Numerous varieties are figured by Segura, El Maguey, 4 ed., pl. 1–9. Vast confusion exists in current literature: the names *A. americana* and *A. mexicana* are often applied to this, and it is difficult to account elsewhere for the many new Latin names given to pulque magueys by Blasquez, and to a number of young garden plants by Jacobi. A yellow-margined variety (also listed as belonging to *A. mitraefórmis*) is var. *marginata*, Trel. A very large and concave-lvd. unvariegated form is var. *cochleáris* (*A. latissima*, Jacobi. *A. Whitakeri*, Hort.). Other important pulque or agua-miel species are: about the City of Mexico, *A. Mapisaga*, Trel. (maguey mapisaga) with narrow small-prickled lvs.; about Durango, *A. compluviata*, Trel. (maguey verde), with green-zoned deeply gutter-shaped lvs., and *A. quiotifera*, Trel. (maguey ceniso), with ashen lvs.; about San Luis Potosi, *A. gracilispina*, Engelm. (*A. potosina*, Web.), with slender spine, and *A. crassispina*, Trel., with stout spine; and about Monterey, *A. melliflua*, Trel. (maguey manso), with elongated ashen lvs., and *A. zonata*, Trel. (maguey verde), with broad green-zoned lvs.

20. *Franzosinii*, Baker. Fig. 138. Lvs. lanceolate, 12 x 80–100 in., roughish, white, recurved-ascending, with large narrowly grooved spine and dark or gray prickles: infl. green, in striking contrast with the lvs.,

140. *Agave americana*, as commonly grown in greenhouses. The yellow-margined form. (No. 21.)

30 or 40 ft.; fls.  $3\frac{1}{2}$  in.; ovary  $1\frac{3}{4}$  in., segm. 1 in., tube  $\frac{3}{4}$  in. Mex. (?) B.M. 8317. G.W. 2, p. 603. G.C. III. 12, p. 177.

cc. Spine little if at all decurrent.

d. Fls. and fr. much as in the preceding. Not bulbiferous.

21. *americana*, Linn. (*A. altissima*, Zumag. *A. europæa*, Vis. *A. ramosa*, Moench. *A. spectabilis*, Salisb.).

Figs. 139, 140. Lvs. lanceolate, 6-8 x 60-80 in., smooth, gray, ascending with outcurved ends, with rather short and stout recurved round-grooved very shortly decurrent spine obliquely flattened at base, and moderately large gray prickles on prominent marginal elevations: infl. 20-30 ft., rather slender; fls.  $2\frac{1}{2}$ - $2\frac{3}{4}$  in.; ovary  $1\frac{1}{4}$  in., segm. 1 in., tube  $\frac{1}{2}$  in. Mex.(?). Established around the Medit. Gt. 24:825; 27, p. 307; 41, p. 269. Penzig, Fl. Litt. Med., pl. 140. Reicheb., Ic. Fl. Germ., pl. 374. B. H. 9, p. 308. R. H. 1875, p. 152. Journ. N. Y. Bot. Gard. 11, pl. 79, 81. Adamovic, Pflanzenw. Dalmat., pl. 1. Abhandl. Hamburg. Kolon. Inst. 6, p. 64. G.W. 8, p. 337. Proc. Am. Phil. Soc. 49, pl. 32.—The plant more commonly cult. in this country as *A. americana* has narrower, more hooked lvs., as in the next, but grayer and with the short recurved spine scarcely decurrent and round at base, var. *Milleri*, Baker (*A. Milleri*, Haw.? *A. virginia*, Mill.? *A. latéviens* and *A. americana latéviens*, Hort.?) Variegated forms of this, frequently grown, are var. *marginata* in yellow- or white-margined forms, var. *striata* variously lined with yellow or white, and var. *medio-picta* with a broad median yellow band. Wiesner Festschr., pl. 6. A reputed hybrid between *A. americana* and *A. densiflora* is  $\times$  *A. massiliensis*, Hort. Deleuil.

22. *picta*, Salm-Dyck (*A. longifolia picta*, *A. mexicana picta*, and *A. Milleri picta*, Hort.). Lvs. linear-lanceolate, ascending with recurved ends, at length 6-8 x 100 in., smooth, dark green with bright white or yellow marginal variegation, slightly glaucous when young, with needle-like, straight, narrowly grooved spine and moderate prickles on somewhat prominent marginal elevations: infl. tall and rather slender; fls. 3 in.; ovary  $1\frac{1}{2}$  in., segm. 1 in., tube  $\frac{1}{2}$  in.: caps. oblong, stipitate and beaked. Mex.(?). G.W. 8, p. 337. Wiesner Festschr., p. 342, pl. 7. Pop. Sci. Monthly, 70, p. 210. Proc. Amer. Phil. Soc. 49, pl. 32.—Green seedlings (var. *viridis*) occur on the Riviera and are in limited cult.

DD. Fls. rather small, yellow, shallow-tubed: caps. thin-walled, small. Not bulbiferous.

23. *marmorata*, Roehl (*A. Todaroi*, Baker. *A. Troubetzkoyana*, Hort. *A. undulata*, Tod.). Lvs. broadly lanceolate, outcurved, 10-15 x 72 in., very rough, green- and gray-banded, with rather short and stout recurved narrowly grooved spine and large rough rusty brown prickles often from prominent marginal elevations: infl. ample; fls. golden,  $1\frac{1}{2}$  in.; ovary  $\frac{3}{4}$  in., segm.  $\frac{1}{2}$  in., tube  $\frac{1}{4}$  in.: caps. short, stipitate. S. Mex.

DDD. Fls. moderately long, creamy, deep-tubed: caps. firm, elongated. Not bulbiferous.

24. *Pálmeri*, Engelm. Lvs. lanceolate, ascending, 3-4 x 18-30 in., blue-green, somewhat glaucous, with long, slender, open-grooved spine and slender, hooked garnet-purple or gray prickles, often on marginal elevations: infl. ample; fls. leathery, 2- $2\frac{1}{4}$  in.; ovary 1 in., segm.  $\frac{1}{2}$  in., tube  $\frac{3}{4}$  in.: caps. oblong, not stipitate. Ariz. and New Mex. Rep. Mo. Bot. Gard. 7, pl. 48-52. Journ. N. Y. Bot. Gard. 5, p. 178.

BBBBBB. Lvs. triangular, thick and stiff, rather small: fls. small, yellow, shallow-tubed, not followed by bulbils. Trunkless.

25. *deserti*, Engelm. Cespitose: lvs. triangular-lanceolate, falcately erect, 2 x 6-12 in., gray, with slender, gray-brown, grooved spine and friable teeth: infl. slender, sparse; fls. yellow,  $1\frac{1}{4}$  in.; ovary flask-shaped,  $\frac{1}{2}$  in., segm.  $\frac{1}{2}$  in., tube  $\frac{1}{2}$  in.: caps. oblong, scarcely stipitate. Colo. desert, Calif. Rep. Mo. Bot. Gard. 7, pl. 33, 34; 22, pl. 41, 42.

26. *Pringlei*, Engelm. Cespitose: lvs. triangular-oblong, ascending, 2 x 6-16 in., gray, with slender, drab, grooved spine and rather firm teeth: fls.  $1\frac{1}{2}$ -2 in.; ovary 1- $1\frac{1}{4}$  in., segm.  $\frac{1}{2}$  in., tube  $\frac{1}{4}$  in. Mts. of N. Low. Calif. Rep. Mo. Bot. Gard. 22, pl. 44.

AA. Infl. spike-like, the fls. usually in pairs though exceptionally clustered on very short branches: bulbils very rarely following the fls. (27-55.) Subgenus LITTEA.

B. Lvs. triangular-lanceolate, thick and stiff, rather small: fls. often clustered on short branches, cup-shaped, small. Trunkless.

27. *utahensis*, Engelm. (*A. Newberryi*, Engelm.). Cespitose: lvs. erect-spreading, 1-2 x 6-12 in., gray, with slender, grooved, gray spine and rather small and friable gray teeth: infl. 5-15 ft., with simple or forked branches 1-2 in. long; fls. 1- $1\frac{1}{4}$  in.; ovary flask-shaped,  $\frac{5}{8}$  in., segm.  $\frac{3}{8}$  in., tube  $\frac{1}{8}$  in.: caps. thin-walled,

141. *Agave attenuata*. (No. 28.)

small, not stipitate. Grand Cañon region. Pop. Sci. Monthly, 1911, p. 11. G.F. 8, p. 384. Rep. Mo. Bot. Gard. 7, pl. 32.

BB. Lvs. moderately large, thin, unarmed or at most very minutely denticulate, neither filiferous nor horny-margined. Trunk well developed in the first: fls. open, rather small.

28. *attenuata*, Salm-Dyck (*A. glaucescens*, Hook.) Figs. 141, 142, 143. Trunk 4-5 ft., sometimes prostrate: lvs. broadly oblanceolate, spreading, with recurved tips, 6-10 x 25-30 in., glaucous, thin, entirely unarmed: infl. 5-10 ft., usually recurving, its very short stalk closely covered by bracts; fls. paired, about 2 in.; ovary flask-shaped,  $\frac{3}{4}$ -1 in., segm.  $\frac{3}{4}$  in., tube  $\frac{1}{4}$  in. Exceptionally produces large bulbils among the caps. after flowering. Mex. F.E. 31, p. 1172 B. B.M. 5333. J. H. III. 42, p. 392. R.H. 1876, p. 149. Erfurter Führer. 7, p. 70. G.F. 10, p. 95. Rep. Mo. Bot. Gard. 9, pl. 31. G.C. III. 8, p. 560; III. 17, p. 455; III. 45, suppl. pl. Pharm. Journ. 70, p. 706.—Varies in a form with sterile base of spike longer and sparsely bracted, and fls. in clusters of 6-8, var. *paucibracteata*, Rep. Mo. Bot. Gard. 11, pl. 7. The varietal names *elliptica*, *latifolia*, *latissima* and *subundulata* have been applied to garden forms. A cross with *A. Verschaffeltii* is  $\times$  *A. Guignardii*, Hort.; a cross with *A. xylonacantha* is listed.

29. *Ellemeetiàna*, Koch. Nearly or quite trunkless: lvs. lanceolate, spreading, 6 x 24 in. or more, glaucous, thin, unarmed: infl. 5-10 ft., erect, the rather short sterile base closely covered by linear bracts; fls. paired,

greenish white,  $1\frac{1}{4}$  in.; ovary flask-shaped,  $\frac{5}{8}$  in., segm.  $\frac{5}{8}$  in., tube nearly suppressed; filaments very long,  $2\frac{3}{4}$  in. E. Mex. G.C. II. 8, p. 748; III. 47, p. 201.

142. Flowers of *Agave attenuata*.

B.M. 7027. Ref. Bot. 163. —With lvs. very minutely denticulate it becomes var. *subdentata*, the distinctness of which from *A. pruinosa* is not clear. Reported crossed with *A. micracantha*.

BBB. Lvs. moderately large, variously fleshy but usually flexible, neither filiferous nor horny-margined, teeth never large; fls. moderate, often with recurved segms. Nearly trunkless.

C. Spine slender and weak.

30. *álbicans*, Jacobi (*A. micracantha albidior*, Salm-Dyck. *A. Ousselghemiàna*, Jacobi). Trunkless, caespitose: lvs. oblanceolate,  $4 \times 12$ – $15$  in., spreading, glaucous, thin, with small, needle-shaped, narrowly grooved spine and close-set, minute, brown prickles connected by a papery margin: infl. scarcely 3 ft., rather few-fl. above the middle; fls. paired, reddish green, nearly sessile,  $1\frac{1}{4}$ – $1\frac{1}{2}$  in.; ovary  $\frac{1}{2}$ – $1$  in., segm.  $\frac{1}{2}$  in., tube  $\frac{1}{4}$  in.; caps. prismatic-ovoid, small. Mex. (?). B.M. 7207. Bull. Soc. Tosc. Ort. 3, p. 303. Lyon Hort. 22, p. 363. [With recurved long black prickles, and fls.  $2\frac{1}{4}$  in. long, it is var. *ctenophora*, Trel. A beautiful form with milk-white mottled variegation is var. *medio-picta*, Trel. (*A. micracantha picta*, *A. micracantha variegata*, *A. Ousselghemiàna alba-picta*, *A. Ousselghemiàna picta*, and *A. álbianca variegata*, Auct.), Wiesner Festschr., pl. 10. Hybrids are reported between this species and *A. maculata* and *A. xalapensis*.

31. *Célsii*, Hook. (*A. Celsiana*, Koch. *A. densiflora glaucophylla*, Hort.?). Lvs. broadly oblong,  $4 \times 12$ – $18$  in. or more, glaucous, with slender weak spine and very irregular close-set, often multiple, prickles, fleshy except at the very tip: infl. about 4 ft., densely fl. at top; fls. reddish or yellowish green,  $1\frac{1}{2}$ – $2$  in.; ovary and segm.  $\frac{3}{4}$  in., tube  $\frac{1}{2}$  in.; caps. small. B.M. 4934. R.H. 1861, p. 335. Gn. 12, p. 213. —A hybrid with *A. Salmiana* is reported.

32. *micracantha*, Salm-Dyck (*A. glaucescens*, Otto?). Caespitose: lvs. broadly lanceolate, spreading,  $3$ – $5 \times 15$ – $25$  in., grayish green, with slender weak spine and small, close-set, dark prickles: infl. about 10 ft., the rather short sterile base densely bracted; fls. brownish green,  $1\frac{1}{2}$  in.; ovary  $\frac{1}{2}$ – $\frac{3}{4}$  in., segm.  $\frac{1}{2}$  in., tube  $\frac{1}{4}$  in. E. Mex. (?). Ref. Bot. 327. Gt. 37, p. 115. —Hybrids are reported with *A. Ellemectiana*, *A. Sartorii*, *A. Verschaffeltii*, *A. xylonacantha* and *A. xylonacantha micracantha*. *A. mitis*, Salm-Dyck, and *A. rupicola*, Regel, are closely related and *A. chloracantha*, Salm-Dyck. (*A. caribaea*, Hort.), differs chiefly in its greener lvs., with pale prickles.

cc. Spine moderate but strong, round-grooved.

33. *polyacantha*, Haw. (*A. abortiva*, Terr.? *A. chiapensis*, Jacobi.? *A. chiapensis porrecta*, Hort. *A. densa*, Hort.? *A. densiflora*, Hort.? *A. multiflora*, Hort. *A. Ottónis*, Jacobi? *A. Salmidyckii*, Baker? *A. uncinata*, Jacobi? *A. Wolkensteinii*, Hort.?). Caespitose: lvs. lanceolate, upcurving,  $2$ – $5 \times 10$ – $24$  or  $36$  in., soon green, with narrow-grooved strong spine and rather small and close-set brown or gray prickles: infl.  $4$ – $5$  ft.; fls. about 2 in.; ovary  $\frac{3}{4}$  in., segm. and tube  $\frac{1}{2}$  in. S. Mex. (?).

B.M. 5006. G.W. 2, p. 604. Journ. Soc. Hort. Bas. Rhin. 3, p. 324. Gn. 12, p. 396. R.H. 9, p. 517. G.C. II. 3, p. 502. Hybrids are reported between *A. chiapensis* and *A. xylonacantha* and *xylonacantha latissima* and with "*Dasylyrion gracilis*," *A. densiflora* and *A. americana* ( $\times$  *A. massiliensis*); *A. densiflora* and *A. geminiflora* ( $\times$  *A. Táylori*),—G.C. II. 8, p. 620; *A. densiflora* and *A. mitriformis*; *A. densiflora* and *A. Verschaffeltii*, and *A. densiflora* and *A. xylonacantha*.

ccc. Spine stout, openly grooved.

34. *Bottèrii*, Baker. Lvs. oblanceolate, outcurved-ascending,  $6$ – $8 \times 24$ – $30$  in., green, with flat-grooved strong spine and short, broad, blackish close-set prickles: infl. scarcely 5 ft.; fls. reddish or yellowish green, 2 in.; ovary  $\frac{3}{4}$  in., segm. and tube  $\frac{5}{8}$  in. each. Mex. (?). B.M. 6248. G.C. II. 8, p. 264.

35. *xalapensis*, Roezl. Lvs. lanceolate, spreading,  $2$ – $5 \times 10$ – $30$  in., nearly green to decidedly glaucous, with very openly grooved heavy spine and moderately long, heavy, rather close-set red to blackish prickles: infl.  $5$ – $10$  ft.; fls. 2 in.; ovary  $\frac{3}{4}$  in., segm. 1 in., tube  $\frac{3}{4}$  in.; caps.  $\frac{3}{4} \times 1\frac{1}{2}$  in., slightly constricted at base. E. Mex. Monatsschr. f. Kakteenk. 14, p. 151. R.H. 1875, p. 276. Reported hybrids are *A. xalapensis*  $\times$  *filifera* ( $\times$  *A. Románii*, Hort.), *A. xalapensis*  $\times$  *Ousselghemiàna*, *A. xalapensis*  $\times$  *Salmiana*, and *A. xalapensis*  $\times$  *xylonacantha* ( $\times$  *A. Pfersdörffii*, Simon).

BBBB. Lvs. fibrous and often rigid, the sometimes very large teeth connected by a detachable horny margin: fls. moderate, with soon erect segms. At most short-trunked.

c. Teeth rather small: lvs. elongated, rather thin but stiff.

36. *Lecheguilla*, Torr. (*A. multilineata*, Baker. *A. Poselgeri*, Salm. *A. tetragona*, Hort.). Lvs. triangular-oblong, concave, falcately ascending,  $1 \times 16$ – $24$  in., green or bluish but not glaucous, pale-banded ventrally and dark-lined on the back, with flattened gray-brown spine and recurved slender prickles joined by a very narrow straight margin: infl.  $3$ – $12$  ft., glaucous; fls.  $\frac{3}{4}$ – $1\frac{1}{2}$  in.; ovary flask-shaped,  $\frac{1}{2}$  in., segm.  $\frac{1}{2}$  in., tube  $\frac{1}{2}$  in. W. Texas and southward, in a number of forms of which the southernmost, from below San Luis Potosi, with broader lvs. and heavier prickles, is *A. mesotillo*, Hort. It furnishes the greater part of the ittle or lechuguilla fiber of New Mex. usually ascribed to *A. heteracantha*. Pop. Sci. Monthly 70, p. 223. Bot. Bound. 1, pl. 34, 39. Rep. Mo. Bot. Gard. 7, pl. 31; 13. pl. 42. Bull. Univ. Texas 60, pl. 3, 6. —Closely allied forms, frequent in European gardens, are *A. caeruleascens*, Salm-Dyck (a hybrid of which with *A. Victoriae Reginae* is reported), differing chiefly in being very glaucous, and its var. *stenophylla* with lvs. over 4 ft. long; *A. Funkiana*, Koch & Bouché, with flatter, more oblong, rather glaucous lvs., which furnishes the ittle of Jaumave; *A. Nissónii*, Baker, with thin, yucca-like, glaucous lvs.; *A. nigrés-cens* (*A. heteracantha nigrés-cens*, Hort.),

143. Cross-sections of leaf of *Agave attenuata*, dark blue-green, long-triangular, often undulate lvs., sometimes almost or quite unarmed on the margin, when it is the form *inermis*.

37. *lophantha*, Schiede. Lvs. lanceolate, spreading,  $1\frac{1}{2}$ – $2 \times 12$ – $18$  in., green, glossy, with openly grooved brown spine and variously hooked rather small prickles joined by a narrow, nearly straight margin: infl.  $9$ – $15$  ft.

fls.  $1\frac{1}{2}$  in.; ovary  $\frac{3}{4}$  in., segm.  $\frac{5}{8}$  in., tube  $\frac{1}{8}$  in. E. Mex. G.W. 8, p. 337. With prominent and persistent pale band on the upper face it is var. *univittata* (A. *univittata*, Haw. A. *ensifera*, Jacobi? A. *tenuata*, Hort.?). Ref. Bot. 215. B.M. 6655. G.C. II, 7, p. 368.—Crosses of A. *univittata* with A. *xylocantha* are reported, of which  $\times$  A. *perbella*, Hort., is said to be one, A. *pulcherrima*, Hort., in part, seeming to be another writing for the same.

38. *heteracantha*, Zucc. Like A. *lophantha* but lvs. somewhat sinuate and with variously hooked less equal and closer prickles. The median band is often prominent. S. Mex. G.W. 2, p. 605. G.C. II, 7, p. 369. Gt. 19, pl. 639.—Most of what is called A. *heteracantha* is A. *Lecheguilla*.

cc. Teeth often large: lvs. either broad or thick.

d. Margin nearly straight.

39. *Kerchövei*, Lem. Lvs. triangular, spreading, 3–4 x 16–20 in., thick, gray-green, not lined beneath, with channeled gray spine and large spreading triangular teeth joined by a rather wide margin: infl. dense and heavy, 18 ft. S. Mex. G.C. II, 7, p. 527.—Formerly much grown in a number of dissimilar types: var. *Beaucárnei* (A. *Beaucárnei*, Lem., A. *Lemàirei*, Hort., A. *Kerchövei coarctata*, Hort.), with very short lvs.; var. *macrodonta*, with larger and more hooked teeth; var. *distant*, with more separated teeth which have a well-developed accessory basal cusp in f. *diplacantha*, and var. *majör*, with a short branching trunk. Related forms with shorter lvs. and slenderer, sparser infl. are A. *triangularis*, Jacobi (A. *Kerchövei brevifolia*, Hort., A. *horrída triangularis*, Baker), Karsten & Schenck, Veg. Bilder. pl. 46, with prickles much as in A. *Kerchövei*; and its var. *rigidissima* (A. *rigidissima*, Jacobi), with small prickles lacking in f. *subintègra*.

40. *Rozliana*, Baker (A. *horrída lævior*, Hort.). Lvs. ovate-lanceolate, spreading, 2–4 x 12–16 in., rather thick, green, broadly pale-striped above, not lined on the back, with grooved brown and then gray spine and moderately large teeth joined by a moderate margin: infl. not very heavy. S. Mex. G.C. 1871, p. 74; II, 7, p. 528. F. 1870, p. 42.—Presents as extreme forms: var. *Inghami*, Baker (A. *Gilbeyi longifolia*, Hort., A. *Inghami* and A. *Inghami gigantea*, Hort.), with broad, often concolorous lvs. and large prickles, known when dwarfed as var. *Gilbeyi* (A. *Gilbeyi* and A. *horrída Gilbeyi*, Hort.), Gt. 23, p. 89; 27, p. 84. Neubert's Gart. Mag. 50, p. 15. G.C. 1873, p. 1305; and var. *Peacockii* (A. *Killschii*, Hort., A. *Peacockii*, Croucher), B.M. 7757. G.C. 1873, p. 1400, with narrowly triangular-lanceolate lvs., sometimes entire. The names *Regeliàna*, *Regelii* and *Regelii macrodonta*, identified by Jacobi with A. *triangularis*, seem also to have been applied to this; and the now unrecognized A. *artichaut*, A. *horrída nana* and its f. *lævior* and A. *horrída pygmæa* of gardens may belong here. A. *Hanburi*, Baker, suggests a possible hybrid of this.

41. *Ghiesbréchtii*, Koch (A. *Ghiesbréchtii*, Auct. A. *grandidens*, Hort.? A. *grandidentata*, Hort.? A. *fragilis*, Jacobi? A. *squallidens*, Hort.?). Lvs. lanceolate, 3–4 x 10–12 in., upcurved-spreading, little if at all striped, with inrolled spine and moderate prickles joined by a moderate margin. S. Mex. (?). G.C. II, 7, p. 621.—The typical clear green form varies into an equally large or longer-lvd. form with smaller, closer-set prickles, var. *Leguayana*, Baker (A. *Leguayana*, Hort., or, with wider margin, f. *laticincta*), and a more compact and concave lvd., blue-green form, var. *Rohànii*, Baker (var. *obscura*, Jacobi). A cross of A. *filifera* and A. *Ghiesbréchtii* is reported.

42. *horrída*, Jacobi. Lvs. oblanceolate-oblong, spreading, flat, rather thin, about 3 x 12 in., glossy green, neither striped nor lined, with flat-grooved short spine and large irregular prickles often with accessory

cusps, joined by a heavy margin: infl. moderately slender; fls. yellowish or purplish green,  $1\frac{1}{4}$  in.; ovary and segm.  $\frac{3}{4}$  in. each., tube  $\frac{1}{4}$  in. Cent. Mex. B.M. 6511. F. 1870, p. 42.—Forms occur with larger revolute-margined lvs.: var. *Maigretiana* (A. *Maigretiana*, Jacobi. A. *granulosa*, Scheidw.), G.W. 2, p. 593. S.H. 4, p. 299. G.F. 2, p. 115; or with smaller prickles, var. *micracantha*, Baker, Rep. Mo. Bot. Gard. 7, pl. 62, 63. The names A. *DeSmetiana* (A. *DeSmettiana*, Jacobi, being a form or ally of *miradorensis*), A. *Ghiesbréchtii horrida*, A. *Morganii* and A. *Pilgrimii* have been applied in gardens to forms of this or one of the two foregoing, not now recognized.

dd. Margin with prominent fleshy hummocks under the teeth.

43. *xylocantha*, Salm-Dyck, also written *xylocantha*, *xylinacantha* and *xylynacantha* (A. *amurensis*, Jacobi. A. *Köchii*, Jacobi. A. *Köchii amurensis*, Ellem.). Lvs. oblong, concave, tortuously spreading, 2–5 x 12–24 in., rough, dull gray-green, dark-lined beneath, with flexuous channeled gray spine and very large often multiple prickles saddling large green prominences, joined by a moderately heavy margin: infl. rather slender; fls.  $1\frac{1}{2}$  in.; ovary  $\frac{3}{4}$  in., segm.  $\frac{5}{8}$  in., tube  $\frac{1}{8}$  in. E. Mex. B.M. 5660. G.C. II, 7, p. 527. Lyon Hort. 1879, p. 207.—Extensively hybridized, some of its offspring recognizable in their scabrid green-lined oblong lvs. with green prominences going into the bases of the large unequal teeth: with *attenuata* or *attenuata subdentata*, *chiapensis*, *densiflora*, *filifera* ( $\times$  A. *Villàrum*, Hort.,  $\times$  A. *Villæ*, Pirota,  $\times$  A. *hýbrida*, Vill.), *micracantha*, *univittata* (A. *armata*, Hort.? A. *aspera*, Tod.? Terraciano, Primo Contr. pl. 3, 5,  $\times$  A. *hýbrida*, Versch.), A. *xylocantha vittata* and A. *xylocantha hybrida* ( $\times$  A. *perbella*, A. *xylocantha perbella*, Hort.), G.C. II, 7, p. 527, *Verschaffeltii* and *zalapensis* ( $\times$  A. *Pfersdorffii*, Sim.). At one time, several varieties were listed: *cornuta* or *longifolia*, the more typical form, *latifolia macracantha*, variously spelled, *majör*, *Maximiliana*, *torta* and *Vanderdonckii*. A rare form with median variegation is var. *medio-picta*.

BBBBB. Lvs. 3-sided, short and very stiff, the detachable horny margin toothless: fls. as in the preceding. Trunkless.

44. *Victoriæ Reginæ*, Moore (A. *Considerantii*, Duchartre). Lvs. in a globose cluster, triangular-oblong, acutely 3-angled, 1–2 x 6–8 in., dark green, with a short black triangular spine and gray margin decurrent on the edges and keel: infl. 10–12 ft., rather slender but compact; fls.  $1\frac{1}{4}$  in.; ovary  $\frac{5}{8}$  in., segm.  $\frac{5}{8}$  in., tube  $\frac{1}{8}$  in.: caps. small. N. E. Mex. G.C. 1875, p. 484; 1880, p. 788; II, 18, p. 841; III, 1, p. 806. R.H. 1875, p. 429; 1890, p. 392; 1897, p. 100. G.W. 2, p. 592; 10, p. 213. G.Z. 20, p. 88, 135. Peacock, List of Succ. Pl. pl. S.H. 4, p. 287. I. H. 28, pl. p. 413. Lyon Hort. 22, p. 371; 31, p. 146. R.B. 1876, p. 16. G.M. 6, p. 196. Gn. 8, p. 351; 22, p. 448, 460; 48, p. 117. Gt. 1878, p. 74. Journ. N. Y. Bot. Gard. 7, p. 163.—Deleuil is said to have effected a cross with A. *cærulescens*. Differing in its fewer-lvd. more open rosettes and in the triple spines at apex of the lvs. is A. *Nickelsia*, Hort. Both agree with the following filiferous species in having the lvs. white-marked by adherent cuticle, and with the preceding marginate species in their detachable horny border, and in fls.

BBBBBB. Lvs. fleshy-fibrous, toothless (sometimes with minute prickles at base), the margin typically shredding away in fibers, as in *Yucca*: fls. nearly as in the group of A. *micracantha*. Trunkless.

45. *Schöttii*, Engelm. Cespitose: lvs. linear-triangular,  $\frac{1}{4}$  x 6–12 in., with scarcely grooved spine and few long slender threads: infl. 4–6 ft., slender; fls. somewhat curved, yellow, scented as in *Polianthes*,  $1\frac{1}{4}$ – $1\frac{1}{2}$  in.; ovary and segm.  $\frac{3}{8}$  in. each, tube  $\frac{5}{8}$  in.: caps.  $\frac{1}{2}$  x

$\frac{5}{8}$  in. S. Ariz. B.M. 7567. Rep. Mo. Bot. Gard. 7, pl. 29. —With denticulate lf.-bases it is var. *serrulata*, Mulford. Rep. Mo. Bot. Gard. 7, pl. 29. A plant approaching *A. parviflora*, from the Pinal Mts. of Ariz., with concave lvs. 2–4 in. long, fls.  $\frac{5}{8}$  in. long with ovary  $\frac{3}{8}$  in., segm.  $\frac{1}{8}$  in. and tube  $\frac{1}{8}$  in., and ovoid caps., is *A. Toumeyana*, Trel., Rep. Mo. Bot. Gard. 5, pl. 32; 7, pl. 30. A species of the Santa Catalina Mts., Ariz., with lvs. as in *A. Lecheguilla* but filiferous instead of marginate, and fls. nearly as in *Schottii*, is *A. Trelæsei*, Toumey, Rep. Mo. Bot. Gard. 12, pl. 31a, 32, 33.

46. *parviflora*, Torr. Small and compact: lvs. ascending, oblong,  $\frac{1}{4} \times 2$  in., with flat spine and few short coarse outcurved threads, the dilated base denticulate: infl. 2–3 ft., very slender; fls. greenish white,  $\frac{5}{8}$  in.; ovary  $\frac{3}{8}$  in., segm.  $\frac{1}{8}$  in., tube  $\frac{1}{8}$  in.; caps. very small. Ariz. to Sonora Boundary. Pop. Sci. Monthly, 1911, p. 7. Rep. Mo. Bot. Gard. 5, pl. 32, 7, pl. 30.—A similar New Mexican plant with narrowly triangular falcate lvs. and grooved spine is *A. Hartmaini*, Wats. A less dwarf

144. *Agave angustissima*. (No. 48.)

plant with lvs. resembling small forms of the following but denticulate at base, sometimes cult. as *A. parviflora*, is *A. perpléxans*, Trel.

47. *filifera*, Salm-Dyck (*A. pseudofilifera*, Ross & Lanz.). Lvs. somewhat upcurved-spreading, oblong-lanceolate, 1–1 $\frac{1}{2} \times 8$ –24 in., with openly grooved spine and rather sparing thin marginal threads: infl. rather stout and dense, 10–15 ft.; fls. maroon,  $1\frac{1}{2}$  in.; ovary and segm.  $\frac{5}{8}$  in. each, tube  $\frac{1}{8}$  in. E. Cent. Mex. G.C. II. 7, p. 303; III. 21, p. 167. I. H. 7: 243. Lyon Hort. 1879, p. 208; 1900, p. 371; 1909, p. 147. Gt. 36, p. 544. Neubert's Gart. Mag. 39, p. 307. G.W. 6, p. 79; 1907, p. 9. Ref. Bot., 164. Rep. Mo. Bot. Gard. 11, frontisp. Icon. Sel. Hort. Thenensis, pl. 144.—Varies into a number of forms: var. *filamentosa*, Baker (*A. filamentosa*, Salm-Dyck, *A. filifera latifolia*, *longifolia*, *robusta* or *major*, *Bonaparte* or *Littæa filamentosa*), G.C. 34, p. 101, with large lvs.; var. *compacta* (vars. *brevifolia*, *compacta*, *densa*, *depauperata* and *minor*, Hort.), with short broad lvs.; f. *variegata* (*A. filifera superba*, Hort.), in which the dingy cuticular stripes of the type (var. *viridis* or *immaculata*) are brighter and more persistent. Hybrids are reported with *geminiflora* ( $\times$  *A. Táylori*),

*Ghiesbreghtii*, *schidigera* ( $\times$  *A. Leopöldii* II, *A. filifera* *Leopöldii*, J. H. 1893, p. 334), *zalapensis* ( $\times$  *A. Románi*) and *zyloneacantha* ( $\times$  *A. Villárum*).

48. *schidigera*, Lem. (*A. filifera adornata*, *A. adornata*, *A. filifera pannosa*, *A. filifera schidigera*, *A. schiedigera*, *A. schiedigera princeps*, *A. princeps*, *Littæa Rözlui?*). Lvs. narrowly oblong, spreading, about  $\frac{1}{2} \times 12$  in., with flattened spine and rather wide shaving-like marginal threads. Cent. Mex. I. H. 330. B.M. 5641. G.W. 2, p. 592. S.H. 4, p. 297.—A number of closely allied forms are rather frequently mentioned or encountered in cult.: with narrow, often reddened lvs. and stalked fls., *A. Ortgiesiana* (*A. schidigera Ortgiesiana* and *A. maritima*, Hort.); with sessile or nearly sessile fls. and mostly very curly and numerous marginal threads, *A. angustissima*, Engelm. (*A. Bignètii* or *Diguètii*, Hort.). Fig. 144. G.F. 6:5 (adapted in Fig. 144); *A. vestita*, Wats., A. G. 1892, p. 609; and *A. Knightiana*, Drum., B. R. 1145. Actes Soc. Linn. Bordeaux. 16, pl. Reported hybrids are *A. schiedigera* or *princeps* with *filifera* ( $\times$  *A. Leopöldii* II) and *A. schidigera*  $\times$  *Verschaffeltii*.

49. *geminiflora*, Gawl. (*A. Bonaparte*, *A. Bóscii*, *A. geminiflora filamentosa*, *A. júncea filamentosa*, *Bonaparte filamentosa*, *B. flagelliformis*, *B. júncea*, *Dracæna Bóscii*, *D. filamentosa*, *Littæa* or *Littæa* or *Littæa geminiflora*, and *Yucca Bóscii*, Hort.). Lvs. very many, biconvex, long, gracefully recurving, narrowly linear, scarcely  $\frac{1}{4}$  in. wide, with fine marginal threads. W. Mex. (?). Occasionally found in a threadless form, var. *àtricha*. Dict. Sc. Nat. 62, pl. 55. F.S. 7, p. 6. Reichenbach, Icon. 3, pl. 209, 210. Bibl. Ital. 1816, pl. Journ. of Sci. 1817, pl. I. G.W. 7, p. 548. Hybrids are reported with *A. densiflora* ( $\times$  *A. Táylori*, Hort. *A. geminiflora Táylori*, G.C. II. 8, p. 620. Mn. 7), and *A. filifera* (*A. Wrightii*, Drum., B.M. 8271.)

BBBBBB. Lvs. hard-fibrous, closely striate-grooved, at most scabrous margined: fls. rather small with tube and segms. about equal. Trunkless.

50. *striata*, Zucc. (*Bonaparte júncea rigidifolia*, *B. rigida*, *B. rigidifolia*, *B. striata* and *B. tenuifolia*, Hort.). Lvs. many, spreading, rhombically biconvex,  $\frac{1}{4} \times 24$ –36 in., gray, with needle-shaped brown spine: infl. about 10 ft.; fls. greenish,  $1\frac{1}{4}$  in.; ovary  $\frac{1}{2}$  in., protruding into the tube, segm.  $\frac{1}{2}$  in., tube  $\frac{3}{8}$  in. Cent. Mex. B.M. 4950. Gt. 29, p. 24. Jacobi, Versuch, p. 154. G.C. II. 8, p. 556. G.W. 10, p. 213. With lvs. conspicuously recurving it becomes var. *recurva*, Baker (*A. recurva*, Zucc.), G.C. II. 8, p. 556. Jacobi, Versuch, p. 158. *A. paucifolia*, Tod. (*A. Rözlui*, Hort.) differs chiefly in its fewer lvs. one-half wider, Hort. Panorm., pl. 19. The name *striata* has been applied, as a specific name, to variegated forms of *A. americana*.

51. *stricta*, Salm-Dyck (*A. hystrix* or *hýstrix*, *A. striata stricta*, *Bonaparte hystrix*, *B. robusta*, *B. stricta*, *Littæa hystrix*, *Yucca hystrix*, Hort.). Lvs. many, falcately upcurved in a globose cluster, triangularly biconvex,  $\frac{1}{4} \times 10$ –14 in., often pale or purplish, with a flattened triangular spine: infl. 5–10 ft.; fls.  $1\frac{1}{4}$  in.; ovary  $\frac{1}{2}$  in., segm.  $\frac{3}{8}$  in., tube  $\frac{1}{2}$  in. S. Cent. Mex. Jacobi, Versuch, p. 153. Gt. 31, p. 56. Gart. Mag. 40, p. 309. L. de Smet, Cat. 1874, pl.—Known in a number of forms: *purpurea* with purplish, and *rosea* with rosy foliage of the ordinary type; *glauca* (*A. dealbata hystrix*, *A. hystrix glauca* and *glaucescens*, *A. striata glauca*, *Bonaparte glauca*, *B. striata pulverulenta*, *Littæa dealbata*, *L. glauca*, Hort.), with long, and *nana* (*A. dealbata brevifolia*, *compacta minor* and *nana*, etc.), with short, pruinose lvs. A closely related form with flat rhombic lvs. with flatter spine, and short-tubed fls. is *A. echinoides*, Jacobi (*A. striata echinoides*, *A. ensiformis?*, *A. hystrix Richardsii?*, *A. Richardsii?*, *A. striata Richardsii*, *Dasyllirion júnceum?*, Hort.). Gn. 19, p. 372.

52. *falcata*, Engelm. Lvs. moderately numerous, falcately ascending, 3-sided, with slender 3-sided spine: infl. 3-9 ft.; fls. purplish, 1 in.; ovary  $\frac{3}{8}$  in., segm.  $\frac{1}{4}$  in., tube  $\frac{1}{2}$  in. N. Mex.—The "guapilla," furnishing an important part of the itxle of N. Mex.

53. *dasyliroides*, Jacobi. Lvs. moderately numerous, outcurved-ascending, thin and flat,  $\frac{1}{2} \times 10-12$  in., pale, with flattened brown spine: infl. 5-6 ft., recurving; fls.  $1\frac{1}{2}$  in., ovary and segm.  $\frac{5}{8}$  in. each, tube  $\frac{1}{4}-\frac{3}{8}$  in.: caps. slender,  $\frac{3}{8} \times 1$  in. S. Mex. B.M. 5716. G.C. II. 8, p. 557; III. 5, p. 804. Lyon Hort. 22, p. 365. G.W. 10, p. 213.—The more glaucous form is *A. dealbata*, Lem. (*A. dasyliroides dealbata*, Baker). *A. intrépida*, Greenm., of Cent. Mex., is very similar.

BBBBBBBB. Lvs. rather fleshy, long and narrow, unarmed or with minute soft prickles. Trunkless.

c. Fls. moderate, with narrow segm. and slender tube.

54. *yuccafolia*, DC. (*A. Cohniana*, Jacobi. *A. spicata*, Guss.). Lvs. few, recurved, with minute slender spine, concave,  $1 \times 24$  in., glaucous, the dry edge minutely denticulate: infl. 10 ft.; fls.  $1\frac{1}{2}$  in.; ovary and segm.  $\frac{5}{8}$  in. each, tube  $\frac{1}{2}$  in.: caps.  $\frac{5}{8} \times \frac{3}{4}$  in. Mex. Redouté, Lil., pl. 328, 329. B.M. 5213. R.H. 1860, p. 519. Deutsch. Gart. Mag. 1870, 2 pl. Gn. 12, p. 583.—A very similar if distinct plant, from Jalisco, is *A. Houighui*, Hort., and another is *A. yuccafolia cæspitosa*, Terr., Primo Contr., pl. 4.

cc. Fls. rather small, with broad separated segms.

55. *bracteosa*, Wats. Lvs. sigmoidally spreading, 3-sided, gray, narrowly triangular,  $1\frac{1}{2} \times 20$  in., spineless, minutely denticulate: infl. 3-5 ft., the scape densely covered by narrow outcurved bracts; fls.  $1\frac{1}{4}$  in.: ovary  $\frac{3}{4}$  in.; segms.  $\frac{5}{8}$  in., tube nearly suppressed: caps.  $\frac{3}{8} \times \frac{3}{4}$  in. N. Mex. G.C. II. 18, p. 776.

The following names occur as being in cult.: *A. Bakeri*, Hook. f. Resembles a gigantic eremurus in habit. Fls. with pale greenish yellow segms. Mex. (?) Gn. 61, p. 240.—*A. carcharioides*. Allied to *A. Ghiesbreghtii*. Lvs. flatter, narrower and more spiny.—*A. Langlæssei*, André. General habit as of *Furcraea Bedinghausii*. Infl. about 3 ft. high. Mex. R.H. 1901: 349.—*A. littæoides*. Allied to *A. Scolymus*. Stemless: lvs. strongly prickly toothed, terminated by a stout spine: fls. greenish yellow.—*A. Pavoliniæna*. Stemless: fls. green-yellow.—*A. Watsonii*. Allied to *A. horrida*. Distinguished by extremely narrow border of the lf. Probably Cent. Amer.—*A. Weberi*. Distinguished by almost complete absence of marginal teeth. Mex.—*A. Wrightii*, J. R. Drumm. Allied to *A. geminiflora*. Has been cult. under name of *A. Taylori*. Trunk short: margins of lvs. sharp without teeth or prickles; perianth dark green with cream-white borders. Cent. Amer. B.M. 8271.

WILLIAM TRELEASE.

AGDÉSTIS (a mythical hermaphrodite monster, the genus being an anomalous one in its order). *Phytolaccææ*. Tender climbing shrub from Mex. and Guatemala. Cult. in Calif. at one time. A monotypic genus.

*clematidea*, Moc. & Sesse. Lvs. alternate, petiolate, cordate: fls. axillary or in terminal, branched, racemose cymes, white, star-shaped; sepals 4; petals 0.—Grows 40-50 ft. in one season and is covered in Sept. with masses of small white blossoms in dense racemes; very sweet-scented. The red sts. come from a tuber which grows half out of the earth, and which is sometimes 100 and 150 lbs. in weight. These tubers look like solid rocks. They are of a gray granite-color. To do its best, this plant requires very rich soil and an abundance of moisture. Small offsets appear in quantities around the old tubers and furnish good material for prop. On account of its ill-smelling foliage, the agdestis cannot be recommended for veranda decoration; but it is a fine plant for covering unsightly objects and outhouses; to be looked for in extreme South.

N. TAYLOR.†

AGÉRATUM (Greek, *not growing old*, first applied to some everlasting). *Compositæ*. Garden annuals.

Florets all tubular, blue (rarely pink) or white; pappus of separate or united scales; otherwise like *Eupatorium*.—About 30 species, mostly Trop. Am.

herbs. Two in cult., with opposite, ovate, stalked and crenate-serrate lvs. and tassel-like heads in clusters. Mostly loose-growing plants, 1-2 ft. high, but with compact, dwarf, and variegated forms. Easily grown from seed in the open or started in house or hot-bed. They thrive in any garden soil, bloom all summer and, if started late, winter-blooming under glass.

*conyzoides*, Linn. Involucral scales oblong, abruptly acuminate, sparingly if at all hairy on the back, erose and ciliate: lvs. blunt or rounded at base, rarely heart-shaped. In most warm countries, often weed-like.

*Houstonianum*, Mill. (*A. mexicanum*, Sims). Fig. 145. Involucral scales lance-linear, attenuate, entire, ciliate, the back finely, densely, and somewhat viscidly hairy: lvs. usually heart-shaped at base: heads slightly larger than in the last. Mex. B.M. 2524.—The better species and more frequent in cult.

For so-called *A. conspiciuum* and *A. Lassei*, see *Eupatorium glechonophyllum* and *E. Lassei* respectively.

B. L. ROBINSON.

AGLÆIA (Greek, *splendor*; from the order and general appearance). *Meliaceæ*. A genus of more than 100 species of tender trees and shrubs from China, with minute, yellow, fragrant fls., said to be used in perfuming certain teas. Prop. by cuttings.

*odorata*, Lour. Ten to 20 ft.: lvs. alternate, 5-7 pinnate: fls. in axillary, branching panicles. March-May. Wight. *Icones. Ind. Or.* 2:511.—Cult. sparingly in Calif. and under glass in botanic gardens.

145. *Ageratum Houstonianum*. ( $\times \frac{1}{2}$ )

AGLAONEMA (Greek, *bright thread*). *Aracææ*. Green-house herbs grown for foliage and habit.

Low plants with an erect st. and basal shoots: lvs. with a long sheathed petiole, the blade usually oblong or oblong-lanceolate, with a thick costa and few lateral nerves: peduncles in clusters, shorter than the petiole: spathe straight, convolute below, open above; spadix sessile or stalked.—About 15 species, of Trop. Asia and Afr., allied to *Arum*, *Alocasia* and *Dieffenbachia*, and requiring essentially the same treatment as those genera.

These plants are evergreen, often beautifully variegated. Aglaonemas may be divided, or cuttings may be taken from plants that become too tall and weak. In either case the cuttings and divisions should be put into the sand-bed previous to potting, to develop new roots. All of the kinds will succeed in fibrous loam enriched with rotted manure, with the addition of a moderate quantity of leaf-mold, sand, and some crushed charcoal. (G. W. Oliver.)

*pictum*, Kunth. Dwarf: lvs. somewhat unequilateral, oblong or elliptic, ovate (4-7 in. long and 2-3 in. wide), very dark green, blotched with white, the central markings usually extending the whole length of the midrib. spathe white or whitish, 1-1½ in. long. Sumatra. I.H. 29:445.

*nebulosum*, N. E. Br. Somewhat larger: lvs. narrower (5-8 in. long, 1½ in. or less wide), more acuminate, the markings rather more broken and not so continuous along the midrib. I.H. 34:24. A.G. 16:361, and

146. *Aglaonema costatum*. ( $\times \frac{1}{5}$ )

F.E. 7:961 (as *A. pictum*).—This and *A. pictum* are confused in the trade. Both species deserve more attention than they have received in this country.

*costatum*, Veitch. Fig. 146. Very dwarf and compact: lvs. heart-shaped, thick, 3 in. wide, one-third longer than wide, seldom exceeding 5 in. long, dark shining green, with midrib ivory-white and scattering blotches of white. Holds its tufted lvs. through the winter. Moluccas. J.H. III. 63:225.

*A. commutatum*, Schott. Lvs. oblong-lanceolate, obtuse at the base, the apex long-acuminate, intense green, marked with spots of a paler green and of white. E. Indies.—*A. Ræblinii*, Hort., is "a fine decorative plant, with thick, leathery foliage" (Manda).—*A. versicolor*, Hort. Lvs. obliquely oblong, about 4 in. long by half as wide, rounded at the base, the apex acute, irregularly marked with patches of dark velvety green interspersed with paler green and milky blotches. E. Indies.

GEORGE V. NASH.†

AGNUS-CÆSTUS: *Vitex*.

AGRIMONIA (old name, perhaps a corruption of *Argemone*). *Rosaceæ*. AGRIMONY. Hardy perennial herbs, natives of the north temperate zone, with alternate odd-pinnate, aromatic and astringent lvs.: fls. yellow, racemose, with 5 small petals and 5-15 stamens: fr. armed with hooked bristles.—Sometimes cult. as woodland or shrubby plants. Not showy. Prop. by division of rootstocks in spring.

*Eupatoriæ*, Linn. (*A. officinalis*, Lam.). COMMON AGRIMONY. Fig. 147. Petals twice as long as calyx, latter making a small, lightly adhering bur.—Cult. in herb gardens to make a tonic tea, also in wild borders. Native to Eu. Grows 2-3 ft. high, in little clumps, from a short rootstock. Has been confused with our native *A. hirsuta*, Bicknell, which is not in the trade.

*odorata*, Mill. Lfts. narrower than in *A. Eupatoriæ*, pubescent; lobes more deeply crenate-dentate: petals more than twice as long as the calyx. Italy.—Occasionally cult. in Amer.

N. TAYLOR.†

AGROPYRON (Greek, *agros*, field, and *puros*, wheat). *Graminææ*. WHEAT-GRASSES. Perennial grasses, often producing creeping rootstocks.

Spikelets 3- to many-fl., sessile, placed sidewise, singly and alter-

147. *Agrimonia Eupatoriæ*. Flower and bud.

nately on the opposite sides of a continuous rachis, forming stiff terminal spikes; glumes equal, usually firm, many-nerved, acute or awned, sometimes nearly as long as the spikelet; lemmas 5-7-nerved, usually more or less awned, the palea ciliate on the keels.—Species 30 to 40 in the temperate regions of both hemispheres. The genus differs from *Triticum* chiefly in being perennial, and in the entire apex of the glumes.

Many of the native species of the western states are important range grasses or furnish nutritious wild hay. One of these, western wheat-grass (*A. tenerum*, Vasey) (Dept. of Agric. Div. of Agrost. 17:297) has been recently introduced into cultivation and is sold by seedsmen of the northwestern states. One species, introduced from Europe, the familiar quack-grass (*A. repens*, Beauv., Fig. 148, also known as couch-grass, quick-grass and quitch-grass), is a troublesome weed in cultivated land, because of its long, creeping rootstocks. Though difficult to eradicate, it has value as a forage plant.

A. S. HITCHCOCK.

AGROSTËMMA: *Lychnis*.

AGRÓSTIS (an ancient Greek name for a forage grass, from *agros*, a field). *Graminææ*. BENT-GRASS. Annual or usually perennial grasses with erect or creeping stems and open panicles of small flowers.

Spikelets 1-fl.; glumes about equal, acute; lemma shorter and more delicate than the glumes, sometimes awned from the back, palea usually shorter than the lemma, often small or wanting.—Species about 100, distributed over the entire world, especially in the north temperate zone. The genus comprises several forage

148. Creeping stem or "root" of quack-grass. ( $\times 12$ )

and lawn grasses and a few ornamental, the panicles being used for bouquets. *A. nebulosa* is excellent for dry bouquets. *A. elegans* of gardens is an Aira.

A. Panicle open but not diffuse: perennial lawn and pasture grasses.

B. Palea present.

*álba*, Linn. RED-TOP. HERD'S-GRASS (locally). Culms erect, 2-3 ft., from a usually decumbent base, producing short rootstocks; sheaths smooth; ligule membranaceous, 2-3 lines long; blades flat, scabrous, rather strongly nerved, acuminate-pointed; panicle oblong or pyramidal, several inches or even a foot in length; spikelets 1-1½ lines long; the glumes scabrous on the keels; lemma awnless; palea one half to two-thirds as long as the lemma. Dept. of Agric., Div. of Agrost. 17:187. Ibid. B.P.I. Bull. 68, pl. 2.—A common meadow and pasture grass, native of Eu., but abundantly escaped in the northern and central portions of the U. S. along roadsides and in waste places. Var. *vulgáris*, Thurb. FINE BENT-GRASS. RED-TOP. A more delicate grass, about 1 ft. high: panicles 1-3 in.; ligule usually 1 line or less. Dept. of Agric. B.P.I. Bull. 68, pl. 3.—This form is commonly used as a lawn grass. Var. *aristáta*, Gray. Similar to var. *vulgáris* but the lemmas bearing an exerted awn from near the base. Infrequent. Var. *marítima*, Mey. Producing long stolons; panicles narrow, contracted. Dept. of Agric. B.P.I. Bull. 68: pl. 4.—A native of the sea-coast of N. Amer. and Eu. A form of this is cult. as a lawn grass under the name of creeping bent and has received the horticultural name *Agróstis álba* var. *stolonífera*, but is not *A. stolonífera*, Linn.

BB. *Palea wanting.*

**canina**, Linn. RHODE ISLAND BENT. BROWN BENT. Slender, erect, cespitose,  $\frac{1}{2}$ –2 ft.: spikelets 1 line long; lemma bearing about the middle an exerted bent awn. Dept. of Agric. B.P.I. Bull. 68, pl. 9. Eu.—Cult. as a lawn grass, and sparingly escaped. Much of the commercial seed under this name is *Agrostis alba* var. *vulgaris*. The seed of *A. canina* may be distinguished by the absence of the palea.

AA. *Panicle diffuse, the main branches scabrous, long and hair-like, naked below.*

B. *Plants annual: palea present.*

**nebulosa**, Boiss. & Reut. CLOUD-GRASS. Fig. 149. Culms branched below, slender, 1 ft.; blades few and small; ligule 2–3 lines; panicles oblong, about half the plant, delicate, the branches verticillate; spikelets  $\frac{1}{2}$  line, long-pedicelled, sometimes awned. Spain.—Cult. for dry bouquets. Sometimes called *A. cupillaris* but is not *A. capillaris* of botanical authors.

BB. *Plants perennial: palea wanting.*

**hiemalis**, B. S. P. (*A. scabra*, Willd.). HAIR-GRASS. TICKLE-GRASS. SILK-GRASS. Culms low and delicate, 1–2 ft.; blades small and mostly radical; panicles very diffuse, the spikelets borne toward the extremities of the branches. Dept. of Agric. B.P.I. Bull. 68, pl. 26.—The panicles break away at maturity and are blown about by the wind. The young panicles are often used for dry bouquets.

*A. minutiflora*. See *Sporobolus minutiflorus*.

A. S. HITCHCOCK.

AGUACATE, ALLIGATOR PEAR, AVOCADO: *Persea*.

**AILANTHUS** (from its native name *Ailanto*, meaning *Tree of Heaven*). Syn., *Pongèlion*. *Simarubaceæ*. Trees chiefly grown for their handsome large foliage.

Large trees: lvs. alternate, odd-pinnate, deciduous: fls. small, in large terminal panicles, polygamous; sepals and petals 5 or 6; disk small, 10-lobed; stamens 10; carpels 5 or 6; fr. consisting of 1–5 distinct oblong samaras with the compressed seed in the middle.—Eight or 9 species in Cent. and S. Asia and in N. Austral.

These trees are sparingly branched, with large pinnate foliage, inconspicuous greenish flowers in upright panicles followed by winged fruits; the foliage exhales a disagreeable odor when bruised. The ailanthus foliage gives a tropical effect when the growth is very strong.

The Chinese species are fairly hardy North; only as young plants are they somewhat tender. They are very rapid growers and stand smoke and dust well. If plants are cut back to the ground after they have become established (in two or three years after planting), they will throw up very strong shoots and make an excellent screen. This practice may be repeated year after year. Sumacs, paulownias, basswoods, mulberries, and other fast-growing things may be treated in this way. The ailanthus foliage is very like that of the cedrela (which see for illustration of differences). The best known is *A. altissima*, which is often planted as a street tree, particularly in cities, as it resists smoke

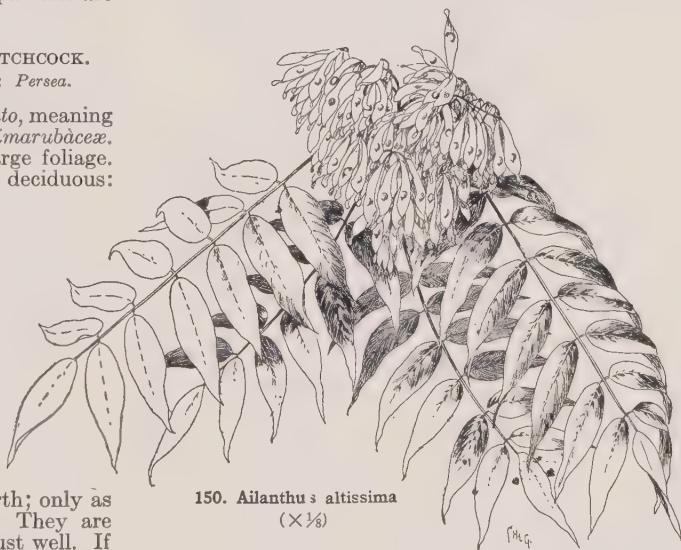

better than many other trees and is not attacked by insects. For street planting, the fertile plant only should be used, because the male exhales a disagreeable odor when flowering, and the pollen is said to cause catarrhal troubles. It grows in almost any soil, but best in a light and somewhat moist one.

Propagation is by seeds which must be sown soon after ripening, and by root-cuttings. It suckers from the roots.

A. *Branchlets and petioles glabrous or only finely pubescent: lfts. glabrous beneath.*

**altissima**, Swingle (*A. glandulosa*, Desf.). TREE OF HEAVEN. Fig. 150. Tree, to 60 ft.: young branchlets minutely pubescent, usually dull yellowish brown: lvs.  $1\frac{1}{2}$ –2 ft. long; lfts. 13–25, stalked, ovate-lanceolate, usually truncate at the base, 3–5 in. long, finely ciliate, with 8–10 pairs of veins, glabrous and glaucescent beneath, near the base with 2–4 coarse teeth, each with a large gland beneath: samaras  $1\frac{1}{2}$  in. long. June, July. China. G.C. III. 2:365. Gn. 24, pp. 63, 65 (habit); 32, p. 330. Mn. 10, p. 152 (habit). M.D.G. 1901:324 (habit). Var. **erythrocarpa**, Rehd. (*A. erythrocarpa*, Carr. *A. rubra*, Hort.). Lvs. darker green above and more glaucous beneath: fr. bright red, very effective in late summer and autumn. Var. **pendulifolia**, Rehd. Lvs. very large, drooping. R.H. 1906, p. 545. Var. **sutchuenensis**, Rehd. & Wilson (*A. sutchuenensis*, Dode). Young branchlets reddish brown, glabrous, lustrous: petioles purplish glabrous: lfts. not ciliate, cuneate at the base, at least in older plants: fr. about 2 in. long. W. China.—In China this species and *A. vilmoriniana* are sometimes planted as the host of a silkworm, *Attacus cynthia*, which produces a coarse silk, inferior to that of the common silkworm. As a shade and street tree, it is now much planted in temperate regions and naturalized in some localities.

**Giraldii**, Dode. Tree; young branchlets finely pubescent; petioles purplish: lvs. 2–3 ft. long; lfts. 33–41, closely set, lanceolate, 4–6 in. long, with 2–4 glandular

150. *Ailanthus altissima*  
( $\times \frac{1}{2}$ )

teeth near the base, undulate at the margin and long-pointed, with 14–15 pairs of secondary veins, dark green above, pale green beneath: panicle 8–12 in. long; fr.  $2\frac{1}{2}$  in. long. W. China.

AA. *Branchlets and petioles, at least in young trees, prickly and pubescent: lfts. pubescent beneath.*

**Vilmoriniana**, Dode (*Pongèlion vilmorinianum*, Van Tieghem. *A. altissima* var. *spinosa*, Bois). Tree, to 50 ft.: lvs. 2–3 ft. long; lfts. 17–35, oblong-lanceolate,

4-6 in. long, with 2-4 gland-bearing teeth near the base, glabrous or pubescent above, glaucescent and pubescent beneath: panicle to 12 in. long: fr. about 2 in. long. W. China. R.H. 1904, p. 445. Gn. 75 p. 632 (habit).—Has proved at least as hardy as *A. altissima* at the Arnold Arboretum.

*A. excelsa*, Roxb. (Pongelion excelsum, Pierre). Tall tree: lvs. 3 ft. long, abruptly pinnate; lfts. 20-28, teeth without glands. India. Can be grown only in tropical regions or in the hothouse.—*A. flavescens*, Carr.=*Cedrela sinensis*. ALFRED REHDER.

**AIÏRA** (an ancient Greek name for Darnel). *Gramineæ*. HAIR-GRASS. Annual grasses with delicate culms and open capillary panicles. Spikelets 2-fld. one or

151. *Ajuga reptans* var. *variegata*. ( $\times \frac{1}{2}$ )

both fls. awned from the middle of the back; palea nearly as long as the lemma.—Species 6, natives of the Medit. region, intro. in the Atlantic states and on the Pacific coast. Cult. for dry bouquets. The species have been confused by florists with *Agrostis* (as *Agrostis elegans*) from which genus they may be distinguished by their 2-fld. spikelets.

**capillaris**, Host. (*A. elegans*, Willd.). Spikelets less than 1 line long, all long-pedicelled.

**caryophyllæa**, Linn. Pedicels mostly shorter than the spikelets. Dept. of Agric. Div. of Agrost. 7:170.

*A. caespitosa*=*Deschampsia caespitosa*.—*A. foliis variegatis*. This name is listed in trade catalogues, but the seedsmen report that all failed. Probably is *Deschampsia caespitosa*.

A. S. HITCHCOCK.

**AIR-PLANT**. In common speech, any plant that grows on the trunk or in the top of another plant is called an air-plant. The proper term is *epiphyte* (that is, *growing on a plant*), which see. In horticulture, the term air-plant is usually applied to epiphytal orchids, tillandsias, and the like. Most of these grow on old bark, perhaps deriving some of their nourishment from the bark, but most of it from the air and rain. Air-plants are not parasites,—they do not derive their support from the juices of the host.

The term is sometimes applied to plants that make roots from leaves or other parts that are severed and allowed to remain out of the earth. Bryophyllum is a leading example, because new plants start from the leaf-edges. The dioscoreas and rajiarias that bear aerial tubers are sometimes known as air-plants. See also *Resurrection Plants*.

**AJÛGA** (not yoked: the calyx not bilabiate). *Labiataæ*. BUGLE-WEED. Hardy herbaceous European perennials, creeping by stolons.

Height 6-12 in.: fls. numerous, in whorls, normally blue or purple, with rosy or white varieties; corolla 2-lipped, the upper lip short, the lower spreading.—Considerably used in rock-gardens and for border planting. Prop. by division in spring or by seeds.

**genevënsis**, Linn. (*A. rugosa*, Hort. *A. alpina*, Hort.). St. erect, pubescent: cauline lvs. oblong-elliptic or obovate, narrowed at the base; lower ones petiolate; floral lvs. ovate or wedge-shaped, coarsely toothed,

sparsely hairy: upper fl.-whorls spicate; lower whorls distant. May, June.

**pyramidalis**, Linn. St. erect: cauline lvs. obovate, hardly petiolate, in a 4-sided pyramid; floral lvs. broadly ovate, the highest often colored; all lvs. entire: fl.-whorls usually all spicate.

**réptans**, Linn. St. prostrate: lvs. ovate or obovate, entire or sinuate, shiny.—A low, dense, fast-spreading creeper, excellent for covering shady slopes. The typical and white-fld. forms are less cult. than the following: Var. **rùbra**, Hort. More valued for its dark purple lvs. than its blue fls. Var. **variegata**, Hort. Fig. 151. Lvs. splashed and edged creamy yellow. Var. **atropurpurea**, Hort. Fls. purplish blue. May.—Useful for carpeting the ground in shady places.

*A. metálica* var. *crispa*, Hort., intro. by Henderson, 1899, is described as dwarf (4-5 in.), with curled, metallic glossy and blue fls. in a pyramidal spike.—A bedding plant, intro. from Germany. None of the varieties are so desirable as the typical form.—*A. Brückbanki*, Hort., "with fine blue fls.," and *A. osmáfera*, Hort., are trade names for blue-fld. bugles that are unknown in hort. or botanical literature, and it is uncertain to what species they are to be referred.

N. TAYLOR.†

**AKEE**: *Blighia*.

**AKÈBIA** (from *Akebi*, its Japanese name). *Lardizabalaceæ*; by some included in *Berberidaceæ*. Twining woody plants.

Glabrous twining shrubs: lvs. half-evergreen, long-petioled, digitate; fls. monœcious, in axillary raceme, the pistillate at the base, the staminate smaller, at the end of the raceme; sepals 3; stamens 6; carpels 3-12, with sessile stigma; fr. a large oblong berry with numerous seeds imbedded in a pulp, opening along the inner suture.—Two species with several varieties in Japan and China.

The akebias are very ornamental, hardy climbing shrubs of graceful appearance, especially adapted for places in which very dense shade is not wanted. They require a sunny position and well-drained soil; also valuable in the cool greenhouse for covering pillars and walls, growing best in a sandy compost of loam, leaf soil and peat. In Japan, the fruit which is very showy but with us rarely produced, is eaten, and the stems are much used for wicker-work.

Propagation is by seeds, by greenwood or hardwood cuttings, and also by root-division and layers.

**quinàta**, Decne. Figs. 152, 153. Climbing 12 ft. or more: young branchlets purplish: lfts. 5, oval or oblong-obovate, entire, emarginate, 1-2 in. long: fls. fragrant, the pistillate purplish brown, about 1 in. broad, the staminate smaller, rosy purple, in early spring: berry oblong, 3-5 in. long, dark purple with glaucous bloom; seeds black. April, May. China, Japan. B.R. 33:28. B.M. 4864. G.F. 4:137 (adapted in Fig. 153). A.G. March, 1891, figs. 5, 7, and plate. G.W. 10, p. 500. Gn. 51, p. 151. R.H. 1853:141. S.Z. 77.—Hardy, handsome, not attacked by insects or fungi. Very graceful and desirable.

152. *Akebia quinata* flowers.

**lobàta**, Decne. (*A. quercifolia*, Sieb. & Zucc.).

Lfts. 3, broadly ovate, coarsely crenate, 1–2 in. long; fls. in long racemes, smaller than those of *A. quinata*. Japan, China. B.M. 7485. A.G. March, 1891, p. 140. G.W. 13, p. 438. S.Z. 1:78. Var. *austrâlis*, Diels. Lfts. oval or ovate to ovate-oblong, entire or nearly so, coriaceous.—Recently intro. from China and probably tender. Var. *clematifolia*, Ito. Lfts. broadly ovate to ovate, entire, of thin texture, to  $3\frac{1}{2}$  in. long. Japan. A supposed hybrid of this and the preceding species is *A. pentaphylla*, Makino, with 3–5 lfts. entire or sparingly crenate.

ALFRED REHDER.

**ALÂNGIUM** (from the Malabar name). Including *Marlea*. *Alangiaceæ*, formerly included in *Cornaceæ*. Trees or shrubs, rarely grown in temperate regions for their handsome large foliage and fragrant fls. A genus of over 20 species of shrubs or small trees of the Old World tropics, with alternate entire or lobed evergreen or deciduous lvs. and small, perfect whitish, often fragrant, fls. in axillary clusters; calyx small, campanulate; petals 4–10, linear, usually laxly reflexed; stamens 4–30; ovary inferior, style simple, elongated; fr. a 1-seeded drupe. Sometimes cult. in Old World gardens, either as stove plants or out-of-doors in warmer regions, but probably not in the American trade.

*A. begoniifolium*, Baill. (*Marlea begoniifolia*, Roxbg.) Tree to 60 ft.: lvs. ovate, entire or slightly lobed, acuminate, usually rounded at base, to 8 in. long; fls.  $\frac{3}{4}$  in. long, in cymes; petals and stamens usually 6. Afr., S. and E. Asia. B.R. 24:61. E.P. IV. 220b, p. 3.—*A. decapetalum*, Lam. (*A. salviifolium* var. *decapetalum*, Wang. A. Lamarckii, Thwait.). 30 ft.: lvs. entire, oblong-lanceolate; fls. fragrant, white, solitary or in 2's or 3's in the axils; petals 10. India. E.P. IV. 220b, 10.—*A. platanifolium*, Harms (*Marlea platanifolia*, Sieb. & Zucc.). Tree: lvs. roundish in outline, 3–5-lobed, to 8–10 in. long; fls. over 1 in. long, in few-fl. cymes, petals and stamens usually 6. Japan, China, E. P. IV. 220b, p. 23. This seems to be the hardest species and is probably hardy as far north as Washington, D. C.

ALFRED REHDER.

**ALBÉRTA** (from Albertus Grotus, commonly known as Albertus Magnus, philosopher of the thirteenth century, who wrote concerning plants). *Rubiaceæ*. Two species of shrubs or trees, one of which has been introduced as a hothouse or greenhouse subject.

Leaves thick, opposite; fls. rose-colored or purplish, in terminal panicles; calyx 10-ribbed and 5-lobed, often colored in fr.; corolla elongated-tubular.

**mâgna**, E. Mey. Bark pale, the young branches reddish brown; lvs. 4–5 in. long, obovate-oblong, obtuse, entire, narrowed into a short, stout petiole; midrib stout; panicle terminal, erect, 6 in. high and nearly as broad at the base; corolla-tube 1 in. long, slightly swelling in upper part, pubescent; lobes 5, small, triangular, recurved. Natal. B.M. 7454. G.C. III. 22:416. Gn. 53:430. The other species is *A. minor*, Baill., from Madagascar.

L. H. B.

**ALBÍZZIA** (after *Albizzi*, an Italian naturalist). *Leguminosæ*. Ornamental woody plants chiefly grown for their handsome foliage and also for their attractive flowers; some are valuable timber trees; closely allied to the acacias.

Trees or shrubs: lvs. deciduous, alternate, bipinnate; lfts. usually small and numerous, oblique; fls. in axillary, peduncled spikes or globular heads; calyx tubular or campanulate, 5-toothed; corolla small, funnelform, with the segm. connate more than one-half; stamens numerous, more or less connate at the base, exserted; fr. a large strap-shaped pod without pulp.—About 25 species in tropical and subtropical regions of Asia, Afr. and Austral.; 1 in Mex.

The albizzias are unarmed trees or shrubs with graceful feathery foliage and yellowish, white or pink flowers in summer. Most of the species can be grown only in subtropical and tropical regions except *A. Julibrissin* which is the hardest species and can be grown as far north as Washington, D. C. *A. lophantha* is sometimes grown as a greenhouse shrub.

For cultivation, see *Acacia*.

*A. Fls. in cylindrical axillary spikes: lvs. sub-persistent.*

**lophántha**, Benth. (*Acácia lophántha*, Willd.). Shrub or small tree, 6–20 ft.: lvs. with 14–24 pinnæ, each with 40–60 lfts., about 5 lines long, linear, obtuse; spikes mostly 2, about 2 in. long, yellowish; fls. distinctly pedicelled. S. W. Austral. B.M. 2108. B.R. 5:361. L.B.C. 8:716.—Sometimes cult. as greenhouse shrub and flowering in spring, and in the open in the S.; it has become naturalized in S. Calif. Often known as *Acacia speciosa*. There is a var. *gigantæa* in the trade.

**montâna**, Benth. Small tree; ferrugineously villous: lvs. with 14–24 pinnæ, each with 40–80 lfts. linear-

153. *Akebia quinata* fruit. ( $\times \frac{1}{2}$ )

oblong, 3–4 lines long, obtuse; spikes cylindric, 2–3 in. long; fls. very short-pedicelled. Java.—Closely related to the preceding species, differing chiefly in its yellowish pubescence and in the short-stalked fls.

AA. *Fls. in globular heads: lvs. deciduous.*

B. *Stamens united only at the base.*

C. *Lfts. ovate or oblong, obtuse.*

D. *The fls. pedicelled, in axillary heads.*

**Lébbek**, Benth. (*Acácia Lébbek*, Willd. *A. speciosa*, Willd.). **LEBBECK TREE**. **SIRIS TREE**. **WOMAN'S-TONGUE TREE**. Fig. 154. Tall tree: lvs. with 4–8 pinnæ, each with 10–18 lfts., obliquely oblong or oval,  $1\frac{1}{2}$  in. long, nearly sessile; fls. greenish yellow, in short-peduncled, axillary heads, 3–4 together. Trop. Asia, N. Austral.—Planted as a yard tree in American tropics.

**occidentâlis**, Brandege. Small tree, 15–25 ft.: lvs. with 8 pinnæ, each with 6–10 lfts., oblique-oval,  $\frac{3}{4}$ – $1\frac{1}{2}$  in. long, glabrous; fls. yellowish, in axillary heads. June, July. Mex., Low. Calif.—Possibly only a variety of *A. Lébbek*, and not indigenous.

DD. *The fls. nearly sessile in fascicled heads forming large terminal panicles.*

**odoratissima**, Benth. (*Acácia odoratissima*, Willd.). Tall tree: lvs. with downy rachis; pinnæ 6–14, each with 16–50 lfts., oblique-oblong,  $\frac{3}{4}$ –1 in. long, glaucous beneath; heads few-fl., numerous, greenish white. E. Indies.

*procëra*, Benth. (*Acácia procëra*, Willd.). Tall tree: lvs. with nearly glabrous rachis; pinnæ 6-10, each with 12-16 lfts., oblique-oblong, 1-1½ in. long, glabrous: heads few-fld., greenish white. Trop. Asia, Austral.

cc. *Lfts. falcate, with the midrib close to the upper edge, acute.*

*Julibrissin*, Durazz. (*Acácia Julibrissin*, Willd. *A. Nemu*, Willd.). Tree, 30-40 ft.: rachis of the lvs. with a small gland at the base; pinnæ 8-24, with numerous lfts., falcate-oblong, ¼ in. long: heads pink, slender-peduncled, crowded on the upper end of the branches. Warmer Temp. Asia from Persia to Japan. Summer. S.F. 1:51. Var. *rôsea*, Mouillef. (*A. rôsea*, Carr.). Fls. bright pink, dwarfier and harder than the type. R.H. 1870:490, 1912, pp. 184, 185. F.S. 21:2199.—This variety is sometimes grown under the name *A. Nemu*.

Var. *môllis*, Benth. (*A. môllis*, Boiss. *Acácia môllis*, Wall.). Lfts. broader, densely pubescent. Himalayas and Abyssinia.

154. *Albizzia Lebbeck.*  
(×¼)

*stipulâta*, Boiss. (*Acácia stipulâta*, DC.). Tall tree: young branches with large, persistent stipules: rachis of the lvs. with many glands, pubescent; pinnæ 12-40, with numerous lfts., oblong-linear, ¼-½ in. long, pubescent beneath: heads in axillary simple or terminal compound racemes. Trop. Asia.

BB. *Stamens connate into a long, narrow tube.*

*fastigiâta*, Oliver (*Zýgia fastigiâta*, E. Mey.). Tree: branches and petioles rusty-pubescent; pinnæ 8-14, each with 16-30 lfts., trapezoid-oblong, ⅓-½ in. long, pubescent beneath: heads in terminal corymbs on the end of the branches. Trop. Afr.

*A. moluccâna*, Miq. Tree: rachis of the lvs. with many glands; pinnæ 14, each with 12-40 lfts., obliquely elliptic-oblong, glaucous and pubescent beneath. Moluccas.—Incompletely known.

ALFRED REHDER.

**ALBÛCA** (*whitish*; the color of the first-described species). *Liliacææ*. Tender bulbs from the Cape of Good Hope allied to *Ornithogalum*, and treated in the same way.

Bulb tunicated: lvs. all radical, flat or terete: fls. large, yellow, white or green, in single racemes: perianth of 3 outer oblong more or less spreading parts and 3 inner shorter connivent segms.; stamens 6, the filaments often winged; stigma 3-lobed: fr. a 3-valved caps.—S. and Trop. Afr. and Arabia.

There are a good number of species of *Albuca* (about 30), but few are much known to cultivation, and none of them is apparently planted to any extent in this country. *Albucæ* are late spring and summer bloomers, producing attractive white or yellow flowers. In mild climates, they may be carried over winter in a frame or with a good protection of litter. Propagation is by

offsets or by seeds. Some of the species are hothouse plants. Allied to *Urginea*, to which the *A. major* of catalogues probably belongs. Numbers of hybrids have been produced.

*aûrea*, Jacq. Two ft.: bracts yellow: fls. 10-30, pale yellow, upright: lvs. very narrow, flat. June.

*Nélsonii*, N. E. Br. Three to 5 ft.: fls. 1½ in. long, in a large cluster or spike, almond-scented, pure white with a red-brown stripe down the middle of each segm. (but pure white under glass): lvs. long, grooved or concave at base, flat above, pointed. July, Aug.—Probably the best species yet intro. The bulbs are lifted in autumn; or they may be potted up for greenhouse use. It is an excellent plant when well grown. B.M. 6649. L. H. B.

**ALCHEMÍLLA** (from an Arabic name). *Rosacææ*. Hardy herbaceous perennials, suitable for rock-gardens and front rows of borders.

Low (6-8 in.): lvs. palmately lobed or compound: fls. small, greenish or yellowish, in clusters; petals 0; stamens 1-4; pistils 1-4, becoming achenes included in the persisting calyx.—Species 30 or more in Cent. and S. Amer., Afr., India and elsewhere, largely in mountains.

Plants of easiest culture. Propagation is effected by division or by seeds. *A. arvensis* and *A. pratensis* of Europe are naturalized in North America. The *A. major* of catalogues is probably a form of one of the species.

*alpina*, Bieb. Lvs. digitate, 5-7-cut; lfts. usually 7, lanceolate-cuneate, obtuse, serrate at apex, silky hairy beneath, shiny. Eu.

*sericea*, Willd. Lvs. larger than in *A. alpina*, 5-7-nerved, digitate; lfts. 7, lanceolate, acute, deeply serrate from the middle to apex, downy beneath. Caucasus.

*vulgâris*, Linn. (*A. montâna*, Schmidt). **LADY'S MANTLE**. Lvs. 7-9-nerved, 7-9-cut; reniform, plicate-concave. North temperate zone. L. H. B.†

**ALCHÓRNEA** (in memory of Stanesby Alchorne). *Euphorbiacææ*. **DOVEWOOD**. Tropical shrubs or trees with alternate, entire or dentate lvs.: fls. usually dioecious, in elongated slender catkin-like infl.; staminate calyx 4-lobed; stamens 8.

One species, *A. ilicifolia*, Muell. Arg., is rarely grown in greenhouses, and is listed by U. S. Dept. of Agric. as intro. from Austral. It is a tall, handsome shrub with thick, holly-like lvs. The wood is useful.

J. B. S. NORTON.

**ALDER:** *Alnus*.

**ALECTORÛRUS** (Greek, apparently cock's-tail). *Liliacææ*. An anthericum-like plant, summer-blooming and suitable for outdoor culture; hardy in England. Blooms well in pots. One species, *A. yedoensis*, Makino, of Japan (known also as *Anthericum yedoense*, Maxim., and *Bulbinella yedoensis*, Matsum.), is now intro. to gardens. It is a perennial glabrous herb with a short and thick rootstock: lvs. 6-11, 2-ranked, 20 in. or less long: fls. many, small, pale rose, racemose along panicle branches on a scape or st. surpassing the lvs.; perianth bell-shaped, segms. 6; stamens 6, in some fls. exerted and in others only equaling the segms.; ovary 3-lobed. In Japan it is known as Keibi-ran. B.M. 8336. G.C. III. 48:352.

L. H. B.

**ALÉCTRYON** (Greek name for the chanticleer). *Sapindacææ*. **TIROKI**. Tall trees, one of which is grown in California.

Leaves alternate, pinnate, stipulate, the lfts. entire or toothed: fls. mostly unisexual, in axillary or terminal panicles, the petals wanting, containing a small lobed disk; stamens 10 or less: fr. a hard woody caps., the seeds arillate, with spiral cotyledons.—Some 16 species in Malaya and the Pacific Isls.

**excelsum**, Gaertn. Evergreen, 30-60 ft., with unequally pinnate lvs. 4-12 in. long, the lfts. 4-6 pairs and 2-4 in. long, ovate-lanceolate and acuminate, nearly or quite entire; fls. greenish, in a much-branched panicle: fr. globose, woody; seed large, jet-black and shining, sunk in a large scarlet aril. New Zeal.—Said to have been in cult. in Calif. for more than 40 years and to have been sometimes sold for *Nephelium Litchi* (to which it is closely related). In New Zeal. it yields a tough elastic timber used for tools and yokes, and the natives extract oil from the seeds.

L. H. B.

**ÁLETRIS** (Greek word for *female slave* who ground corn; alluding to apparent meanness of the fls.). *Liliacæ*. Hardy small herbs, sometimes grown in borders.

Leaves thin, flat, lanceolate, grass-like, in a spreading cluster, all radical: fls. small, in a spiked raceme, terminating a slender scape 2-3 ft. high; perianth not woolly, but wrinkled and roughened with many points that give a mealy appearance; perianth 6-cleft; stamens 6, inserted at the base of the lobes; style 3-cleft.—The aletris are about 8 in number, in moors, barrens, and grassy places in N. Amer., E. Asia and Japan. They are fibrous-rooted, very bitter herbs, with fls. on a naked scape 1-2 ft. high. July, Aug. They prefer a moist but sunny situation. Prop. slowly by division; or seeds may be used. A plant once catalogued as *A. japonica* is undetermined.

**farinosa**, Linn. Fls. tubular, white; lobes lanceolate-oblong. N. Amer. L.B.C. 12:1161.

**auræa**, Walt. Fls. bell-shaped, fewer and shorter than in *A. farinosa*, yellow; lobes short, ovate. S. E. N. Amer. B.M. 1418 (erroneously as *A. farinosa*).

L. H. B.

**ALEURÏTES** (Greek, *farinose* or *floury*). *Euphorbiacæ*. Tropical trees grown for the oils they yield or sometimes for shade and ornament.

Leaves alternate, palmately veined, 3-5-lobed, the long petioles with 2 glands at the apex: fls. usually monœcious, in lax terminal cymes; sepals 2-3, valvate; petals 5; stamens 8-20, the inner row monadelphous; 1 ovule in each cell of the 2-5-celled ovary: fr. large, drupaceous, with thick-shelled seeds.—Four species, with milky juice, natives of E. Asia and Pacific Isls. *Jatropha* and *Hevea*, are related genera. Page 3565.

All of the species are cultivated in tropical countries for the drying oil derived from the seeds. These oils are similar to linseed oil, but dry quicker, harder and more waterproof but less lightproof and elastic. The seeds of *A. moluccana* yield 60 per cent of oil (kekuna, kelun or bankul oil), which is used for burning or in varnishes. The seed or oil is also used to some extent as food and the wood is worked. The tree is grown for shade. It is said to be easily grown in the tropics up to 2,000 feet altitude. It is easily propagated from seeds, which sprout in four to five weeks. The oil (wood-oil, tung-oil) of the seeds of the wood-oil trees (*A. cordata*, *A. Fordii*) is much used, especially in China and Japan, for treating woodwork, cloth, and the like, and for burning. Its importation to this country is on the increase, where it is used in varnishes and other products, paints, soaps, linoleum, and so on. *A. Fordii*, which is the hardier species, has been extensively introduced into the southern states by our Department of Agriculture and is reported to be doing very well.

*A. cordata* is a fine smooth-barked tree, good for shade and will stand high temperature, but not much below freezing. *A. Fordii* is a very ornamental tree.

The wood-oil trees are usually grown on dry, thin soil not suited to general farming. They are grown from seeds, and begin to produce nuts in three to six years. The seedlings are raised in a bed and transplanted when about a foot high or are planted where they are to stand. They may also be propagated from hardwood cuttings, which root readily. An average tree is said to yield

twenty to fifty pounds of nuts with about 24 per cent of oil. The oil is pressed from the seed after roasting. The seed is poisonous. See Circ. 108, U. S. Bu. Pl. Ind.

#### A. Pubescence stellate.

**moluccana**, Willd. (*A. triloba*, Forst.). CANDLE-NUT. CANDLEBERRY TREE. VARNISH TREE. Tree with long spreading branches: lvs. large, ovate-acuminate, short-lobed, rusty pubescent below: paniculate cymes 4-5 in. long of many small fls.; stamens 15-20; ovary 2-celled: fr. 2-3 in. thick; seeds large, rough and walnut-like.—Probably native of Malay region but now widely cult. and wild in the tropics. In wooded valleys up to 3,000 ft. Mem. Torr. Bot. Club. 8:117. Blanco Flor. Filip. 220.—Also known as Belgaum walnut, Indian walnut, kukui and various other native names.

**trispérma**, Blanco (*A. saponaria*, Blanco). BANUCALAG. Differs from *A. moluccana* in having 7-10 stamens, a 3-4-celled ovary, lvs. more entire and seeds smooth. Philippines.—Intro. once by U. S. Dept. of Agric. The seed used for the drying oil. Other native names are balocanad, baguilumbang, calumbang, balucanag. Blanco Flor. Filip. 296.

#### AA. Pubescence not stellate.

**cordata**, R. Br. JAPAN WOOD-OIL TREE. Twenty-five to 30 ft. high: lvs. broadly ovate, acuminate, 3-5-lobed or toothed: petals oblong,  $\frac{3}{4}$  in. long, hairy at base; stamens 8-10; ovary 3-4-celled: fr. warty; seeds about the size and shape of large castor beans. S. E. Asia and adjoining isls.; cult. especially in Japan, south of 40°, and in Formosa.

**Fördii**, Hemsl. (*A. cordata*, Muell. Arg., in part). CHINA WOOD-OIL TREE. Ten to 25 ft. high: lvs. ovate-cordate: petals 1 in. or more long, orbicular ovate, somewhat hairy; stamens 8-10; ovary about 4-celled: fr. smooth: panicles of reddish white fls. in spring; fr. ripe in Sept. Cent. Asia.—Extensively cult. for the oil. Perfectly hardy in Cent. Fla. and resistant to drought.

J. B. S. NORTON.

**ALEXANDERS**. Name applied to *Smyrniium Olusatrum* (Umbelliferae), the blanched leaf-stalks of which were once used as a salad and pot-herb, but now out of cultivation because of the superior value of celery. It is a biennial, native to Europe, with ternately dissected pinnate radical leaves, and small yellow flowers in umbels. Seed is sown in late summer or in autumn, and the plants transplanted in rows as they come up in spring. The plants are blanched by being banked with earth.

**ALFÁLFA, LUCÉRNE** (*Medicago sativa*, Linn.). A deep-rooted perennial forage plant of the *Leguminosæ*. The plant grows one to four feet high, bears pinnate leaves with three ovate-oblong toothed leaflets, and small head-like racemes of purple clover-shaped flowers. It is native to Europe. In the arid parts of the United States it is the staple hay and forage plant, and it is also grown to a considerable extent in the East. Two to six mowings may be made each year from established meadows. Fifteen to thirty pounds of seed are sown to the acre; and the seed is preferably sown alone, without another crop. Alfalfa should not be pastured the first year. In two or three years it becomes thoroughly established and productive, and it should continue for many years. June-grass often runs it out in a cool, moist climate. Alfalfa often becomes a weed in waste places. See Cyclo. Amer. Agric. II, for full account.

**ALFILARIA**. Spelled also *Alfilera* which is the West American, and *Alfilarilla*, the Spanish-American for *Erodium cicutarium*, L'Her. *Geraniacæ*. A hairy annual with pinnate lvs., sometimes used for pasture in dry regions. See Cyclo. Amer. Agric. II, p. 197.

**ÁLGA**, plural **ALGÆ**. A general name for chlorophyll-bearing thallophytes. They are flowerless plants, allied to the fungi, and generally inhabit water. Those occurring in salt water are known as seaweeds. None is cultivated. The green "moss" on flower-pots is made up of algæ.

**ALGARÔBA** is the fruit of *Ceratonia siliqua*.

**ALHÂGI** (its Mauretanian name). *Leguminosæ*. Shrubs grown for their profusely produced red flowers.

Spiny plants: lvs. alternate, oblong, small, deciduous, entire; fls. papilionaceous, red, small, in few-fld. axillary racemes; calyx campanulate, 5-toothed; pods

155. *Allamanda cathartica* var. *Hendersonii*. ( $\times \frac{1}{4}$ )

terete, contracted between the seeds.—Three closely related species from Greece and Egypt to the Himalayas.

These plants are low, much-branched shrubs with small and sparse, pale foliage and numerous small red flowers toward the end of the branches. Only the following species, which produces the Persian or alhagi manna, is but very rarely met with in collections. It may be cultivated in temperate regions in dry and sunny positions and propagated by seeds and by green-wood cuttings under glass with slight bottom heat; as a desert plant, it is impatient of too much moisture, and needs special attention, particularly in the seedling state.

**camelòdrum**, Fisch. **CAMEL'S THORN**. Low, spiny shrub, glabrous or nearly glabrous: lvs. oblong, obtuse,  $\frac{1}{2}$ – $1\frac{1}{4}$  in. long; fls. red, about  $\frac{1}{3}$  in. long, on few-fld. axillary racemes, forming panicles at the end of the branches. Summer. Caucasus to the Himalayas.—Easily distinguished by its glabrousness from the other species, which are more or less pubescent. The other species are *A. græcorum*, Boiss., *A. maurorum*, Medic.

ALFRED REHDER.

**ALÍSMA** (derivation doubtful). *Alismaceæ*. A genus of 2 species of hardy aquatics, with small white or pale rose fls. on scapes with whorled, panicle branches. Perennial by a stout proliferous corm. Useful in ponds. Prop. by division or seeds. According to N. Amer. Flora 17:43, 1905, the native water-plantain is not the same as the Old World species, to which, exclusively, should be applied the name here taken up for the species which has hitherto been considered cosmopolitan, and is now so treated.

**Plantão-aquática**, Linn. (*A. Plantão* of authors. *A. subcordatum*, Raf.). **WATER-PLANTAIN**. Lvs. variable, but usually broadly cordate-ovate, thinner and narrower when growing under water: panicle 1–2 ft. long. Common in swales and still waters in U. S.; also in Eu. and Asia.

*A. natans*, Linn., is now referred to the monotypic genus *Elisma* (*E. natans*, Buch.). It is native to Eu., and is offered in foreign catalogues. Fl. white, single, on a long peduncle: floating lvs. elliptic and obtuse. See *Elisma*.

N. TAYLOR.†

**ALKÁNNA, ÁLKANET**: *Anchusa*.

**ALKEKÉNGI**: *Physalis*.

**ALLAMÁNDA** (Dr. Allamand, Leyden). *Apocynaceæ*. Tropical shrubs, mostly climbers, grown in green-houses and conservatories, and in the open far south.

Leaves entire, whorled: fls. terminal, large and funnel-shaped, with a flat spreading or reflexed limb, the tube inflated below the throat in which there are 5 hairy scales; stamens 5, the filaments very short; ovary 1-loculed: the fr. (seldom seen in conservatories) a large spiny globular or oblong pod.—About a dozen species in Brazil and 1 in Cent. Amer.

With the exception of *A. violacea* and *A. neriifolia*, all the forms in cultivation are probably forms of one variable species. The original name for this is *A. cathartica*, and the plants known in the trade as *A. grandiflora*, *A. nobilis*, *A. Schottii*, *A. magnifica*, *A. Williamsii* are all referred to it as varieties. For garden purposes they are distinct, but botanically the differences are so slight as not to justify their being retained as species. *A. violacea* is readily distinguished by the color of the flowers, and *A. neriifolia* by the swollen base of the corolla.

The allamandas comprise several of the finest climbing plants in cultivation and are general favorites wherever grown. They are of very easy culture, thriving well under the ordinary conditions of a stove or warm greenhouse. A mixture of two parts of strong turfy loam and one part of sharp sand, leaf-mold and charcoal, suits them best. Cuttings root readily in a close case in sandy soil in a temperature of 70° F. at almost any time of the year, but spring is by far the best time, as the young plants have a long season of growth ahead of them and make better plants than those rooted later. Both old and new wood may be used for propagation; the young growth should be taken off with a heel if possible, whilst pieces of the previous season's wood, which has been well ripened, may be cut up into lengths with two or three joints, in spring; the stems which are removed during the annual pruning may be used for this purpose. All the species make most excellent pot-plants, but in order to obtain them at their best they should be planted out in a well-drained border. When well established, either in pots or borders, they should be fed liberally with natural or artificial manures, during the whole of the growing season, as all the species without exception, are gross feeders. After growth has ceased in late autumn or winter, the plants should be kept nearly, but not quite dry at the roots until February or March, when they should be cut back as far as is necessary, and started in a moist position in the greenhouse. Any repotting that they require should be done before the new growths are more than 6 inches long. The weaker kinds, as *A. violacea*, *A. cathartica* var. *grandiflora* and var. *Williamsii*, are best grafted on the strong-growing var. *Hendersonii*. Spring and summer.

*A. Plant* bushy, or little climbing: fl. swollen at base.

**neriifolia**, Hook. A dwarf bush or half climber: sts. terete, woody below, covered with down when young: lvs. petiolate, 2–5 in a whorl, elliptic or ovate-acuminate, rich dark green above, pale dull green below, midrib and principal veins softly pilose; petiole very short: infl. short, 1–3 in. long; fls. yellow on short pale green terete stalks up to  $\frac{1}{2}$  in. long; bracts  $\frac{1}{2}$  in. long,

green; calyx spreading, lobes unequal, light green, elliptic-ovate,  $\frac{1}{2}$  in. long; corolla rich golden yellow, striped inside the tube with reddish brown; tube 2 in. long, spreading upward with a swollen bulbous greenish base; limb  $1\frac{1}{2}$  in. diam., lobes orbicular or oval, obtuse  $\frac{1}{2}$  in. long. Brazil. B.M. 4594.

AA. Plant mostly tall climbing, in greenhouses usually trained on rafters: fl. not prominently enlarged at base.

B. Fls. purple.

**violacea**, Gardn. (A. *Blanchetii*, A. DC.). A slender-growing climber: sts. long, slender, terete, green tinted with red on side exposed to the sun, hairy: lvs. usually in 4's, almost sessile, elliptic, 4-6 in. long, dull green and covered with hispid hairs: infl. up to 1 ft. long, loosely fld.; bracts small,  $\frac{1}{4}$  in., lanceolate, pale green; fls. in pairs, terminating each branch of the cyme; pedicel  $\frac{1}{2}$  in. long, hairy; calyx  $\frac{2}{3}$  in. diam., campanulate, lobes  $\frac{1}{2}$  in. long, elliptic-ovate, inner pair smaller than the rest, and lanceolate; corolla bright reddish purple, tube 2 in. long, narrow and constricted in the middle, upper part purple-red, middle part greenish yellow, and lower part reddish brown, limb spreading 2-2 $\frac{1}{2}$  in. diam., lobes orbicular, throat rich dark reddish purple shading to yellowish white at the base. Brazil. B.M. 7122.—A fine handsome species, quite distinct from all other species and varieties in the color of its fls. It is a poor grower on its own roots, but thrives well when grafted on *A. cathartica* var. *Hendersonii* or var. *Schottii*.

BB. Fls. yellow.

**cathartica**, Linn. Lvs. and calyx glabrous: plant tall-climbing: lvs. rather small, obovate, usually in 4's, and more or less wavy-margined, thin, acuminate: fls. golden yellow, white-marked in the throat, the lobes acuminate on one angle, 3 in. or less across, the tube gibbous or curved. S. Amer. B.M. 338. P.M. 8:77.—The type first described, but now rarely seen in cult.

Var. **nobilis** (A. *nobilis*, T. Moore). A strong, tall climber, with purple twigs: lvs. and calyx more or less hairy: lvs. in 3's or 4's, large, acuminate, very short-stalked: fls. very large (4-5 in. across), nearly circular in outline of limb, bright, clear yellow, with magnolia-like odor. Finest fls. in the genus. Brazil. B.M. 5764.

Var. **Schöttii**, (A. *Schöttii*, Pohl). Strong-growing, suitable for rafters: young shoots and petioles slightly pubescent, the older sts. warty: lvs. in 3's or 4's, broadly lanceolate and acuminate: corolla large, rich yellow, the throat darker and beautifully striped. Brazil. B.M. 4351. *A. magnifica*, Hort., is a form of this.

Var. **Hendersonii** (A. *Wardleyana*, Lebas. A. *Hendersonii*, Bull). Fig. 155. Tall and vigorous, free-flowering, excellent for roofs: glabrous: lvs. large, elliptic-ovate, thick and leathery, in 3's or 4's: fls. large, yellow-orange, with 5 light spots in the throat, the corolla of thick substance, purplish on the exterior when in bud. Gn. 29:400. I.H. 12:452.—The commonest allamanda in this country. Intro. from Guiana by Henderson & Co., St. John's Wood, England, and distributed by Bull about 1865.

Var. **grandiflora** (A. *grandiflora*, Hook.). St. thin and wiry: lvs. thin, ovate-lanceolate, pointed, usually in 3's: fls. somewhat smaller than those of var. *A. Hendersonii* but larger than *A. cathartica*, lemon- or primrose-yellow. Brazil. Gn. 39:192. P.M. 12:79.—Thrives well when grafted on forms of *A. cathartica*. Plant rather bushy.

Var. **Williamsii**, Hort. Habit slender, easily trained into bush form or a dwarf climber: sts. terete, slender, wiry, dull green, bright red on side exposed to the sun, covered with short hairs: lvs. elliptic shortly petiolate, usually in 3's or rarely in 4's, rich dark green above, pale dull green below, hairy on both sides, especially along the midrib on the lower side; petiole  $\frac{1}{2}$  in. long, hairy: infl. rather short; fls. in pairs at each joint of the cyme; bracts much reduced, barely  $\frac{1}{10}$  in. long, acute;

calyx erect, not spreading, sepals unequal, lanceolate, or elliptic,  $\frac{1}{2}$  in. long, green; corolla yellow, tube only slightly curved 2 $\frac{1}{2}$  in. long, narrow and stalk-like in lower half, then broadening out and becoming campanulate in upper half, upper side of the pouch suffused with reddish brown, limb spreading, 2 in. diam., lobes ovate, obtuse,  $\frac{3}{4}$  in. long, throat deeper shade of yellow and stained with reddish brown. Garden origin. Gn. 40:468.

L. H. B.

C. P. RAFFILL.

ALLEGHENY VINE: *Adlumia*.

ALL-HEAL: *Brunella vulgaris*.

ALLIGATOR PEAR, AGUACATE: *Avocado*, *Persea*.

**ALLIUM** (ancient Latin name of garlic). *Liliaceæ*. Bulbous plants, mostly cultivated in the open, but a few of them grown under glass as florist's flowers; and comprising also the onions and their allies.

Leaves flat, channelled, or terete and hollow: fls. in a simple umbel, from a 1-2-lvd. usually scarious spathe; stamens and perianth segms. 6, the perianth parts distinct or nearly so, 1-nerved, and often becoming dry and persistent; style slender, the stigma either entire or parted.—Strong-scented plants, with fls. white, yellow, or in shades of purple and rose. There are 250-300 species in temperate parts of the northern hemisphere. Numbers of species, particularly the Asian, are frequently seen in botanic gardens and choice collections, but only *A. Moly* and *A. neapolitanum* are common in this country among the ornamental species, and no attempt is made to describe all the species here that are mentioned in garden literature. For the vegetable garden members of the genus, see *Chives*, *Garlic*, *Leek*, *Onion*, *Shallot*. In parts of the northeastern states *Allium vineale* is a bad weed; it has a slender scape sheathed below with hollow thread-shaped lvs., and greenish rose-colored fls. (or bulblets in the place of fls.).

No special treatment is required by the alliums. Most of the cult. forms are hardy spring bloomers, and may be treated the same as other hardy border bulbs. Propagation is by offsets and by the bulblets in the umbel; also readily by seeds.

156. *Allium fistulosum*. (Plant  $\times \frac{1}{6}$ )

A. Group I, comprising the vegetable-garden species.

B. Lvs. terete and hollow.

c. Plant caespitose (in tufts or clumps) and perennial.

1. *Schœnôprasum*, Linn. CHIVES or CIVES. Lvs. 4-6 in., very many, slender and awl-shaped: scapes equaling the lvs.; fls. light purple, small and many in a globular head. Eu.

—The lvs. are used for seasoning, growing readily as the herbage is cut. Var. *sibiricum*, Hartm., is a large form in northern N. Amer.

cc. Plants not in mats, treated practically as annuals (except perhaps No. 6).

2. *Cêpa*, Linn. COMMON ONION. Tall, with large tubular lvs.: scape glaucous, much overtopping the lvs., swollen near middle; fls. white or bluish in a large globular head-like umbel: bulb not making many off-sets, distinctly rounded at top and bottom. Var. *bulbellifera*, Bailey, has bulbels in the

157. *Allium Moly*. (Plant  $\times \frac{1}{4}$ )

place of fls.—the top, tree or Egyptian onion. Var. *multiplicans*, Bailey, has dividing bulbs,—the multiplier onion. Persia and adjacent regions.

3. *fistulôsum*, Linn. WELSH ONION. Fig. 156. Differs in having no distinct bulb, but only an enlarged base or crown: lvs. usually more clustered. Siberia. B.M. 1230.

4. *ascalonicum*, Linn. SHALLOT. Smaller, 1 ft.: lvs. many, awl-shaped: fls. lilac: bulbs long and pointed, each one soon separating into many cloves or parts adhering to a common disk. Syria.

BB. Lvs. not hollow, more or less plane.

5. *sativum*, Linn. GARLIC. Plant 12 in. or less: lvs. very narrow, keeled: fls. purple, often replaced by bulbels: bulbs small, breaking up into many small ones that are more or less covered with the dry scales. Eu.

6. *Pôrrum*, Linn. LEEK. Stout plant, 2 ft. or more: lvs. very broad and strongly conduplicate or keeled: scape arising the second season; fls. white or blush: bulb simple and scarcely more than an enlargement of the stalk. Eu.

AA. Group II. The garden alliums, mostly exotic.

B. Fls. yellow.

7. *Môly*, Linn. Fig. 157. Lvs. flat, broad: fls. numerous, in a dense umbel, in early spring. S. Eu. B.M. 499.—Well known, and a favorite for massing; common in rock-gardens. Hardy in the N.

BB. Fls. white or whitish.

c. Lvs. very broad, obtuse.

8. *victoriâlis*, Linn. Tall: lvs. ovate or broad-oblong, short: fls. greenish white, in large heads. Spring. Siberia. B.M. 1222.—Hardy.

cc. Lvs. narrow, acute or tapering.

9. *neapolitanum*, Cyr. Fig. 158. Lvs. long and rather narrow, loose-spreading, shorter than

the scape: fls. large, pure white, with colored stamens on long pedicels. Eu.—Needs protection if grown outdoors. Much used for cut-flowers in winter and spring. The most popular species. A. *Hermétii grandiflorum*, recently intro. from Holland, is a clear white odorous variety, well adapted for forcing.

BBB. Fls. pink, rose, or lilac.

c. Segms. with recurved tips.

10. *acuminâtum*, Hook. Scape 4-10 in.: lvs. 2-4, not longer than the scape, very narrow: umbel many-flid., perianth segms. a third longer than the stamens, the inner ones serrulate. W. Amer.

cc. Segms. not recurved.

11. *rôseum*, Linn. Scape 12-18 in.: lvs. narrow, with inrolled tips: fls. few (10-12), on long pedicels in an open umbel. S. Eu. B.M. 978.

12. *senescens*, Linn. Scape 1-2 ft.: lvs. narrow, erect, often twisted: fls. rather small, numerous, in a rather dense head. Eu. B.M. 1150.

13. *Éllisii*, Hook. f. Lvs. 4-5, 1 ft.,  $2\frac{1}{2}$  in. wide, glaucous green: scape 1 ft., very stout, being  $\frac{2}{3}$  in. diam.; fls. rose with white toward the base, wide-spreading,  $1\frac{1}{2}$  in. or more long and stiff and erect in fr. Persia. B.M. 7875.

14. *albopilôsum*, C. H. Wright. Very robust: lvs. strap-shaped,  $1\frac{3}{4}$  in. wide, 18 in. or less long: scape 1 ft. as many as 80-flid.; fls. deep lilac with metallic sheen, the segms. nearly 1 in. long, rigid after flowering. Persia. etc. B.M. 7982. G.C. III. 34:40.—Probably the largest-flid., and most imposing garden species.

AAA. Group III. Native alliums, sometimes advertised.

The species in Group II, comprise those that are likely to be in general cultivation. Aside from these there are various native species, mostly from western America, which are offered by dealers in American plants. These are recorded below.

B. Bulbs clustered, narrowly oblong: scape terete.

c. Lvs. elliptic-lanceolate, 2 or 3.

15. *tricôccum*, Ait. COMMON WILD LEEK. Fig. 159. Fls. greenish white on scape 4-12 in. high in early spring. Grows in clumps. New Eng. to Wis. and N. C.

cc. Lvs. linear, flat or channelled.

16. *cérnum*, Roth. Fls. rose-colored or white, in open, nodding umbels. Alleghanies and W.

17. *validum*, Wats. Fls. rose-colored or nearly white, in dense erectish umbels: scape 1-2½ ft., very stout. Nev., Calif., Ore.

18. *hæmatochiton*, Wats. Fls. deep rose, in a small, erect umbel: bulb-coats deep red: scape 1 ft. or less high. Calif.

BB. Bulbs usually solitary, globose to ovate: scape terete or nearly so.

c. Coats of bulbs fibrous.

19. *reticulâtum*, Fraser. Scape 3-8 in.; fls. white to rose, with thin segms. W. Amer. B.M. 1840, as *A. stellatum*.

20. *Geyeri*, Wats. A foot high, stouter: fls. rose, with broad acute strongly nerved segms. W. Amer.

158. *Allium neapolitanum*. ( $\times \frac{1}{4}$ )

CC. Coats of bulb not fibrous.

D. Lvs. 2 or several.

E. Ovary with only 3 crests, or none at all.

21. *scapòsum*, Benth. Fls. white, red-veined, in a loose, few-flid. umbel: bulbs dark: scape 1 ft. or more. W. Amer.

22. *mádidum*, Wats. Fls. white or nearly so, in a many-flid. umbel: bulbs white: scape less than 1 ft., angled. Ore.

23. *Cùsickii*, Wats. Fls. rather numerous, nearly white: lvs.  $\frac{1}{4}$  in. wide: scape 3-4 in. Ore.

24. *Bolánderi*, Wats. Fls. rose, few, the segms. serrulate: scape 4-10 in. Calif.

25. *unifòlium*, Kellogg. Lvs. several, narrow and flat: scape stout, 1-2 ft.; fls. rose, 10-30, the segms. ovate-lanceolate, exceeding stamens and style. Calif.

EE. Ovary distinctly 6-crested: fls. usually rose-colored.

F. Scape usually more than 6 in. high (in the wild).

26. *stellàtum*, Fraser. Bulb-coats reddish: scape 6-18 in.; pedicels  $\frac{1}{2}$ - $\frac{3}{4}$  in. long; stamens and styles exserted. W. Amer. B.M. 1576.

27. *Sánbornii*, Wood. Bulb-scales white: scape 12-24 in.; pedicels shorter; umbel densely many-flid.; stamens and styles exserted. Calif.

28. *attenuifòlium*, Kellogg. Lvs. channelled: scape slender, 6-15 in., leafy below; umbel dense; fls. nearly white. W. Amer.

FF. Scape usually less than 6 in. high (in the wild).

29. *serràtum*, Wats. Lvs. very narrow: filaments broadened at the base. W. Amer.

30. *Bidwelliæ*, Wats. Scape 2-3 in.; umbel few-flid., the pedicels  $\frac{1}{2}$  in. long; filaments filiform. Calif.

159. *Allium tricoccum*. ( $\times \frac{1}{2}$ )

DD. Lf. solitary, linear or filiform: scape 2-5 in. high: caps. 6-crested.

31. *fimbriàtum*, Wats. Lf. filiform and revolute: scape 3 in.; fls. deep rose, stigma 3-cleft. S. Calif.

BBB. Bulbs mostly solitary: scape stout, 2-winged: lvs. 2, broad.

C. Stamens not exserted.

32. *falcifòlium*, Hook. & Arn. Fls. rose, the segms. minutely glandular-serrate and twice longer than stamens: scape 2-3 in. W. Amer.

33. *ánceps*, Kellogg. Fls. white, with purplish veins, the segms. little longer than stamens. Calif., Ore.

CC. Stamens exserted.

34. *platycàule*, Wats. Fls. rose, the segms. long-acuminate: scape 3-5 in. Calif. B.M. 6227 (as *A. anceps*)

L. H. B.

**ALLOPLECTUS** (*diversely plaited*; referring to appearance of the calyx). *Gesneràcæ*. Tender tropical evergreen shrubby plants, with tubular

yellowish axillary fls. and opposite lvs.; one of each lf. in the pair smaller than the other, their under surfaces usually reddish or purplish. To be grown in the warm-house with similar treatment as that for *Gesnera*.

*rèpens*, Hook. Trailing by means of roots thrown out between the pairs of lvs.: lvs. ovate, coarsely serrate, hairy or smooth: calyx pale green, blotched with purple; corolla yellow, tinged red, gaping; tube swollen at the base; limb of 4 spreading segms., the uppermost being twice cut. E. Indies. B.M. 4250.

*sparsiflorus*, Mart. Erect: lvs. ovate-oblong, acute entire; petiole and nerves beneath often red: calyx of 5 cordate or triangular dark blood or purple sepals, forming a striking contrast to the yellow club-shaped densely hairy corolla; limb of corolla of 5 equal segms. Brazil. B.M. 4216, erroneously as *A. dichrous*.

*Schlímii*, Planch. & Lind. Fig. 160. Lvs. acuminate, rounded or subcordate at base, oblong, green above, violet or purple-violet beneath: fls. axillary, in pairs or sometimes more numerous, the calyx spotted with green; corolla yellow-scarlet below, shading upward into a delicate violet above. Trop. S. Amer. F.S. 8:827.

A. *Forgétii*, Hort. Corolla pale yellow, spurred on the back. Peru.

N. TAYLOR.†

**ALLSPICE.** The dry berry of the Pimento (*Piménta officinális*, Lindl.), an evergreen tree of the *Myrtàcæ*. The tree grows in the West Indies. Jamaica yields much of the product. The fresh berry is about the size of a pea. It is borne in clusters. The word allspice is also applied to various plants with aromatic fragrance, as *Calycanthus*. See *Pimenta*.

**ALMOND.** A name given to the tree and fruit of *Prúnus communis*, Fritsch. (*Amýgdalus communis*, Linn.), of the *Rosàcæ*. It is also applied to certain dwarf ornamental trees or bushes, as flowering almond (see *Prunus*).

The almond has been cultivated from time immemorial. It is thought to be native to the Mediterranean basin. Some inquirers have supposed it to be the original of the peach, but this idea is evidently untenable. The flowers are peach-like and handsome (Fig. 161). The almond rut of commerce is the pit or stone of a peach-like fruit (Fig. 162). The fleshy part, which is so thick and edible in the peach, is thin and hard, and it splits at maturity. There are two general tribes or races of almonds,—the bitter and the sweet. The former has a bitter kernel, which is used in the manufacture of flavoring extracts and prussic acid. It is grown mostly in Mediterranean countries. Of the

160. *Alloplectus Schlimii*. ( $\times \frac{1}{2}$ )

sweet or edible almonds, there are two classes,—the hard-shell and the soft-shell. The former is of little value, and is not grown to any extent. The soft-shell type produces the edible almonds of commerce. Some of the thinnest-shelled forms are known as Paper-shells.

161. Flower of common almond.

It was once thought that almond-growing could be successfully practised in the peach-growing sections of the East, but late spring frosts, and other difficulties, have caused the effort to be abandoned commercially. Individual almond trees are occasionally seen, and they frequently bear profusely. They are nearly as hardy as the peach. The commercial cultivation of the almond on this continent is confined to western America, and the remainder of this account is therefore written from the Californian standpoint.

L. H. B.

Almond-growing in California has received the attention of horticulturists for half a century, and during the whole of its course the industry has been marked by vicissitudes which, it must be admitted, are not yet ended. Two chief sources of difficulty are now clearly discerned to have attended the effort from its beginning, and present knowledge may enable planters to avoid, in the future, errors that have led to much disappointment and loss—the vestiges of which still encumber the ground, though clearing is proceeding rapidly. Thus far the almond tree has yielded more firewood than any other single fruit tree which has been largely planted in California, and yet planting has continued, planting and uprooting keeping pace, so that about 1,500,000 trees are annually reported by the county assessors, of which number about two-thirds may be counted of bearing age. The California almond product for a series of years is estimated as follows:

1905.....	2,125 tons	1909.....	1,650 tons
1906.....	900 "	1910.....	2,750 "
1907.....	750 "	1911.....	1,700 "
1908.....	3,000 "	1912.....	3,000 "

Irregularity in production is mainly due to the occurrence or absence of spring frosts. In spite of these facts, the almond will remain an important California product, through the satisfactory performance of trees enjoying favorable environment, which is being generally accepted as a safe guide for current planting.

The two chief sources of failure with the almond are the sterility of many varieties without cross-pollination, and the extreme propensity of the tree for early blooming, with the consequent destruction of the bloom or the young fruit by temperature very little below the freezing point. These two evils have been singularly associated historically, and only lately have they been shown to be independent factors and both of them demanding the closest attention from planters. At first it was thought that the wide planting of self-sterile varieties by themselves was the cause of disappointment, because, after years of chopping-out or grafting-over old unproductive trees to the Prune d'Agen, for which it is an excellent stock, it was observed, by chance, that the Languedoc variety adjacent to Drake's seedling, of local origin, was heavily laden with nuts when it was sterile without such association. Attention was then directed to the growth of seedlings, and a large lot of seedlings of the bitter almond, grown by A. T. Hatch, exhibited such satisfactory bearing habit and such striking variation toward new types of the soft-shell sweet almond that the growth of new selected California seedlings was seized upon as a panacea for the previously ex-

perienced troubles with the almond. These new varieties were conceived to be not only self-fertile but hardy, and large plantations were made without due regard to the frosty character of the locations. Low valley lands of great area, and some extent of high plateaux, were planted. Fine, large trees grew only to lose their crops year after year by frosts from February to April, until the growers cast the trees upon the wood-pile. As a deduction of the experience of several decades, we have arrived at what seems now to be the proper conception of the situation of the almond in California, which is, that the most prolific varieties must be chosen, must be associated for purposes of cross-pollination, and must be planted in places of least liability to frost. There is a factor of some moment in the late-blooming habit of some varieties, which will be considered presently.

The soil best suited to the almond is a light, well-drained loam. The tree makes a strong and rapid root-growth, and is more tolerant of drought than any other of our leading deciduous fruit trees. For this reason, as well as to avoid frost, it is often desirable to place the almond on the higher and drier lands of the valley—providing the soil is not heavy and too retentive of surplus water in the rainy season. The root is most intolerant of standing water, and will quickly die if exposed to it. Because of its thrift in light, dry soils, the almond root is used rather largely as a stock for the Prune d'Agen, and to some extent for the peach in the dry valleys.

Almond trees are grown by budding into seedlings grown from either the sweet or the bitter hard-shell almonds, the bud being set during the first summer's growth of the seedling, and then either planted out as a dormant bud the following winter or allowed to make one season's growth on the bud in the nursery. The tree grows so rapidly, both in root and top, that only yearling trees are used.

At transplanting, the young trees are cut back so as to form a low head with only about a foot of clear trunk. They are allowed to make free growth during the following summer, and in the following winter are cut back so as to encourage branching on the main limbs within a foot of their attachment to the trunk. At the same time, the branches are reduced to four or five in number, symmetrically arranged around the stem and at good distance from each other, so that they shall not unduly crowd each other as they enlarge. Another full growth during the following summer and another cutting back the following winter give the trees the vase-form on the outside, with enough interior branches to fill the

162. Almond nuts. ( $\times \frac{1}{2}$ )

inside of the tree without crowding. Thus the tree is systematically pruned after each of its first two years' growth in the orchard. After that, shortening-in of the branches usually ceases, and the third summer's growth is allowed to stand for fruit-bearing, with only thinning-out of growth to prevent crowding. This thinning-out has to be done from time to time in later years, otherwise the tree becomes too thick, and interior branches dwindle for lack of light. The amount of thinning varies in the different climates of the state: the greater the heat, the denser the tree for its own protection. With the proper adjustment of heat and light, fresh bearing wood may be encouraged in the lower part of

the tree, otherwise it becomes umbrella-shaped, with the fruit wood at the top and bare poles below.

The almond is the earliest bloomer of our common fruits. It puts forth flowers sometimes as early as January, but the usual date is about February 10 for the earliest bloomers in the warmer parts of the state, with the later bloomers at intervals thereafter until April 1. Records of full bloom of a number of varieties widely grown in California, which have been kept at the University of California substation, situated in the Sierra foot-hill region, show the following succession: Commercial, February 27; Sultana and Paper-shell, March 10; King and Marie Duprey, March 11; IXL, March 12; Languedoc, March 19; Nonpareil, March 20; Routier Twin, March 24; Pistache, March 25; Drake and Texas, April 2. Obviously the late bloomers have greater chance of escaping frost, and there is at present some disposition to make this a consideration in selecting varieties for planting. The dates just given show an extreme variation in time of blooming. Some years the intervals are much shorter, but the relation seems to be constant. The crop ripens from August 15 to October 1, according to locality. Early maturity does not follow early blooming—that is, as with other fruits, the first to bloom are not necessarily the first to ripen.

Not less than twenty-five varieties of almonds have been grown to a greater or less extent in California. Varieties of foreign origin have almost wholly given place to selected seedlings of local origin, and of these a very few constitute the main crop at present. These are named in the order of their acreage, as follows: Nonpareil, Ne Plus Ultra, IXL, Drake, Texas Prolific, Languedoc. Of these, the first three occupy not less than three-fourths of the acreage.

In handling the crop, the local climate modifies methods somewhat, and the growth-habit is also involved. In regions very free from atmospheric humidity in the summer, the hull opens readily and discloses a clean, bright nut, which can be marketed without treatment. Where this is not the case, and the nut is more or less discolored, bleaching in the fumes of sulfur has to be practised. The nut must be dry before sulfuring, or the fumes will penetrate and injure the flavor of the kernel. Sulfured nuts also lose largely in power of germination. The practice is to gather the nuts, dry for a few days in the sun, then spray with water very lightly or with a jet of steam, so that only the surface of the shell is moistened, and then sulfur, and a light color can be secured without penetration of the fumes. The nuts can usually be gathered from the ground as they naturally fall, or can be brought down by shaking or the use of light poles. Some varieties are more easily harvested than others, and the same variety falls more readily in some localities than in others. A greater or less percentage, according also to variety and locality, will have adhering hulls, and for clearing them, locally-invented machines, called almond-hullers, are used. Early rains in some localities are apt to stain the nuts. Such stains cannot be removed by sulfuring, and the nuts have to be crushed and the product marketed as kernels for the use of confectioners. Machinery is also used for this operation, and a considerable fraction of

the product reaches the market in this form because of the demand for candied and salted almonds.

The standard of excellence in the almond, from a commercial point of view, as learned by the experience of California producers, is that the kernel must be as smooth, symmetrical and plump as possible. The twinning of kernels, welcome as it may be to searchers for philopenas, results in misshapen kernels, which are very objectionable to the confectioners, who are very large users of almonds. Constancy to single kernels is therefore a good point in a variety.

Large proportion of kernel to shell by weight is also, obviously, an important point to almond-buyers. At the same time, the shell may be so reduced in strength as to break badly in shipping in sacks and in subsequent handling. Incomplete covering also exposes the kernel to the sulfur and to loss of flavor. The ideal is such degree of thinness of shell as can be had with complete covering of the kernel and durability in handling.

Careful comparison of the proportion of kernel weight to gross weight of the popular California varieties, as compared with a leading imported variety, was made by a committee of the California Horticultural Society, with the following result: From one pound of each of the following varieties the net weight of kernels in ounces was: Imported Tarragona, 6 $\frac{2}{3}$ ; California Languedoc, 7 $\frac{1}{2}$ ; El Supremo, 7 $\frac{1}{2}$ ; Drake, 8 $\frac{3}{4}$ ; IXL, 9; Commercial, 9 $\frac{1}{4}$ ; La Prima, 9 $\frac{1}{2}$ ; Princess, 9 $\frac{1}{2}$ ; Ne Plus Ultra, 10; King, 10; Paper-shell, 11; Nonpareil, 11 to 13.

EDWARD J. WICKSON.

163. Bearing habit of the almond.

ALMOND, DEMERARA: *Terminalia Catappa*.

ALMOND, FLOWERING: *Prunus*.

ÁLNUUS (the ancient Latin name). *Betulaceæ*. ALDER. Ornamental woody plants grown chiefly for their foliage; some species are valuable as timber trees.

Trees or shrubs: lvs. alternate, deciduous, short-petioled, usually serrate or dentate: fls. monœcious, apetalous, in catkins; staminate ones elongated, each bract with 3 fls.; stamens 4 in each fl., with short filaments not divided at the apex; pistillate catkins short, each bract with 2 fls.; styles 2; the pistillate catkins developing into a ligneous, generally ovoid cone with persistent, 5-lobed scales: fr. a small nutlet.—About 30 species in the northern hemisphere, in Amer. south to Peru. Monograph by Winkler in Engler's *Pflanzenreich*: *Betulaceæ* 101 (1904).

The alders are deciduous trees or shrubs with medium-sized leaves and pendulous staminate catkins in spring before the leaves; the short pistillate catkins developing into woody cones about  $\frac{1}{2}$  to 1 inch long and usually arranged in small racemes. The profuse male catkins are pleasing in early spring. The wood is valuable for its durability in water; of the native species, *A. rubra* is the most important timber-tree; in the Old World, *A. glutinosa* and *A. japonica*. Most species are suitable for planting on damp soil, where they grow rapidly, but *A. cordata* prefers a drier situation; also *A. japonica*, *A. incana* and *A. tinctoria* grow well in drier situations.

Usually propagation is by seeds gathered in the fall and well dried; sown in spring with but slight covering, and kept moist and shady, they germinate soon; a slight covering with moss, taken off when the seedlings appear, will be useful. At the end of the same year or the following spring, the seedlings are transplanted, usually into rows 1 to 2 feet apart and 6 inches from each other. After two years, they may be planted where they are to stand. The shrubby species, also *A. glutinosa*, grow from hardwood cuttings placed in moist and sandy soil, also from layers, and *A. incana* from suckers. Rarer kinds are grafted on common potted stock in early spring in the propagating-house; grafting out-of-doors is rarely successful.

A. Pistillate catkins terminal, inclosed during the winter in the bud, opening in spring: fr. with broad membranous wing: winter-buds sessile with 2 or more unequal scales. (*Alnobetula*.)

B. Lvs. ovate or elliptic, with 5-10 pairs of veins.

1. *viridis*, DC. (*A. Alnobetula*, Hartig. *A. undulata*, Willd.). EUROPEAN GREEN ALDER. Shrub, 2-6 ft.: lvs. elliptic or ovate, to round-ovate, acute, usually narrowed at the base, sharply serrulate, 1-2½ in. long, glutinous while young, bright green above, pale green and glabrous beneath or pubescent on the veins: staminate catkins 2-3½ in. long; pistillate catkins with glabrous or ruberulous peduncles: cones 3-4, oblong,

slender-peduncled. March, April. Mts. of Eu. L.B.C. 12:1141. H.W. 2:14.

2. *Mitchelliana*, Curt. (*A. viridis* of most American authors). AMERICAN GREEN ALDER. Shrub, 2-10 ft.: young branchlets glabrous or sparingly pubescent: lvs. elliptic or ovate-elliptic, acute or obtuse, rounded or subcordate at the base, 1½-3 in. long, densely serrulate, glutinous while young, with impressed veins above, reticulate beneath and glabrous: staminate catkins 2-3 in. long; pistillate catkins with pubescent peduncles: cones 3-6, oblong, slender-peduncled. March, Apr. Mts. of N. E. Amer., west to Brit. Col., south to N. C. —Hardy shrub with handsome bright green foliage, very aromatic when unfolding and of very pleasant effect in spring with its long male catkins; handsomer than the preceding species.

BB. Lvs. ovate-oblong to ovate-lanceolate, with 12-24 pairs of veins.

3. *yasha*, Matsum. (*A. firma* var. *yasha*, Winkl.). Tree, to 30 ft.: young branchlets pubescent: lvs. ovate-oblong, 2-4 in. long, acute, usually rounded at the base, sharply and irregularly serrate, with 12-18 pairs of veins, pubescent on the veins beneath: cones 1-3, ellipsoid or sub-globose, ¾ in. long, on slender peduncles about 1 in. long. Japan. J.C.T. 16:2.

4. *pendula*, Matsum. (*A. firma* var. *multinervis*, Regel). Tree, to 30 ft., or shrub: young branchlets pubescent: lvs. oblong-lanceolate, acute or acuminate, 2-4 in. long, irregularly and often nearly doubly serrate, with 18-24 pairs of veins, pubescent on the veins beneath, at maturity nearly glabrous: cones 3-5, ovoid, about ½ in. long, in pendulous racemes, 1-2 in. long. Japan. S.I.F. 2:12. J.C.T. 16:3. —Very handsome alder, still rare in cult.; the plant cult. under this name is usually the preceding species.

AA. Pistillate catkins axillary, appearing in autumn: winter-buds with 2 equal scales, stalked. (*Gymnothyrsus*.)

B. Fls. opening in the fall from catkins of the same year: lvs. not plicately folded in the bud.

5. *maritima*, Nutt. (*A. oblongata*, Regel, not Ait. nor Willd.). Tree, to 30 ft.: lvs. cuneate, oblong or obovate, shining above, pale green beneath, glabrous, remotely and crenately serrate, 2-4 in. long: cones 2-4, large, on short, stout peduncles. Del., Md. S.S. 9:458. G.F. 4:269. Nutt., N. Amer. S. 1:10. —Ornamental shrub or small tree with handsome shining foliage, attractive in autumn with its male catkins.

BB. Fls. opening in early spring before the lvs., from catkins formed the previous year and remaining naked during the winter.

C. Lvs. not plicate in the bud, green beneath, veins arching: cones 1-6, long-stalked.

6. *japonica*, Sieb. & Zucc. (*A. firma*, Hort., not Sieb. & Zucc.). Fig. 164. Tree, 50-80 ft.: lvs. cuneate, oblong-lanceolate, acuminate, sharply and irregularly serrulate, glabrous at length, bearded in the axils of the veins beneath, 2-6 in. long: cones 3-6, peduncled. Japan. G.F. 6:345 (adapted in Fig. 164). S.I.F. 1:19. —Tall, pyramidal tree with dark green foliage; the largest and perhaps the most beautiful of all alders.

7. *cordata*, Desf. (*A. cordifolia*, Ten. *A. tiliacea*, Hort.). Small tree, 20-50 ft.: lvs. cordate, ovate or roundish, acuminate, 2-4 in. long, bearded in the axils beneath, glandular when young: cones 1-3, ovoid, about 1 in. long, peduncled; nutlets with narrow wing. Italy, Caucasus. L.B.C. 13:1231. G.C. II. 19:285. —Round-headed tree with handsome, distinct foliage, changing orange-yellow in autumn, resembling that of a linden or pear, therefore sometimes called *A. tiliifolia* or *A. pyrifolia*, in gardens. Not quite hardy N.

cc. *Lvs. plicate in the bud, the veins going straight to the points of the larger teeth: cones 4-10, short-stalked or sessile.*

d. *Under side of lvs. glaucous, not bearded: cones sessile or short-stalked.*

8. *incana*, Willd. Shrub or tree, to 60 ft.: branches pubescent; lvs. oval or oblong-ovate, acute,  $1\frac{1}{4}$ -4 in. long, doubly serrate, pubescent or nearly glabrous beneath: cones 4-8, mostly sessile,  $\frac{1}{2}$  in. long. Northern hemisphere, in different varieties. H.W. 2:13.

Var. *glauca*, Ait. (*A. glauca*, Michx.). Shrub, to 12 ft.: lvs. often nearly glabrous beneath. N. Amer., Eu. Em. 251.

Var. *vulgaris*, Spach. Tree, to 50 ft.: lvs. usually densely pubescent beneath: cones 1 in. long. Eu., Asia.

Var. *pinnatifida*, Spach (var. *laciniata*, Hort.). Lvs. pinnately lobed or cleft, with dentate lobes.

9. *tinctoria*, Sarg. (*A. incana* var. *tinctoria*, Hort.). Fig. 165. Tree, to 60 ft.: young branchlets glabrous or slightly pubescent: lvs. broadly ovate, 4-6 in. long, membranaceous, coarsely doubly serrate, slightly lobed, glaucous and rufously pubescent on the veins beneath. Japan. G.F. 10:473 (adapted in Fig. 165). S.I.F. 1:19 (as var. *glauca*).—Handsome ornamental tree of very vigorous growth, with large foliage.

10. *rubra*, Bong. (*A. oregana*, Nutt.). Tree, 40-50 ft.: lvs. oblong-ovate, 3-5 in. long, crenate-serrate, slightly lobed, revolute on the margin, nearly glabrous beneath; petioles and veins orange-colored: cones 6-8, oblong. W. N. Amer. S.S. 9:454. Nutt., N. Amer. S. 1:9.

dd. *Under side of lvs. green or brownish green, usually bearded.*

#### E. Cones upper sessile.

11. *rugosa*, Spreng. SMOOTH ALDER. Shrub, to 25 ft.: young branchlets pubescent or nearly glabrous: lvs. ovate or broadly elliptic to obovate, acute or obtuse, 2-5 in. long, doubly serrate and often slightly lobed, beneath covered more or less with brownish pubescence or glabrous: cones 4-10, the upper sessile, the lower short-stalked, ovoid, about  $\frac{1}{2}$  in. long. E. N. Amer. Mx. 3:4. Var. *serrulata*, Winkl. (*A. serrulata*, Willd.). Branchlets glabrous or nearly so: lvs. usually obovate,

obtuse, finely and doubly serrulate, glabrous or nearly glabrous beneath. Em. 248.—By most European botanists this variety is considered a distinct species, but, though the extreme forms seem quite distinct, they are connected by all kinds of intermediate forms. In flower, *A. rugosa* is easily distinguished from *A. incana*

166. *Alnus glutinosa*. ( $\times \frac{1}{2}$ )

by the pistillate catkins which are upright in *A. rugosa*, nodding in *A. incana*.

#### EE. Cones all distinctly peduncled.

12. *glutinosa*, Gaertn. (*A. vulgaris*, Hill. *A. rotundifolia*, Mill. *A. communis*, Desf.). BLACK ALDER. Fig. 166. Tree, to 70 ft.: lvs. orbicular or obovate, rounded or emarginate at the apex, 2-5 in. long, irregularly obtusely serrate, with 5-7 pairs of veins, nearly glabrous beneath, glutinous when unfolding: cones distinctly peduncled. Eu., N. Afr., Asia, naturalized in some localities in N. Amer. H.W. 2:12. H.T. 130.—A vigorously growing tree with dark green, dull foliage, valuable for planting in damp situations. Commonly planted in many forms: Var. *abrea*, Versch. Lvs. yellow. I.H. 13:490. Var. *denticulata*, Ledeb. (*A. oblongata*, Willd.). Lvs. usually cuneate, serrulate. S. Eu. Var. *barbata*, Callier (*A. barbata*, C. A. Mey.). Lvs. ovate, acute, pubescent on the veins beneath. Caucasus. Var. *imperiælis*, Desf. Lvs. deeply pinnately lobed with lanceolate or nearly linear lobes. Var. *incisa*, Willd. (var. *oxyacanthifolia*, Spach). Lvs. small, deeply incised, like those of *Crataegus oxyacantha*. Var. *laciniata*, Willd. Lvs. pinnately lobed; lobes oblong. Var. *rubrinervia*, Dipp. Lvs. large and shining, with red nerves and petioles: pyramidal tree of vigorous growth, very handsome.

*A. acuminata*, HBK. Tree: lvs. usually ovate and pubescent beneath, doubly serrate. Cent. Amer., north to Ariz.—*A. cremastogyne*, Burkill. Tree: young branchlets glabrous; lvs. oblong-obovate, glabrous, sharply serrate, 3-4 in. long: cones cylindrical, solitary on slender peduncles, about  $1\frac{1}{2}$  in. long. W. China.—Recently intro., probably not hardy N.—*A. firma*, Sieb. & Zucc. (*A. Sieboldiana*, Mats.). Allied to *A. yasha*. Tree: lvs. ovate, or ovate-oblong, acute, rounded at the base, with 10-15 pairs of veins, 3-5 in. long: cones about 1 in. long, solitary on a peduncle  $\frac{1}{2}$ -1 in. long. Japan. S.I.F. 2:12.—*A. fruticosa*, Rupr. (*A. viridis* var. *sibirica*, Regel). Allied to *A. viridis*. Shrub: lvs. broadly ovate or elliptic-ovate, usually rounded at the base, nearly doubly or sinuately serrate. Siberia, Corea.—*A. hirsuta*, Turcz. (*A. incana* var. *hirsuta*, Spach). Allied to *A. tinctoria*. Tree: young branchlets, and petioles tomentose: lvs. suborbicular to elliptic, acutish, denticulate and slightly lobed, ferruginously tomentose beneath. Japan, Manchuria.—*A. jorullensis*, HBK. Allied to *A. acuminata*. Lvs. oblong-lanceolate, coarsely dentate. Cent. Amer.—*A. mollis*, Fernald. Closely allied to *A. crispa*. Shrub or small tree: branchlets pubescent: lvs. pubescent beneath, 2-4 in. long. N.E. Amer., west to Lake Winnipeg, south to Mass.—*A. nitida*, Endl. Tree, to 100 ft.: lvs. ovate to ovate-oblong, short-acuminate, not plicate, 3-4 in. long, entire or remotely serrulate, bright green and lustrous

165. *Alnus tinctoria*. ( $\times \frac{1}{2}$ )

above, glabrous; male catkins very slender, to 6 in. long; cones 2-4, peduncled. Himalayas. B.M. 7654.—*A. oblongifolia*, Torr. Tree, 20-30 ft.; lvs. oblong-ovate, cuneate, doubly serrate, 2-3 in. long; strobiles  $\frac{1}{2}$ -1 in. long, peduncled. N. Mex. and Ariz. S.S. 9:457.—*A. occidentalis*, Dipp.—*A. tenuifolia*—*A. orientalis*, Decne. (*A. barbata*, Hort., not C. A. Mey. *A. firma*, Hort., not Sieb. & Zucc. *A. macrophylla*, Hort.). Allied to *A. cordata*. Tree; lvs. ovate-oblong, obtusely or crenately serrate, 2-5 in. long, glabrous, with 8-10 pairs of veins; cones ovoid, glutinous,  $\frac{1}{2}$ -1 in. long; nutlets without wing. Asia Minor.—*A. pubescens*, Tsch. (*A. glutinosa* × *incana*). Lvs. roundish-ovate or obovate, irregularly serrate, pubescent beneath. Natural hybrid.—*A. rhombifolia*, Nutt. Tree, 60-80 ft.; lvs. cuneate, oval or ovate, 2-3½ in. long, finely serrate, yellowish green and puberulous beneath; strobiles oblong, peduncled. W.N. Amer. S.S. 9:456.—*A. Sieboldiana*, Mats.—*A. firma*—*A. sinuata*, Rydb. (*A. sitchensis*, Sarg.). Allied to *A. viridis*. Shrub, 3-16 ft.; lvs. slightly lobed, serrulate, glabrous, thin. W. N. Amer. S.S. 14:727.—*A. Späthii*, Callier (*A. japonica* × *subcordata*). Tree; lvs. ovate-lanceolate, sharply lobed, serrulate, purple when unfolding. Of garden origin. *A. subcordata*, C. A. Mey. Tree, 30-50 ft.; lvs. ovate or oblong-ovate, rounded at the base, 2-6 in. long, crenately or doubly serrate, glabrous or sometimes pubescent beneath; cones about 1 in. long; nutlets with a narrow wing. Caucasus.—*A. tenuifolia*, Nutt. (*A. incana* var. *virescens*, Wats. *A. occidentalis*, Dipp.). Small tree, occasionally 30 ft.; lvs. ovate, 2-4 in. long, slightly lobed and doubly serrate, green and nearly glabrous beneath. W. N. Amer. S. S. 9:455.

ALFRED REHDER.

**ALOCASIA** (name made from *Colocasia*). *Aracææ*. Warmhouse foliage plants, with green, veined and mottled, large hanging leaves.

Stem thick, short or assurgent, densely marked with lf.-scars: lvs. with long sheathed petioles, the blade, when young peltate, when old usually sagittate-cordate, the basal lobes commonly more or less united; spathe with the tube much shorter than the blade, ovoid or oblong, convolute, the blade oblong, usually boat-shaped; spadix shorter than spathe.—Stove foliage plants from E. Asia, comprising about 40 species, in addition to many hybrids. Related to Caladium and Colocasia, from which separated by technical

167. *Alocasia Sanderiana*.

fr. characters. See Monogr. by Engler in De Candolle's *Monographiæ Phanerogamarum*, Vol. II.

The species of *alocasia* grown in greenhouses have foliage of great beauty and coloring and rank high amongst ornamental foliage plants. The leaves are remarkable for their coloring, markings, size and shape, some of them being of a rich metallic coloring while others are green and green-and-white with prominent veining. *Alocasias* are propagated by suckers or cuttings of the rhizomes, placed in small pots containing a mixture of light fibrous peat and sand in equal proportions, and plunged in a close frame or propagating-box with bottom heat. They may also be grown from seeds sown in 4-inch pots, in a light peaty soil in a temperature of 75° F. The month of March is the best time for propagating and potting. The evergreen species (as *A. cuprea*, *A. longiloba*, *A. Lowii*, *A. Regina*) thrive best in a compost of two parts fibrous peat and sphagnum moss and one part lumps of fibrous loam, to which should be added a sprinkling of silver sand and a few nodules of charcoal to keep the whole sweet. The herbaceous species (as *A. macrorrhiza*) do best in good fibrous loam to which one-third of well-rotted cow-manure or pulverized sheep-manure has been added. Perfect drainage of the pots is absolutely necessary, and, in potting, the evergreen species should be coned up 2 or 3 inches above the rim of the pot, and finished off with a surfacing of live sphagnum moss. The season of active growth begins about the first of March, when plants should be given a temperature of 70° at night, with a rise of 15° by day, and the atmosphere must be

kept in a humid condition. They should be given a position free from drafts and direct sunlight. They require an abundance of water at the roots as the leaves develop, and are greatly benefited by an occasional watering of clear liquid sheep- or cow-manure. To secure the best development of the leaves, heavy syringing should be avoided, but frequent spraying on all fine days with an atomizer sprayer is very beneficial. Towards winter the humidity of the atmosphere and the supply of water to the roots should be reduced with the evergreen species, and gradually withheld altogether as the leaves mature, with the herbaceous species. The temperature during winter should not fall below 60°. (E. J. Canning.)

A. Lvs. distinctly notched or undulate on the margin.

1. *princeps*, Nichols. Lvs. sagittate, the basal lobes narrow and spreading, the margins deep-sinuate; upper surface olive-green, with darker veins, the under lighter colored, with brown veins and margin; petioles brown-spotted, slender. E. Indies.

2. *Sanderiana*, Bull. Fig. 167. Lvs. long-sagittate, with deeply notched margin, the basal lobes wide-spreading, deep glossy green with metallic reflection, with prominent white margins and veins; petioles brownish and striped. Philippines. Gng. 6:84. G.Z. 28, p. 267. J.H. III. 45:173.—One of the best of recent introductions. Runs into various forms, and has entered largely into cult. hybrids.

AA. Lvs. plain and entire on the margin.

B. Markings chiefly on the petioles, the blades green.

3. *zebrina*, Koch & Veitch. Lvs. triangular-sagittate, the margin somewhat repand, the front lobe oblong-triangular, cuspidate, the basal lobes obtuse; petioles beautifully marked with large zigzag bands of green. Philippines. F.S. 15:1541-2.

4. *Villeneuvei*, Lind. & Rod. Lvs. sagittate-ovate, the veins of lighter green and prominent, basal lobes very unequal; petioles spotted with chocolate-brown. Large. Borneo. I.H. 34:21.—Named for de Villeneuve, Brazilian ambassador to Belgium.

BB. Markings or coloration chiefly on the lf.-blades.

c. Veins and midrib light yellow.

5. *Lindenii*, Rod. Lvs. cordate-ovate, long-pointed, 8-12 in. long, bright green, with yellowish veins curving off from the midrib and vanishing near the margin; petioles nearly white. New Guinea. I.H. 33:603.—Bruised lvs. emit a strong odor.

cc. Veins and midrib white or silvery.

d. Midrib and primary nerves not bordered.

6. *longiloba*, Miq. (*A. gigantea*, Hort.). Petioles 2 ft., greenish white, mottled purple; blade sagittate, 18 in. long, the basal lobes very long and erect, the upper surface green, with silvery or gray bands along veins and midrib, the under surface light purple. Java.

7. *Löwii*, Hook. Petioles 2-3 ft., rose-color; blade narrow-ovate, 18 in. long and a third as wide, long-pointed, the basal lobes long-acute, upper surface olive-green, with very distinct silvery bands, under surface rich purple. Borneo. H.F. III. 9: pl. 6. F.S. 21:2204. B.M. 5376. A.F. 11:559 (as var. *grandis*).

DD. *Midrib and primary nerves bordered with pale or gray-green.*

8. *Putzëysii*, N. E. Br. Much like *A. longiloba*: lvs. broader (oval-sagittate), dark metallic green, prominently veined and bordered white, the petioles pale red-purple, under surface dark purple. Sumatra. I.H. 29:439. G.C. II. 19:501.—More brilliant than *A. longiloba*, and has wider spaces between the veins.

9. *Thibautiana*, Mast. Petioles 3 ft., greenish; blade 2 ft. long and 18–20 in. broad, ovate-cordate, the basal lobes broad and rounded, olive-green, with broad silvery

168. *Alocasia cuprea*. ( $\times \frac{1}{2}$ )

veins and rib, the under surface deep purple. Borneo. G.C. III. 17:485. I.H. 28:419. G.Z. 25, p. 265.

10. *Veitchii*, Schott. Resembles *A. Lowii*, Hook., in shape and ground-color, but the midrib and primary veins are bordered with gray-green, the secondary veins whitish and the petiole green-striped. Java. B.M. 5497 (as *A. Lowii* var. *picta*).

ccc. *Veins white and lf. blotched and mottled.*

11. *macrorhiza*, Schott. Large, reaching 10 or 15 ft.: lf.-blades 3 ft. long, long-sagittate and pointed, the lobes short and obtuse, margin often somewhat wavy, the midrib very broad and conspicuous, the blotches or patches of green and white (in the var. *variegata*, G.W. 15, p. 339, which is the common form) very striking. Ceylon. I.H. 8:305.—One of the commonest species. Lvs. sometimes almost white.

cccc. *Veins dark or purple, or the lf. dark-colored.*

12. *cuprea*, Koch (*A. metallica*, Schott). Fig. 168. Petioles 2 ft. or less long, green; blade ovate and peltate, 18 x 12 in., notched at the base and cuspidate at the point, dark metallic green with darker rib and veins, the under side rich purple. Borneo. B.M. 5190. I.H. 8:283. G. 19:413. F.S. 21:2208–9. Lowe, 60. Gn. 50:336.—One of the best, and common.

13. *Regina*, N. E. Br. Lvs. thick, ovate-cordate, obtuse or cuspidate, the basal lobes short and nearly or quite obtuse, the ribs and veins beneath pubescent, somewhat fleshy, dark green above with darker veins and brown-purple beneath; petioles terete, pubescent spotted purple. Borneo. I.H. 32:544.—Several cult. varieties and hybrids are in the trade in this country: *A. argyrea*, Sander, lvs. large, dark green with a silvery sheen, hastate-lanceolate (G.W. 15:342); hybrid of *longiloba* x *Pucciana*; *A. bataviensis*, petiole dark purple, lf.-blade dark green; *A. Chantrieri* (raised by Chantrier Bros., Mortefontaine, France), hybrid of *cuprea* x *Sanderiana*, with long wavy lvs., purple below and

prominently white-veined (I.H. 35:64. R.H. 1887, p. 465); *A. Chelssonii*, cuprea x *longiloba*, with lvs. purple below and green above; *A. gigas*, much like Villeneuvei; *A. intermedia*, hybrid by Veitch 25 years ago (G. 2:61. G.W. 15, p. 341. F. 1869, p. 80); *A. La Salliana*; *A. Luciana*, Thibautiana x *Putzeysi*, with lvs. dark green above and whitish veins and margins, purple beneath (I.H. 34:27); *A. mortefontaineensis*, Lowii x *Sanderiana*; *A. Pucciana*, *Putzeysi* x *Thibautiana*; *A. Sedenii*, cuprea x Lowii, with ovate-peltate lvs. purple beneath and white-veined above (I.H. 24:292); *A. Van Horstii*.

The following names are also in our trade: *A. illis-tris*=*Colocasia antiquorum*; *A. Jenningsii*=*Colocasia affinis*; *A. Johnstonii*=*Cyrtosperma Johnstonii*; *A. Marshallii*=*Colocasia Marchallii*; *A. violacea*=*Colocasia antiquorum*(?).

The following may be expected to appear in the American trade: *A. Augustiniana*, Lind. & Rod. Lvs. peltate and wavy, green above and below, with pale nerves, the petioles brown-spotted; allied to *A. zebrina*. I.H. 33:593. New Guinea(?).—*A. Curtisii*, N. E. Br. Petioles 3 ft. or less, purple-barred; lf.-blade 20 in. or less, and half as wide, shining green and gray-ribbed above, deep purple beneath. Penang.—*A. Desmetiana*, Hort. Lvs. elongated, heart-shaped and sinuate; petiole spotted.—*A. eminens*, N. E. Br. Lvs. peltate, the blade 2 ft. or less long and nearly half as broad, purple beneath, green and light-veined above; petioles 5 ft. or less, barred. E. Indies.—*A. grandis*, N. E. Br. Large: lvs. 2 ft. or less long, ovate-sagittate, half as broad, black-green below, bright green above; petioles 4 ft. or less, blackish. E. Indies.—*A. guttata*, N. E. Br., var. *imperiensis*, N. E. Br. Lvs. sagittate, acute, 1½ ft. or less long and half as broad, purple beneath, brown-green and dark-blotched above. Borneo. I.H. 31:541.—*A. indica*, Schott. 6 ft. or more, stout and fleshy: lvs. often 3 ft. across, ovate-cordate, bright green on both sides. E. Indies. F.S. 21:2206 (as *A. plumbea*).—*A. Margaritæ*, Lind. & Rod. Lvs. slightly peltate, wavy, shining, green with blackish midrib, the veins and brownish petioles pubescent. New Guinea. I.H. 33:611.—*A. marginata*. Said to have come from Brazil. Lvs. 2 ft. or less long and very broad, slightly wavy, rounded and short-pointed, pale green, striped and mottled with purple; petioles brown-marked.—*A. Micholitziana*, Hort. Lvs. arrow-shaped, velvety, the margins wavy, the midrib white. Malaysia. G.C. III. 51: Suppl. May 25, p. XVI.—*A. odora*, Koch. Forming a trunk: lvs. sagittate-ovate, the margin slightly undulate, up to 3 ft. long, on long petioles. J.H. III. 42:393.—*A. plumbæa*, Hort.—*A. grandis*(?).—*A. reversa*, N. E. Br. Dwarf and compact, the petioles 6 in. long, blade less than 1 ft. long, bright green, with rib and nerves olive-green. B.M. 7498. Philippines.—*A. Rodigasiana*, André. *A. Thibautiana* x *A. Regina*.—*A. Sanderiana* var. *gandavensis*, Rod. Lvs. wavy-margined, purple and blotched beneath. I.H. 43:65.—*A. scabriuscula*, N. E. Br. Lvs. spreading, not deflexed, sagittate and not peltate, shining green above and paler beneath. Borneo.—*A. sinuata*, N. E. Br. Lvs. sagittate and sinuate, dark green above with lighter areas, and whitish green below. Philippines.—*A. spectabilis*, Hort. G.22:171.—*A. Watsoniana*, Hort.—*A. Putzeysi*.—*A. Wavriniana*, Mast. Lvs. erect, toothed, not sagittate, lanceolate and long-pointed, dark green; petioles purple-spotted, winged. G.C. III. 23:243. F.E. 10:886. Gn. 55:183. Celebes.

L. H. B.

GEORGE V. NASH.†

ALÔE (Arabic name). *Liliaceæ*, tribe *Alotnææ*. Acaulescent or variously caulescent perennial succulents.

Leaves often large, usually crowded in rosettes or along end of st.: fls. red or yellow, often paler-striped, straight, tubular (Fig. 169), with short straight limb, equaled or surpassed by the stamens.—Afr., especially in the Cape region, 1 species about the Medit. and extensively naturalized in all warmer parts of the world, and 1 in China. Plants of the coolhouse, best planted out in a well-drained place in summer, when they flower prettily.

The generic or scientific name *Aloe* is a Latinized form of an Arabic name. As an English word it is pronounced in two syllables, thus Al-oe. Popularly this word is loosely used, the common American *aloe* being *Agave americana*, the commonest "century plant." The "bitter aloes" of commerce is a resinous juice much used as a laxative. The best quality is called "Socotrine or Zanzibar aloes," a product of *A. Perryi*, which was known by the Greeks of the fourth century B.C. to come from the island of Socotra. The "Barbadoes

169. Flowers of an *aloe*.

aloes" is the product of *A. vera*, a species much planted in the West Indies. Genera allied to Aloe are *Apicra*, *Gasteria*, *Haworthia*, *Pachidendron*, and *Phylloma*. The group is difficult for the botanist, there being few authentic specimens in the herbaria, because of the large size of the plants, the infrequent flowering, and the difficulty of suitably drying them. Monograph by Alwin Berger in *Das Pflanzenreich*, 1908, hft. 33.

Propagation is by seed, which usually is not true to name, and by suckers or cuttings well dried-off. Branching for this purpose may be induced by searing the crown of old plants. Hybrids between the different species and with related genera are easily secured and interesting.

Aloes are much cultivated as decorative plants, being amongst the most popular of desert and succulent plants for their stiff, harsh and rugged habit. Fig.

170. A good pot plant of aloe, showing the offsets.

170. They are often grouped about large public buildings, where they emphasize certain architectural features. Large collections are to be seen only in botanic gardens and in the collections of a few fanciers. The largest dealer has nearly one hundred kinds, but grows only five or six kinds in quantity.

Old plants of Aloe will keep healthy for several years in the same pots without a renewal of soil, and flower freely at the same time. The soil most suited to their needs is sandy loam three parts, lime rubble and broken brick one part, with a little decayed manure to strengthen the mixture. Very firm potting is necessary. Drainage is a more important item than soil, and must be perfectly arranged to enable the surplus water to run freely from the soil. Broken bricks are preferable to pieces of pots, large pieces for the bottom of the pot or tub, and smaller pieces above, till the last layer is quite fine. Some of the species need freer rooting conditions than others. *A. ciliaris* will grow from 5 to 7 feet in a season. *A. abyssinica* is of robust growth, and differs from most others in the color of the flowers, which are pure yellow, the others being mostly orange and orange-scarlet. *A. plicatilis* makes an ornamental tub plant when 4 or 5 feet high. Except during the period in which the species are in active growth, they need very little water, the principal idea being to keep the soil sweet and porous even when in growth. At all times the air of the house should be as dry as possible, full sunshine not hurting them. Propagation is by seeds, suckers and cuttings. The arborescent kinds should be rooted after they have completed growth. Dust over the cut part of the cutting with powdered charcoal and dry in sunshine before putting it in to root. Insert singly in as small pots as they will go into, and plunge in a sand-bed. Very little moisture is necessary while rooting. (G. W. Oliver.)

A. *Lvs. clustered, rather few and thin, flaccidly erect, linear, concave, smooth, finely serrulate: st. very short: infl. unbranched; fls. oblong or narrowed upward; stamens included. (1-4.)*

B. *Raceme short; pedicels elongated; fls. with distinct segms.*

C. *Lvs. 2-ranked.*

1. *Codperi*, Baker (*A. Schmidtiana*, Regel). Somewhat cespitose: *lvs.* 1-2 x 12-40 in., faintly striate, somewhat white-blotched; *infl.* 1-2 ft. high; *fls.* nodding, 1¼-1½ in. long, yellowish or greenish white, rosy at base, with distinct green-tipped segm. Cape. B.M. 6377. *Gt.* 970. *Lyon Hort.* 22, p. 305. Wood & Evans, *Natal Pl.* 41.

CC. *Lvs. spirally arranged.*

2. *micracantha*, Haw. *Lvs.* ½ x 18 in.: *infl.* 1 ft. high; *fls.* nodding, 1¼-1½ in. long; red, the distinct segm. green above or tipped and lined with green. Cape. B.M. 2272. *Salm, Aloe* §21, f. 1.

3. *minima*, Baker. *Lvs.* ¼ x 6-8 in.: *infl.* 6-12 or even 30 in. high; *fls.* spreading, ¾-1¼ in. long, greenish white or the distinct segm. rosy tinged. Cape. Hook. *Icon.* 2423. Wood, *Natal Pl.* 338.

BB. *Raceme elongated; pedicels short; fls. spreading or ascending: lvs. spirally arranged.*

4. *kniphofioides*, Baker. *Lvs.* ¼ x 12-15 in.: *infl.* 2 ft. high; *fls.* ascending, 1¼ in. long, pale red, with very short segm. and long tube. Cape. Hook. *Icon.* 1939.

AA. *Lvs. spirally rosulate (3-ranked in A. variegata), fleshy, acute or pungent: stamens little protruded. (5-26.)*

B. *Plants small: lvs. 3-8 in. long: st. never tall: infl. racemose; pedicels long; fls. nearly cylindrical.*

C. *The lvs. bristle-tipped, soft-toothed and warty: raceme rather short.*

5. *aristata*, Haw. (*A. longiaristata*, R. & S.). *Lvs.* erect, triangular-lanceolate, ¾ x 3-4 in., with a whip-

like apical thread, white-warty in transverse lines on the back and with rather small close white marginal teeth: infl. 1-1½ ft. high; fls. 1¼ in. long, reddish yellow, the moderately long tube somewhat constricted above the base. Cape. Gt. 1883, p. 151. Salm, Aloe §15, f. 7. Lyon Hort. 22, 307. Berger 61.—In aspect resembling *Haworthia*. Varies in a nearly smooth-lvd. form, var. *leiophylla*, Baker, and a gray-lvd. form with 2-ranked tubercles, var. *parvifolia*, Baker. Hybrids are: *A. × prorúmpens*, Berger, *A. × Begúnii*, Hort., *A. × perfectior*, Berger, *A. × Chludmii*, Beguin, *A. × Lap-axii*, Radl., *A. × Quéhlii*, Radl., *A. × Nowátnyi*, Radl., *A. × Bedinghausii*, Radl., and *A. × Simoniána*, Deleuil. All are known or believed to be crosses with species of the related genus *Gasteria*.

cc. The lvs. not bristle-tipped, rather coarsely toothed, sometimes warty.

d. Teeth pale, racemes rather long.

6. *humilis*, Haw. (*A. perfoliata humilis*, Linn.). Lvs. suberect, rather incurved, triangular-lanceolate, ¾ x 4 in., gradually acute, somewhat striate, sharply white-tuberculate, at least on the back, and with rather close large white marginal teeth: infl. 1½-2 ft. high; fls. 1½ in. long, red or yellowish, the green-tipped segms. distinct nearly to the base. Cape. Salm, Aloe §15, f. 1.—With somewhat the habit of *Haworthia*. Varies from the narrow green-lvd. type into glaucous forms of this, with rather thicker lvs., var. *incurva*, Haw. (*A. incurva*, Haw.), B.M. 828, Salm, Aloe §15, f. 3, and rather thin, more concave lvs., var. *echinata*, Baker (*A. echinata*, Willd.), Salm, Aloe §15, f. 2., Berger 64, 65, and one with purplish lvs., var. *macilenta*, Baker; as well as a broader-lvd. glaucous large form, var. *suberecta*, Baker (*A. suberecta*, Haw. *A. acuminata major*, Salm-Dyck), which is sometimes white-mottled, var. *semiguttata*, Haw.; a moderately large broad-lvd. form, var. *acuminata*, Baker (*A. acuminata*, Haw., *A. suberecta*, Haw.), B.M. 757; and a small blue-glaucous form with closer prickles and smaller warts, var. *subtuberculata*, Baker (*A. subtuberculata*, Haw.). Hybrids are: *A. × insignis*, Brown (*A. humilis × A. drepanophylla*), *A. × spinosissima*, Hort. (*A. humilis echinata × A. arborescens pachythyrsa*), *A. × cyanea*, Hort. (*A. humilis incurva × A. arborescens frutescens*), *A. × Todari*, Borzi, (*A. Todari præcox*, Borzi), *A. × Grusonii*, Henze, Monatschr. Kakteenk. 11, p. 57. (*A. humilis × A. Schimperii*), *A. × Hénzei*, Hort. (*A. Grusonii × A. variegata*), and perhaps *A. × latecoccinæa*.

7. *virens*, Haw. Lvs. curved, spreading, triangular, about 1 x 8 in., somewhat mottled or also lined, not warty, with rather distant, coarse, white, marginal teeth: infl. about 2 ft. high; fls. 1½-2 in. long, red, the tube longer than the paler green-tipped sometimes very short segm. Cape. B.M. 1355. Salm, Aloe §15, f. 8. Berger 62, 63. Journ. et Fl. des Jard. 1832, 20.

dd. Teeth dark: racemes short.

8. *pratensis*, Baker. Acaulescent: lvs. erect-spreading, 1-2 x 4-6 in., acute, striate, with large chestnut or blackish pickles on the margin and toward the top of the back: infl. 1½ ft. high; fls. 1¼-1½ in. long, yellowish red, the distinct segm. green-tipped. Cape. B.M. 6705. Berger 67.

9. *glauca*, Mill. (*A. rhodacantha*, DC.) Shortly caulescent: lvs. erect-spreading, 1½-2 x 6-8 in., acuminate, somewhat white-lined, with close strong reddish prickles on margin and back at apex: infl. 2-2½ ft. high; fls. 1¼ in. long, red, the nearly distinct segm. somewhat paler and green at tip. Cape. Salm, Aloe §17, f. 2. DC., Pl. Gr. 44. B.M. 1278.—This pale-lvd., always strongly armed species varies in a distinctly caulescent less glaucous form with even larger prickles, var. *muricata*, Baker (*A. muricata*, Schult., *A. glauca spinosior*, Haw.).

ccc. The lvs. not bristle-tipped or warty, minutely toothed or merely rough-edged: pedicels rather short.

10. *variegata*, Linn. (*A. punctata*, Haw.). At length with a leafy st. 6-9 in. high: lvs. green, ascending, in 3 close oblique ranks, about 1 x 2-5 in., triangular, v-shaped, abruptly acute, crossed by bands of elongated white blotches, edged and keeled by cartilaginous warty, or toward the tip serrate rather than toothed, white borders: infl. about 1 ft. high; fls. 1¼-1½ in. long, red, the green-nerved segms. rather shorter than the nearly cylindrical tube. Cape. B.M. 513. DC., Pl. Gr. 21. Salm, Aloe §20, f. 2. Berger 68. G.Z. 4:92. Wien. Ill. Gart. Zeit. 1904, p. 122. Gt. 29, p. 25. Mordaunt, Hb. 2:90. Lyon Hort. 21, p. 62; 22, p. 307. Deutsch. Tiefsee-Exped. 2:124. F.E. 8:98.—In habit resembling *Haworthia*. Varies in a form with broader lvs. with smaller less banded blotches, var. *Haworthii*, Berger. Hybrids: *A. × smaragdina*, Hort. (*A. variegata × Gasteria candicans*?), *A. × Rebütii*, Hort. (*A. variegata × Gasteria*, sp.), *A. × Desmetiana*, Hort. (*A. variegata × humilis echinata minor*), *A. × imbricata*, Hort. (*A. variegata* or *A. serrulata ×*?), *A. × mortolensis* (*A. variegata × Gasteria acinaciformis*).

11. *serrulata*, Haw. (*A. perfoliata serrulata*, Ait.). Fig. 171. At length short-std.: lvs. somewhat glaucous, rather spirally arranged and spreading, 2 x 8 in., ovate, nearly flat above, with scattered elongated white blotches and serrulate white margin and keel: infl. 1½ ft. high; fls. 1½-2 in. long, red, the green-nerved segms. scarcely equaling the somewhat constricted tube. Cape. B.M. 1415. Salm, Aloe §20, f. 1. Berger 68. Hybrids: *A. × Höyeri*, Radl. ("*A. serrulata × Lomatophyllum borbonicum*"?).

BB. Plants moderately large: lvs. 6 or 8 to mostly 12-20 in. long, smooth: st. never tall: infl. usually branched on strong plants; fls. saccate at base, then constricted, or in the last two less saccate, and widened above the constriction; filaments little if at all exerted.

c. The lvs. unarmed: infl. compoundly corymbose, with very short racemes.

12. *striata*, Haw. (*A. paniculata*, Jacq. *A. albocincta*, Haw.). Nearly simple: lvs. upcurved-spreading, 4-6 x 15-20 in., triangular-oblong, pale or reddish, somewhat pruinose, striate, with entire white cartilaginous margin: infl. 2-3 ft. high, ample; fls. 1¼ in. long, red or yellowish, the pale-tipped segms. much shorter than the tube. Cape. Jacq. Fragm. 62. G.C. III. 36:423. Berger 69.—Varies in a form with red-margined lvs., var. *rhodocincta*, Hort. (*A. Hanburiana*, Naudin), G.W. 3, p. 553, and a form with white-blotched lvs., var. *oligospila*, Baker, B.M. 5210. Hybrids: *A. × Schimperii*, Tod., Hort. Pan. 16; *A. × Bortiana*, Terr.; *A. × Schænlandii*, Baker; *A. × Páxii*, Terr.; *A. × Lynchii*, Baker, G.C. III. 29:199; *A. × Derbétzii*, Hort.; *A. × leptophylla*, Brown, B.M. 7624, Berger 70, and a narrower-lvd. form of it, var. *stenophylla*, Baker. Unnamed hybrids with *A. saponaria* are known, and *A. × Schimperii* has been recrossed with *A. striata*.

cc. The lvs. toothed: infl. simply corymbose, or unbranched when poorly developed.

d. Racemes short.

13. *saponaria*, Haw. (*A. perfoliata saponaria*, Ait. *A. saponaria minor*, Haw. *A. disticha*, Mill. *A. × maculosa*, Lam. *A. umbellata*, Salm-Dyck. *A. umbellata minor*,

171. Aloe serrulata. (No. 11.)

DC.). Cespitosely clustered: lvs. ascending or spreading, lance-oblong, acuminate, 2 x 6–8 in., often reddish, glaucous, faintly striate, with pale blotches more or less in transverse bands, the large, marginal, confluent teeth brown: infl. 1½–2½ ft. high, commonly branched; fls. 1½–1¾ in. long, red, the paler more or less green segms. much shorter than the tube. Cape. Wood & Evans, Natal Pl. 100. B.M. 1460. DC., Pl. Gr. 98, Salm, Aloe §23, f. 1. Berger 71, 72. Lyon Hort. 22, p. 305. Lam., Encycl. 236.—Varies in a dwarf form with lvs. scarcely 4 in. long, var. *brachyphylla*, Baker, and a larger greener-ivd. form, var. *latifolia*, Haw. (*A. latifolia*, Haw. *A. saponaria major*, Linn. *A. umbellata major*, DC.) Salm, Aloe §23, f. 3. B.M. 1346.

DD. *Racemes more elongated.*

14. *macracantha*, Baker. Simple, becoming caulescent: lvs. recurving, lance-oblong, 3–5 x 12–18 in., striate and irregularly somewhat white-blotched, with large, yellow-brown, distinct marginal teeth: infl. 1–2 ft. high; fls. 1¾ in. long, greenish yellow or orange, the segms. half as long as the tube. Cape. B.M. 6580.

15. *zebrina*, Baker (*A. platyphylla*, Baker. *A. Lugardiæna*, Baker. *A. Baumii*, Engl. & Gilg. *A. bamangwalensis*, Schoenl.). Somewhat clustered: lvs. erect-spreading with recurved acute tips, 2½ x 6–12 in., lance-oblong, often reddish, dull, at first pruinose, striate and with elongated pale blotches more or less in transverse bands, the sinuate margin with confluent large red- or brown-tipped teeth: infl. 3–4 ft. high; fls. 1¼ in. long, red, the nerved segms. shorter than the tube. Trop. Afr. Baum, Kunene-Sambesi Exped., 90. G.C. III. 35: 226. B.M. 7948. Berger 75.

16. *macrocarpa*, Tod. Cespitose: lvs. spreading, gradually pointed, 2 x 8–15 in., broadly triangular-oblong, pale, striate, mottled in transverse bands, with irregular, small, confluent, brown-tipped marginal prickles: infl. 2 ft. high; fls. 1 in. long, light red, the nerved segms. shorter than the tube. Trop. Afr. Tod., Hort. Pan. 9. Berger 76.—A larger Abyssinian form, with fls. becoming 1¼ in. long, is var. *major*, Berger.

17. *Græni*, Baker. Lvs. spreading, concave, acute, 3 x 15–18 in., lance-oblong, glossy green, striate and with elongated pale blotches confluent in irregular cross-bands, the sinuate margin with confluent, moderately large, frequently paired, brown upcurved teeth: infl. 1½–4 ft. high; fls. 1–1½ in. long, dull red, the segms. much shorter than the tube. Natal. B.M. 6520.

18. *obscura*, Mill. (*A. perfoliata obscura*, Ait. *A. saponaria obscura*, Haw. *A. picta*, Thunb. *A. picta major*, Willd. *A. maculata*, Desf.). Lvs. in a compact rosette, 2½–3 x 8 in., triangular-lanceolate, green, striate and with scattered small pale blotches, the sinuate, narrowly cartilaginous margin with rather short and close red-tipped teeth: infl. simple or forked, 2½–3 ft. high; fls. 1¼ in. long, red, the nerved segms. about equaling the tube. Cape region. DC., Pl. Gr. 97. B.M. 1323. Salm, Aloe §23, f. 2. Dillenius, Eltham. 15. Allgem. Deutsch. Gart. Mag. 6:17. Hybrid: *A. x pseudopicta*, Berger.

19. *commutata*, Tod. Lvs. as in *A. saponaria* but with somewhat recurved apex and weaker green-based prickles, 1½–2 x 6 in.: infl. few-branched, 3 ft. high; fls. campanulately widened, 1½ in. long, light red, the nerved segms. shorter than the tube. Cape region(?). Tod., Hort. Pan. 18. Berger 77.—Varies in a form with the reddish lvs. scarcely ½ in. wide and more conspicuously white-banded, var. *tricolor*, Berger (*A. tricolor*, Baker). B.M. 6324.

20. *grandidentata*, Salm.-Dyck. Lvs. recurved-spreading, 2½–3 x 12–18 in., lance-oblong, pale, striate and with elongated pale blotches confluent beneath into transverse bands, the sinuate margin with rather distant, large, smoky teeth: infl. 2–3 ft. high; fls. 1½ in.

long, rosy, the segms. about equaling the campanulately widened tube. Cape region. Salm, Aloe §23, f. 4. Berger 77.

BBB. *Plants rather large: lvs. 15–30 in. long, smooth: st. rarely tall (6 ft. in one form of A. Eru): infl. usually simply paniced or subcorymbose; fls. not saccate.*

21. *vèra*, Linn. (*A. perfoliata vèra*, Linn. *A. elongata*, Murr. *A. barbadensis*, Mill. *A. vulgaris*, Lam. *A. flava*, Pers.). Cespitose, the sts. at length 1–1½ ft. high: lvs. suberect or spreading, gradually narrowed from the base, pale, 2–3 x 12–20 in., irregularly white-blotched and narrow when young and 2-ranked on offsets, the repand margin with weak pale prickles: infl. 2–3 ft. high, often simple; fls. 1 in. long, yellow, the segms. about equaling the oblong tube. Medit. region and intro. generally through the tropics. Fiori & Paoletti, Fl. Ital. 1, p. 206. Sibthorpe, Fl. Græca, 341. Salm, Aloe §18, f. 2. Stephenson & Churchill, Med. Bot., 109. Bentley & Trimen, Med. Pl. 282. Berger 84.—The source of “Barbados aloes.” Varies in a large Arabian form with broader lvs., taller infl., and fls. shading into orange, var. *officinalis*, Baker (*A. officinalis*, Forsk., *A. rubescens*, DC.), DC., Pl. Gr. 15; a smaller Asiatic form with red-tinged fls., var. *chinensis* (*A. indica*, Royle. *A. chinensis*, Baker), B.M. 6301; and a hardier garden form of this, var. *Lânzæ*, Berger (*A. Lânzæ*, Tod.), Tod., Hort. Pan. 39. Berger 84.

22. *agavefolia*, Tod. Little caulescent or cespitose: lvs. recurved-spreading, concave, gradually narrowed, rather thin, 3–6 x 18–20 in., with scattered, small, oblong, pale blotches, the margin with large triangular hooked prickles: infl. 3 ft. high, paniced; fls. 1–1½ in. long, dull red, the green, pale-margined segms. about equaling the constricted tube. Trop. Afr. Tod., Hort. Pan. 23.

23. *abyssinica*, Lam. (*A. vulgaris abyssinica*, DC. *A. abyssinica Peacockii*, Baker. *A. Peacockii*, Berger & Schum. *A. Campèri*, Schweinf.). Scarcely clustered, acaulescent: lvs. at first ascending, gradually narrowed, rather sharp-pointed, 4–6 x 12–30 in., pale, not mottled, with rather small, confluent, deltoid, reddish marginal prickles: infl. 3 ft. high, dichotomously few-branched; fls. 1¼–1½ in. long, yellow or orange, the segms. rather shorter than the slightly narrowed tube. Trop. Afr. Salm, Aloe §18, f. 1. DC., Pl. Gr. 27. B.M. 6620. Berger 87, 88.

24. *èlegans*, Tod., differs mainly in having more elongated racemes.

25. *Èru*, Berger (*A. abyssinica*, Baker). St. branched, scarcely 2 ft. high: lvs. recurving, very fleshy, 1½–3 x 16–34 in., pale, somewhat glossy, with elongated white blotches, the repand margin with large reddish-tipped teeth: infl. 3–6 ft. high, dichotomously branched; fls. campanulate, scarcely ¾ in. long, yellow or orange, the segms. longer than the slightly constricted tube. Trop. Afr.—Several minor forms occur—*maculata*, *erecta*, *glauca*, *pârvi-punctata*,—and two large forms have been described, var. *cornuta*, Berger (*A. spicata*, Baker, *A. albopicta*, Hort.), Benth. & Trimen, Med. Pl. 284, and var. *Hoókeri*, Berger (*A. abyssinica*, Hook.), B.M. 7712, respectively short-std. and with a trunk 6 ft. high.

26. *Pèryi*, Baker. Trunk about 1 ft. high, simple: lvs. spreading, gradually narrowed or acuminate, 2–2½ x 15 in., pale green or reddish, somewhat striate but not mottled, the margin with rather small and close brown-tipped prickles: infl. 1½ ft. high, somewhat paniced; fls. 1 in. long, reddish becoming yellow, the green-tipped segms. much shorter than the slightly constricted tube. Socotra. B.M. 6596.—This is now held to be the source of “Socotra aloes,” long attributed to *A. succotrina*.

AAA. *Lvs. rather numerous, spirally arranged on a lengthened st., acute or pungent.* (27–39.)

B. *The lvs. rather separated, not armed on the back.*

C. *St. weak: lvs. thin, finely prickly on the margin, distinctly separated, with perfoliate striate sheaths: infl. short, racemose.*

27. *ciliaris*, Haw. St. elongated, scrambling, more or less verticillately branched: lvs. elongated lanceolate, striate, coarsely white-denticulate, spreading, about 1 x 3–6 in.: infl. 6–8 in. high; fls.  $1\frac{1}{2}$  in. long, bright red, the greenish segms. much shorter than the cylindrical tube; stamens little protruding. Cape. Salm, Aloe §25, f. 1. Berger 9, 97. Henslow, S. Afr. Pl. p. 269. —Varies into a smaller-lvd. form with nearly entire lf.-bases and smaller fls., var. *Tidmarshii*, Schoenl., and a form with broader lvs., var. *Flanaganii*, Schoenl. Hybrids: *A. x de Lätii*, Radl. (*A. ciliaris* x *succotrina*).

28. *striatula*, Haw. (*A. Macdonanii*, Baker. *A. aurantiaca*, Baker). Resembling *A. ciliaris*: lvs. longer, narrowly triangular, minutely denticulate: fls. from reddish becoming yellow or orange, with longer segms. and long-protruding stamens. Cape. Monatsschr. f. Kakteenk. 16, p. 4. Berger 99, 100.

cc. *St. stouter: lvs. rather fleshy and close: infl. taller, paniced.*

29. *Hildebrandtii*, Baker. St. slender, elongated: lvs. lanceolate-attenuate, 2 x 6–9 in., somewhat thick, glaucous, sometimes white-blotched as are the short sheaths, with rather small yellow marginal teeth: infl.  $1\frac{1}{2}$  ft. high, nearly sessile; fls. 1 in. long, red with more or less yellow- or green-marked segms. about equaling the somewhat constricted tube. Trop. Afr. B.M. 6981. Berger 104.

30. *inermis*, Forsk. (*A. Lüntii*, Baker). St. short: lvs. recurved-spreading, gradually narrowed, 2 x 12 in., fleshy, very pale green or reddish, blade and sheath mottled with white at least when young, entire: infl. 2–3 ft. high, open; fls. 1 in. long, rosy, with green-lined yellowish segms. shorter than the somewhat constricted tube. Arabia. B.M. 7448. Berger 105.

BB. *The lvs. more fleshy, with short, nearly concealed sheaths: infl. often paniced.*

c. *Racemes elongated: lvs. not armed on back.*

31. *Kirkii*, Baker. St. short: lvs. crowded, lanceolate-acuminate, 2 x 9–12 in., somewhat thick, glossy, green or reddish, with rather coarse confluent reddish marginal teeth: infl. 2 ft. high; fls.  $1\frac{1}{2}$  in. long, light red with yellowish base and greenish segms. shorter than the cylindrical tube. Zanzibar. B.M. 7386.

cc. *Racemes short: lvs. more or less armed on back as well as margin.*

d. *Erect: lvs. elongated.*

32. *sorðria*, Berger. Lvs. elongated, triangular,  $2\frac{1}{2}$  x 18 in., dull green, brown-striate, with variable whitish marginal teeth alternately larger and smaller: infl. about 2 ft. high; fls.  $1\frac{1}{2}$  in. long, light red, with segms. longer than the tube. Cape.

DD. *Prostrate: lvs. short and broad: infl. often forked.*

33. *mitrifórmis*, Mill. (*A. xanthacantha*, Salm-Dyck). Fig. 172. Lvs. upcurved, ovate, acute, 2–3 x 4–6 in., glaucous, somewhat prickly toward the tip beneath, with large and strong yellow or brown marginal teeth: infl. 1 ft. or more high; fls. 2 in. long, bright red with recurving, paler, nearly distinct segms. Cape. DC., Pl. Gr. 99. B.M. 1270. Salm, Aloe §24, f. 3. Berger 108. —Very polymorphic, the broad-lvd. typical form, with dorsal teeth on the keel only, varying into a form with smaller marginal teeth, those on the back continuing to the apex, var. *pachyphýlla*, Baker; another, in which they stop short of the apex, var. *xanthacantha*, Baker (*A. xanthacantha*, Willd.). Salm, Aloe §24, f. 4; and a

third with acuminate lvs., var. *Commelinii*, Baker (*A. Commelinii*, Willd. *A. mitrifórmis humilior*, Haw.), Salm, Aloe §24, f. 5: narrower-lvd. forms with short and broad yellow teeth, var. *flavispina*, Baker (*A. flavispina*, Haw.), Salm, Aloe §24, f. 2; or long subulate white teeth, var. *albispina*, Berger (*A. albispina*, Haw.): and a variant of the type with scattered teeth over the back of the broad lvs., var. *spinulosa*, Baker (*A. spinulosa*, Salm), Salm, Aloe §24, f. 6. Berger 109.

34. *nóbilis*, Haw. (*A. mitrifórmis spinosior*, Haw.). Lvs. lance-deltoid, 2 x 4–6 in., green, somewhat prickly toward the tip beneath, with large, strong, confluent, white marginal teeth: infl. 2 ft. high; fls.  $1\frac{1}{2}$  in. long, red, with recurving distinct segms. Cape. Salm, Aloe §24, f. 7. Berger 109.

172. *Aloe mitriformis*. (No. 33)

35. *dístans*, Haw. (*A. mitrifórmis angustior*, Lam. *A. perfoliata brevifolia*, Ait. *A. brevifolia*, Haw. *A. mitrifórmis brevifolia*, Sims. *A. mitrifórmis humilior*, Willd.). Branched and prostrately spreading: lvs. ascending, broadly ovate, acute, 2 x 3–3½ in., glaucous, somewhat mottled below and prickly toward the tip beneath, with strong, dark-tipped yellow marginal teeth: infl.  $1\frac{1}{2}$  ft. high; fls.  $1\frac{3}{4}$  in. long, red, with recurving greenish segms. about as long as the cylindrical tube. Cape. Salm, Aloe §24, f. 1. B.M. 1362. Berger 107.

AAAA. *Lvs. numerous, elongated, succulent, acute or pungent, spirally crowded at end of the prominent, sometimes tall trunk.* (36–49.)

B. *Stamens scarcely protruded: fls. narrow: lvs. smooth*

c. *Trunk scarcely 4 ft. high: infl. usually racemose.*

36. *succotrína*, Lam. (*A. soccotrina*, DC. *A. perfoliata soccotrina*, Ait. *A. socotrína*, Steph. & Church. *A. vera*, Mill.). Scarcely caespitose, the dichotomously branched st. at length 3–4 ft. high: lvs. falcately upcurved, gradually narrowed, pale or glaucous, sometimes white-blotched toward the base,  $1\frac{1}{2}$ –2 x 15–20 in., the margin serrate with small connate white prickles: infl. 2 ft. high; fls.  $1\frac{1}{4}$  in. long, light red, the

distinct segms. green-nerved. Cape. DC., Pl. Gr. 85. Salm, Aloe §22, f. 1. B.M. 472. Stephenson & Churchill, Med. Pl. 110. Berger 113.—Varies in a form with more armed, broader, shorter and straighter lvs., var. *saxigena*, Berger.

37. *purpurascens*, Haw. (*A. sinuata*, Thunb.? *A. perfoliata purpurascens*, Ait. *A. socotrina purpurascens*, Ker. *A. ramosa*, Haw.). Cespitose, nearly caulescent: lvs. upcurved, gradually tapered, green, sometimes more or less striate, and white-dotted on the back below,  $2\frac{1}{2}$  x 18–20 in., the margin with moderately long connate hooked purplish teeth: infl. 3 ft. high; fls.  $1\frac{1}{2}$  in. long, light red, the distinct segms. paler and green-nerved. Cape. Salm, Aloe §22, f. 2. B.M. 1474. Berger 113. Winkler, Pharm. Waarenk. 182.

cc. Trunk finally 10–20 ft. high: not cespitose.

d. Infl. a simple or forked raceme.

38. *arborescens*, Mill. (*A. perfoliata arborescens*, Ait. *A. arborea*, Medikus. *A. fruticosa*, Lam.? *Catevala arborescens*, Medikus. *A. arborescens Milleri*, Berger). Trunk simple, finally 10–15 ft. high, clothed at top with the withering lvs.: lvs. sinuately spreading, gradually narrowed, dull green, 2 x 24 in., the repand margin with rather long cartilaginous white prickles: infl. elongated; fls. about  $1\frac{1}{2}$  in. long, red, with distinct segms. Cape(?). B.M. 1306. Bot. Repos. 468. Berger 115.—Varies into numerous forms: green-lvd., with shorter trunk and long lvs., var. *Ucriæ*, Berger (*A. Ucriæ*, Terr.), Salm, Aloe §26, f. 3. G.W. 10, p. 13. Berger 116, 117; or shorter lvs., var. *viridifolia*, Berger, —Berger f. 117; or glaucous or blue-lvd., with branched infl., var. *natalensis*, Berger (*A. natalensis*, Wood & Evans), Berger 115; or simple infl. with normal fls., var. *frutescens*, Link. (*A. frutescens*, Salm-Dyck), Berger 120; or fls. 2 in. long, var. *pachythyrsa*, Berger. Berger 118, 119.

39. *pluridens*, Haw. (*A. Atherstonei*, Baker). Trunk unbranched, finally 8–10 ft. high: lvs. as in the preceding but glossy and somewhat striate,  $2\frac{1}{2}$  x 16 in.: infl. branched; fls.  $1\frac{1}{2}$  in. long. Cape. Berger 121.

dd. Infl. a candelabrum-like forking panicle, with upcurved nearly sessile fls.

40. *africana*, Mill. (*A. africana angustior*, Sims. *A. Bolusii*, Baker. *Pachydendron africanum*, Haw. *P. principis*, Haw. *P. angustifolium*, Haw.). Trunk simple, finally 20 ft. high: lvs. few, rather separated, sinuately spreading or recurved, triangular-oblong, glaucous,  $2\frac{1}{2}$ –3 x 20–24 in., with rather large triangular horny marginal teeth: infl. 2 ft. high; fls.  $1\frac{1}{2}$  in. long, yellow, with segms. shorter than the oblong tube. Cape. Salm, Aloe §27, f. 2. B.M. 2517. Berger 128.

41. *candelabrum*, Berger, differs chiefly in having the fls. red. Cape.

bb. Stamens much longer than the rather ample short perianth: not cespitose.

c. The lvs. smooth, toothed: infl. racemose or forked.

42. *rubroviolacea*, Schweinf. Not branched, scarcely 3 ft. high: lvs. spreading, acuminate triangular, purplish-pruinose, 4 x 24 in., the reddish margin with rather distant curved dark-pointed moderate teeth: infl. often forked, 2 ft. high; fls.  $1\frac{1}{2}$  in. long, light red, the segms. rather longer than the tube. N. Afr. B.M. 7882. Berger 122, 123. Hybrids: *A. rubroviolacea* x *A. supralævis*.

43. *Salmдықiāna*, Schult. Branching, low: lvs. arcuately spreading, gradually tapered, glaucous, 3 x 30 in., the yellowish margin with rather large cartilaginous teeth: infl. 2–3 ft. high, paniculate; fls.  $1\frac{1}{4}$ – $1\frac{1}{2}$  in. long, red, the green-tipped segms. nearly distinct. S. Afr. Salm., Aloe §27, f. 1. Berger 125, 126.—Varies in a less dense form with stouter trunk, var. *fulgens*, Berger (*A. fulgens*, Tod.), Tod., Hort. Pan.

33. Hybrids: *A. x Winteri*, Berger (*A. Salmдықiāna* x *A. arborescens frutescens*), *A. x Varvarii*, Borzi (*A. Salmдықiāna* x *A. cæsia*?).

44. *drepanophylla*, Baker. Trunk slender, simple, 9–12 ft. high: lvs. very narrowly lanceolate-attenuate, glaucous,  $1\frac{1}{2}$  x 24–36 in., the cartilaginous margin minutely denticulate: infl.  $1\frac{1}{2}$  ft. high; fls. scarcely 1 in. long, from red becoming whitish, green-lined, with nearly distinct segms. Cape. Berger 127.

45. *speciosa*, Baker. Taller, 18–25 ft. high, branching: lvs. very numerous, spreading, gradually tapered, blue, the rosy margin with minute prickles: fls.  $1\frac{1}{4}$  in. long, from rosy becoming whitish, green-nerved, the segms. about equaling the tube. N. Afr. Berger 124.

cc. The lvs. often armed on one or both faces, toothed: st. nearly simple: infl. paniculately forked.

46. *supralævis*, Haw. (*A. Galpinii*, Baker. *Pachydendron supralæve*, Haw.). Not branched, 3–6 ft. high: lvs. numerous, upcurved, lanceolate, glaucescent, 4–6 x 20–30 in., prickly on the back only, the marginal teeth rather large, reddish brown: infl. 3 ft. or more high; fls.  $1\frac{1}{8}$  in. long, red-orange, becoming yellowish, with segms. longer than the tube. Cape. Salm, Aloe §27, f. 6. Berger 129, 130.—Varies in a form with few if any prickles on the backs of lvs., var. *erythrocarpa*, Berger. Berger 130.

47. *férox*, Mill. (*A. perfoliata férox*, Ait. *A. muricata*, Haw. *A. horrida*, Haw. *A. pseudoférox*, Salm-Dyck. *A. subférox*, Spreng. *Pachydendron férox*, Haw. *P. pseudoférox*, Haw.). Exceptionally forked, 3–10 ft. high: lvs. numerous, curved, lanceolate, glaucous, becoming reddish, 4–5 x 28 in., more or less prickly on both faces, the purplish margin with rather large reddish-brown teeth: infl. 4 ft. high; fls.  $1\frac{1}{4}$  in. long, greenish yellow, with smoky-tipped segms. longer than the rather narrow tube. Cape region. B.M. 1975. Berger 131, 132. Salm, Aloe §27, f. 5.—Varies in a whiter-lvd. form with brighter yellow black-tipped fls., var. *xanthostachys*, Berger.

ccc. The lvs. smooth, prickly-margined: trunk very large, dichotomously branched, not cespitose: infl. tripartite.

48. *dichotoma*, Linn. (*Rhipidodendron dichotomum*, Willd.). Stout flat-topped tree, 25–30 ft. high, repeatedly forked as in *Dracæna Draco*: lvs. nearly flat, recurved-spreading, lanceolate, glaucous, 2–3 x 6–10 in., the yellowish-brown margin minutely prickly: infl. 1 ft. or more high; fls. very stout,  $1\frac{1}{4}$  in. long, yellow, with broad, nearly distinct segms. Cape. G.C. 1873, p. 712; 1874, p. 567. Berger pl. 1. and f. 135.—Varies in a smaller-fl. form with shorter stamens, var. *montana*, Berger (*A. montana*, Schinz).

49. *Bainèsii*, Dyer. Large flat-topped tree, 30–60 ft. high, copiously branched: lvs. concave, recurved-spreading, elongated, green, 2–3 x 24–36 in., the pale margin with rather small teeth: infl. 1 ft. or more high; fls.  $1\frac{1}{4}$ – $1\frac{1}{2}$  in. long, yellowish red, with segms. shorter than the tube. Cape region. G.C. 1874, p. 568. B.M. 6848. Berger 136, 137.—Varies in a broader-lvd. form with minute marginal prickles, var. *Bárberæ*, Baker (*A. Bárberæ*, Dyer. *A. Zeyheri*, Hort.), G.C. 1874, p. 568.

AAAAA. Lvs. rather few, strictly oblong, succulent, 2-ranked, minutely prickly near the very obtuse tip only: st. stout, evident: infl. unbranched; fls. oblong; stamens scarcely protruded.

50. *plicatius*, Mill. (*A. disticha plicatilis*, Linn. *A. linguiformis*, Linn. *A. flabelliformis*, Salisb. *Kumara disticha*, Medikus. *Rhipidodendron distichum*, Willd. *R. plicatile*, Haw.). Somewhat repeatedly forking, 3–10 ft. high, not cespitose: lvs. flat or 2-edged as in *Gasteria*, ascending, glaucous,  $1\frac{1}{2}$  x 8–16 in., the narrow cartilaginous margin minutely somewhat denticulate

upward: infl. 1-3 ft. high; fls.  $1\frac{1}{2}$  in. long, red, with segms. scarcely equaling the tube. Cape. B.M. 457. DC., Pl. Gr. 75, Jacq., Schoenbr. 423. Salm, Aloe §28, f. 2. Medic. 4. Berger 139, 140.

*A. Cameronii*, Hemsl. Fls. almost cinnabar-red, passing into yellow toward the top. E. Trop. Afr. B.M. 7915.—*A. Campylo-stiphon*, A. Berger. Pale yellow fls. E. Trop. Afr.—*A. Chabaudii*, Schoenl. Allied to *A. stricta*. Lvs. bordered with small prickles; outer segms. of fls. pale brick-red with whitish wings at apex. Trop. Afr. G.C. III. 38:102.—*A. decora*, Schoenl. A dwarf species having red fls. tipped with green. S. Afr. G.C. III. 38:3865.—*A. Lästii*, Baker. Fls. pale yellow, greenish at top. Zanzibar.—*A. laxiflora*, Hort. Very lax arrangement of fls. which are orange-red in lower part and yellow at apex. Cape Colony. G.C. III. 39:130, desc.—*A. Marlothii*, A. Berger. Extremely spiny lvs. and nearly horizontally spreading fl.-spikes. British Bechuanaland.—*A. Orpenae*, Schoenl. Lvs. lined with white spots and markings on both surfaces: fls. red, tipped with white. S. Afr. G.C. III. 38:3865.—*A. pallidiflora*, A. Berger. A stemless plant: lvs. armed on margins with sharp spines: fls. pale flesh-color. S. Afr. B.M. 8122.—*A. pendens*. A shrubby species: fls. drooping, dull yellowish red. S. Arabia. B.M. 7837.—*A. rubrolutea*, Schinz. Unbranched st. 8 ft. high or more: lvs. armed or margins with brown denticled and somewhat hooked spines: fls. bright red. Trop. S. W. Afr. B.M. 8263.

WILLIAM TRELEASE.

**ALONSÒA** (Alonzo Zanoni, Spanish official at Bogota). *Scrophulariaceae*. ALONSOA. Tropical American plants, cultivated as annuals in the open, or grown for the attractive winter bloom in pots.

Flowers showy: plant of good habit: corolla very irregular and turned upside down by the twisting of the pedicel, bringing the larger lobe uppermost; stamens 4: lvs. (at least below) opposite or in 3's.—About a dozen species, many of which have been in gardens at one time or another.

Alonsoas are tender, and need protection from frost. Seeds are usually started under glass in the North, although plants bloom well from seeds sown directly in the open. Use only finely prepared soil. For winter bloom, plants are propagated by cuttings or seeds, the latter being sown in late summer.

*incisifolia*, Ruiz & Pav. (*A. urticæfolia*, Steud. *Celsia urticæfolia*, Sims, B.M. 417). Fig. 173. About 2 ft. high, erect: lvs. ovate to oval-lanceolate, long-tailed, deeply cut-toothed: fls. nearly  $\frac{1}{2}$  in. across, very irregular (somewhat hood-shaped), scarlet, with protruding organs, on slender axillary peduncles; upper limb of corolla 2-4 times longer than calyx; anthers 2-3 times shorter than filaments. Also a white-fl. variety. Peru.—A greenhouse shrub.

*Warscewiczii*, Regel (*A. incisifolia* var. *Warscewiczii*, Boiss. *A. grandiflora*, Hort. *A. compacta*, Hort.). Fls. large, the plant herbaceous or nearly so and treated as a garden annual: lvs. cordate or cordate-lanceolate, double-toothed: calyx-lobes blunt; upper lobes of corolla 4-5 times as long as calyx, and anthers 3-4 times shorter than the crooked filaments, the fls. light cinnabar-red or scarlet-red (and a white variety). Peru.—

Apparently the commonest alonsoa in gardens, 2-3 ft., readily grown from seeds as a half-hardy subject; July till autumn; useful also for winter bloom. Plant very bushy, with mostly reddish brown branches.

*acutifolia*, Ruiz & Pav. (*A. myrtifolia*, Roehl). Plant stout but bushy, 20-30 in.: lvs. broad-lanceolate, sharply simple-toothed: pedicels single, glandular hairy (as also the calyx); fls. larger than *A. Warscewiczii*, the limb or lip 3-4 times as long as the calyx; anthers long, several times exceeding the filaments; color of fls. cinnabar-red. Peru. Var. *candida*, Voss (*A. albiflora*, Hort.), fls. white. Grown as a garden annual, and also in pots for winter bloom.

*linearis*, Ruiz & Pav. (*A. linearifolia*, Steud. *A. lini-flora*, Hort.). Plant bushy and much branched, 12-20 in.: lvs. linear, pointed, entire or finely toothed, often fasciated or crowded: fls. scarlet. Peru. Var. *gracilis*, Hort. (*A. pumila*, Hort.), is a smaller graceful form. Cult. as garden annual and also in pots indoors.

*A. caulilata*, Ruiz & Pav. Lvs. less cut than in *A. incisifolia*: fls. smaller: st. 4-angled. Peru.—*A. intermedia*, L.B.C. 1456=*A. linearis*.—*A. liniifolia*, Roehl. Plant  $1\frac{1}{2}$  ft. or less high: lvs. lanceolate or narrower, entire: fls. bright scarlet. Peru.—*A. Mathewii*, Benth. Lvs. lanceolate, toothed: fls. scarlet, in terminal racemes. Peru. Greenhouse.

L. H. B.

ALŌYSIA: *Lippia*.

**ALPINE PLANTS.** In gardening, a term used to designate those plants that thrive in imitated alpine conditions,—in cool places of short-growing season and abundant cold-water supply in the growing and blooming period, and soil conditions approaching those of mountains; in practice, alpine-gardening is a form of rock-gardening.

The cultivation of alpine plants in some parts of the United States must always be attended with difficulty. Wherever, as in the coastal plain region of the Atlantic seaboard, the summers are long, dry and hot, it is almost impossible to cultivate many of the most desirable alpiners.

A study of the natural environmental habitats of alpiners is the very best way to arrive at really valuable ideas upon their cultivation. Excluding all those alpiners of apparently little definite habitat preference, such as the snowdrop, daffodil, poet's narcissus, trailing myrtle, Christmas rose, and Scotch pink, all of which are true alpiners, but also tolerant of quite ordinary garden conditions, there is a large class, some hundreds of species, that will grow only in situations approximating their native habitat. These plants, some of which are perhaps the most beautiful flowers in cultivation, grow usually in a region having long, rigorous winters, a growing season averaging 100 to 120 days, and a constant supply of moisture which, on account of its source in the snow above the vegetation-line, is always nearly ice-cold.

It is true of most of these alpiners that they grow among the rocks, and, as we shall see presently, this is a factor that must be reckoned with. Many of them grow in the open sun and are exposed to violent, often bitter, winds. Others again are on north-facing slopes, where the sun rarely, if ever, reaches them. A partial list of alpiners given below will show the preference of some of the more common species with regard to the exposure to sunlight.

*Localities in the United States and Canada where alpine gardens may be tried with a fair measure of success.*

One of the basic requirements of most true alpiners is a short growing season. The Atlantic seaboard from Nova Scotia southward, east of the "fall line" (the flat, usually somewhat sandy, regions between the eastern fringe of the Alleghanies and the sea, such as southern Long Island, southern New Jersey and all south of it except parts of Virginia, North Carolina, South Carolina, and Georgia), has an active growing

173. *Alonsoa incisifolia*. ( $\times \frac{1}{4}$ )

season of 170 days and upward. This is computed by adding the days from the last frost of spring to the first frost of autumn. At New York, the season is 210 days, at Philadelphia, 220 days, and of course constantly increasing southward.

On account of this long growing season and also because of the dry, hot character of the winds, it is almost impossible, without great expense, to maintain an alpine garden in this region. The same is true of the coastal part of the Pacific coast, and in the Mississippi Valley up to about St. Louis. This is, of course,

174. Arrangement in a rock-garden to insure sub-irrigation.

a general statement, and peculiarly favorable local conditions within the areas specified may be found, where the attempt can be made. But it is extremely doubtful whether any really good alpine garden can be maintained within this area permanently without a great maintenance expense, in the way of constantly supplying new plants, keeping the garden regularly cooled down by water and the like.

As one goes back from the coast, even a few miles, there is a marked change in the climate, and particularly noticeable is the constantly diminishing length of the growing season. Near Hartford, the Highlands of the Hudson, northern New Jersey and Pennsylvania, the growing season averages from 138 to 120 days, more or less. As a general rule it may safely be stated that anywhere east of the Mississippi where elevations of 1,000 feet or greater are found, an alpine garden is permissible except in the southern Alleghanies, where greater elevations must be sought. This length of the growing season is easily computed for all parts of the country, as indicated above; and wherever we find an active growing season of 100 to 140 days, it would be profitable to make an alpine garden. In the East it will be found that the short season is almost always correlated with elevations in excess of 1,000 feet and in the West at several times that altitude.

#### Position of the alpine garden.

So far as our purpose is concerned, there are three classes of alpine plants: (a) those that require full sunlight, (b) shade-inhabiting species, and (c) those that are apparently indifferent as to exposure. To meet all these conditions within a single garden is not always possible, and a selection of plants must therefore be made, unless one is fortunate enough to have a situation that combines these requisites. As a general rule it is better at some distance from a dwelling, stable, or garage, both architecturally and culturally. No class of plants is quite so wild as alpenes, and the more secluded the garden, and the greater the suggestion of sequestered nature the better. A screen of evergreens or other trees, and a northward-facing slope, insuring good drainage, is perhaps the best all-round combination that one could desire. If the garden is at a slight elevation above the immediate surroundings, so much the better; although this is not absolutely essential. Southern or western exposures are to be avoided unless the garden is at least 4,000 feet above the sea in the East, and from 6,000 to 8,000 feet in the West. It should also be arranged so that drainage will not be entirely down through the soil as in ordinary gardens, but rather so

that the water can trickle from the roots of those above to those below. This is often best attained by a judicious use of rocks, which will be considered later.

#### Making the garden.

Having decided that one lives within the area in which it is safe to begin the installation of an alpine collection, the next most important consideration is to give the plants the requisite local condition. Nearly all of them require good rich soil, at least 18 inches deep, preferably deeper. Even those species that grow in the crevices of the rocks in their native habitat do so not because they "like" such situations, but most probably because no more favorable place is available.

In preparing the soil, it is well to remember that at least one-third of the mixture should be fine rotted leaf-mold mixed with equal parts of loam and sand. The latter is quite necessary in order to insure perfect drainage. It has been stated that some alpenes will thrive in situations that approximate our bogs in having a high humic acid content. But most of the species thrive where the drainage is good and the soil is sweet, not sour.

If for no other reason than to insure perfect drainage, it is best to construct the garden in a series of terraces with walks of more or less irregular outline between, as taste and convenience dictate. Avoid all semblance of formality in the arrangement of these terraces, as artificiality or formalism in the alpine garden are quite the least desirable features to be sought.

The terraces, or any modification of them, are best held in place by a more or less free use of rocks. The placing of these requires great skill and taste, as their purpose must be twofold—to add a sense of naturalness to the garden and to make suitable pockets in which to grow the plants. While it is true that many alpenes, such as *Thalictrum aquilegifolium*, *Clematis recta*, *Aconitum lycoctonum*, *Digitalis ambigua*, *Polemonium caeruleum*, *Gentiana asclepiadea*, and *Delphinium elatum*, with many others, can be grown without the use of rocks, it is true, on the whole, that most alpenes grow better and seem more at home when rocks are part of their environment. Just what part the rocks play in the home economy of the plants is not very well understood, but the readiness with which they conduct the water to the roots, and their tendency to keep the soil cool both suggest themselves as possible benefits.

For such species as *Phlox Douglasii*, *Cassiope Mertensiana*, *Polemonium montrosense*, and all plants of their type whose natural home is at elevations from 10,000 to 12,000 feet, care must be taken to insure almost constant sub-irrigation of cool water. In their native habitats, such plants have their roots constantly in the icy water of the substratum, and any conditions that do not approximate this will make failure almost certain.

An arrangement for insuring this sub-irrigation is figured in Fig. 174, diagrammatically. The pocket of soil in the rocks having been filled with the proper soil mixture, the water may be let in at a, with a rock just in front of the pipe to insure the water's downward passage (d). With the bottom made water-tight by concrete or rocks and clay, and the outlet regulated at b, a definite water-level can always be maintained at c. The outlet can be arranged as indicated to flow either over the surface of the rock below or in a pipe behind it. If the water for this plan comes from a cool spring, so much the better. The smallest stream of water is sufficient, as it is not the water itself with which one is aiming to supply the plants, so much as the cooling of the soil, rocks and atmosphere that ensues from a gentle flow of water through and around the soil and rocks.

Such measures are not necessary for all alpenes, but a few species must be grown under conditions approximated by these methods. The expense of installing and maintaining such construction, however, is relatively great.

as compared with the simple arrangement of the rocks in pockets, overhanging ledges, nooks, and so forth, which is all that is required for the great majority of alpinists. A common and particularly undesirable method of procedure is to tumble a great mass of rocks together, usually utterly without form or definite purpose except to look "artistic," then pile soil amongst them and plant the whole mass. If the idea is constantly kept in mind that the rocks are for use primarily, that they are cultural necessities, and that plants naturally grow between, and among, and often half underneath them,—then the final result is likely to be beautiful, because they are useful and have been placed with an eye to their sole *raison d'être* in the alpine garden, which is to be a home for alpine plants.

In placing the rocks, indeed in the arrangement of the garden generally, it is better to avoid situations in which the drip from overhanging trees or other objects will fall on the plants. No plants are specially benefited by drip, and alpinists, particularly those having tomentose leaves, will suffer from such treatment.

#### *Plants for the alpine garden.*

Unfortunately, very few American dealers carry anything like an adequate stock of alpine plants, and only the commonest and best-known species are to be found in the American trade. This has had the effect of restricting the popularity of alpine gardening in this country, and, furthermore, all the alpine gardens of any size have had to seek in Europe for the large variety of species that constitute a well-stocked collection. Many European firms, particularly in England and France, have specialized in alpinists. At least 1,000 species are offered by one continental dealer alone. A common but altogether unsatisfactory method, and one that has resulted in numberless failures, is the attempt to import plants direct from these dealers. The time of transit, the highly specialized character of the cultural requirement of alpinists, and the lack of attention during transit, all operate to make such shipments costly and usually unsuccessful.

The best and most satisfactory method is to buy seeds of the plants to be cultivated. The initial cost is less than one-fifth and the personal satisfaction in having grown one's stock of plants more than offsets the time spent in this work. The seeds should be imported early in the spring or even in the late winter for those with greenhouse facilities. Sow the seeds in pans or boxes in a light soil of leaf-mold and sand in about equal parts. It is best partially to shade the seeds and very young seedlings for a few days. Pot up when the seedlings are stout enough to stand the transfer, which of course, varies with different species. If it is inconvenient

to place them in their permanent home the first year, they may be repotted and then the pots plunged in ashes in the frame. With proper shading from the intense sunlight, and a plentiful supply of cool water so that the ashes are kept moist and cool, they will grow very well under these conditions for the first year. Many of the species can be grown always with this treatment if one has no garden ready for them. The shading for these frames is easily made of ordinary plasterer's lath, the strips being placed about one inch apart and the whole shade arranged so as to be about 2½ feet above the surface of the ground.

Of all the genera cultivated as alpinists, the most important are the gentians, saxifrages, sedums, a few dwarf primulas and the pinguiculas. These are much better known abroad than in North America, but many of the best of them can be grown in this country. Among the gentians, Correvon of Geneva classifies them for cultural purposes as follows:

1. Calcareous-soil gentians requiring sun: *alpina*, *angustifolia*, *Clusii* and *Kochiana*.
2. Sphagnum-moss species: *bavarica*, *Rostarii*, *septemfida*.
3. Marshy-ground species: *angustifolia* (also in group 1) *asclepiadea*, *Pneumonanthe*.
4. Peaty sand and sandstone with peat in it: *alba*, *Bigelovii*, *ciliata*, *frigida*, *Parryi*, *pumila*, *Wallichiana*.
5. Of indifferent habitat preference: *brevidentis*, *crucifera*, *dahurica*, *decumbens*, *macrophylla*, *Oliveri*, *Saponaria*, *scabra*, *straminea*, *Weschniakowii*.

Among the saxifrages only the dwarf, usually perennial, kinds are grown as alpinists. In moist, rocky places in the alpine garden the following species of pinguicula will be useful: *P. vallisnerifolia*, *P. grandiflora*, with purple and blue flowers and *P. alpina* with white flowers. *P. vulgaris* and *P. lusitanica* may be grown in general situations in the "alp."

It is often necessary to make a definite selection of species for a sunny or shady place, as most of our alpinists cannot be grown without reference to the amount of sunlight. For those who can arrange only for a rather sunny situation, in which the amount of shade is not sufficient to keep the soil and rocks cool, the following will be found helpful:

#### ALPINES FOR SUNNY SITUATIONS.

NAME	Color of flowers	Height	Time of flowering
<i>Acron species</i> . . . .	Grown for gray foliage	Creeping, 3-4 in.	
<i>Acantholimon glumaceum</i> . . . . .	Rose	3 in.	Summer
<i>Achillea argentea</i> . . . . .	White	4 in.	Summer
<i>A. rupestris</i> . . . . .	White	3 in.	Summer
<i>A. umbellata</i> . . . . .	White	6 in.	Summer
<i>Æthionema</i> , various sp. . . . .	Pink	About 1 ft.	Summer
<i>Ajuga reptans atropurpurea</i> . . . . .	For purple foliage	9 in.	
<i>Alyssum</i> , various sp. . . . .	Yellow and white	6 in.	Spring

<i>Viola</i> , various sp...	Blue and white	3-4 in.	Spring
<i>Waldsteinia fragari-oides</i> .....	White	3-6 in.	Spring

To these may be added the native species that grow naturally in America at elevations in excess of 1,500 feet, such as *Copis trifolia*, *Cornus canadensis*, *Clin-tonia borealis*, *Tiarella cordifol a*, *Trillium grandiflorum*, *Claytonia caroliniana*, *Dalibarda repens*, *Polemonium VanBruntiae*, various terrestrial habennarias, *Mitella nuda*, *Arenaria granlandica*, and many others.

The plants both for shaded and sunny situations will grow better if there is a liberal top-dressing of leaf-mold and sand, about half and half, applied each spring. It will be noted that all the plants listed in both lists are perennials. Most natural alpiners are of this type, the shortness of the growing season precluding the possibility of the full development of an annual.

For those who wish to go into the growing of alpiners more extensively, a partial list of the alpine genera together with an indication of the number of species that are to be found in the principal European trade catalogues is appended. Many additions will suggest themselves as the alpine gardener becomes better acquainted with those listed below and their relatives:

LIST OF THE CHIEF ALPINE GENERA.

The figures indicate approximately the number of species in each genus that are alpiners.

Achillea, 5.	Epimedium.	Pedicularis, 5.
Aconitum, 6.	Erigeron.	Petasites, 2.

The literature on alpine-gardening, in English, is very meager. Any good book of the flora of high moun-tain regions,—and there are a dozen or more excellent

works on the flora of the Alps,—will aid in the way of suggesting new species that may be grown. A good but rather out-of-date book on the making and culture of alpine gardens is A. Kerner's "Die Cultur der Alpenpflanzen." A useful work containing many cultural hints is H. S. Thompson's "Alpine Plants of Europe, with Cultural Hints." The first International Congress of Alpine Gardens met at Naye, Switzerland, in 1904. As yet nothing except administrative reports of this convocation has been published.

N. TAYLOR.

**ALPÍNIA** (Prosper Alpinus, an Italian botanist). *Zingiberaceæ*. Stove herbs, cultivated both for leaves and the racemes or panicles of flowers.

Many-stld. leafy plants, with ginger-like rhizomes: fls. in spikes or panicles terminating the leafy sts., often showy; calyx wide-tubular or nearly bell-form, the tube short and the 3 points or parts erect; corolla of 3 parts; stamens reduced to 1 pollen-bearing organ, and 1 or more staminodia, one of the staminodia being showy and longer than corolla and notched or toothed: fr. a 3-celled caps.—About 150 species in Polynesia, Japan,

*tricolor*, Sand. St. erect: lvs. oblong-acuminate, 10 in. long,  $1\frac{1}{4}$  in. wide, green with white or creamy yellow stripes. Solomon Isl. G.C. III. 33:249 (suppl.).

AA. *Foliage green, not striped.*

**nùtans**, Roscoe (*Zerúmbet speciosum*, Wendl.). SHELL-FLOWER. Striking plant, reaching 10–12 ft., with long, lanceolate glabrous long-veined lvs.: fls. orchid-like, yellow with pink, sweet-scented, in a long, drooping, terminal, spike-like raceme. E. Indies. G.C. III. 19:301. I.H. 43, p. 259. B.M. 1903. P.M. 13:125. R.H. 1861:51.—Fine for foliage masses, and an old favorite. Said to grow 20 ft. high in S. Calif. in rich soil and with plenty of water, and to bloom continuously.

**mùtica**, Roxbg. Fig. 176. A handsome strong species: lvs. very short-stalked or sessile, long-lanceolate and pointed: fl. with large bright yellow lip veined crimson, the outer segms. oblong and white. *A. mutica*, Hook. f., B.M. 6908, is probably not the *A. mutica* of Roxburgh. E. Indies. Excellent free-flowering species.

**Allùghas**, Roscoe. Strong,  $3\frac{1}{2}$ –7 ft.: lvs. sessile or nearly so, lanceolate or linear-lanceolate, short-acuminate,  $1\frac{1}{2}$  ft. or less long, 3–4 in. broad: fls. small, crowded, greenish white, the lip cuneate, pink, emarginate. India. Spring.

**calcaràta**, Roscoe. Slender, 3–5 ft.: lvs. sessile, narrowly linear-lanceolate and attenuate-acuminate: fls. medium in size, greenish white, the lip variegated with red and yellow on a lighter ground. India. Fall.

Many kinds of these interesting ornamental plants are likely to find their way into choice collections. Some of them are as follows: *A. gigantèa*, Blume, reported in S. Calif., very tall, even to more than 20 ft., with very large nodding panicle.—*A. japonica*, once catalogued in U. S., but not known whether it was the *A. japonica* of Thunberg.—*A. longepetiolata*, coming from W. Trop. Afr., of robust habit, 6 ft.: lvs. elliptic, the uppermost linear, wing-petioled: fls. white or rose in terminal panicle, purple-spotted.—*A. magnifica*, Roscoe=*Phaëmeria magnifica*.—*A. Nieuwenhuisii*, Valet. (*A. borneensis*, Valet.), distinct species, 4–6 ft.: lvs. 2 ft. or less long: fls. purple-lipped, in panicles 12 in. long: fr. large. Borneo.—*A. officinarum*, Hance. Supplying the "radix Galangæ minoris" of pharmacists, once used as an aromatic stimulant by Arabs and Greeks: rhizome thick, creeping, the st. tuberous at base: lvs. narrowly lanceolate, long-acuminate: fls. white in simple spike, the lip red-nerved. China. B.M. 6995.—*A. pumila*, Hook. f. Lvs. from rootstock, 6 in. or less, on petioles 2–4 in.: fls. in short spike, 1 in. long, pink, the lip recurved, on a very short scape. China. B.M. 6832. *A. Schumanniana*, Valet. (*A. fimbriata*, Gagn.). 3–5 ft.: lvs. lanceolate, 18 in. long,  $1\frac{1}{2}$  in. broad: fls. purple in spikes, handsome. Formosa.—*A. zingiberina*, Hook. f. 4–5 ft.: lvs. oblanceolate, oblong, cuspidate, 12 in. or less long, 3 in. broad: fls. greenish, the lip white veined crimson, in panicles. Siam. B.M. 6944.

L. H. B.

**ALSEUÓSMIA** (*alsos*, grove, and *euosme*, fragrance). *Caprifoliaceæ*. A group of 4 species of tender New Zealand shrubs, usually glabrous. Lvs. alternate or opposite, with minute tufts of hair in the axils of the veins beneath: fls. fragrant, green or red, axillary, solitary or in clusters; corolla tubular or funnel-form: fr. a purple, many-seeded berry.—Perhaps not cult. outside botanic gardens.

*A. macrophylla*, A. Cunn. NEW ZEALAND HONEYSUCKLE. 6–10 ft.: lvs. 3–6 in. long, elliptic or oblanceolate, acute, serrate, or entire, petiolate: fls. in small axillary clusters, drooping,  $1\frac{1}{2}$  in. long, creamy with dull red streaks; corolla lobes recurved, toothed, the tube cylindric. B.M. 6951.

N. TAYLOR.

**ALSIKE**: Clover and *Trifolium*.

**ALSÏNE** (Greek for *grove*, where some species grow). *Caryophyllaceæ*. A few species of Alsine are in the market, mostly for rock-gardening. There is much difference among botanists as to the standing of the genus Alsine. Some persons refer it to *Arenaria*, others make it a tenable name to replace *Stellaria*, and Pax in Engler and Prantl's *Pflanzenfamilien* retains it for about sixty species, mostly in the temperate and cold parts of the northern hemisphere, and distinguishes both *Arenaria* and *Stellaria*; for the purposes of this *Cyclopedia* it seems to be desirable to follow the Index Kewensis disposition; and the few cultivated species are therefore accounted for under *Arenaria*.

176. *Alpina mutica*.

and E. India. Some of the cult. forms have undoubtedly been referred to *Alpinia* without knowledge of the botanical characters, and their botanical position is therefore doubtful. Monogr. in Engler, *Pflanzenreich*, hft. 20 (1904).

*Alpinia* contains many handsome species, but only a few are common in cultivation. They are tropical plants and require a moist air and a temperature of 55° to 60° F. A mixture of two parts loam, one part leaf-mold, and one part dried cow-manure forms an excellent compost. While growing, they need an abundance of water, and the large-growing kinds require large pots or tubs. After flowering, allow them to rest in heat, but do not dry them off. The plants are propagated by division in the spring. *A. nutans* is grown for its handsome flowers and attains a height of 12 or 13 feet. *A. vittata* is popular on account of its variegated foliage. *A. mutica* has very showy flowers, but is apparently little known in the trade. (Robert Cameron.)

A. *Foliage striped: plants of doubtful botanical position.*  
**vittata**, Bull (*Amònum vittatum*, Hort.). Lower: lvs. distichous, lanceolate, with pale green or creamy yellow bars or stripes between the nerves: fls. red, in axillary spikes. S. Sea Is. A.F. 8:787. Gn. 4, p. 25.

**álbo-lineàta**, Hort. A plant 3–4 ft. high, with broad bands of white and pale green on the elliptic-lanceolate lvs.

**Sánderae**, Sand. St. ascending: lvs. very short-stalked and 5 in. or less long,  $1\frac{1}{4}$  in. or less broad, tapering both ways, rich shining green, regularly and closely striped in broad bands of white leading from the midrib to the margin. New Guinea. G.C. III. 33:248 (suppl.). 1903. Probably a variegated form of *A. Rafflesiana*, Wall.

**ALSÓPHILA** (Greek, *grove-loving*). *Cyatheaceæ*. Tree ferns, grown in choice large conservatories, and in the open in warm countries.

Alsophilas have simple or forked free veins, round sori, and no indusia. Numerous species are found in the tropical regions of both hemispheres. The species of *Alsophila* are very similar in appearance to the tree ferns placed in the genus *Cyathea* and are probably not generically distinct.

177. Pinna of *Alsophila australis*

Of the different species of *alsophila*, only one is in general commercial use. *A. australis* is a very graceful and rapidly growing tree fern, with finely divided fronds of a pleasing shade of light green, with the stipes thickly covered with light brown, hairy scales. It is grown from spores, which can be obtained only from old and large specimens, and which, like the spores of most commercial ferns, will germinate very freely if sown on a compost consisting of finely screened soil, leaf-mold and sand in equal parts. To develop a good crown of fronds in old specimen plants which may look starved, the stem may be covered to any thickness consistent with good appearance with green moss, which may be attached with thin copper wire, and which, if kept continually moist, will soon be thickly covered with fine roots. *Alsophilas* should be grown in a temperature of 60° F., and the soil should never be allowed to become very dry. (Nichol N. Bruckner.)

*A. Lvs. bipinnate; rachises merely fibrillose.*

**Rebéccæ**, F. Muell. Lvs. ample, from 8 in. or so high; pinnae 12–15 in. long, with 20–30 pinnules on each side, which are 2–3 in. long and serrate or crenate throughout. Austral. G.Z. 28, p. 2.

**AA. Lvs. tripinnatifid or tripinnate; rachises armed with spines.**

**B. Segms. long, strongly curved; pinnules tapering to a slender point.**

**excélsa**, R. Br. Lvs. coriaceous, with more or less woolly rachises; pinnae 6–10 in. wide, with crowded pinnules, which are provided with about 20 pairs of segms. which are strongly curved and more or less enlarged at the ends. Norfolk Isl. and Austral.—Said to have a trunk 60–80 ft. high.

**Coöperi**, F. Muell. Smaller than the last: rachises with pale brown scales; pinnae spear-shaped, with linear pinnules 4–5 in. long. Queensland.

**lunulâte**, R. Br. Lvs. rather thick, herbaceous, from smooth rachises; pinnules close, 5–6 in. long, with 20–30 pairs of segms., which are finely serrate throughout.

**BB. Segms. ½ in. or less long.**

**austrâlis**, R. Br. Fig. 177. Rachises straw-colored; lvs. ample, with primary pinnae 18 in. long, 6–10 in. wide; pin-

nules deeply pinnatifid, with segms. broadest at the base, ovate-oblong and sharply serrate. Tasmania and Austral.

**fêrox**, Presl. (*A. aculeata*, J. Smith). Rachises brownish: pinnae 12–18 in. long; pinnules narrow, 3–4 in. long, ½–½ in. wide, with 15–18 pairs of segms. which are narrow and slightly serrate. Trop. Amer.

**AAA. Lvs. quadripinnatifid.**

**oligocârpa**, Fee. Fig. 178. Rachises smooth, grayish straw-colored; pinnules 1½–2 ft. long, the segms. ligulate, deeply pinnatifid, with blunt lobes; sori median, 4–6 on the lower lobes. Colombia.

*A. Baroûmba*, Hort. Recently intro. Not so elegant as *A. Loubetiana*, but of interest for its majestic dimensions. Congo Free State.—*A. congoensis*, Hort. Large, handsome fronds, with prominent yellow midrib: pinnae deeply and regularly cut.—*A. incana*, Hort. A magnificent tree fern with black spiny petioles. Congo. R.B. 34:172.—*A. Loubetiana*, Hort. A decorative tree fern with broad lvs.: rachis hairy brown. S.H. 4:453.

L. M. UNDERWOOD.

R. C. BENEDICT.†

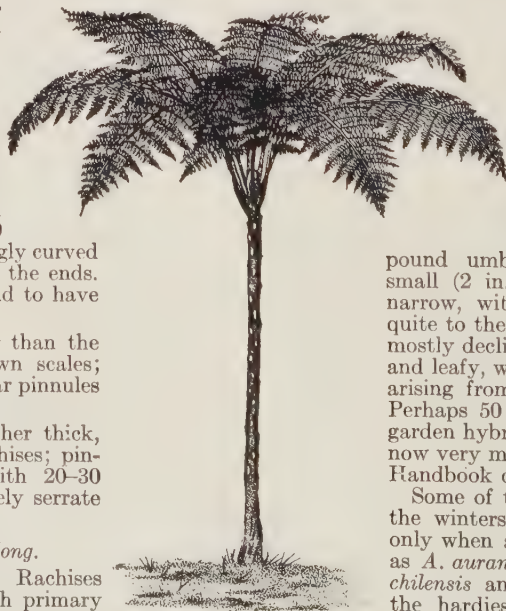

**ALSTÔNIA** (Dr. Alston, once professor of botany at Edinburgh). *Apocynaceæ*. Two trees of this genus are introduced in southern Florida and southern California for outdoor planting.

Corolla-tube cylindrical, usually swollen at the base, the parts spreading, usually twisted in the bud; anthers inclosed in the tube.—Between 30 and 40 species of trees or shrubs of E. India and Austral., with small white fls. in terminal cymes, and simple entire lvs. in whorls or opposite. *A. scholaris*, R. Br., is the devil-tree or pali-mara of India, the bark of which is medicinal. Trees yield caoutchouc.

**macrophýlla**, Wall. A tall tree, with milky juice: lvs. 6–12 in. long, 2½–3 in. wide, oblanceolate or elliptic-lanceolate, obtusely acuminate, nerves 16–20 pairs: cymes numerous, the fls. small; corolla-tube glabrous, the throat villous; ovary glabrous. Malaya.

**scholaris**, R. Br. Tree, 50–90 ft.: lvs. 4–8 in. long, 1–1½ in. wide, coriaceous, usually 4–7 in a whorl, obovate or elliptic-oblong, white beneath; with 30–60 veins: fls. pubescent, subcapitate, ovary hirsute. Wight Icones Ind. Or. 2:422. Rheede Hort. Malab. 1:45.—Intro. by Montarioso Nursery, Santa Barbara, Calif., in 1910. Tropics.

N. TAYLOR.†

178 *Alsophila oligocarpa*.

**ALSTREMERIA** (Baron Alstremer, friend of Linnæus). *Amaryllidaceæ*. **ALSTREMERIA**. Coolhouse and stove plants, with tuberous roots, treated as bulbs; and some of them also grown in the open for summer bloom.

Showy tall or slender plants with the red, purple or yellow blossoms in simple or compound umbels terminating the st.: fls. small (2 in. or less long), comparatively narrow, with 6 segms., parted nearly or quite to the ovary, often irregular; stamens mostly declined; stigma 3-cleft; sts. slender and leafy, weak, or even disposed to climb, arising from a root of thickened fibers.—Perhaps 50 species in S. Amer. There are garden hybrids. The alstremerias are not now very much grown. Monogr. by Baker, Handbook of the Amaryllideæ.

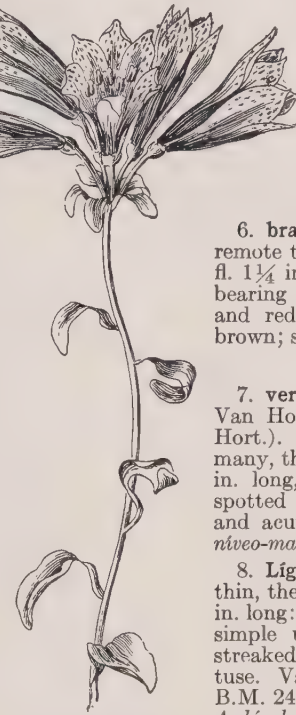

Some of the alstremerias have survived the winters in Washington of late years only when a heavy mulch has been given, as *A. aurantiaca* and its form *A. aurea*, *A. chilensis* and its forms. Evidently among the hardiest are *A. brasiliensis* and *A. pulchella*, although some of the others have

not been tried. For outdoor planting, alstroemerias are at their best in a partly shaded position, and at all times during their growth the roots must have an abundance of water. In fact, there is little use in attempting their cultivation out-of-doors when these conditions cannot be given.—In colder climates, the alstroemerias can be grown very successfully by planting out in spring, and, as soon as they die down, lift, and keep over winter in a place from which frost is excluded. An annual lifting, or, when grown in pots, an annual shaking-out, should be given, because they increase to such an extent that the younger and smaller crowns are apt to take the nourishment from the large flowering crowns. The largest ones ought to be separated from the smaller ones, and either grown in pots or planted outside when the proper time arrives. In this way the genus will become much more popular than it now is either for cutting or for the decoration of the border.—The best soil is largely composed of vegetable humus; when this is not to be had old well-decayed cow- or stable-manure should be incorporated with the soil. When they are planted outside, the tubers should be put deep in the ground, and the soil should be well worked for at least 15 inches. The tubers are slightly egg-shaped, attached to a common stem; the roots are from the ends of the tubers, and also from near the growing points of the crowns.—For greenhouse work one of the best is *A. Pelegrina* var. *alba*. The roots may be potted up in autumn in large pots, and treated as other tender late winter tuberous or bulbous plants are treated. See *Bulbs*. Some of the Van Houtte hybrids are extremely pretty, but, with the others, they are rather unsuitable for pot culture, owing to the peculiar formation of the roots.—The species are easily raised from seeds, which should be sown rather thinly in deep pans, and allowed to remain without pricking off or shifting for the first season; also by division of the roots. (G. W. Oliver.)

179. *Alstroemeria pulchella*. ( $\times \frac{1}{2}$ )

A. Lvs. of fl.-st. (or scape) broad, oblong or oblong-spatulate.

1. *pulchella*, Linn. f. (*A. psittacina*, Lehm.). Fig. 179. Sterile st. a foot or less long, with aggregated petioled lvs.: flowering st. 2-3 ft., with scattered lvs.: fls. in a simple umbel, on pedicels 1-1½ in. long, long funnel-shaped, the segms. unequal, dark red and tipped with green and spotted inside with brown; stamens nearly as long as limb. Brazil. Fig. 179 is of the *A. psittacina*, B.M. 3033.—An old garden plant.

2. *chilensis*, Cree. CHILIAN LILY. Stout, 2-4 ft.: lvs. scattered, obovate or spatulate, or the upper becoming lanceolate, twisted at the base, fringed, somewhat glaucous: fls. large, rose or red (or varying to whitish), the two lower segms. longer and straighter; umbel with 5 or 6 2-fld. peduncles. Chile.

AA. Lvs. of fl.-st. lanceolate (at least the lower ones).

B. Fls. purplish or red.

3. *Pelegrina*, Linn. Fl.-st. stout, a foot or less high: lvs. about 30, thin, ascending, 2 in. or less long and ½ in. or less wide; fl. 2 in. or less long; lilac, the outer segms.

broad and cuspidate, the inner ones spotted red-purple: umbel few-rayed, normally simple, but becoming compound in cult. Also a pure white variety (*A. alba*, Hort.). *A. quillotensis*, Hort., is a robust cult. form. Chile. B.M. 139. Gn. 46, p. 472. L.B.C. 13:1295.

4. *hæmantha*, Ruiz & Pav. (*A. Simsii*, Spreng.). Fl.-st. 2-3 ft.: lvs. crowded and thin, somewhat stalked, 3-4 in. long and ¾ in. or less wide, the upper becoming linear, glaucous beneath: fls. 2 in. or less long, bright red tipped green, the inner ones with red-purple spots on a red-yellow ground; umbel very compound, the branches 4-6 in. long. A white-fl. variety is cult. Chile. B.M. 2353 (as *A. pulchella*).

BB. Fls. yellow or yellowish.

5. *aurantiaca*, Don (*A. aurea*, Hort.). Fl.-st. 2-4 ft. high: lvs. nearly 50, thin, somewhat petioled, slightly glaucous below, 3-4 ft. long and ½ in. wide: fls. 10-30, in a compound umbel, the perianth bright yellow, outer segms. tipped green and inner ones spotted brown.—There is a form with pale, unspotted fls. Chile. B.M. 3350 (as *A. aurea*). Gn. 26: 540. *A. lutea*, Hort., is probably a form of this species.

6. *brasiliensis*, Spreng. St. 3-4 ft.: lvs. remote thickish, oblong-lanceolate, 2 in. long: fl. 1¼ in. long, in a 5-rayed umbel (each ray bearing 1-3 fls.), the segms. oblong-spatulate and reddish yellow, the inner ones spotted brown; stamens shorter than segms. Brazil.

AAA. Lvs. of fl.-st. linear.

7. *versicolor*, Ruiz & Pav. (*A. peruviana*, Van Houtte. *A. sulphurea* and *A. tigrina* Hort.). Fl.-st. short (1 ft. or less high): lvs. many, the lower ones about 1 in. long: fls. 1 in. long, in a nearly simple umbel, yellow spotted purple, the segms. all oblanceolate and acute. A marginate 1-fl. form is var. *niveo-marginata*. Chile.

8. *Ligtu*, Linn. Fl.-st. 1½-2 ft.: lvs. 20-30, thin, the lowermost becoming lanceolate, 2-3 in. long: fls. 1½ in. long, in a nearly or quite simple umbel, whitish, lilac or pale red, streaked purple, the inner segms. often obtuse. Var. *pulchra*, Baker (*A. pulchra*, Sims, B.M. 2421. *A. Flös-Martini*, Ker, B.R. 731. *A. bicolor*, L.B.C. 15:1497), has narrower and longer lvs., and all the segms. acute or cuspidate. Chile. Common and variable in cult.

*A. Hookeri*, Lodd., is a form of *A. Ligtu*. The *A. Ligtu* of B.M. 125 is *A. caryophyllacea*, Jacq., with long-clawed, very unequal segms. in two sets or lips, red and red-striped. Brazil.

9. *violacea*, Phill. St. 1-2 ft.: lvs. scattered and spreading, 1 in. or less long, those on sterile shoots larger, ovate-oblong and 5-nerved: fls. on forked pedicels in a 5-rayed umbel, 1½-2 in. long, bright lilac, the outer segms. obovate, truncate and with a short cusp, the inner oblong-acute, spotted. Chile.

10. *revoluta*, Ruiz & Pav. Fl.-st. 1 ft. or more: lvs. crowded, linear, 1½ in. or less: fls. 6-12, purplish, ¾ in. or less, the segms. oblanceolate-clawed, reflexed or spreading from the middle in full bloom, the inner segms. yellowish and spotted. Chile. L. H. B.

ALTAMIRANO (named for Dr. F. Altamirano, late Director of the Instituto Medico Nacional, of the City of Mexico). *Crassulaceæ*. Low, much-branched perennials with the habit and foliage of *Sedum*, but with the petals united into a distinct tube. On account of the tubular fls., some of the species were first described

as Cotyledon, with which they have little else in common. None of the species is especially attractive, but all of them develop at the base or on the branches curious rosettes of lvs. Twelve specimens are known, of which 5 have been grown in Washington greenhouses and the New York Botanical Garden. *A. elongata*, Rose, has puberulent sts. and lvs. and white fls.; *A. calcicola*, Rose, is more or less glaucous, with turgid lvs. and greenish-yellow fls.; *A. Göldmanii*, Rose, is glabrous, with linear lvs. and pale yellow fls.; *A. Bâtesii*, Rose, is glabrous, with linear lvs. and fls. purplish or becoming so; *A. scopulina*, Rose, is glabrous, with linear lvs. and pure white fls. J. N. ROSE.

**ALTERNANTHERA:** *Telanthera*.

**ALTHÆA** (Greek, *to cure*). *Malvaceæ*. Tall annual, biennial or perennial herbs, grown in the open garden. The flowering shrubs known as altheas are forms of *Hibiscus syriacus*.

Flowers axillary, solitary, or racemose in the axils or at the summit of the st., with 6-9 bracts below the calyx, but otherwise as in Malva.—About 15 species in the temperate regions of the world.

*officinalis*, Linn. **MARSH MALLOW**. Fig. 180. Erect, 3-4 ft., downy: lvs. ovate, often heart-shaped or 3-lobed, frequently undivided, tomentose: fls. 1 in. across, bluish or rose, clustered in the axils of the lvs. Perennial,

180. *Althæa officinalis*. (Plant  $\times \frac{1}{10}$ ). Marsh Mallow.

in marshes. E. Eu., and occurring in this country as an escape.—Root used for mucilage and for other purposes; also medicinal. The root of commerce has its brown outer covering removed. Rarely cult., but occasionally escaped in marshes near the coast.

*rosea*, Cav. **HOLLYHOCK**, which see for culture. St. strict and spire-like, hairy: lvs. large and rough,

rounded-heart-shaped, wavy-angled or lobed: fls. large and nearly sessile, in a long wand-like raceme or spike, in many forms and colors. Biennial. China. B.M. 3198.

*ficifolia*, Cav. **ANTWERP HOLLYHOCK**. Biennial, 3-6 ft.: lvs. 7-lobed, toothed: fl. lemon-yellow or orange, large, in terminal spikes, showy, single or double. Eu.—Grown in Calif.

*cannabina*, Linn. Perennial, 5-6 ft., branching: lvs. digitately 5-parted, upper ones 3-parted, the lobes narrow and strongly toothed: fls. not large, rose-colored, on many-fld. axillary peduncles that are longer than the lvs. Eu.—Grown sometimes as a border plant. It yields a fiber.

L. H. B.

**ALUM - ROOT:**  
*Heuchera*.

**ALÝSSUM**  
(classical name).

*Crucifæræ*. Low plants with many small clustered flowers, grown in the open and often used in rock-gardens.

Plants branching, often tufted: fls. white or yellow, sometimes varying to rose; filaments often notched: fr. a small orbicular pod, with 1 or 2 wingless seeds in each of the 2 compartments; valves of pod nerveless, flattened at the margins.—As many as 100 species in middle Eu., Medit. region and the Caucasus.

The sweet alyssum is one of the commonest annuals, grown both in the open and forced in benches, beds or pots. It is of the easiest culture, either indoors or out. The compact varieties are most prized for pot culture. Under glass, it requires temperature of a carnation house. It will stand considerable frost in the open, and may be sown early; it blooms all summer, and until killed by winter. Useful for window-gardens and baskets. For winter bloom, sow seeds late in August or in September. When blooms begin to fail, cut back the plant, and it will bloom again.

The perennial alyssums require no special treatment. They are usually propagated by dividing the roots; also by cuttings and seeds.

181. Sweet Alyssum.  
( $\times \frac{1}{2}$ )

A. Fls. white; annuals or perennials.

1. *maritimum*, Lam. (*A. odoratum*, Hort.). **SWEET ALYSSUM**. Fig. 181. A low, spreading, light green annual, with lanceolate or linear entire lvs., tapering to the base, and small honey-scented fls. in terminal clusters, which become long racemes. Eu. Many cult. vars.: var. *Benthamii* or *compactum*, a dwarf and compact form, not over 6 in. high; var. *variegatum*, with pale white-edged lvs.; var. *giganteum*, robust, broad-lvd.; var. *procum-*

bens, of spreading habit; and various horticultural forms with trade names.

2. *spinosum*, Linn. A woody-stemmed little perennial, with lanceolate acute silvery lvs., spiny fl. branches, and very small numerous fls. Eu.—Rockwork; 3–6 in. A rose-colored form is reported.

3. *pyrenæicum*, Lapeyr. Dwarf, shrubby, not spiny: lvs. obovate, tomentose: fls. white with brown anthers. Pyrenees. Perennial.

4. *podolicum*, Bess. (*Schivereckia podolica*, Andr. & Bess.). Dwarf: lvs. in rosette, lanceolate, 2-toothed on margins: fls. white, short-pedicelled; petals entire. Early spring. S. Russia. Perennial.

AA. Fls. yellow or orange: perennials.

B. Lvs.  $\frac{1}{2}$  in. or less long.

5. *serpyllifolium*, Desf. (*A. alpestre*, Linn.?). Dwarf (3–4 in. high), somewhat woody at the base, with rough-hoary lvs., and pale yellow fls. in racemes. Eu. Intro. 1892.

BB. Lvs. mostly 1 in. or more long.

6. *saxatile*, Linn. GOLDEN-TUFT. Fig. 182. A foot high, woody at base: lvs.

oblongate or ovate-lanceolate, entire or wavy, hoary-tomentose: fls. golden yellow, numerous, in little compact clusters. Eu. B.M. 159. A.F. 5:37.—Common in rockwork, making a spreading mat, blooming in early spring. There are many forms of this standard rock plant. Var. *compactum*, Hort., dwarf. Var. *florè-plèno*, Hort., double-fl. Var. *variegatum* Hort. (*A. variegatum*, Hort.), has parti-colored foliage, very attractive.

7. *gemonense*, Linn. Less hardy than the last: lvs. lanceolate, grayish, velvety: fls. lemon-yellow: st. woody at base. Eu.

8. *rostratum*, Stev. (*A. Wierzbickii*, Heuff.). About 20 in.: lvs. 2 in. long, broad-oblong, pointed, hairy: fls. deep yellow, in dense heads, in summer. Asia Minor.

9. *argenteum*, Vitm. Fig. 183. Dwarf and dense grower, 15 in. or so: lvs. oblong or spatulate, silvery beneath, some of the tufted fls. yellow, in clustered heads, all summer, beginning later than those of *A. saxatile*. Eu.

10. *montanum*, Linn. Tufted alpine, 2–3 in. high, more or less herbaceous, pubescent: lvs. obovate: fls. yellow, fragrant, in a simple raceme. Eu.

11. *Moellendorffianum*, Asch. Sts. ascending: lvs. with stellate hairs on both sides, from spatulate to subovate, obtuse: fls. yellow, in elongated many-fl. racemes, the pedicels nearly horizontal and bractless: fr. nearly orbicular. Bosnia.

Many other species of *Alyssum* are likely to be found in choice rock-garden collections. *A. alpestre*, Linn. 3 in., grayish: fls. yellow, in simple raceme.—*A. atlanticum*, Desf.=*A. montanum*.—*A. Bertholdii*, Desv.=*A. argenteum*.—*A. cuneifolium*, Tenore=*A. montanum*.—*A. dasycarpum*, Steph. Annual: fls. yellow.—*A. diffusum*, Tenore=*A. montanum*.—*A. macrocarpum*, DC. Shrubby, somewhat spiny, 8 in.: lvs. oblong, silvery: fls. white.—*A. orientale*, Ard. 1 ft.: lvs. lanceolate, toothed, downy: fls. yellow, in corymbs.—*A. tortuosum*, Rupr. 6 in., st. twisted: lvs. narrow, hoary: fls. yellow, in corymbs.

L. H. B

ALÝXIA: *Gynopogon*.

AMAGLÝPTUS: *Hemiraphis*.

AMANITA: *Mushroom*.

AMARABÒYA (native name). *Melastomaceæ*. A genus of only 3 species of tender shrubs from Colombia, which are showy both in foliage and flower. Lvs. large, opposite, sessile, with 3 prominent nerves, brownish red beneath: fls. large, cymose; petals usually 6; stamens 12–15. For cult., see *Pleroma*. Not known to be in American trade. Considered by some as a section of the much larger genus *Blakea*.

*A. amabilis*, Linden. Lvs. 10–12 in. long, 8 in. broad: fls. white, margined carmine; stamens white; style red, exserted. I.H. 34:9. —*A. princeps*, Linden. Fls. carmine; stamens white; styles white. I.H. 34:4. —*A. splendida*, Linden. Fls.  $6\frac{1}{2}$  in. across; petals narrower at the base than in the other species; stamens yellow; style red, exserted. I.H. 34:34.—Perhaps the showiest of all the *Melastomaceæ*.

N. TAYLOR.†

AMARÁNTUS (Greek, *unfading*, in allusion to the lasting character of the calyx and floral bracts). *Amarantaceæ*. AMARANTH. Coarse annual plants, grown for colored foliage and the showy flower-clusters; related to the cockscomb.

Plants tall and erect or spreading or even prostrate: lvs. alternate, entire, petioled: fls. very small congested in terminal or axillary spikes or glomerules, each fl. subtended by 3 chaffy bracts; petals 0; sepals 3–5, persistent; stamens 2–5: fr. a small 1-seeded utricle.—Some 45–50 species, mostly weedy plants, widely distributed. Some of the pigweeds are of this genus, as *A. retroflexus*, sometimes known as beet-root and red-root; *A. hybridus*; *A. græcizans* (*A. albus*), one of the tumble-weeds; *A. spinosus*; *A. blitoides* and *A. Palmeri*, spreading eastward along railroads.

The amarantus are usually planted as open-air annuals, and they require no special treatment. They thrive best in a hot and sunny place. In very rich soil the leaves become very large but usually lack in bright coloring. Seeds may be sown in the open or in frames. The dwarf and compact varieties, which often have beautifully variegated foliage, may be grown in pots or used for bedding. Give plenty of room.

A. Lvs. linear-lanceolate, long and drooping.

*salicifolius*, Veitch. Graceful pyramidal habit, 3 ft.: lvs. 5–8 in. long and  $\frac{1}{4}$  in. wide, wavy, bronze-green, changing to orange-red. Philippines. G. C. I. 1871: 1550. F.S. 19:1929.

AA. Lvs. broad, mostly ovate.

B. Spikes drooping.

*caudatus*, Linn. LOVE-LIES-BLEEDING. Fig. 184. Tall, robust and diffuse (3–5 ft.): lvs. ovate to ovate-oblong,

183. *Alyssum argenteum*. (Plant  $\times \frac{1}{2}$ )

182. *Alyssum saxatile*. ( $\times \frac{1}{4}$ )

stalked, green: spikes red, long and slender, naked, in a long and drooping panicle, the terminal one forming a long, cord-like tail. Also vars. with yellowish and whitish panicles. Tropics. G.W. 6:709.—Common, and an old favorite. Var. *atropurpureus*, Hort. Foliage blood-red. Var. *albiflorus*, Hort. Spikes white or greenish white. Var. *gibbosus*, Hort. Plant not large: fls. red, clustered in more or less separated fascicles or heads.

BB. Spikes erect.

*hypochondriacus*, Linn. PRINCE'S FEATHER. Tall and glabrous: lvs. oblong-lanceolate, acute: spikes blunt, aggregated into a thick, lumpy terminal panicle, of which the central part is elongated: bracts long-awned.—An old garden plant, with the heavy heads variously colored, but mostly purple. Lvs. usually purple or purple-green. Trop. Amer. Cult. in many forms and sometimes a weed in old grounds. Considered by some to be a form of *A. hybridus*, Linn. (*A. hybridus* var. *hypochondriacus*, Rob.). Var. *sanguineus*, Hort. (*A. cruentus*, Hort., not Willd.). Entire plant blood-red. Var. *virescens*, Hort. Lvs. green above, purplish beneath. Var. *viridis*, Hort. Plant green, except the floral parts. Var. *racemosus*, Moq. Lateral fl.-branches elongated, light-colored. There are other garden forms.

*paniculatus*, Linn. (*A. hybridus* var. *paniculatus*, Uline & Bray). St. usually pubescent: lvs. oblong-ovate to ovate-lanceolate, broader than in the last: spikes thinner than in the last, acute or acutish, and in an open, more graceful terminal panicle: bracts sharp-pointed but not long-awned. Trop. Amer.—Common, and sometimes a weed. Var. *speciosus* (*A. speciosus*, Sims, B.M. 2227). Stout, large, erect plant (3½–4½ ft.), with sts. and lvs. reddish or purple-green: panicle dark red-purple; handsome. Var. *cruentus*, Moq. (*A. cruentus*, Linn., not Hort.). Lateral fl.-branches spreading-nodding, blood-red. Var. *sanguineus*, Moq. Lateral branches long, slender, often nodding at the tip: fls. and some or all the lvs. blood-red. Var. *flavescens*, Voss. Panicles large and branched, yellowish or greenish.

*gangeticus*, Linn. Usually a lower plant, 3 ft. or less and often only 1 ft., with thin, ovate-pointed lvs., and fls. in short, glomerate, interrupted spikes, both terminal and axillary. Tropics.—Very variable. Cult. by Amer. Chinese (Fig. 185) as a pot-herb under the name of hon-toi-moi, with green lvs. (Bailey, Bull. 67, Cornell Exp. Sta.). Various dwarf and compact bedding forms are common. Used more for foliage than for fl.-panicles. Var. *melancholicus*, Voss (*A. melancholicus*, Linn.). Lvs. variously colored, sometimes mostly in two colors (*A. bicolor*, Hort.), and also in three colors (*A. tricolor*, Hort.): lvs. long-petioled, broadly to narrowly lanceolate. Here belong the JOSEPH'S COAT group of the bedding amaranths.

Many Latin-form names are in the catalogues, probably all of which are referable to above species or are hybrids of them: as *A.*

*splendens*, a form of *A. gangeticus* var. *melancholicus*; *A. speciosus aureus*, to *A. paniculatus* var. *flavescens*; *A. Héndert*, probably a hybrid with *A. salicifolius*, or a var. of it, with long-drooping, brown lvs., and tall, pyramidal stature; *A. Górdonii*, or Sunrise, with bronzy banded lvs. and brilliant scarlet lvs. on top; *A. superbus*, lvs. blood-red above and crimson beneath, probably one of the melancholicus forms; *A. Dissii*, Spreng., with lvs. and fls. bright colored, and suggested as a var. of *A. spinosus*, which is a smooth weedy species with 2 spines in the axils of the narrow-ovate or rhomb-ovate lvs. —*A. Huttonii*, Veitch=Celosia. L. H. B.

**AMARYLLIS** (classical name). *Amaryllidaceæ*. Summer- or autumn-blooming bulbous plant (March and Apr. at the Cape), the leaves usually appearing later.

Plant stout, producing many strap-like lvs.: fls. large, fragrant in a few- to several-fl. umbel; perianth with a short ribbed tube, the divisions oblong or lanceolate, the filaments distinct and no scale between them; stamens on the throat of the tube: fr. a globose caps., opening irregularly.—One species, from Cape of Good Hope. In gardens, the hippeastrums (winter and spring bloomers) are known as Amaryllis.

In dealing with the culture of amaryllis, it is customary to speak of the genus in its horticultural sense,—to include hippeastrum and related things. Such is the understanding in the following cultural directions. There are two widely differing methods of cultivating the amaryllis to produce showy flowers in the spring months,—the border method and the pot method. Any one trying both of these methods will soon come to the conclusion that they differ not only in method, but in flower-producing results. The first method is to plant the bulbs in a prepared border after they are done flowering, say about the middle of May. The border should have perfect drainage, and, if convenient, be on the south side of a house or wall, fully exposed to the sun during the greater part of the day. The bulbs are set out in rows, necessarily with as little disturbance of the roots as possible, because, if they are bulbs that have undergone similar treatment the previous year, by the middle of May they have made a considerable number of new roots; besides, the foliage also has gained some headway, and may be considered as in actual growth. In planting, carefully firm the soil around the old balls, give one watering, and on the succeeding day, after the surface of the soil has been raked over, cover to the depth of 2 inches with half-decayed cow-manure. With frequent waterings during the summer and the removal of weeds, they will need no more attention until the approach of cool weather, when they should be lifted, sized, and potted; however, at this season, if wet weather has predominated, some of the bulbs will be in a semi-dormant state, while the majority will yet be in active growth. Here is the drawback to this method: The roots are large and fleshy, they

185. Amaranthus gangeticus. (X 1/4)

take up considerable room in a 6- or 7-inch pot, and the soil cannot be evenly distributed amongst them, neither can it be made as firm as it should be. The result is the partial decay of the roots and leaves, and in the spring, when the flower scapes appear, they are developed at the expense of the bulb, through having insufficient roots to take up nourishment from the soil. The flowers are small, few in number, and do not show what the plant is capable of. Partly to ameliorate these

conditions, the bulbs in active growth at lifting time may be heeled-in on a greenhouse bench until they gradually ripen, taking care that some of the soil is retained on the roots; otherwise the ripening process is altogether too rapid, so that the roots and leaves suddenly lose their robust nature, become flabby, and eventually die. For this method, it can be said that a larger number of bulbs can be grown with less trouble than by the pot method, but neither bulbs nor flowers compare in size with those kept in pots the year round. For the purpose of merely increasing stock, the outdoor method is to be preferred.—Most of the kinds are naturally evergreen; potting under those conditions is best done either after the plants have made their growth in the fall or after they have finished flowering in April. When done in the fall, they are allowed to remain rather dry during the winter; this will keep the soil of the original ball in a sweet condition until the time arrives to start them into growth, which may be anywhere after the first of January, or even earlier if necessary. They will winter all right, and keep their foliage, in a brick frame in which the temperature is not allowed to fall below 45° F. By the beginning of February, in a structure of this sort, they will be showing flower-scapes, and should then be taken to a position in which more heat and light can be given. A weak solution of cow-manure will much help the development of the flowers. When in bloom, a greenhouse temperature, with slight shade, will prolong the flowering period. After flowering, the greatest care should be taken of the plants, as it is from that period till the end of summer that the principal growth is made. A heavy loam, enriched with bone-dust and rotted cow-manure, suits them well.—The seeds of *hippeastrums* should be sown as soon as ripe, covered very lightly with finely sifted leaf-mold, and, if this shows a tendency to dry too quickly, cover with panes of glass until germination takes place. As soon as the first leaves are developed, they should be potted in the smallest sized pots and kept growing.—In the propagation of varieties, it will be found that the large bulbs make two or more offsets each season; these should not be detached until it is certain that they have enough roots of their own to start with after being separated from the parent. If a well-flowered specimen clump is desired, the offsets may be allowed to remain attached to the parent; they will, in most cases, flower the second year under generous treatment.—*Amaryllis Belladonna* and the plant known as *A. longifolia* (really a *crinum*) are hardy in the District of Columbia; *A. longifolia* thrives even in damp, heavy soils, with no protection, and flowers abundantly each year. *A. Belladonna* needs a warm, sheltered spot, with deep planting. This popular autumn-blooming plant succeeds best where it can remain out-of-doors all the year. It seems to thrive in fairly rich sandy loam. A position facing south near the wall of house or by the side of a greenhouse seems to suit its requirements. In rather dry soils where frost does not penetrate deeply, it is not necessary to lift the tubers each year. (G. W. Oliver.)

**Belladonna**, Linn. **BELLADONNA LILY**. Fig. 186. Scape 2-4 ft., with a 2-lvd. dry spathe or involucre just underneath the umbel: fls. on short pedicels, lily-like, short-tubed, and flaring, with pointed segms. 2-3 in. long, and 6 deflexed stamens, fragrant, normally rose-red; scape solid: lvs. strap-shaped, canaliculate and acute. B.M. 733. Gn. 33:268; 47, p. 46; 49, p. 276; 54, p. 414. G.C. III. 24:315.—An old favorite, with many Latin-named garden forms. There are varieties ranging from white to red, and varying in shape and size of fls., many of them receiving Latin descriptive names. Var. *purpurea*, Hort. Fls. purple, at least on the limb. Var. *pallida* (*A. pallida*, Red.), has pale flowers. Var. *blanda*, Voss (*A. blanda*, Gawl. B.M. 1450), is a large form, with white fls., fading to blush. Var. *rosea perfecta*, Hort. Excellent blooms, satiny rose and white-

striped: fls. late, at the time the lvs. appear; the segms. pointed. Gt. 45, p. 443. Var. *spectabilis tricolor*, Hort. Fls. showy, in large umbels, rose-color, white inside, highly perfumed. Gt. 45, p. 358. Var. *máxima*, Hort. Strong grower, with many large rose-colored fls. G.M. 45:303. Var. *Párkeri* (*A. Párkeri*, Hort.). Probably hybrid of *Brunsvigia Josephinæ* and *Amaryllis Belladonna*: umbel circular, with as many as 30 blooms; fls. deep rose with white and orange at base inside, and orange on outside of tube: 3 ft., handsome: also a white-fl'd. form. G.C. III. 50:211. Gn. 75, p. 460.

See *Brunsvigia* for *A. gigantea* and *A. orientalis*; *Crinum* for *A. longifolia* and *A. ornata*; *Hippeastrum* for *A. alvica*, *A. equestris*, *A. fulgida*, *A. Johnsonii*, *A. Leopoldii*, *A. pardina*, *A. procea*, *A. Regina*, *A. reticulata*, *A. vittata*; *Lycoris* for *A. aurea*, *A. Hallii*, and *A. radiata*; *Nerine* for *A. Nerine*; *Sprekelia* for *A. formosissima*; *Sternbergia* for *A. lutea*; *Vallota* for *A. purpurea*; *Zephyranthes* for *A. Atamasco*, *A. candida* and *A. erubescens*. The following trade names probably belong to other genera, most likely to *Hippeastrum*: *A. crocea*, *A. Graveana*, *A. macrantha*, *A. refulgens*. L. H. B.

**AMASÓNIA** (after Thomas Amason, early American traveler). *Verbenacæ*. About a half-dozen species of under-shrubs of Trop. Amer. Fls. yellow or sulfur-colored in racemose or paniculate clusters; calyx 5-cleft; corolla 5-cleft, almost 2-lipped. May be treated as warmhouse species of *Clerodendron*.

**calycina**, Hook. f. (*A. punicea*, Hort. not Vahl. *Taligalea punicea*, Hort.) Lvs. 6-12 in. long, elliptic, acuminate, coarsely irregularly toothed or sinuate, glabrous, except the floral ones: fls. 1½-2 in. long, drooping; calyx nearly 1 in. long, red. B.M. 6915. Gn. 27:130. R.B. 20:13.

*A. erecta*, Linn. A slender, sparingly branched shrub: lvs. alternate and whorled, 4-5 in. long, oblong, crenate-serrate, dark green above, paler beneath: fls. white, racemously paniculate; bracts scarlet. Guiana.

N. TAYLOR.†

186. *Amaryllis Belladonna*.

**AMBRÓSIA** (a classical name). *Compositæ*. About fifteen species of weedy evil-smelling herbs, mostly American. The common ragweed is *A. artemisiæfolia*, Linn. The kingweed of western wheatfields, and also of low waste places, is *A. trifida*, Linn. Probably none is cultivated, the listed *Ambrosia mexicana* probably being of some other genus, very likely an *artemisia*.

**AMBROSÍNIA** (*Giacinti Ambrosini*, an Italian). *Aracææ*. A dwarf perennial tuberous herb of Italy and Algeria.

Spathe boat-shaped, lying on the earth, the mouth gaping; spadix included: fr. a many-seeded berry.—Half-hardy; planted in the open or in pots, and blooming in the fall. A single species.

**Bássii**, Linn. Three or 4 in.: lvs. 2 or 3, overtopping the spathe, the lf.-blade ovate or ovate-elliptic, obtuse, often retuse: spathe ¾ in. long, tipped with a brown tail, divided lengthwise, the anthers being in one compartment (which has a hole to admit insects), and the solitary ovary in the other, thus preventing automatic close pollination. B.M. 6360.—There is a narrow-leaved form (var. *angustifolia*, Guss.), a spotted-leaved form (var. *maculata*, Engler), and a form with pale green reticulations (var. *reticulata*, Engler). Propagation is by seeds started inside or in frames, or by division in spring.

L. H. B.

**AMELANCHIER** (said to be a Savoy name). *Rosa-ceæ*. SHAD-BUSH. JUNE-BERRY. Ornamental woody subjects chiefly cultivated for their profuse white flowers appearing in early spring; some species also grown for their fruits.

Deciduous shrubs or small trees: winter-buds conspicuous, pointed, with several imbricate scales: lvs. alternate, petioled, serrate: fls. in racemes terminal on short branchlets, rarely solitary; calyx-tube campanulate, adnate to the ovary, with 5 persistent lobes; petals 5; stamens 10-20; styles 2-5; ovary inferior, 2-5-celled, each cell with 2 ovules and subdivided: fr. a berry-like pome, juicy, with a cavity at the top.—About 20 or 25 species, most of them in N. Amer., 2 in Mex., 4 in Eu., and W. Asia, and 1 in E. Asia. The species are closely related and often difficult to distinguish,

187. *Amelanchier alnifolia*.  
( $\times \frac{1}{2}$ )

especially as numerous spontaneous hybrids apparently occur. For a detailed treatment of the species of E. N. Amer., see Wiegand in *Rhodora* 14, p. 117 (1912). In trade catalogues, they are sometimes confused with *Aronia*, which is easily distinguished by its compound corymbose infl., 5-celled mealy fr. and by the midrib of the lvs. being glandular above.

The amelanchiers are deciduous shrubs or trees with simple, suborbicular to oblong serrate leaves, rather small white flowers in racemes followed by purplish or bluish black berry-like fruits. They are very desirable for ornament, producing a profusion of white flowers in early spring, and range from shrubs only a few feet high, as *A. humilis* and *A. stolonifera*, to trees attaining 40 feet in height, as *A. canadensis* and *A. laevis*. The latter species is perhaps the most beautiful, the white color of the pendulous loose racemes being enhanced by the red bracts and the bronzy red color of the unfolding leaves; the other species are pure white when blooming, the young leaves being covered by a whitish tomentum.

*A. humilis* and *A. stolonifera* and also *A. sanguinea* seem to be the best for fruit, which ripens later than the others; there is also a large-fruited form of *A. laevis*. See *Juneberry*.

All the species mentioned below are hardy North and thrive upon a variety of soils and succeed well in dry climates; some, as *A. sanguinea*, *A. humilis* and *A. rotundifolia* show a preference for calcareous soil and grow well in dry situations, while others, as *A. oblongifolia* and *A. Bartramiana* prefer moist and swampy soil.

Propagation is by seeds sown soon after ripening or stratified and sown in spring and the stoloniferous species also by suckers; rare kinds are sometimes budded in summer on a common species or on *Crataegus*.

<i>florida</i> , 4.		

A. Fls. in racemes: lvs. folded in bud; petioles slender.

B. Styles free, very short, not exceeding the calyx-tube.

1. *rotundifolia*, Dum.-Cours., not Roem. (*A. Amelanchier*, Sarg. *A. vulgaris*, Moench. *A. ovalis*, Medikus, not Borkh.). SERVICE-BERRY. Upright or spreading, rather stiff-branched shrub, 2-8 ft.: young branchlets tomentose: lvs. oval to obovate, serrate from near the base, subcordate at the base, usually rounded at the apex, 1-2 in. long, woolly beneath when young: racemes many-fl.; petals linear-oblongate, obtuse or emarginate: fr. bluish black, bloomy. May; fr. in Aug., Sept. Cent. and S. Eu. B.M. 2430. H.W. 3, p. 87. G.C. II. 9:793. M.D.G. 1900:497 (habit). J.H. III. 54:395.

BB. Styles more or less connate at the base, about as long as the stamens.

C. Teeth of lvs. about  $\frac{1}{4}$ - $\frac{7}{8}$  in.; lvs. rather coarsely serrate; veins usually straight and close together.

D. Apex of lvs. acute or acutish; blade densely woolly beneath when young.

2. *sanguinea*, DC. (*A. rotundifolia*, Roem., not Dum.-Cours. *A. canadensis* var. *spicata*, Sarg., in part. *A. spicata*, Rob. & Fernald, not Koch). Slender shrub: sts. solitary or few together, to 8 ft. high: lvs. orbicular-oval to oval-oblong, rounded or subcordate at the base,  $1\frac{1}{2}$ - $2\frac{1}{2}$  in. long, serrate nearly to the base: fls. on a loose, usually nodding raceme; petals  $\frac{1}{2}$  in. long; summit of ovary densely woolly: fr. rather large, nearly black, bloomy, juicy and sweet. Maine to Minn. and Ala. May; fr. in Aug., Sept. B.B. 2:238 (as *A. rotundifolia*).—Var. *grandiflora* (forma *grandiflora*, Wiegand). Fls. large; petals  $\frac{3}{4}$  in. long and nearly  $\frac{1}{4}$  in. wide.

3. *humilis*, Wiegand (*A. spicata* of many writers, not Koch). Stiffly upright shrub, 1-4 ft., stoloniferous and forming patches: lvs. oval-oblong or oval, subcordate or rarely rounded at the base, 1-2 in. long, serrate to below the middle: racemes many-fl., rather dense and upright; fls. small; petals oblong-obovate, about  $\frac{1}{2}$  in. long; fr. nearly black, bloomy, juicy and sweet. May; fr. in Aug. Vt. to Alberta, south to N. Y. and Iowa.

DD. Apex of lvs. rounded or truncate: blade very soon glabrous.

4. *alnifolia*, Nutt. (*A. canadensis* var. *alnifolia*, Torr. & Gray). Fig. 187. Shrub with rather stout upright branches, to 10 ft.: lvs. broadly oval to oval-truncate or subcordate at the base, 1- $1\frac{3}{4}$  in. long,

coarsely and sharply toothed rarely below the middle, floccose-tomentose at first, very soon becoming glabrous: racemes many-fl'd., upright, short and dense, slightly tomentose at first; fls. rather small; petals oblong to narrowly oblong,  $\frac{1}{2}$ – $\frac{1}{2}$  in. long; sepals short: summit of the ovary woolly; fr. nearly black, bloomy. May; fr. in July. Mich. to Ore. and Wash. S.S. 4:196. S.F. 1:185; 5:415. G.M. 52:143 (habit). Var. *florida*, Schneid. (*A. florida*, Lindl. *A. oxyodon*, Koehne). Lvs. and racemes glabrous or nearly so from the beginning. B.R. 19:1589. Var. *pumila*, Schneid. (*A. canadensis* var. *pumila*, Nutt.). Glabrous like the preceding var., but very low and stoloniferous.

CC. Teeth of lvs. 7–15 to  $\frac{1}{2}$  in.; lvs. finely and closely serrate.

D. Lvs. tomentose when young.

E. Apex of lvs. obtuse, rounded or sub-acute.

F. Top of ovary woolly; lvs. generally oval.

5. *stolonifera*, Wiegand (*A. spicata*, Brit. & Brown, in part, not Koch. *A. ovalis* of many authors, not Medikus). Upright stoloniferous shrub, 1–4 ft. high, forming patches: lvs. oval, rarely oval-oblong or orbicular, rounded at the base or rarely subcordate, 1–2 in. long, finely serrate, usually quite or nearly entire on the lower third, glabrous above, densely white-tomentose beneath when young: racemes short, dense, upright, tomentose or nearly glabrous; fls. small; petals obovate-oblong, about  $\frac{1}{2}$  in. long; top of ovary woolly; fr. purplish black, bloomy, juicy and sweet. May, a few days later than *A. laevis*; fr. in July. Newfoundland and Maine to Va.

6. *ovalis*, Borkh. (*A. spicata*, Koch, *Crataegus spicata*, Lam.). Bushy shrub with numerous sts., to 12 ft.: lvs. oval to obovate, sometimes oval-oblong,  $1\frac{1}{2}$ – $2\frac{1}{2}$  in. long, serrate to the base, white-tomentose beneath when young: racemes upright, woolly; petals obovate,  $\frac{1}{2}$  in. long; top of ovary woolly; fr. bluish black, with the sepals upright and slightly spreading. M.D.G. 1900: 496.—This is possibly a hybrid between the preceding and the following species; much cult. in Eu.

FF. Top of ovary glabrous or nearly so: lvs. generally oblong.

7. *oblongifolia*, Roem. (*A. canadensis* var. *oblongifolia*, Torr. & Gray. *A. Botryopium*, Brit. & Brown, in part. *A. obovalis*, Ashe.). Shrub, with slender upright sts. growing in rather dense clumps, but not stoloniferous, to 25 ft.: lvs. oblong to obovate-oblong, usually rounded at the base, and rounded or acute at the apex,  $1\frac{1}{4}$ – $2\frac{1}{2}$  in. long, very finely serrate nearly or quite to the base, white-tomentose beneath when young: racemes short, dense and upright, silky-tomentose; petals obovate-oblong to oblanceolate or linear, about  $\frac{1}{2}$  in. long; top of ovary glabrous or sometimes slightly woolly; fr. nearly black, with bloom, sweet. May, with *A. laevis*; fr. in June. Maine to S. C.—S.S. 4:195. Em. 2:503 (lower figure). B.M. 7619. G.C. III. 21:333. D.G.M. 1900: 497 (habit).—This differs from all other species except *A. ovalis* and *A. Bartramiana* in having the sepals on the immature fr. upright or only slightly spreading; in the other species they are recurved.

EE. Apex of lvs. very acute or shortly acuminate.

8. *asiatica*, Endl. (*A. canadensis* var. *asiatica*, Miq. *A. japonica*, Hort.). Shrub or tree, to 40 ft., with slender spreading branches: lvs. ovate to oblong-elliptic, acute, rounded or subcordate at the base, 2–3 in. long, finely serrate all around, densely white or yellow tomentose beneath when young: racemes rather dense, nodding, woolly, top of ovary woolly; fr. bluish black. May; fr. in Sept. Japan, Korea. S.Z. 1:42. S.I.F. 1:47. Var. *sinica*, Schneid. Lvs. less tomentose, often finally glabrous, smaller, usually serrate only above the middle. China.

9. *canadensis*, Medikus (*A. Botryopium*, Borkh. *A. canadensis* var. *Botryopium*, Torr. & Gray. *A. canadensis* var. *tomentula*, Sarg.). SERVICE-BERRY. Bushy tree, fastigiate branched: st. solitary or few, sometimes shrubby: lvs. generally obovate, less often ovate, oval or oblong, acute or acuminate, usually cordate at the base,  $1\frac{1}{2}$ – $3\frac{1}{2}$  in. long, sharply serrate quite or nearly to the base, densely white-tomentose beneath when young, less so above, tomentum usually partly persistent: racemes rather dense, nodding, silky-tomentose; petals linear or linear-oblong, about  $\frac{1}{2}$  in. long; top of ovary glabrous or slightly hairy; fr. maroon-purple, tasteless. May, early, before the lvs.; fr. in June. Maine to Iowa, Mo. and south to Ga. and La. S.S. 4: 194. B.R. 14:1174. Gn. 73, p. 239 (habit; may be *A. oblongifolia*).—This is the only species with the lvs. tomentose on both surfaces when young.

DD. Lvs. quite glabrous.

10. *laevis*, Wiegand (*A. canadensis*, Gray, not Medikus). Irregularly branched tree, with spreading

branches, to 40 ft., sometimes shrubby: lvs. oval-ovate to ovate-oblong, short-acuminate, subcordate or rotundate at the base, rarely broadly cuneate,  $1\frac{1}{2}$ – $2\frac{1}{2}$  in. long, sharply serrate nearly to the base, quite glabrous and purplish when young: racemes slender, many-fl'd., drooping, glabrous or nearly so, lower pedicels very long, in fl. about 1 in., in fr. sometimes 2 in. long; petals oblong-linear, about  $\frac{1}{2}$  in. long; top of ovary glabrous; fr. purple or nearly black, bloomy, juicy and fairly sweet. May; fr. in June. From Newfoundland to Mich. and Kans., south to Ga. and Ala. Em. 2:503 (upper figures). H.T. 242. M.D.G. 1900:494, 495. G. 16:48; 34:343 (habit). G.M. 44:306 (habit).—This is the most graceful and the handsomest species in bloom, differing from all other species in the purplish young foliage and the drooping racemes.

AA. Fls. solitary or 2 or 3 at the end of the branchlets; petals broad, obovate: lvs. imbricate in the bud, flat when unfolding; petioles short, less than  $\frac{1}{2}$  in. long.

11. *Bartramiana*, Roem. (*A. oligocarpa*, Roem. *A. arguta*, Nutt.). Fig. 188. Shrub, to 8 ft.: lvs. elliptic

to elliptic-oblong, acute or rounded at the apex, cuneate at the base,  $1\frac{1}{4}$ –2 in. long, sharply serrate to below the middle or nearly to the base, glabrous when young; fls. 1–3, pedicels glabrous,  $\frac{1}{2}$ –1 in. long; petals about  $\frac{1}{2}$  in. long; top of ovary woolly; fr. purplish black, bloomy. May; fr. in July and Aug. Swamps. Labrador to Mich. and Minn., south in the mts. to Pa. G.F. 1:247 (adapted in Fig. 188).

*A. Cusickii*, Fernald. Shrub, to 10 ft.: lvs. suborbicular, about  $1\frac{1}{2}$  in. long, glabrous or nearly so; fls. large, petals oblong, about  $\frac{3}{4}$  in. long; fr. scarlet, finally black. Ore. and Wash. to Idaho.—Not in cult., but ought to be intro., as it has the largest fls. of all.—*A. ulahensis*, Koehne. Dwarf shrub with small obovate lvs. scarcely 1 in. long, pubescent on both sides; racemes short, with very small fls. Utah and Ariz.—Not in cult.; the plant cult. under this name belongs to another species, to which could not be determined.

ALFRED REHDER.

**AMÉLLUS** (for the river Mella). *Compósitæ*. Nine or 10 Cape of Good Hope annual and perennial herbs allied to Aster. Lvs. hairy, oblong, opposite below; heads solitary and terminal or lateral; fls. blue-rayed; pappus single. *A. Lychnitis*, Linn., sometimes grown as an evergreen glasshouse plant, has linear-lanceolate hoary lvs. and showy blue or violet fls. Summer bloomer, a few inches high.

**AMHÉRSTIA** (Countess Amherst and her daughter, Lady Amherst, promoters of botany in India). *Leguminosæ*. A monotypic genus comprising *A. nobilis*, Wall., one of the noblest of flowering trees, native to India, where it reaches a height of 40 ft. and more. Fls. gaudy red, 8 in. long, with wide-spreading petals, the upper ones gold-tipped, and colored petal-like bracts, in long, hanging racemes; lvs. pinnate, nearly 3 ft. long. The tree first flowered in Eng. in 1849. It requires hothouse treatment. The fls. last only 2 or 3 days. Demands rich, loamy soil, and abundant moisture during the growing season, after which the wood must be ripened firm. Propagation is by seeds, more often by cuttings of half-ripened wood under a glass, with bottom heat of about 80°. Thrives well in the open in Jamaica. B.M. 4453. F.S. 5:513–516.

N. TAYLOR.†

**AMIÁNTHIUM**: *Zygadenus*.

**AMÍCIA** (named for J. B. Amici, Italian physicist, born 1786). *Leguminosæ*. Woody plants, one of which is known in cultivation as a half-hardy greenhouse subject, or in the open in warmer regions.

Straggling pellucid-dotted shrubs, or sub-shrubs, with alternate abruptly pinnate lvs. and few lfts.: fls. rather large, papilionaceous, yellow, in axillary or terminal racemes or rarely solitary; calyx with 2 very large upper segms. and very small lateral segms.; stamens equal: fr. very narrow, compressed, jointed.—About 5 species in the mts. of Mex. to Bolivia.

**Zygomeris**, DC. Eight feet, pubescent: lfts. 2 pairs, orbiculate or wedge-shape, mucronate: fls. large, pale yellow with purple on the keel; pod 2-jointed. Mex.—Intro. in S. Calif.; unusual in greenhouses. L. H. B.

**AMMÔBIUM** (Greek, *living in sand*). *Compósitæ*. Hardy herb, cult. as an everlasting or immortelle.

Florets perfect, yellow, surrounded by a dry, silvery white involucre, and subtended by chaffy scales; pappus of 2 bristles and 2 teeth.—Two or 3 Australian species. Commonly grown as an annual, but seeds are sometimes sown in Sept., and the plant treated as a biennial. Of easiest culture, the seeds being sown where the plants are to grow. In the N., sow seeds in spring. Cut the fls. before they are fully expanded, and hang in a dry, shady place. They will then remain white.

**alatum**, R. Br. Three ft. or less high, erect and branched, white-cottony, the branches broadly winged: early root-lvs. ovate at the ends and long-tapering below (javelin-shaped); st.-lvs. small and distant, entire or nearly so; heads 1–2 in. across, the involucre becoming pearly white, petal-like; fls. all tubular. V. 2:62.

Austral. A large-headed form is var. **grandiflorum**, Hort. L. H. B.

**AMMÓCHARIS** (*ammos*, sand; *charis*, beauty). *Amaryllidaceæ*. Greenhouse bulb, cultivated for late winter and spring bloom.

Allied to *Brunsvigia*, but the perianth regular, the tube cylindrical and straight, ovary flask-shaped and narrowed to a neck.—Two species in Cape of Good Hope region (by some regarded as forms of one species): *A. falcata*, Herb., with limb 4 times length of tube, and *A. coranica*, Burchell, B.R. 139:1219 (as *Amaryllis*), with limb only twice as long.

**falcata**, Herb. Bulb ovoid, sometimes 6–9 in. diam., with brown tunics: lvs. 1–2 ft. long, 1 in. wide, strap-shaped, spreading, produced in spring before the bloom: fls. 20–40, in an umbel, bright red, fragrant.—*A. falcata* requires rich, loamy soil. It starts to grow in the spring. Give plenty of water during growing season in summer. It can be cult. out-of-doors. When perfected and finished in autumn, the bulb may be put under the greenhouse bench; keep moderately dry in sand or earth; may be potted in January, after which it will soon throw out its fine, fragrant blooms.

L. H. B.†

**AMMONIACAL CARBONATE OF COPPER**: *Fungicide*.

**AMMÓPHILA** (Greek, *ammos*, sand, and *philein*, to love). *Graminææ*. Perennial grasses, with long, creeping rootstalks and spike-like panicles: spikelets 1-flid., awnless, the rachilla prolonged behind the palea as a hairy bristle; lemma firm, about as long as the glumes, hairy at the base; palea as long as lemma—Species 1 or 2, on the sandy seacoast of Eu., the Atlantic Coast of N. Amer. and the shores of the Great Lakes.

**arenaria**, Link (*A. arundinacea*, Host). BEACH-GRASS. MARRAM-GRASS. SEA SAND-REED. PSAMMA. One to 3 ft.: blades long, somewhat involute: panicle pale, several in. or as much as a ft. long. Dept. Agric., Div. Agrost. 7:167; 14:11. Sand-dunes along the seacoast.—On account of the long, hard, branching rootstocks, it has been much used as a sand-binder in Eu. and certain parts of Amer., especially Cape Cod and Golden Gate Park in San Francisco.

A. S. HITCHCOCK.

**AMÔMUM** (Greek-made name, referring to the qualities as antidote for poisons). *Zingiberaceæ*. Hothouse ginger-like herbs with narrow entire leaves, grown for the habit and foliage and for the flowers in dense cone-like spikes.

Amomums are aromatic tropical and subtropical plants, spreading by means of hard rhizomes and forming dense masses of handsome erect or spreading annual sts. and linear, lanceolate or elliptic lvs.: fls. in dense cone-like spikes or racemes, half hidden in the floral-bracts; calyx funnel-shaped, split down one side, only slightly toothed; corolla-tube cylindrical, little longer than the calyx, the upper lobe curved, the 2 lower spreading and narrow; lip (staminode) large and petal-like, mostly obovate-cuneate; fertile stamen with a narrow or a very slender filament: fr. ovoid, with a thick and fleshy exterior.—About 50 species in tropics of Asia, Afr. and Pacific Isls., allied to *Alpinia* and *Elettaria*. The “grains of paradise” are amomum seeds, of several species, probably mostly of *A. Granum-Paradisii* and *A. Melegueta*; they are used, or have been used, for flavoring beverages. Cardamons (aromatic tonic seeds) are secured from species of *Amomum* and from *Elettaria*.

Some of the amomums are extremely handsome as foliage plants, apart from their flowers. Many of the species have been confused with and included with the genus *Alpinia*, but may be readily distinguished from the flower-clusters, being borne on erect-solitary peduncles arising from the base of the leafy stem or direct

from the rhizome, the inflorescence in *Alpinia* being always terminal on the leafy shoots. They thrive in an open soil, rich in humus and with abundance of water during the growing period. They require a rest of several months and to be kept on the dry side, but not so dry in the case of the evergreen species as to cause the leaves to shrivel.

**Cárdamon**, Linn. **CARDAMON**. Plant, 4-8 ft.: lvs. thick, spicy, lanceolate: fls. brownish, in a recumbent compound spike. E. Indies.—Produces many of the cardamon seeds of commerce. Not to be confounded with *Elettaria Cardamomum* (which see). Sometimes seen in growing collections of economic plants. Forms very large clumps.

**Meleguêta**, Roscoe. Plant 4-5 ft., the rhizome slender: lvs. lanceolate, acuminate, glabrous, 6-9 in. long and 1 in. or less broad, narrowed at base and nearly sessile on sheath: fls. solitary, 3-4 in. long, short-peduncled; upper corolla-lobe 2-3 in. long; lip 2 in. or less broad, pure white or tinged pink: caps. flask-shaped, 3 in. long, red or orange when ripe. Trop. Afr.

**Gránum-Paradisii**, Linn. (*A. grandiflorum*, Smith. *A. Afzèlii*, Roscoe). Plant 4-5 ft.: sts. red at base, rhizome slender: lvs. lanceolate, acuminate, glabrous, 4-8 in. long and 1½ in. or less broad at middle, wedge-shaped at base and short-stalked on sheath: fls. 3-4 in the spike, the peduncles 2-6 in. long, white; corolla-lobes 2 in. long; lip 2 in. or less long, yellow at the throat: caps. ovoid, pubescent, 2-3 in. long, much grooved. Guinea. B.M. 4603.

**angustifolium**, Sonn. (*A. madagascariense*, Lam. *A. Daniellii*, Hook. f. *A. Clusii*, Hanb. *A. erythrocarpum*, Ridl.). Plant, 10-15 ft., the rhizome stout: lvs. oblong-lanceolate, acute, thin and glabrous, the lower ones 1 ft. or more long and 3 in. broad, nearly sessile: fls. several in spike, yellow, tinged red; upper corolla-lobe oblong, 1½ in. long; lip about as large as the lobe, deflexed. W. and E. Afr. B.M. 4764, 5250.

**hemisphæricum**, Baker. Sts. densely tufted, 10-12 ft.: lvs. distichous, short-petioled above the sheathing base, 1½ ft. long and 3 in. broad, cuspidate, green above and claret-brown beneath: fls. very numerous, in a globose head, the outer bracts large and empty, obtuse, tinged brown, the inner bracts nearly as long as the fl.; lobes of calyx and corolla green; lip strap-shaped, emarginate, red-brown in middle and yellow at edge. Straits Settlements. B.M. 7592.

**magnificum**, Benth & Hook. f. A species of large dimensions, reaching, when planted out in a rich soil, up to a height of 20 ft.: rhizomes branching freely, stout, dark brown, green when young: lf.-st. erect, arching at top, terete: lvs. distichous shortly petioled, lanceolate or elliptic, 1-2 ft. long, acute, glabrous, upper side green, (red when young) lower side suffused with reddish brown: peduncle stout, solitary, 2-5 ft. high; infl. a globose head with large bright scarlet and green bracts, outer bracts 3 in. long, ovate, or ovate-lanceolate; fls. numerous, densely crowded near the center of the head; sepals lanceolate, an inch long, primrose, tinted with red; petals lanceolate, slightly longer than the sepals, yellow, tinted with red; lip longer than the corolla-lobes, red, with a margin of yellow. Mauritius. B.M. 3192 (as *Alpinia*).

**vitellinum**, Lindl. Stemless, glabrous, 2 ft.: lvs. oval: fls. in oblong loose sessile spike, yellow; lip oblong. E. Indies(?).

**vittatum**, Bull, not Hance. A handsome dwarf evergreen species with each leading shoot bearing 2-4 erect or spreading elliptic lvs. 4-5 in. in length, alternately striped with silvery white and dark green on the upper side, and dull green on the lower. Habitat unknown.

—Habit neat and compact, and similar in general appearance to some of the calatheas. Easily prop. by division of the rhizomes.

L. H. B.

C. P. RAFFILL.

**AMÓRPHA** (Greek *amorphos*, deformed; the fls. are destitute of wings and keel). *Leguminosæ*. FALSE INDIGO. Ornamental plants grown for their foliage and flowers.

Shrubs, sometimes suffrutescent: lvs. alternate, odd-pinnate, deciduous, with entire small lfts: fls. in dense terminal spikes, small, papilionaceous, but without wings and keel; calyx campanulate with 5 nearly equal teeth or the lower ones longer; standard folded around the stamens; stamens connate at the base, exserted: pod short, indehiscent, slightly curved, with 1-2 seeds.

—Ten to 15 closely related species in N. Amer., south to Mex. Conspectus of all the known species by Schneider in Bot. Gaz. 43:297 (1907).

Amorphas are low or medium-sized shrubs with graceful pinnate foliage and small blue or purple flowers, in dense upright spikes.

Most of the species are hardy as far north as Massachusetts; farther north they must be considered as only half-hardy. They grow well in

sunny and somewhat dry situations but *A. fruticosa* prefers moist soil; they are well adapted for the borders of shrubberies.

Propagation is usually by seeds; also by greenwood cuttings under glass in early

summer, or by hardwood cuttings, placed in sheltered situations early in fall and left undisturbed till the following autumn. They may be grown, also, from layers and suckers.

*A. Lowest pair of lfts. close to the st.: plant grayish or whitish pubescent, suffrutescent.*

**canescens**, Nutt. **LEAD-PLANT**.

Low shrub, 1-3 ft., densely white-canescent: lvs. 2-4 in. long; lfts. 21-49, nearly sessile, oval or ovate-lanceolate, acutish, 4-7 lines long: fls. blue, the spikes crowded into terminal panicles: pod tomentose. June. Southern states. Mn. 5:707. B.M. 6618. R.H. 1896: 280.—Handsome free-flowering shrub of dense habit, well adapted for rockeries and borders of shrubberies in sunny and well-drained situations.

**herbacea**, Walt. (*A. pubescens*, Willd. *A. pumila*, Michx.). Low shrub, 2-4 ft., grayish pubescent: lvs. 2-6 in. long; lfts. 11-37, elliptic to oblong, rounded at both ends, 4-6 lines long, pubescent or glabrous above, beneath dotted with dark glands, short-petioled: fls. varying from violet-purple to white spikes in terminal clusters: pod glandular. N.C. to Fla. L.B.C. 7:689.

*AA. Lowest pair of lfts. remote from the st.: plant glabrous or nearly so, rarely yellowish pubescent.*

*B. Calyx with the lower lobes elongated and pointed: pod curved on the back: young growth finely tomentose.*

**fruticosa**, Linn. **BASTARD INDIGO**. Fig. 189. Shrub, 5-20 ft.: lvs. 6-10 in. long; lfts. 11-21, oval or elliptic, ½-1½ in. long, mostly obtuse and mucronulate: spikes dense, 3-6 in. long, usually in panicles; fls. dark purple: pods stout, glandular. From Wis. and Pa. south. B.R. 5:427.—Interesting ornamental shrub of spreading habit, with fine feathery foliage; remarkable for the unusual color of its dark violet-purplish fls. A very

189. *Amorpha fruticosa*. ( $\times \frac{1}{4}$ )

variable species; of the many varieties, the following are probably the most important: Var. *crœco-lanata*, Mouillef. (*A. crœco-lanata*, Wats.). Covered with yellowish brown pubescence. W.D.B. 2:139. Var. *albiflora*, Sheldon. With white fls. Var. *cærulea*, Mouillef. With pale blue fls. Var. *péndula*, Dipp. (*A. péndula*, Carr.). With recurved or pendulous branches. Var. *humilis*, Schneid. (*A. humilis*, Tausch). Low form with smaller and narrower lvs. B.M. 2112 (as *A. nana*). Var. *crispa*, Kirchn. Lvs. with crisp margin.

*tennessensis*, Shuttlw. Shrub, 5-20 ft.: lvs. 6-8 in. long; lfts. 13-55, elliptic-oblong to oblong-ovate,  $\frac{1}{4}$ - $\frac{3}{4}$  in. long, obtuse; spikes clustered, to 6 in. long; fls. violet-purple; pods slender, glandular. Tenn.

BB. Calyx with all the lobes very shallow and rounded: pod straight on the back: young growth glabrous, bloomy and purplish.

*glabra*, Poir. (*A. montana*, Boynt.). Glabrous shrub, to 6 ft. high: branches purplish: lvs. 3-6 in. long; lfts. 9-19, ovate or oval to oblong-ovate, 1-2 in. long, obtuse, rounded at the base: spikes clustered,  $2\frac{1}{2}$ -6 in. long; fls. blue; calyx-lobes very short and obtuse: pods nearly straight on the back with few glands. Spring. N. C. to Ga. and Ala.

*A. californica*, Nutt. Allied to *A. fruticosa*. Only very young branches pubescent: lfts. 11-17, oval to elliptic-oblong, obtuse, broadly cuneate at the base: spikes 2-4, to 12 in. long. Calif.—*A. californica*, Hook. & Arn.—*A. hispidula*.—*A. caroliniana*, Croom (*A. glabra*, Boynt., not Poir.). Allied to *A. fruticosa*. Lfts. numerous, elliptic-oblong, about  $\frac{1}{2}$  in. long, glabrous: racemes several, 4-8 in. long; pods: nearly straight on the back. Summer. N. C. to Fla.—*A. glabra*, Boynt., not Poir.—*A. caroliniana*.—*A. hispidula*, Greene (*A. californica*, Hook. & Arn., not Nutt.). Allied to *A. fruticosa*. Branchlets and petioles with prickly glands and pubescent: lfts. 17-25, ovate to oblong, villous: spikes solitary, to 7 in. long; pods very glandular. Calif.—*A. laevigata*, Nutt. Allied to *A. fruticosa*. Glabrous: lfts. 9-21, remote, elliptic to elliptic-oblong, obtuse or emarginate, cuneate at the base, 1- $1\frac{1}{4}$  in. long: racemes solitary or several, to 12 in. long: pod straight on the back, very glandular. Spring. Ark., Texas. Var. *pubescens*, Gray (*A. texana*, Buckl.). More or less pubescent. Texas.—*A. microphylla*, Pursh (*A. nana*, Nutt.). One ft. high: lfts. small,  $\frac{1}{2}$  in. long, crowded, glandular beneath: spikes usually single. From Minn. and Iowa west to Rocky Mts.—*A. montana*, Boynt.—*A. glabra*.—*A. nana*, Nutt.—*A. microphylla*; see also *A. fruticosa*, var. *humilis*.—*A. paniculata*, Torr. & Gray. Shrub, to 12 ft. high; grayish tomentose: lfts. 11-17, ovate-oblong or elliptic-oblong, 1-2 in. long: racemes long and slender, panicle. Texas.—*A. pubescens*, Willd.—*A. herbacea*.—*A. pumila*, Michx.—*A. herbacea*.—*A. texana*, Buckl.—*A. laevigata* var. *pubescens*.—*A. virgata*, Small. Allied to *A. fruticosa*. Perennial, 2-6 ft., sparingly branched: lfts. broad, coriaceous: spikes single or few. Southern states.

ALFRED REHDER.

**AMORPHOPHALLUS** (Greek-made name). *Araceæ*. Giant aroids from the eastern tropics, grown as curiosities in hothouses.

Leaves ample; petioles smooth or warty and variously spotted; blade ample, 3-parted, the divisions pinnatifid: spadix long; spathe (or "flower") funnel- or bell-shaped at the base, springing from the great bulb-like tuber in advance of the lvs., the latter usually pedately compound: differs from *Arum* and related genera by technical characters. Monogr. by Engler in De Candolle's *Monographiæ Phanerogamarum*, Vol. 2, 1879.

*Amorphophallus* are propagated by offsets of the tubers. These offsets are miniature tubers which grow out of the parent tuber. They are taken off at the time of potting, placed in pots just large enough to accommodate them, in a soil composed of loam, leaf-mold and sand in about equal proportions and kept in a temperature of 65° to 70°. They are rarely, if ever, propagated by seeds in northern gardens, and for this reason, together with their disagreeable odor when in flower, they are not commonly grown. The flowers are like a huge calla except that the spathe and spadix are of a dark chocolate color. The odor is supposed to attract carrion-loving insects, which pollinate the flowers in their native home and bring about the production of seeds. Towards the end of March the plants should be taken from their winter quarters and placed on the

stages of a moderately warm greenhouse and kept moist, where, if the tubers are strong enough, they will soon flower. The leaves begin to grow immediately after the flowering season. Toward the end of May, they should be planted out in the open ground, or they may be used in subtropical bedding.

Plants should be lifted in the fall, before frost, and potted in any good, rich soil, and placed in a warm greenhouse to ripen off the leaves, after which they may be stored away under the greenhouse stages, or in any convenient place where the temperature does not fall below 50°, giving just sufficient moisture to keep the tubers from shriveling. (E. J. Canning.)

**Rivièri**, Dur. **DEVIL'S TONGUE**. **SNAKE PALM**. Fig. 190. Scape (sent up in early spring) preceding the lvs., 3-4 ft., dark-colored and speckled with light red: lf. often 4 ft. across, pedately decomposed, the

petiole mottled, standing on a stalk like an umbrella: spathe rosy, calla-like, with a long-projecting and slender, dark red, slightly curved spadix, the whole "flower" often measuring 3 ft. long. Cochin China. R.H. 1871, p. 573. Gn. M. 5:232. G.W. 14, p. 173. V. 7:116.—The best-known species in American gardens. Has a strong and disagreeable odor.

190. Flower-stem and bit of leaf of *Amorphophallus Rivièri*.

**campanulatus**, Blume. **STANLEY'S WASH-TUB**. Scape lower (2 ft. or less); spathe nearly or quite 2 ft. broad and 15 in. high, with a horizontal, spreading fluted border (not calla-like), red-purple on the margin and grayish, spotted white lower down, and becoming purple in the center; spadix 10-12 in. high, the purple top enlarged and convoluted: lf. much as in *A. Rivièri*: tuber weighing 8-10 lbs., shape of a flat cheese. An old garden plant from E. Indies. B.M. 2812 (as *Arum campanulatum*). F.S. 15:1602-3. G.C. 1872: 1720, 1721; III. 5:755. G.W. 13; p. 9.

**giganteus**, Blanc. "Fl. larger than *A. campanulatus* (often 2 ft. across) and much more pleasing in color, shading from deep red to cream-color toward the center. The club-shaped spadix is dark maroon, with yellow and red base. After flowering, the foliage-st. appears,—a stout st. of deep green color, mottled with gray. After growing at the rate of several inches a day, it expands into a large palm-like lf., of a rich, dark green color, often measuring 5 ft. across." Blanc, 1892, received "under this name from India." *A. campanulatus*(?). Probably not the *A. giganteus* of Blume.

**simlense**, Blanc. "Fl. 15 in. long, the inside of peculiar golden color, spotted purple; the back is metallic brown. Fine palm-like foliage." The cut in Blanc's catalogue shows a spathe produced into a long foliaceous summit, and a long, slender, recurved spadix. Probably of some other genus: perhaps *Sauromatum*.

*A. Afzelii*, Hort. (*Corynophallus Afzelii*, Schott.)=Hydrosme leonensis.—*A. Eichenleri*, Hook. f. Spathe 2 in. across, purple and white: spadix 5 or 6 in. high, thick, brown: lf. single, much divided. W. Afr. B.M. 7091.—*A. Eliottii*, Hook. Spathe short and broad, dull pink with pale green spots: lvs. tripartite, 18 in. broad. B.M. 7349.—*A. Lacourii*, Linden. (*Pseudodracontium Lacourii*, N. E. Br.). Petioles barred with yellow; blades much cut, green, spotted white. Cochin China. I.H. 25:316.—*A. leonensis*, Lem. Spathe 6 in. long, pear-shaped, the tube bell-shaped, white, dilated into the dark purple limb which is striped and spotted with white; lvs. about 1 ft. wide, tripartite. B.M. 7768.—*A. Leopoldianus*, Nichols. (Hydrosme Leopoldiana, Mast.). Spathe reddish, long acuminate on one side, with undulate margins; spadix 2-3 ft., terete,

recurved; lf. 2-3 ft. across. Congo. I.H. 34:23; 42, p. 380.—*A. nivosus*, Lem., I.H. 12:424 = *Dracontium asperum*.—*A. onophyllus*, Prain. Spathe 6-7 in. long, the tuber broadly ovoid, white, striped and spotted, the limb brown-purple with yellow spots; lvs. tripinnatifid. Andaman Arch. B.M. 7327.—*A. Prainii*, Hook. f. Tuber 6-10 in. diam., not bulbiferous; lvs. 3-5 ft. tall, the petiole green, mottled gray-white on red; spathe-tube 2 in. long, pale green spotted white, the limb 6-8 in. across, yellow, purple-brown inside at base. Perak.—*A. Rêx*, Prain. A larger plant than *A. campanulatus*, the tuber 1 ft. across; lvs. 5-6 ft. tall, the petiole purplish, marked gray and green; spathe campanulate, 12-18 in. across, pale red-purple; spadix with an appendage 10-14 in. long. Java.—*A. sativus*, Blume. Petiole 2-3 ft. tall, rugose, rough, white marked, each division of the blade pinnate-parted, the costa thick, white. Molucca Isls.—*A. Schweinfurthii*, N. E. Br. Spathe broad, reddish brown. E. Afr.—*A. Titānum*, Beccari. One of the most remarkable species known. Tuber 5 ft. in circ.: lf.-stalk 10 ft.: lf.-blade 45 ft. in circ.: spathe 3 ft. in diam.; spadix 6 ft. high. Bloomed at Kew in 1890, the tuber dying thereafter. Sumatra. B.M. 7153-5. G.C. III. 5:748 (as *conophallus*).—*A. variabilis*, Blume. Lvs. pinnatisect: spathe erect, 5 in. long, white inside, spotted outside, the margin rosy. Java and Philippines. G.C. II. 6: p. 680, 681 (as *Brachy-spatha*). J.H. III. 33: 493; 63: 283.—*A. viridus*, N. E. Br. Spathe green externally, suffused with purple and spotted, internally lurid purple. Siam. B.M. 6978.

L. H. B.  
GEORGE V. NASH.

**AMPELOPSIS** (Greek *ampelos*, vine, and *opsis*, likeness). *Vitaceae*. Ornamental woody vines with handsome deciduous foliage and some species with ornamental fruits, used for covering trellis-work, pergolas, arbors, low walls and the like.

Shrubs, climbing by tendrils: branches with close lenticillate bark and white pith and with tendrils opposite the lvs.: lvs. alternate, petioled, simple, lobed, digitate, pinnate or bipinnate; fls. small, greenish, perfect, in dichotomous long-peduncled cymes opposite the lvs. or terminal; calyx indistinct; petals 5, or rarely 4, expanding; stamens as many as petals, short; ovary 2-celled with a slender style, adnate to a distinct cup-shaped disk, entire or crenulate at the margin; fr. a 1-4-seeded berry.—About 20 species in N. Amer., Cent. and E. Asia. By some botanists united with *Vitis*, which is easily distinguished, even in the winter state, by its shredding bark and brown pith, also by the panicu-

191. *Ampelopsis heterophylla* var. *amurensis*. ( $\times \frac{1}{4}$ )

late infl. and the petals cohering into a cap and falling off as a whole; more closely related to *Parthenocissus*, which differs chiefly in its disk-bearing tendrils and the absence of a distinct disk in the fl.; still more closely to *Cissus*, which differs in the fleshy sts., usually 4-merous fls. and 4-lobed disk. Monogr. by Planchon in De Candolle, *Monographiæ Phanerogamarum*, 5:447-463.

The members of this genus are shrubs, climbing, with twining tendrils, not clinging by disks to its support, of medium height, with variously divided, rarely simple foliage, small greenish flowers, in peduncled cymes, followed by blue or yellow pea-sized berries. Most of the species are hardy North, but *A. japonica*, *A. megalophylla* and *A. arborea* are only half-hardy, while *A. cantoniensis* and *A. leuoides* can be grown only in warmer temperate regions. Page 3565.

They are not particular as to the soil and situation but grow best in fresh and loamy land. Where only a light covering is desired, species like *A. japonica*, *A. aconitifolia* and *A. arborea* should be planted; *A. heterophylla* var. *amurensis* makes a rather dense covering and is well suited for the covering of parapets, low walls and rocks; *A. megalophylla* is a very strong grower, with bold foliage. Some species, as *A. heterophylla* and particularly its var. *amurensis* are very ornamental in autumn with their bright blue profusely produced berries.

Propagation is by seeds and by hardwood or greenwood cuttings. All species may be propagated by cuttings with a good eye, placed in sandy soil under bell-glasses in September.

#### A. Lvs simple or lobed.

##### B. Under side of lvs. whitish: lvs. of firm texture.

1. *humulifolia*, Bunge. Lvs. broadly ovate, 3-5 lobed, sometimes only slightly so, 3-5 in. long, truncate or subcordate at the base, acute or acuminate, bright green and lustrous above, glaucescent and glabrous or hairy beneath: cymes slender peduncled: fr. few and small, usually pale yellow with bluish cheek, or pale yellow or entirely pale blue. N. China.—This species has been always confused with *A. heterophylla*, from which it is easily distinguished by the firmer texture of lvs., their pale whitish under side and the color of the frs. It is very hardy and the foliage has the appearance of that of a true *Vitis*.

2. *micans*, Rehd. (*Vitis repens*, Veitch, not Wight & Arn.). Shrub, climbing to 20 ft.: young growth purplish: branchlets glabrous: lvs. triangular-ovate and not lobed or broadly ovate and slightly 3-lobed, subcordate or sometimes truncate at the base, short-acuminate, the lobes acute, coarsely crenate-serrate, dark green and with a velvety sheen above, glaucescent below, 2-4 in. long: cymes long-stalked and rather dense: fr. dark blue. Cent. China.—Has proved hardy at the Arnold Arboretum. Var. *cinerea*, Rehd. (*A. heterophylla* var. *cinerea*, Gagnep.). Lvs. grayish pubescent on both sides or only below, often deeply 3-5-lobed.

##### BB. Under side of lvs. green: lvs. membranous.

3. *cordata*, Michx. (*Vitis indiana*, Willd. *Cissus Ampelopsis*, Pers.). Nearly glabrous: lvs. cordate, roundish-ovate, not or slightly 3-lobed, acuminate, acutely serrate, pale green beneath, usually pubescent on the veins: cymes loose, slender-stalked: berries bluish or greenish. From Ill. and Ohio south. Mn. N. 2:6.

4. *heterophylla*, Sieb. & Zucc. (*Vitis heterophylla*, Thunb.). Branchlets glabrous or hairy: lvs. cordate, 3-5-lobed, with rounded sinuses, sometimes slightly 3-lobed, lobes serrate or incised, shining green beneath and usually glabrous or sometimes hairy,  $1\frac{1}{2}$ -3 in. long: cymes on stalks  $\frac{1}{2}$ -2 $\frac{1}{2}$  in. long: fr. changing from pale lilac to verdigris color and finally bright blue or

sometimes finally whitish. July, Aug.; fr. Sept., Oct. E. Asia. B.M. 5682 (as var. *humulifolia*). Gt. 1813: 765. Gn. 10, p. 451. Var. *élegans*, Koch (*A. tricolor*, Hort. A. *Sieboldii*, Hort. *Vitis heterophylla* var. *variegata*, Nichols.). Lvs. smaller, blotched and striped with white; flushed pink when young; slow-growing and tenderer. Gn. 54, p. 5.—A handsomely colored form, adapted for planting in vases and baskets. Var. *citruloides*, Schneid. (*A. citrullodes*, Lebas). Lvs. deeply lobed with rather narrow sinuately lobed segms. Var. *amurénsis*, Planch. (*A. brevipedunculata*, Koehne. *Vitis brevipedunculata*, Dipp.). Fig. 191. Branchlets and petioles usually hairy; lvs. slightly 3-lobed, 2-4 in. long, lobes crenately serrate, hairy beneath, at least on the veins; cymes rather dense; fr. darker blue.—The variety is a stronger grower than the type and strikingly beautiful in autumn with its variously colored berries; it is well adapted for covering low walls, rocks and trellises.

AA. Lvs. 3-5-parted or digitate, at least partly, with usually lobed segms.

B. Segms. of the lvs. pinnately lobed or only serrate; the lower lvs. sometimes only lobed.

5. *aconitifolia*, Bunge (*A. dissécta*, Carr. *A. aconitifolia* var. *dissécta*, Koehne. *A. affinis* var. *dissécta*, Hort.). Branchlets glabrous; lvs. 5-parted, the segms. pinnately lobed with rather narrow-toothed or entire lobes, 2-3 in. long, green beneath, glabrous or hairy on the veins; berries small, orange when fully ripe, sometimes bluish before ripening. Summer; fr. in autumn. N. China. R.H. 1868, p. 10; 1883, p. 318. Gn. 5, p. 523. G. 1:396.—Very handsome vine with finely divided foliage. Var. *palmiloba*, Rehd. (*A. palmiloba*, Carr. *A. tripartita*, Carr. *A. rubricaulis*, Schneid.). Lvs. usually 3-parted, the lower ones often only 3-lobed, segms. often rather broad, coarsely toothed, rarely pinnatifid. R.H. 1867, p. 10. J.H.S. 28:87 (form with rather narrow segms.).

6. *Delavayana*, Planch. (*A. heterophylla* var. *Delavayana*, Gagnep. *Vitis Delavayana*, Franch.). Young growth hairy and usually purplish; lvs. cordate at the base, partly 3-lobed and partly 3-parted, 2-5 in. long, segms. coarsely crenately toothed, dark green and nearly glabrous above, light green and pubescent beneath or sometimes glabrous, the middle segm. elliptic-oblong, cuneate, the lateral ones very unequal; cymes on peduncles 1 in. or less long; fr. dark blue or bluish black. Cent. China. J.H.S. 28:102.—A strong-growing vine, hardy.

BB. Segms. of the lvs. pinnate; the pinnæ separate from the winged rachis.

7. *japónica*, Makino (*A. serjaniæfolia*, Bunge. *Vitis serjaniæfolia*, Maxim. *A. napiformis*, Carr. *A. tuberosa*, Carr.). Roots tuberous; plant glabrous; lvs. 3-5-parted or digitate, chartaceous, shining and dark green above, the divisions pinnate, with winged rachis, the pinnæ separate from the wings; berry small, blue, punctate. Japan. N. China. Gt. 16:531. R.H. 1870, p. 17. Gn. 6, p. 365. I.T. 5:176.—Very handsome vine with its lustrous and dark green, finely cut foliage, but somewhat tender.

AAA. Lvs. bipinnate or pinnate; lfts. distinctly stalked.

B. Lfts. usually  $\frac{1}{2}$ -1 in. long, very coarsely toothed.

8. *arborea*, Koehne (*A. bipinnata*, Michx. *Vitis bipinnata*, Torr. & Gray. *Cissus stans*, Pers.). PEPPER VINE. St. erect or somewhat climbing; lvs. bipinnate, 4-8 in long; pinnæ and lfts. on each segm. usually 5; lfts. broadly ovate or cuneate-obovate, coarsely toothed,  $\frac{1}{2}$ -1  $\frac{1}{2}$  in. long, veins beneath and rachis usually hairy; berries dark purple. Summer; fr. in autumn. Southern states, Mex. B.B. 2, p. 2409.—Handsome vine with bright green finely cut foliage; not hardy N.

BB. Lfts. usually 2-4 in. long, crenate-serrate.

9. *megalophylla*, Diels & Gilg. (*Vitis megalophylla*, Veitch). Climbing to 30 ft., glabrous; lvs. long-petioled, 6-15 in. or sometimes longer, the larger ones bipinnate; the lower pinnæ with 3-9 lfts., the lowest pair often 3-lvd.; lfts. petioled, ovate or ovate-oblong, 2-5 in. long, rounded or subcordate at the base, membranous, remotely serrate, pale or glaucescent beneath, veins nearly straight, ending in the teeth; fr. bluish black, in loose cymes. W. China. J.H.S. 28:16, 86, 97. Gn. 65, p. 45.—Strong-growing vine, hardier and larger in every part than the following.

10. *cantonensis*, Planch. (*Vitis cantoniensis*, Seem.). Lvs. long-petioled, similar to the preceding species but smaller; lfts. 1-3 in. long, cuneate or rounded at the base, sometimes nearly sessile, chartaceous, remotely and often indistinctly crenate-serrate, veins arching; fr. violet or pale violet. S. China to Malay. Penins.

*A. Davidiana*, Mott. = *Vitis Piasezkii*.—*A. dumetorum*, Hort. = *Parthenocissus vitacea*.—*A. Engelmannii*, Hort. = *Parthenocissus quinquefolia* var. *Engelmannii*.—*A. Roylei*, Hort. = *Parthenocissus quinquefolia* var. *murorum* and *P. tricuspidata*.—*A. St. Paulii*, Hort. = *Parthenocissus quinquefolia* var. *St. Paulii*.—*A. sempervirens*, Hort. = *Cissus striata*.—*A. Thomsonii*, Hort. = *Parthenocissus Thomsonii*.—*A. tricuspidata* and *A. Veitchii*, Hort. = *Parthenocissus tricuspidata*.—*A. virginiana*, Hort. = *Parthenocissus quinquefolia*.

ALFRED REHDER.

AMPELOPOVITIS: *Vitis*.

AMPHICARPÆA (Greek, alluding to the two kinds of pods). Spelled also *Amphicarpa*. *Leguminosæ*. HOG PEANUT. A genus of 6-8 species of herbaceous perennial vines of E. N. Amer. and India, considered by some to contain also the species now credited to *Falcata*. Fls. of 2 kinds, the upper axillary, racemose and showy, the lower apetalous, fertile, and borne in the lower axils.—Not in the American trade and cult. only in botanic gardens. The only common species are *A. monoica*, Ell. (*Falcata comosa*, Auct.), and *A. Pücheri*, Torr. & Gray. Both are pubescent or glabrate vines, with trifoliate lvs., white or purplish fls., and rather conspicuous pods.—Of little value horticulturally.

N. TAYLOR.

AMPHÍCOME (*amphi*, both, and *kome*, hair; the seeds having a tuft of hair at both ends). *Bignoniaceæ*. Greenhouse herbaceous rockery plants from the Himalayas, with large, rosy, funnel-shaped, 5-lobed fls. which are axillary or terminal; lvs. alternate, unequally pinnate.—Species 2.

*arguta*, Royle. Height 3 ft.: lvs. radical, the lfts. in 3-4 pairs, sessile, lanceolate, acuminate, deeply serrate; fls. in terminal racemes, fewer than in the next; corolla-tube rose-colored, trumpet-shaped; calyx-lobes long, awl-shaped. P.M. 6:79.—Intro. by Montarioso Nurseries.

*A. Emōdii*, Royle. Height 1  $\frac{1}{4}$ -3 ft.: lfts. in 5-7 pairs, cordate-ovate, obtuse, shortly petiolulate, margin crenate-lobate; fls. at first corymbose; corolla-tube and throat orange; calyx-lobes short, thick, fleshy. B.M. 4890. Gn. 8, p. 25; 38, p. 458. F.S. 11; 1109.

AMPHIRAPHIS: *Microglossa*.

N. TAYLOR.†

**AMSONIA**, (named for Charles Amson, colonial physician in eighteenth century). Called also *Ansonia*. *Apocynaceæ*. Plants sold for border planting, mostly among shrubby, but little known in cultivation.

Tough-barked perennial herbs with alternate narrow lvs. and terminal panicles of blue or bluish narrow-limbed small fls. in May and June, the inside of the corolla-tube bearing reflexed hairs and also the 5 stamens: fr. two long and slender many-seeded follicles.—About a dozen species in E. U. S. and E. Asia. Prop. mostly by dividing the clumps; also by seeds, and by cuttings in summer.

**Tabernæmontana**, Walt. (*A. salicifolia*, Pursh. *A. Amsonia*, Brit. *Tabernæmontana Amsonia*, Linn.). Glabrous or nearly so, 2–3 ft.: lvs. willow-like, ovate to lanceolate, acuminate, alternate, short-petioled: fls. many, with lanceolate spreading lobes, succeeded by slender, milkweed-like follicles or pods 2–3 in. long. Holds its foliage late. Pa. to Fla. and Texas. B.M. 1373. L.B.C. 6:592. B.R. 151 (as *A. latifolia*).

**angustifolia**, Michx. Villous when young, the st. 1–3 ft.: lvs. linear to lance-linear, an inch or two long, much crowded, margins becoming revolute: corolla-lobes ovate-oblong to linear-oblong. Dryland, N. C., to Texas. L. H. B.

**AMYGDALÓPSIS**: *Prunus*.

**AMÝGDALUS** (Greek-made name, referring to the furrowed pit). *Rosaceæ*. A name given to the peaches, apricots and their kin, but here treated as a section of the genus *Prunus*, which see.

**ÁMYRIS** (etymologically allied to *myrrh*, in allusion to the odor). *Rutaceæ*. TORCH-WOOD. Some 10 species of shrubs and trees ranging from the S. U. S. to Cent. Amer. and W. Indies, a few of which have been mentioned as evergreen cult. plants in hothouses. Lvs. alternate, compound but lfts. sometimes reduced to 1 as in some other rutaceous plants: fls. white, in axillary or terminal spikes; sepals and petals 4; stamens 8: fr. an ovoid or globose drupe, with a single stone.—Apparently none of the species is in cult. in this country, although *A. balsamifera*, Linn., of S. Fla. and the W. Indies, *A. Plumieri*, DC., of the W. Indies, and *A. braziliensis* (properly *Protium braziliense*, of the Burseraceæ) may occur.

**ANACÁMPSEROS** (Greek-made name, of no significance here). *Portulacaceæ*. LOVE-PLANT. Succulent herbs, of a dozen species, from the Cape of Good Hope, but not grown in this country except in botanic gardens. They are greenhouse plants, with ovate fleshy lvs.: fls. racemose, expanding in the sun; petals 5, fugacious; sepals 5, oblong. Prop. by seeds or by cuttings of sts. or lvs. The commonest species is *A. arachnoides*, Sims, a peculiar, cobwebbed, green-lvd. succulent, with simple racemes of white fls. B.M. 1368.

*A. Börderi*, Hort., "is a Pyrenean alpine plant of easy culture in border or rocky; purple fls.; late-blooming." The name is apparently unknown in botanical literature.

N. TAYLOR.†

192. *Anacardium occidentale*. (× 1/5)

**ANACÁRDÍUM** (name refers to the heart-shaped character of the nut). *Anacardiaceæ*. Eight species native to the American tropics, of which one (yielding the cashew nut) is widely cultivated in tropical countries.

Trees and shrubs with leathery alternate lvs.: fls. small and numerous in panicles, polygamous; calyx 5-cleft; petals 5, very narrow; stamens 7–10: fr. kidney-shaped, borne on a greatly enlarged hard receptacle.

**occidentale**, Linn. **CASHEW**.

Fig. 192. A large, spreading tree with milky juice, very impatient of frost, and therefore adaptable only to extreme S. Fla. in the U. S.: lvs. oval or obovate, rounded, or even emarginate at the top: fls. rosy-tinted, fragrant, in clusters terminating the young branches: nut kidney-shaped or heart-shaped, the size of a large bean, the kernel edible. This nut (about 1 in. long) is borne on a fleshy receptacle (the cashew apple, Fig. 33) which is about 3 in. high when mature, white to yellow and red, and is sweetish-sour and edible. Gn. 11, p. 211.—

193. *Anagallis arvensis*. (× 1/4)

A vinous liquor is made from the apple. The kernel of the nut yields oil, and is edible when roasted; the shell of the nut is exceedingly acrid, even the fumes from the roasting being highly irritant. The tree yields a gum which is the basis of a varnish, being used to protect books and woodwork from the ravages of white ants and other insects. The tree grows 20–40 ft. high. Sometimes grown under glass in collections of economic plants; prop. then by cuttings of mature wood with lvs. retained. L. H. B.

**ANAGÁLLIS** (Greek, *delighting*). *Primulaceæ*. PIMPERNEL. Low annual, biennial or perennial herbs cultivated in the open fo. their numerous bright-colored blossoms.

Stems mostly angular, bearing opposite alternate or 3-whorled entire lvs.: fls. axillary, mostly solitary, usually not longer than the lvs., in shades of red, blue or white, the corolla rotate or rotate-bell-shaped and with lobes obovate or linear which are either entire or toothed; stamens 5, attached in the base of the corolla, the filaments usually bearded: fr. a globose caps., circumscissile.—Two dozen species of interesting little plants mostly with trailing or procumbent sts., in many parts of the world. Pax and Knuth, Engler's Pflanzenreich, hft. 22:321–334.

The pimpernels are of simple culture. They thrive in a warm soil, the seeds of the annual species being planted where the plants are to grow. The perennial kinds are increased by division, or by cuttings of young growths started under glass. All of them are free-flowering and attractive minor plants. The many forms in gardens are probably all referable to two species.

*A. lvs. ovate*.

**arvensis**, Linn. (*A. pulchella*, Salisb. *A. orientalis*, Hort. *A. Monellii*, Bieb., not Linn.). COMMON PIMPERNEL, or POOR MAN'S WEATHERGLASS (fls. close at approach of bad weather). Fig. 193. Annual: sts. procumbent or ascending, the branches becoming long, slightly winged: lvs. opposite or in 3's, sessile: fls. scarlet varying to white, the lobes broadly obovate and

obtuse and the edges finely toothed. Eu., Asia, and sparingly run wild in N. Amer. Var. *phœnicea*, Gren. & Godr. Fls. red; corolla-lobes mostly glandular-ciliate at top. Var. *cærulea*, Gren. & Godr. (*A. cærulea*, Schreb. *A. verticillata*, All.). Fls. blue; lobes not glandular and slightly ciliate. Var. *latifolia*, Lange (*A. latifolia*, Linn.). Fls. blue: lvs. very broad: plant stout. B.M. 2389.

AA. Lvs. linear or linear-lanceolate (except perhaps in var. *Monellii*).

*linifolia*, Linn. (*A. angustifolia*, Salisb. *A. fruticosa*, Vent. *A. grandiflora*, Andr. *A. Philippii*, Hort.). Perennial or biennial: sts. woody at base, 1-1½ ft.: lvs. opposite or verticillate, sessile, acute, margin often revolute: fls. blue, reddish underneath, the lobes ovate, obtuse and entire. W. Medit. region. B. M. 831. Var. *Monellii*, Knuth (*A. Monellii*, Linn., not Bieb. *A. Willmoreana*, Don). Lvs. often in 3's, somewhat broader (even to ovate or oblong): corolla longer. Var. *collina*, Ball (*A. collina*, Schousb.). Large, sts. thick: fls. rose-colored or purplish (not blue). Var. *microphylla*, Ball. Many-std., branches ascending: lvs. small, lanceolate: fls. blue, reddish beneath.

L. H. B.

**ANĀNAS** (modified from aboriginal S. Amer. name). Written also *Ananassa*. *Bromeliaceæ*. Stove herbs, allied to the billbergias, and demanding the same general treatment. As ornamental subjects, grown mostly for the rosette of rigid lvs. and the strange, often colored head of fleshy fls., which are 6-cleft, with 6 stamens and 1 style. The ripe head is composed of the thickened rachis, in which the fleshy berry is imbedded, and the fleshy persistent bracts; in the pineapple, the fls. are abortive. Prop. by the leafy crown or topknot, by

194. *Ananas sativus* (pineapple).

strong suckers, or by small offsets from the base: these are treated as cuttings, being rooted in sand with bottom heat, or in the S. set directly in the field. Monogr. by Mez, DC., Monogr. Phaner. 9.

*sativus*, Schult. f. **PINEAPPLE**, which see for field culture Fig. 194. Plant producing a single shaft 2-4 ft. high, and when 12-20 mos. old bearing a head, or pineapple, on the top of which is a rosette of stiff lvs.: lvs.

long and sword-shaped, stiff, more or less rough-edged. The same stalk does not bear a second time, but a new shoot may arise from the same root and bear fruit. Better results are usually secured by severing the sucker or crown, and growing a new plant. American

195. *Ananas sativus* var. *variegatus*. ( $\times \frac{1}{2}$ )

tropics. B.M. 1554 (as *Bromelia Ananas*). B.R. 1081 (as *A. bracteata*).—There is a common cult. form (var. *variegatus* or *stratifolius*), Fig. 195, with striped lvs. Gn. 51, p. 57. *A. Porteanus*, Koch, is a form of *A. sativus*, with olive-green, sharp-spined lvs. with a yellow central band. G.W. 5, p. 51. *A. cochinchinensis*, Hort., is another form (intro. by Pitcher & Manda, 1891).

*A. bracteatus*, Schult. f., is a showy species with red heads, all the bracts being elongated, spiny and prominent. Brazil. B.M. 5025. Regarded by Mez as a form of *A. sativus*.—*A. macrodontes*, Morr., like a bromelia, has large toothed bracts. Brazil. —*A. Mordillonus*, Hort., a form of *A. sativus* probably, has variegated spineless lvs.

L. H. B.

**ANĀPHALIS** (Greek name of a similar plant). *Compositæ*. **EVERLASTING**. Hardy border plant; useful for immortelles. A genus of 30 species, much like *Antennaria*, but differs in the pappus-bristles of the staminate fls. not being thickened (these are thickened upwards in that genus) and the st. leafy.

*margaritacea*, Benth. & Hook. A foot or two high, with many corymbose heads, white: lvs. sessile, linear-lanceolate, long-pointed: involucre pearly white, hence the value of the plant as an everlasting. N. Amer. and Asia.—The plant from Asia, with yellow fls., is perhaps better referred to *A. cinnamomea*, Clarke, but is hardly separable from the type. It is offered as a yellow everlasting.

N. TAYLOR.†

**ANARRHINUM** (snoutless). *Scrophulariaceæ*. A dozen biennials and perennials of S. Eu. and N. Afr. Allied to *Antirrhinum*, but not cult. in this country, except in botanic gardens. Fls. small, in interrupted spike-like racemes, white or blue. Easily grown in ordinary garden soil, but not certainly hardy north of New York. Known also as *Simbulata*.

**ANASTÁTICA**: Resurrection Plant.

**ANCHUSA** (*anchousa*, a paint for the skin). *Boraginaceæ*. **ALKANET**. Hardy annual, biennial or perennial plants, with blue or purple fls. in paniced scorpioid racemes or sometimes in headlike clusters; the corolla trumpet-shaped and the throat closed by scales: lvs. alternate, usually hairy.—Of easy cult. in sunny position except *A. italica* var. "Dropmore," which is best suited in partial shade. Prop. by seed generally, but old perennials may be root-divided in spring.

A. Fls. small, like forget-me-nots.

*Barreliæri*, Vilm. Perennial: height 2 ft.: lvs. ovate-lanceolate, smaller and shorter than in *A. italica*: fls.

blue, with a white tube and pink or yellow throat. May. Eu. and Asia Minor. B.M. 2349.—Valued for its earliness and for cut-fls. The least common of the 3 species.

*officinalis*, Linn. Biennial or perennial, 1–2 ft.: lvs. lanceolate, hairy, radical ones clustered: fls. opening in pairs, bright blue or purple, in loose, one-sided spikes. June–Oct. Eu.—Effective in masses and of easy cult. The common alkanet.

*capensis*, Thunb. Biennial: height 1½ ft.: lvs. narrowly lanceolate and less hispid than in *A. italica*: fls. red-margined, with a white throat; buds red; calyx inflated after the fl. has withered; divisions short-obtuse. June–Sept. Cape of Good Hope. B.M. 1822.—Fine for cut-fls. Often winterkilled, but seeds itself freely; north of Boston best treated as a coolhouse plant. Var. *alba*, Hort., has white fls.

AA. *Fls. large.*

*italica*, Retz. Perennial: height 3–5 ft.: lvs. largest of the 3 species here contrasted, ovate-lanceolate, rough, shining; radical ones sometimes 2 ft. long: fls. bright blue. Medit. B.M. 2197. L.B.C. 14:1383.—If not allowed to go to seed, will bloom continuously from June to Sept. Commonest and perhaps best species. Var. *Dröpmore*. Fig. 196. Three ft.: fls. purple, in loose heads. Best suited to partial shade. Var. *superba*, Hort., has very dark blue fls.

*A. Agárdhi*, Lehm. Lvs. linear. Siberia. Rare.—*A. myosotidiflora*, Lehm. Lvs. large; radical ones long-petiolate, cordate-reniform; cauline ones sessile, oval. Siberia, Caucasus.—*A. ochroleuca*, Bieb. Perennial: 2 ft.: fls. yellowish white: lvs. minutely strigose, lanceolate, ciliate. July, Aug.—*A. sempervirens*, Linn. Lvs. broadly ovate; lower ones petiolate: racemes short, generally bracted at the base. Eu. Esteemed in France.

N. TAYLOR.†

ANDA: *Joannesia*.

ÁNDIRA (Brazilian name). *Leguminosæ*. ANGELEEN TREE. Hothouse trees.

Trees, with conspicuous fls. in racemes: calyx 5-toothed or entire; keel petals distinct; ovary stalked: fr. a roundish 1-seeded pod.—Nearly 30 species of Tropical American and African.

Two or three species are sometimes cultivated in hothouses in the Old World and in American botanic gardens. They must be grown in rich loam and peat in the warmhouse. Propagation is by cuttings of ripened wood in sand under bell-jar, with bottom heat.

*inermis*, HBK. CABBAGE TREE. A tree 20–35 ft.: lvs. impari-pinnate, with 13–15 ovate-lanceolate and acute lfts.: fls. in terminal panicles, purple, on short pedicels. W. Indies and Brazil.

N. TAYLOR.

ANDRÁCHNE (ancient Greek name). *Euphorbiacæ*. Low shrubs with bright green foliage, of little ornamental value; sometimes grown in botanical collections.

Shrubs or perennials: lvs. alternate, usually entire: fls. small, monœcious or incompletely diœcious, axillary, 5–6-merous; staminate in clusters, with petals smaller than the sepals, stamens with free filaments, not exceeding the sepals; pistillate usually solitary, with very small petals, sometimes wanting, ovary 3-celled with 3 distinct, 2-cleft or 2-parted styles: fr. a subglobose or depressed caps., separating into 3 2-valved carpels, 6-seeded.—Ten or 12 species in N. Amer., Peru, Asia, N. and S. Afr., Malay Archipelago.

These are low deciduous shrubs similar to *Securinega*, but smaller, with small bright green leaves, slender-stalked whitish inconspicuous flowers in axillary clusters or solitary, appearing during the summer followed by small greenish brown capsular fruits. There are three species in cultivation, of which two, *A. phyllanthoides* and *A. colchica*, have proved hardy at the Arnold Arboretum; they may be used in borders of shrubberies. They seem to grow in any soil, if it is well-drained, and prefer sunny positions.

Propagation is by seeds, which are usually freely produced, and also by greenwood cuttings under glass. None of the species is in the trade.

*A. colchica*, Fisch. & Mey. Shrub, to 2 ft., usually lower, glaucous, glabrous: lvs. ovate-obtuse, ½–½ in. long: petals 5, filiform, as long as the glands of the disk, much shorter than the calyx: caps. depressed-globose, ½ in. thick. Asia Minor.—*A. cordifolia*, Muell. Arg. Shrub, to 3 ft.: lvs. ovate to oblong, rarely cordate at base, obtuse, 1–2 in. long, soft pubescent beneath: petals spatulate, disk-glands membranous: caps. depressed-globose, ¼ in. thick. E. India.—*A. fruticosa*, Linn. A greenhouse shrub from S. China with ovate or broadly ovate, short-stalked lvs., 1–1½ in. long, and small greenish white, short-stalked fls., staminate as well as pistillate in axillary clusters of 3–6, is now referred to *Breynia* as *B. fruticosa*, Benth. It is probably no longer in cult. B.M. 1862 and L.B.C. 8: 731 (as *Phyllanthus turbinata*).—*A. phyllanthoides*, Muell. Arg. (*A. Roemeriana*, Muell. Arg.). Shrub, to 3 ft. with slender glabrous branches: lvs. oval to obovate, obtuse, ¼–1 in. long, glabrous or slightly pubescent beneath: petals little shorter than the sepals, obovate, dentate near the apex; disk-glands thick: caps. depressed-globose, about ¼ in. thick. Mo. to Ark. and Texas.

ALFRED REHDER.

ANDROCÝMBIUM (name referring to arrangement of stamens around a cavity). *Liliacæ*. A dozen or more species of bulbous plants growing from the

196. *Anchusa italica*, Dropmore variety. (× ¼)

Medit region to S. Afr., one or two of which may be expected in choice greenhouse collections. Bulbs tunicated: sts. subterranean, from which arise a few narrow lvs.: fls. few, in short spikes and subtended by showy bracts in spring or summer. *A. melanthoides*, Willd., of S. and Cent. Afr., recently intro., has bulb like minute tulip: lvs. 2–4, from 3–9 in. long: fls. small, borne in clusters in axils of large bracts which reach 3 in. long and some of which are white, green-veined. G.C. III. 45:315, desc. *A. leucanthum*, Willd. (*A. punctatum*, Baker, in part), of S. Afr., has few whitish fls. in dense umbel and 4 spreading lvs.

ANDRÓMEDA (Greek mythological name). *Ericacæ*. Ornamental low plants grown for their evergreen foliage and for their flowers.

Evergreen shrubs: lvs. short-petioled, narrow, entire: fls. in terminal umbels, pedicelled; calyx small, 5-toothed; corolla urceolate with 5 short recurved lobes; stamens 10 with aristate anthers opening with pores: caps. dehiscent into 5 valves; seeds numerous, small.—Two species through the northern hemisphere.

The andromedas are low evergreen shrubs with small and narrow foliage and small pinkish flowers in terminal umbels. They are perfectly hardy North and suited for borders of evergreen shrubberies and for rockeries and grow best in peaty or sandy and moist soil and in half-shady positions.

Propagation is by seeds, sown thinly soon after maturity, in pots or pans of sandy peat soil, placed in a cool frame. They germinate easily if sown in cut sphagnum, but must be pricked into boxes as soon as they can be handled. Cuttings from mature wood, placed in sand under glass in fall, and kept in a cool greenhouse during the winter, will root easily; also increased by layers. See, also, *Leucothoe*, *Chamaedaphne*, *Pieris* and *Zenobia*.

**polifolia**, Linn. (*A. rosmarinifolia*, Pursh). Fig. 197. One-half to 2 ft.: branchlets usually not glaucous: lvs. narrow-oblong to linear,  $\frac{3}{4}$ –1½ in. long, whitish-glaucous beneath, but not tomentose, later sometimes green, revolute at the margin: fls. nodding on slender pedicels, 2–4 times as long as the globose-urceolate corolla: caps. brownish, ob-ovoid or subglobose, as high as broad. June. N. Eu., N. Asia, rare in the colder regions of N. Amer. L. B. C. 18: 1714. G.W. 12, p. 50 (habit).—Varies with narrower and broader lvs. On account of its slender-stalked fls., more graceful than the following species.

197. *Andromeda polifolia*. ( $\times \frac{3}{4}$ )

branchlets glaucous: lvs. white beneath, with a fine tomentum: fls. on curved thick pedicels, rarely twice as long as the urceolate corolla: caps. depressed, glaucous. June. N. E. Amer., south to Minn. and Pa. L. B. C. 6:546; 16:1591; 18:1725.—Varies like the preceding species with broader and narrower lvs.

*A. acuminata*, Ait.=*Leucothoe populifolia*.—*A. arborea*, Linn.=*Oxydendrum arboreum*.—*A. axillaris*, Michx.=*Leucothoe Catesbaei*.—*A. axillaris*, Lam.=*L. axillaris*.—*A. calyculata*, Linn.=*Chamaedaphne calyculata*.—*A. campanulata*, Miq.=*Enkianthus campanulatus*.—*A. cándida*, Hort.=*Zenobia pulverulenta*.—*A. cassinifolia*, Vent.=*Z. pulverulenta*.—*A. Catesbaei*, Walt.=*Leucothoe Catesbaei*.—*A. cernua*, Miq.=*Enkianthus cernuus*.—*A. dealbata*, Lindl.=*Zenobia pulverulenta*.—*A. fastigiata*, Wall.=*Cassiope fastigiata*.—*A. ferruginea*, Walt.=*Lyonia ferruginea*.—*A. floribunda*, Pursh=*Pieris floribunda*.—*A. formosa*, Walt.=*Pieris formosa*.—*A. glauca*, Hort.=*Zenobia pulverulenta*.—*A. japonica*, Thunb.=*Pieris japonica*.—*A. ligustrina*, Muhl.=*Lyonia ligustrina*.—*A. mariana*, Linn.=*Pieris mariana*.—*A. nitida*, Bartr.=*Pieris nitida*.—*A. ovalifolia*, Wall.=*Pieris ovalifolia*.—*A. paniculata*, Ait.=*Lyonia ligustrina*.—*A. parabolica*, Duham.=*L. ligustrina*.—*A. populifolia*, Lam.=*Leucothoe populifolia*.—*A. pulverulenta*, Bartr.=*Zenobia pulverulenta*.—*A. racemosa*, Linn.=*Leucothoe racemosa*.—*A. speciosa*, Michx.=*Zenobia pulverulenta*.—*A. tetragona*, Linn.=*Cassiope tetragona*.—*A. tomentosa*, Hort., not Dum.-Cours.=*Lyonia ligustrina pubescens*.

ALFRED REHDER.

**ANDROPÖGON** (Greek, *aner*, man, and *pogon*, beard, referring to the silky hairs on the spikelets of some species). *Gramineæ*. BEARD-GRASS. Annual or mostly perennial grasses of various habit but usually with coarse foliage, scarcely horticultural.

Spikelets in pairs at each joint of an articulate rachis, one sessile, perfect, 1-fl.; the other pedicelled, staminate, neutral or reduced to a pedicel; glumes of fertile

spikelet equal, indurated, the first dorsally compressed, the second keeled; sterile and fertile lemmas hyaline, the latter usually awned; palea minute or wanting: rachis usually hairy, often conspicuously so.—A large genus of probably 200 species, widely distributed in both hemispheres except in the colder regions. Includes several important native forage grasses such as blue-stem or blue-joint (*A. furcatus*, Muhl.) with about 3 digitate spikes at the summit of the tall culm; and little blue-stem (*A. scoparius*, Michx.), with single spikes scattered along the branches, both species of the prairie region. Broom sedge (*A. virginicus*, Linn.), a common grass of the Atlantic states, is considered troublesome, though it has some forage value before it flowers. Some of the species, such as silver beard-grass (*A. argenteus*, DC.), are ornamental on account of the silvery panicles. This is a stout grass, 2–4 ft., with bearded nodes and long-stalked oval panicles consisting of numerous woolly ascending or appressed spikes.

Several species of oil-producing grasses formerly included in *Andropogon* are now referred to other genera. *A. Nardus*, Linn.=*Cymbopogon Nardus*, Rendle. *A. citratus*, DC.=*Cymbopogon citratus*, DC. *A. Schoenanthus*, Linn.=*Cymbopogon Schoenanthus*, Spreng. *A. squarrosus*, Linn.=*Vetiveria zizanioides*, Nash.

For a discussion of the sorghums and Johnson-grass referred by some authors to *Andropogon*, see *Holcus*; also Vol. II, Cyclo. Amer. Agric. A. S. HITCHCOCK.

**ANDRÓSACE** (old Greek name of no significance here). *Primulaceæ*. ROCK JASMINE. Small tufted plants grown in the alpine garden.

Root-lvs. clustered: scapes mostly not exceeding 8 in. high, often very short: fls. mostly pink, red and purplish, sometimes white, primula-like but constricted at the throat, umbellate or solitary, in early spring.—Over 80 species in Eu., Asia, N. Amer. and Pacific Isls. Pax and Knuth, Engler's Pflanzenreich, hft. 22:172–220.

Many species of rock jasmine are known in European gardens, and they are much prized by fanciers in alpine-gardening. The tufted leaves sit close to the rocks. Some of them are woolly-leaved. Only currently catalogued species are included in the present account. A well-drained soil, partial shade, free circulation of air, frequent waterings in dry summer months, and protection from heavy fall and spring rains, will lead to success with these charming alpine. A heavy shading of evergreen boughs in winter will be found of great benefit. Close covering is not to be recommended, because it smothers the plants. Very many species have been tried in this country, with variable and not very encouraging results, but in a few instances, with extra care, plants have done well. The northern aspect of a steep rockery seems to be the most favorable position for them. Propagation is by division, seeds or cuttings. Plants should be kept in pots until thoroughly established. The species are biennial or perennial except in group AAA below. Many of them are densely caespitose.

<i>coccinea</i> , 6.	<i>lactiflora</i> , 12.	<i>villosa</i> , 7.
<i>coronopifolia</i> , 12.	<i>Laggeri</i> , 9.	

A. Lvs. long-petioled, large, orbicular-reniform or cordate, lobed or crenate.

1. **Hénryi**, Oliver. Scape 3–9 in., woolly, 12–25-fl.: lvs. to 2½ in. across, orbicular-reniform, lobed and toothed: fls. white. China.

AA. *Lvs. sessile or nearly so, spatulate or linear, nearly or completely entire.*

B. *Fls. in umbels or umbellate heads.*

C. *Plant stout: scape 4 in. or more high.*

D. *Foliage woolly or villous.*

2. *lanuginosa*, Wall. Whole plant densely white-villous: sts. leafy: lvs. small,  $\frac{3}{4}$  in. or less long, lance-ovate, acute: scapes axillary, about 4 in.; fls. rose-colored, in a dense umbel. Himalaya. B.M. 4005.

3. *sarmentosa*, Wall. Creeping by brownish stolons: lvs. clustered, all basal, more or less woolly, lanceolate or ovate-lanceolate, acute,  $1\frac{1}{2}$  in. or less long: scapes often 4 in. long; fls. many, rose-colored. Himalaya. Var. *Chúmbyi*, Hort. (*A. chumyiense*, Hort.). Rosettes dense, and the plant very cespitose: lvs. densely woolly.

DD. *Foliage bristly.*

E. *The lvs. not in rosettes, crowded at base of st., narrowed into petiole.*

4. *foliösa*, Duby (*A. sarmentosa* var. *foliösa*, Hook. f.). Stolons thick, brownish, naked: lvs. all basal, obovate or ovate, sessile but base attenuated, mucronate or acute, ciliate,  $1\frac{1}{2}$  in. or less long: scape pilose, much exceeding lvs.; fls. flesh-colored becoming whitish. Himalaya. B.M. 6661.

EE. *The lvs. in rosettes, long-petioled, usually cordate.*

5. *spinulifera*, Knuth. Not stoloniferous, densely hairy: lvs. linear-obovate, 3 in. or less long with petiole, spinulose at apex: scape 10 in. or less; fls. numerous, densely capitate, purple. China.

6. *Aizöon*, Franch. Lvs. 1 in. or less, rosulate and imbricated, leathery and glaucous, spatulate, not spinulose: scape 1 ft. or less, many times exceeding the lvs., the bracts glandular; fls. 6–10, flesh-colored or red. Himalaya. Var. *coccinea*, Franch. (*A. Bulleyana*, Hort.). Not glandular: fls. red or intense scarlet.

CC. *Plant slender: scape seldom 4 in. high: lvs. all rosulate (in rosettes).*

D. *The lvs. with hairy margins.*

7. *villösa*, Linn. (*A. odoratissima*, Schreb.). Entire plant densely white-hairy, loosely cespitose: lvs. linear-lanceolate or lance-ovate, sessile, entire: scape 2 in. or less; fls. white or rose with yellow-red throat, corolla equaling the calyx-lobes, the corolla-lobes obovate, entire or slightly emarginate. Eurasia. Very variable. Var. *arachnoidea*, Knuth (*A. arachnoidea*, Schott). More cespitose: lvs. oblong-ovate, densely webby-white: scape very short. Var. *robüsta*, Knuth. Plant robust: lvs. lance-ovate, often densely congested, white-silky. Var. *Jacquemöntii*, Knuth (*A. Jacquemöntii*, Duby). Lvs. crowded, imbricated, ovate, obtuse, the hairs white to brown: scape long; fls. flesh-colored, the corolla-lobes obtuse and entire.

DD. *The lvs. glabrous, or only obscurely ciliate.*

8. *hedræantha*, Griseb. Cespitose: lvs.  $\frac{1}{2}$  in. or less long, lance-oblong, obtuse, leathery, not crowded at base of st: scape very short (about 1 in.); fls. 5–10 in each umbel or head, violet-red or pale purple, the corolla-lobes obovate. Balkans.

9. *cárnea*, Linn. (*A. Reverchönnii*, Jord. *A. ròsea*, Jord. & Fourr.). More or less densely cespitose: lvs. linear or subulate,  $\frac{3}{4}$  in. or less long: scape 3 in. or less; fls. 3–7, rose-colored or whitish, the throat yellow. Eurasia. L.B.C. 1:40. Var. *Hälleri*, Linn. Lvs. twice longer than in type, recurved at apex, shining green, sparsely hairy. Var. *Lággeri*, Knuth (*A. Lággeri*, Huet.). Lvs. acuminate, spreading, deep green: scape very short: densely cespitose. Gn. 63, p. 333. Var. *brigantiaca*, Knuth (*A. brigantiaca*, Jord. & Fourr.). Lvs. narrowly linear, short, slightly denticulate at apex: scape to 5 in.: little cespitose.

10. *lacteä*, Linn. (*A. pauciflora*, Vill.). Cespitose, glabrous or nearly so: lvs. rosulate, membranous, linear or linear-lanceolate, obtusish, sparsely ciliate, 1 in. or less long: scape 5 in. or less; fls. snow-white. Eurasia. B.M. 868, 981. Var. *exímia*, Hook. Lvs. less rigid, strongly recurved: fls. larger ( $\frac{1}{4}$  in. across). Switz. B.M. 5906 (as *A. carnea* var. *exímia*).

BB. *Fls. solitary.*

11. *imbricatä*, Lam. Cespitose, stellate-pubescent: lvs.  $\frac{1}{4}$  in. long, linear-spatulate and obtuse, in densely superimposed imbricated rosettes. Alps.

AAA. *Lvs. scarcely petioled, oblong or linear, entire or dentate: fls. umbellate: annual.*

12. *lactiflora*, Pall. (*A. angustifolia*, Andr. *A. coronopifolia*, Andr.). Glabrous, 1 ft. or less high: lvs. 2 in. or less long, rosulate, linear-lanceolate or linear-spatulate, acute, toothed: fls. milk-white, large. Asia.—A handsome little annual, often self-seeding.

*A. Vitaliana*, Lapeyr., listed as the only yellow-fl. Androsace, is *Douglasia Vitaliana*. It is often catalogued as *Aretia Vitaliana*.

L. H. B.

ANDRÖSÆMUM: *Hypericum*.

ANDRÖSTÈPHIUM (Greek-made name, referring to the corona). *Liliacæ*. BABIES' BREATH. Outdoor bulbous plants, allied to the brodiaeas.

Small genus of S. W. and Cent. U. S., with funnel-shaped, spreading-limbed, 6-lobed perianth, 6 stamens, and 3-angled ovary, and a corona or crown at the mouth: lvs. linear, radical: scape simple, leafless.—Plant in a sunny place in sandy soil, placing the bulbs 4–6 in. deep; protect in winter. Prop. by division of the bulbs and by seeds. The name "babies' breath" or "baby's breath" is commonly applied to *Gypsophila*.

*violaceum*, Torr. (*A. cæruleum*, Greene). Slender, 6–10 in.: umbel 2–7-fl., the fls. blue, 1 in. long, supported on a stout ( $\frac{3}{4}$  in.) pedicel; crown exceeding the anthers.—Blooms in spring; pretty. N. TAYLOR.†

ANEILÈMA (Greek, *no involucre*). Syn., *Aphylax*. *Commelinacæ*. Sixty tropical perennials, allied to *Commelina*, from which it may be distinguished by its sub-paniculate infl. *A. biflorum*, R. Br. and *A. stnicum*, Lindl., are sometimes cult. in Old World hothouses and in American botanic gardens. These species are blue-fl., diffuse or trailing plants with their fls. having no involucre bracts. Culture as in *Dichorisandra*.

N. TAYLOR.†

ANÈMIA (Greek, *naked*; without indusia). *Schizæacæ*. Tropical ferns, with 1–3 pinnate lvs. with the lower pair of pinnae erect, elongate and bearing the sporangia in panicles at their extremities.—Of the 40 species, 2 are found in the southern states, and a few are occasionally in cult.

Anemias are dwarf, compact ferns, suited for shelves, or for growing near the glass in warm pits or low houses. They prefer being grown in small pots to being planted out in the fernery. Their growth is too slow to make them popular decorative ferns for general purposes. Propagation is by spores, which germinate freely; tufted kinds by division between March 15 and April 30.—Schneider, Book of Choice Ferns.

A. *Lf. 2–3-pinnate, with narrow divisions.*

*adiantifolia*, Swartz. Lf.-blade 6–9 in. long on a stalk often twice as long, the ultimate divisions oblong or linear-cuneate, with the outer margin toothed. S. Fla. and tropics.

AA. *Lf. only once pinnate with broad pinnae.*

B. *Veins free.*

*mexicana*, Klotzsch. Lf.-blade 6–9 in. long, with 4–6 pinnae on either side, which are distinctly stalked, ovate lanceolate and rounded on both sides at the base fertile pinnae 3–4 in. long, dense. Texas and Mex.

*collina*, Raddi. Lvs. 1 ft. high, stalks hairy, blades with about 10 lfts. on each side, which are rounded at the outer ends and truncate at the upper side at the base; fertile pinnæ about  $1\frac{1}{2}$  in. long, dense. Brazil. S. 1:384.

198. *Anemone patens* var. *Nuttalliana*. ( $\times \frac{1}{2}$ )

Stems usually erect, with great variation in height: basal lvs. lobed, divided or dissected, those of the st. forming an involucre near to, or remote from, the fl.: sepals few or many, petal-like; no true petals; stamens many, shorter than sepals: carpels numerous: fr. a 1-seeded achene.—A genus of about 85 species, with many handsome garden forms; all hardy perennials; cult. for their beautiful show of fls. and in a few cases for their striking foliage. Chiefly native of the north temperate and mountainous regions. As a technical generic name, pronounced *anemone*; as a vernacular, *anémone*. Pritzel, Revision of *Anemone*, in *Linnæa* 15:498 (1841). Britton, N. Amer. *Anemone*, in *Ann. N. Y. Acad. Sci.* 6:217 (1891–92).

The plants thrive best in a fresh, rather rich, sandy loam, well drained; but most of the species will do well in any good garden soil. The tuberous-rooted species are suitable for hardy borders, while most of the others prefer a place in a rockery, and some are partial to shady places. *A. hortensis*, *A. coronaria*, *A. fulgens* and others will well repay the little indoor or greenhouse care they require for producing winter blossoms. They require essentially the same handling as tulips and hyacinths, and are usually classed with bulbous plants. Tubers placed in pots in September or October bring forth a beautiful show of bloom by January or March. For this purpose they should be well drained, and not kept very wet or too warm before the growth is well started; they prefer more moisture at flowering time. There are many garden varieties of *anemone*, among which are *Whirlwind* and *Geante Blanche* (white); *Queen Charlotte*, *Lorely*, and *Kriemhilde* (pink); *Rosa Zwey* (lavender-pink); *Brilliant Diademe*, *Purpurine* and *Prinz Heinrich* (carmine and magenta).

Nearly all the species can be readily propagated by both root-division and seed. The seeds are sown very shallow in a clean bed, in either warm fall or early spring. The division of roots is best made in early spring before growth starts. The season for both outdoor and indoor planting will directly influence the flowering season. Good months for outdoor planting are September, October, November, December, February and March. As a rule, the tuberous anemones will blossom at any time desired, being influenced by the time they are kept out of the ground. The bulbs

may be ripened after flowering time by being taken from the ground to dry, or by covering the bed to keep out rains. *A. japonica* is one of the finest of all fall-blooming herbs.

A. Achenes with long styles, which may become feather-like on ripening; fls. solitary.—*Pulsatilla* section.

B. Involucre bell-shaped, dissected into numerous linear equal lobes.

1. *vernalis*, Linn. (*Pulsatilla vernalis*, Mill. *A. sulphurea*, All.). Very shaggy, 6 in. high or less: lvs. pinnately parted, segms. trifid: fls. purple without, whitish within, and smoothish; erect, on very short peduncles; sepals 6, rarely spreading. Apr. Cool, moist places. Eu. J.H. III. 32:223. Gn. 25:320. Gn. W. 20:891; 26:134. F.E. 18:320. G. 20:158.

2. *Halleri*, All. Villous, 6 in. or less in height; simple: lvs. pinnately divided with segms. 3–4-parted; the lesser divisions lanceolate-linear; involucre of long narrow segms., sessile: fls. large, erect, whitish purple; sepals 6; anthers yellow. Apr. Sunny places. Switzerland. L.B.C. 10:940.

3. *pätens*, Linn. Much like the first variety below, which is more common in Amer., but differs in its broader and shorter lf.-segms. and smaller fls. Eu. Gn. 60, p. 364; 65, p. 167.

Var. *Nuttalliana*, Gray (*Pulsatilla hirsutissima*, Brit.). WILD PATENS. AMERICAN PASQUE FLOWER. Fig. 198. Villous, with long, silky hairs, 4–9 in. high: radical lvs. petioled, others sessile, all much divided into narrow, linear, acute lobes: fls. appearing before

199. Tubers of *Anemone coronaria*.

the root-lvs., bluish purple or whitish, erect, seldom nodding: achenes silky: styles plumose, becoming 2 in. long; peduncle elongates several in. after flowering. Apr. Low ground. North central states and Siberia. C.L.A. 3:177. Gn. M. 13:15.

Var. *ochroleuca*, Sims. Fls. creamy white, appearing at same time as basal lvs. March, Apr. J.H. III 30:343. B.M. 1991.

4. *Pulsatilla*, Linn. (*Pulsatilla vulgaris*, Mill. *A. acutipétala*, Schleich). PASQUE FLOWER of Europe. Villous, hairy, rising  $\frac{3}{4}$ –1 ft.: basal lvs. finely thrice-pinnately divided, on slender petioles; involucre sessile, deeply cut into long narrow lobes: fls. blue to reddish purple,  $1\frac{1}{2}$ –2½ in. across. Apr. Well-drained soil or stony places. Eu. Gn. 32:466; 71, p. 215, 530. L.B.C. 18:1704. G.C. III. 39:307. Gn. M. 13:17. G.M. 52:636. Gn.W. 20:225. Var. *rùbra*, Hort. (*A. rùbra*, Lam.). Dwarfier: fls. always erect. Var. *variegata*, Hort. Fls. pale, appearing in May.

BB. *Involucre lvs. 3, on short petioles, sheathing the st.*

5. *occidentàlis*, Wats. (*A. alpina*, Hook., not Linn.). Silky-hairy,  $\frac{1}{2}$ –1½ ft. high, simple: lvs. 2-parted, the divisions deeply pinnatifid into usually incised linear, acute lobes; involucre short-petioled; basal lvs. long-petioled: fls. solitary, white or purple, varying, 1–2 in. across; receptacle conic, sometimes much elongated: achenes pubescent: plumose styles reflexed; peduncle becoming much elongated after sepals fall. May. Calif. to Brit. Col. Intro. 1892.

200. *Anemone coronaria*, single-flowered form. ( $\times \frac{1}{4}$ )

6. *alpina*, Linn. (*A. acutipétala*, Hort.). Closely allied to the above. St.  $\frac{3}{4}$ –1½ ft. high, from thick, strong roots: lvs. large, finely divided, cut and serrated, smooth or hairy; lvs. of involucre similar: fls. few, in an umbel or solitary, 2–3 in. diam., creamy white inside, purple outside, but varying much; anthers yellow. Mountain-sides. Eu. May, June. L.B.C. 17:1617. B.M. 2007 (var. *major*). Var. *sulphùrea*, Hort. Fls. a delicate sulfur-yellow, larger, downy beneath: lvs. larger. Moist, rich soil. Gn. 35:10; 66, p. 195. G.M. 49:797.

AA. *Achenes woolly or smoothish, with short styles. (Anemone proper.)*

B. *Peduncle 1 (rarely 2): involucre mostly 3-lobed.*

C. *Head of fr. cylindric: achenes woolly.*

D. *Roots tuberous: involucre usually sessile.*

7. *coronària*, Linn. POPPY-FLOWERED ANEMONE. Figs. 199, 200, 201, 202. One-half to 1 ft. high, from tuberous roots: lvs. cut into many fine lobes and lobules; involucral lvs. sessile, 3–4-parted, deeply cut: fls.  $1\frac{1}{2}$ –2½ in. across, poppy-like, of many colors and mixtures of red, blue, white, etc.; stamens blue. Early in spring to June. Meadows, Medit. region. V. 11:257. B.M. 841. Gn. 50:6; 61, p. 275; 16, p. 111. A.F. 25:93. C.L.A. 4:344. G. 24:5. G.L. 20:355. Gn.M. 13:296 J.H. III. 48:383. R.H. 1893:232.—Caen, Scarlet, The Bride, St. Brigid, Victoria Giant, etc., are some of the trade names given to the single forms. Var. *flòre-plèno*, Hort. Fls. double, as shown in Fig. 202; many colors, scarlet being the most common at present. F.S. 16:1678. Gn. 63, p. 353. Var. *chrysanthemiflora*, Hort. A seedling variety produced in 1848, and intro. many years later. Fls. more completely doubled than the above variety by the stamens all becoming petal-like.—A dozen forms, beautiful, self-colored, as deep red, sky-blue and even pure white, have been fixed and named. Useful as cut-fl. Gn. 30:316. R.H. 1887:36; 1897, pp. 418–9. R.B. 21:260–1.

201. *Anemone coronaria*, semi-double-flowered form. ( $\times \frac{1}{4}$ )

8. *fùlgens*, Gay (*A. Pavo-niàna* var. *fùlgens*, DC. *A. hortensis*, Thore). Fig. 203. One ft. high, simple: basal lvs. 3–5-lobed, with rounded outline, followed later by deeply cut lvs.; involucre sessile, several in. below the solitary fl.: fls. vivid scarlet, 2 in. across; stamens black. May, June. France.—Sometimes called a variety of *A. hortensis*, Linn., from which it may have descended. Several garden forms, as *A. annuata-grandiflora*, *A. multipétala*, and Southern Star. Gn. 11:214. Gt. 37:66. R.B. 21:262–3. R.H. 1877:270. G. 4:91.

9. *hortensis*, Linn. (*A. stellata*, Lam.). BROAD-LEAVED GAR-

DEN ANEMONE. Fig. 204. St. simple, erect, 10 in. high: basal lvs. lobed and cut irregularly; involucre small, 3–5-lobed, usually 3 or more in. below the fl.: fls. red, rosy purple, or whitish, single,  $1\frac{1}{2}$  in. across; stamens brownish violet. Rich, light soil. S. Eu. May.—This differs from *A. coronaria* in its coarse, broad lvs. and its elongated, rather narrow-pointed sepals. Garden names are given to the forms with different coloration. B.M. 123. Gn. 61, p. 352. F.W. 1877:257.

10. *palmàta*, Linn. St. 6–9 in. high from tuberous root: basal lvs. leathery, 3–5-lobed, cordate, toothed; involucral lvs. 3-parted: fls. golden yellow, solitary or in 2's; sepals 10 or more. May, June. Deep, light soil. Medit. region. B.R. 200.—Three good varieties in the trade. Var. *flòre-plèno*, Hort., with double yellow or white fls. Var. *àlbida*, Sims (var. *alba*, Hort.). Fls. white: basal lvs. lobed. B.M. 2079. L.B.C. 2:175. Gn. 22:466. Var. *lùtea*, Lodd. Like the last, but with yellow fls. L.B.C. 17:1660.

11. *caroliniana*, Walt. (*A. decapétala*, Amer. authors, not Ard.). St. simple, slender,  $\frac{1}{2}$ –1 ft. high, arising from a large tuber: lvs. of involucre sessile, with 3 wedge-shaped clefts; basal lvs. thrice divided, and much lobed and parted, slender-petioled: solitary fl. erect, 1–1½ in. broad, creamy white or purple; sepals often numerous: achenes densely woolly. April, May. Open places, U. S. G. 6:521.

DD. *Rootstock creeping: lvs. of involucre petioled.*

12. *syvéstris*, Linn. St. 1–1½ ft., simple, or branched once at involucre, from a creeping rootstock: lvs. 3–4-parted, deeply cut at top, hairy beneath; involucre petioled: fls. solitary or in 2's, pure white,  $1\frac{1}{2}$  in. across, nodding, sweet-scented; sepals 6. May–July. Wooded places, Eu. and Liberia. B.M. 54. Gn. 18, p. 561; 30, p. 173; 65, p. 73; 75, p. 189. G. 2:223; 33:31.

202. *Anemone coronaria* var. *flòre-plèno*. (full double) ( $\times \frac{1}{4}$ )

Gn.M. 13:295. J.H. III. 57:80. L.B.C. 18:1739. Var. *flöre-plèno*, Hort. DOUBLE SNOWDROP ANEMONE. Has large, white, double fls. G.C. III. 19:739. *A. baicalénsis*, Turcz., is much like this species.

203. *Anemone fulgens*.  
( $\times \frac{1}{4}$ )

204. *Anemone hortensis*.  
Reduced from an old cut, to show  
a little improved form.

cc. Head of fr. hemispherical: achenes silky-pubescent.  
d. Roots tuberous.

13. *apennina*, Linn. St. simple, slender, 7-9 in.: lvs. twice-divided and lobed, much toothed: fls. sky-blue,  $1\frac{1}{2}$  in. across; sepals 10-12, elongated, obtuse; anthers white. March, Apr. Woods, Italy. Gn. 72, p. 482.—This and a form with whitish fls. are both well suited for shady nooks in clumps of shrubbery, etc. Var. *Allenii*, Hort. Fls. large, pale blue. Var. *plèna*, Hort. Fls. double. Var. *purpurea*, Hort. Fls. bright mauve. Gn. 72, p. 254.

14. *blànda*, Schott & Kotschy. St. 4-6 in. high, from a cylindrical rootstock: lvs. like *A. apennina*, but harder and smoother, and principal divisions sessile: fls. intense sky-blue, differing from above species in being larger, more finely rayed, styles black-pointed, and sepals smooth on the outside; opens in earliest spring or mild winter weather. From Taurus Mts. and Greece; rocky places. Intro. 1898. Gn. 14:200; 75 p. 152. G.L. 19:71. Gn. W. 22: Supp. Apr. 15 (var. *atrocaerulea*). G.C. III. 41:297. (var. *Scythissica*).

dd. Rootstock slender, creeping, cylindrical.

15. *memoròsa*, Linn. (*A. intermedia*, Winkl.). WOOD ANEMONE. Fig. 205. St. simple, 3-8 in., nearly smooth: rootstock horizontal, 3-4 times the st. in diam.: lvs. of involucre petioled, 3-5-parted; basal lvs. appearing after the fl.-st., 5-parted, divisions wedge-shaped, toothed: fls. white or purplish, solitary, 1 in. across: achenes pubescent; styles hooked. Apr., May. Eu. and Siberia. Gn. 63, p. 244 (as *A. intermedia*).—Three or more horticultural varieties. Var. *álba*, Hort. (var. *flöre-plèno*, Hort.). Fls. larger, pure white, and abundant. Intro. 1883. Gn. 32:344; 69, p. 233 (var. *grandiflora*): 75, p. 128 (var. *purpurea*). G. 24:255 (var. *major*). Var. *Allenii*, Hort. Fls. large, lavender-mauve. Var. *major*, Hort. A robust variety with large white fls. Var. *Robinsoniàna*, Hort. (var. *caerulea*, Hort.). A robust form, 6-12 in., with broader and thicker lvs., and large fls., becoming blue. Sometimes given as a separate species. March, Apr. Gn. 46, p. 153; 32, p. 345; 73, p. 266. G. 2:515. R.H. 1901:188. Var. *ròsea*, Hort. (var. *rùbra flöre-plèno*, Hort.). Fls. a reddish purple: now much used; suited to partially shaded places of the perennial border.

16. *quinquefòlia*, Linn. (*A. nemoròsa* var. *quinquefòlia*, Gray). This American species differs from *A. nemorosa* in having smaller fls., involucre lvs. less lobed, foliage paler, and much more slender st. and petioles.—The common windflower or spring anemone, formerly called *A. nemorosa*. Gn.M. 13:15.

17. *deltoidea*, Douglas. St. simple, slender, 6-12 in. high, from a slender rootstock: lvs. trifoliate, basal ones petioled, others nearly sessile, coarsely crenated, often incised: fls. solitary, white, rather large: achenes several, densely pubescent; style very short. Spring. Pacific slope.

ddd. Rootstock horizontal, fleshy or somewhat tuberous.

18. *ranunculoides*, Linn. YELLOW WOOD ANEMONE. St. 3-8 in., from elongated, somewhat tuberous rootstock: lvs. 3-5-parted, divisions deeply cut and serrated: fls. golden yellow, usually solitary, single or semidouble. March and Apr. Rich, light soil in open places and woods. Eu. and Siberia. Gn. 35:408. L.B.C. 6:556.

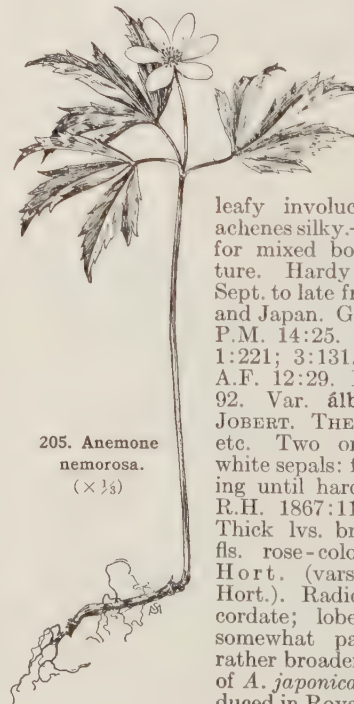

19. *Grayi*, Behr. (*A. oregana*, Gray). St. slender, 3-12 in. high, from a fleshy, brittle rootstock: basal lvs. slender-petioled, 3-parted, coarsely serrate; involucre lvs. petioled, trifoliate, the parts 2-3-lobed, much toothed; sepals blue or purplish: achenes pubescent, in a globose head. Moist, shady slopes. Ore. and Wash. In gardens west of the Rockies. Intro. 1892.

bb. Peduncles 2-5 (mostly 3).

c. Frs. (achenes) woolly or very silky: secondary involucre present.

20. *virginiana*, Linn. Plant hairy, 2-3 ft. high, stout, branching at the involucre: the petioled involucral lvs. 3-parted, the lvs. cleft and lobed; basal lvs. similar, broader than long, on long petioles: fl. peduncles naked (or the lateral ones 2-lvd.); fls. greenish or white,  $1-1\frac{1}{2}$  in. across: achenes woolly, in an oblong head; styles short, awl-shaped. June-Aug. Woods and meadows, U. S. and Canada. G.M. 33:763.

21. *japónica*, Sieb. & Zucc. Fig. 206. Stately, branching st., 2-3 ft. high: plant soft and downy, with short hairs: lvs. ternate, much lobed and toothed: fls. rosy purple or carmine; 1-3 whorls of sepals, 2-3 in. diam., on long peduncles from

205. *Anemone nemorosa*.  
( $\times \frac{1}{2}$ )

leafy involucre; stamens yellow: achenes silky.—A very useful species for mixed borders or for pot culture. Hardy in northern states. Sept. to late frosts. Rich soil, China and Japan. Gn. 30:172. B.M. 4341. P.M. 14:25. A.G. 19:305. Gng. 1:221; 3:131. G.C. III. 16:661. A.F. 12:29. F.S. 2:74. Gt. 61, p. 92. Var. *álba*, Hort. HONORINE JOBERT. THE BRIDE. WHIRLWIND, etc. Two or 3 whorls of large, white sepals: fls. 2-3 in. across, lasting until hard frosts. Gng. 5:117. R.H. 1867:11. Var. *crispa*, Hort. Thick lvs. bronzed on the edges: fls. rose-colored. Var. *hýbrida*, Hort. (vars. *ròsea* and *élegans*, Hort.). Radical lvs. 5-lobed, often cordate; lobes twice serrate: fls. somewhat paler, earlier; sepals rather broader. Said to be a hybrid of *A. japonica* and *A. vitifolia*; produced in Royal Gardens, 1848. Var.

**rûbra**, Hort. **LADY ARDILAUN**. Probably the same as the type, but having lvs. and fls. with a waxy gloss: plant 4-5 ft. high.

**22. multifida**, Poir. Plant silky-hairy, somewhat branched,  $\frac{1}{2}$ -1 $\frac{1}{2}$  ft. high, from a branched, upright rootstock: main involucre 2-3-lvd., others 2-lvd. or naked, short petioles, similar to the root-lvs., 2-3 times 3-parted and cleft, divisions linear: fls.  $\frac{1}{2}$ -1 in. across, red, varying to white or yellow: achenes very woolly. Early summer. Rocks and uplands. Middle states to Hudson Bay.

cc. *Frs. (achenes) glabrous at first: fls. white, somewhat umbellate.*

**23. canadensis**, Linn. (*A. pennsylvanica*, Linn. *A. dichotoma*, Michx., not Linn.). Hairy, stout, 1-2 ft. high, branching at or above the involucre: the 3 lvs. of main involucre sessile, 3-cleft; upper involucres each 2-lvd.; basal lvs. broader than long, much divided, cleft and toothed; petioles long: fls. white, 1-2 in. across: achenes wing-margined, naked, becoming pubescent, grouped into a spherical head. Summer. In shaded woods and open meadows. N. Amer. Gng. 2: 21. Gn. M. 13:355.

**24. narcissiflora**, Linn. (*A. umbellata*, Lam.). St. erect, rather stout,  $\frac{1}{2}$ -1 $\frac{1}{2}$  ft. high: lvs. of involucre sessile; basal lvs. petioled, 3-5-parted, divisions deeply cut: fls. white,  $\frac{1}{2}$ -1 in. across, several in an umbel; anthers yellow: achenes smooth, with short style. May-July. Mountainous regions. Northern hemisphere. Gn. 30, p. 173. B.M. 1120. G. 6:309.

*A. acutiloba*=*Hepatica acutiloba*.—*A. alba*, Juss. Allied to *A. sylvestris*, if not the same. L.B.C. 4:322. B.M. 2167.—*A. Bungeana*, Pritz. Similar in habit to *A. Pulsatilla*. Fls. golden yellow. Siberia.—*A. cernua*, Thunb. Lvs. deeply cut, divided; fls. nodding, color of dragon's-blood. Japan.—*A. cylindrica*, Gray. A tall native species, used for beauty of foliage and fr.—*A. decapetala*, Ard. (*A. trilobata*, Juss. *A. heterophylla*, Nutt.). Native and reported as having been cultivated in southern states. 1891.—*A. elongata*, D. Don. Similar in habit and foliage to *A. sylvestris* but not so beautiful: fls. dull greenish white. Himalaya.—*A. Faminii*, Haw. Fls. pure white, 2-3 in. across: 5 feet high: lvs. 1 ft. across. B.M. 6958. Gn. 34:202.—*A. hupehensis*, Hort. Allied to *A. japonica*. Fls. produced very early. Cent. China.—*A. magellanica*, Hort. Fls. yellow: pretty but not showy. Straits of Magellan.—*A. parviflora*, Michx. Pretty white fls. Native of northern states and Canada.—*A. polyanthus*, Don. Allied to *A. narcissiflora*. B.M. 6840. J.H. III. 32:259.—*A. pratensis*, Linn. Allied to *A. Pulsatilla*. L.B.C. 9:900.—*A. pratensis* var. *obsoleta*, Sims. Fls. pale: lfts. terminated with a sort of bristle. B.M. 1863.—*A. rivularis*, Bush-Ham. Is a distinct species similar to *A. narcissiflora*. G. 18:138.—*A. sphenophylla*, Poepp. Fls. blue. S.W. U.S.—*A. thalictroides*. See *Syndesmon*.—*A. trifolia*, Linn. Lvs. beautifully regular: fls. white, 1 in. across. Two blue varieties. B.M. 6846.—*A. triloba*=*Hepatica triloba*.—*A. vitifolia*, Ham. Allied to *A. japonica*. Has cordate 5-7-parted lvs. B.M. 3376.

K. C. DAVIS.

**ANEMONÉLLA**: *Syndesmon*.

**ANEMONÓPSIS** (*Anemone*-like). *Ranunculacææ*. A beautiful hardy plant for border purposes because of its effective foliage and showy flowers.

This is a perennial herb, with erect sts.: radical and st.-lvs. rather large, ternately compound and much incised, similar to *Actæa*: sepals many (often only 9), regular, petal-like, deciduous; petals many (often 12), short, sessile, with nectariferous impression at the base; carpels few (3-4), forming many-seeded follicles. In general appearance similar to the Japanese anemones, but smaller in all its parts, and with numerous drooping fls., about 1 $\frac{1}{2}$  in. across, of pale purple color. A monotypic genus from Japan, now planted in American gardens.

*Anemonopsis* thrives well in rich, deep loam, in well-drained situations in partial shade. Propagation is by division of the roots in late fall or early spring. Fresh seed may be sown in the fall or early the next spring and the plants will show some flowers the first season. Sow the seed in clean beds of black sandy loam, and cover very slightly.

**macrophylla**, Sieb. & Zucc. The petals, instead of spreading, form a half-closed bud-like cone within the sepals. Gn. 25, p. 383.

K. C. DAVIS.

**ANEMOPÉGMA**: *Bignonia*.

**ANEMÓPSIS** (Greek, from the resemblance of its fl.-cluster to the flower of an anemone). *Saururacææ*. **YERBA MANSÁ**. Aquatic herb, yielding medicinal products.

A monotypic genus closely allied to *Houttuynia* of E. Asia. Stoliferous aquatic plant with pungent aromatic rootstocks: lvs. mostly radical, minutely punctate: infl. a conical spike or spadix subtended by an involucre of petal-like bracts, resembling the fl. of an anemone; fls. small without calyx or corolla, each subtended by a bractlet; stamens 6-8, with short filaments adnate to the ovary at the base; ovary sunk in the rachis of the spike, 1-celled, composed of 3 or 4 carpels, with as many spreading stigmas and parietal 4-10-ovuled placentæ; caps. dehiscent at the top; seeds rounded, punctulate. Calif. and Mex.

**californica**, Hook. (*Anémia californica*, Nutt. *Houttuynia californica*, Benth. & Hook. *Anemiopsis californica*, Endl.)

**YERBA MANSÁ**.

**APACHE BEADS**.

**VAVISA**. An erect

aquatic herb: radical

lvs. long-petioled,

oblong-obovate,

cordate at the

base; cauline lf.

broad, clasping,

from the axil of

which grows a

branchlet reduced

to 1 or 2 lvs.: fls.

minute, crowded,

forming a conical

spadix with a whorl

of whitish petaloid

bracts below it,

giving it the appearance

of an anemone.

Calif. and Mex.

Hook. & Arn. Bot.

Beech. Voy. pl. 92.

—The pungent aromatic

astrigent

rootstocks are

strung into neck-

laces in the form

of cylindrical beads

by the Indians of

the S. W. U. S., and are used

medicinally in the form

of an infusion for malaria,

dysentery, and syphilis.

They are also pulverized and

applied locally to ulcers

and malignant sores. The

plant grows in swampy

places and on the margins of

springs and ponds more

or less alkaline. The roots

are gathered in the dry

season in Mex. and sold in

the local drug markets.

W. E. SAFFORD.

**ANETHUM**: *Dill* and *Peucedanum*; also *Fennel*.

**ANGADÉNIA**: *Ontadenia*.

**ANGÉLICA** (supposed to have angelic healing virtues). *Umbelliferæ*. **ANGELICA**. Herbs, sometimes planted for ornament.

Stout: fls. small, white or greenish, in many-lvd. involuclers: fr. fattened dorsally, with very prominent ribs.—A genus of 60 species in north temperate regions, and from New Zeal. Several of them are native to N. Amer. They are perennial herbs with compound lvs. and large umbels of white fls. not unlike the cow-parsnip (*Heracleum*). The word "angelica" is loosely applied to various plants. In the American tropics, it is used for some of the araliads. The angelica of vegetable gardens is *Archangelica officinalis*.

206. *Anemone japonica*.

**Cúrtisii**, Buckl. Stout perennial, 2-5 ft., glabrous: lvs. 2-ternate, with quinate divisions, the lfts. thin, ovate-lanceolate, irregularly sharp-toothed. Pa. to N. C.—Grown for the subtropical effect of its finely cut, ample foliage. Intro. 1891 by H. P. Kelsey.

**hirsuta**, Muhl. (*A. villosa*, B. S. P. *Archangelica hirsuta*, Torr. & Gray). Pubescent above: lvs. twice pinnately or ternately divided, the lfts. thickish and serrate, the upper lvs. mostly reduced to sheathing petioles. Eastern states. Intro. 1892 by H. P. Kelsey.

N. TAYLOR.†

**ANGELONIA** (South American name, *angelon*, of one of the species). *Scrophulariaceæ*. Perennial herbs or sub-shrubs, grown in hothouses and conservatories, and in the open far South.

Plants with the look of alonsoas: lvs. simple, opposite (or alternate above): fls. showy, blue, irregularly 2-lipped, the upper lip 2-lobed and the lower larger and 3-lobed; calyx 5-parted or 5-toothed; stamens 4, in pairs; ovary 2-celled. The axillary fls. are in a long, leafy terminal raceme: branches 4-sided.—About two dozen species from Mex. to Brazil. Grown as pot-plants in warm glasshouses and prop. by seeds or soft-wood cuttings.

**salicariæfólia**, Humb. & Bonpl. Perennial, 3 ft. or less: lvs. lanceolate to ovate-lanceolate, sessile, toothed, closely pubescent: fls. deep blue. S. Amer. B.M. 2478. P.M. 5:75. B.R. 415.

**Gárdneri**, Hook. Woody, 3 ft.: lvs. linear-lanceolate, more strongly toothed throughout their length: fls. purple, white-centered, handsome, in a long terminal leafy raceme or spike: plant pubescent-glandular and aromatic. Brazil. B.M. 3754.

**grandiflóra**, Hort. (C. Morr.?). Perennial; graceful, 2 ft.: lvs. entire, or slightly toothed, lance-pointed: fls. lilac, fragrant, solitary, not exceeding the lvs., the lobes prominent and spreading. S. Amer.—An excellent plant for winter bloom, particularly the white-fl. var. *álba*, Hort., and grown in the open satisfactorily in Fla. It is a good pot-plant for conservatory or for table decoration. Blooming plants are secured the same year the seeds are sown. Intro. 1897 in Eu. Gt. 46, p. 612; G.C. III. 22:307; Gn. 52, p. 461; R.B. 23:272; all the same picture of a pot-plant of var. *álba*.

**angustifólia**, Benth. Lower: lvs. smooth, narrow-lanceolate: fls. deep violet in erect terminal racemes. Mex.

**cornígera**, Hook. Annual, 1 ft. or more; slightly hirsute: lvs. lanceolate, practically sessile, broad at the base, slightly ciliate: fls. solitary in the axils, shorter than the lvs., rich purple and deeper colored in the throat, the upper segms. velvety-dotted, the middle segm. of the lower lip bearing a horn-like process (whence the name *cornígera*, "horned"). Brazil. B.M. 3848.

**intégerrima**, Spreng. Perennial, with fleshy root, branching above: lvs. lanceolate, entire, narrowed at base: fls. stalked in the axils of short bracts and forming a terminal spike or raceme 6 in. long, light blue and purple-spotted, the throat wide open and lobes very short and rounded except the lower which is broad-ovate and toothed. S. Brazil, Paraguay. Gt. 54:1538.

L. H. B.

**ANGIÓPTERIS** (Greek, *vessel-fern*). *Marattiaceæ*. An Old World genus of coarse greenhouse ferns, with twice- or thrice-pinnate lvs., and the large fleshy sporangia arranged in boat-shaped marginal sori. In cult., requires plenty of room and abundant drainage.

Angiopteris grows wild in swampy places, and is of robust habit. If grown in pots, the pots may stand in 2 or 3 inches of water. Although spores are freely produced, no seedlings are on record. Easily propagated by the fleshy scales at the base of each frond. Each

scale contains at least two dormant buds, and should not be divided. They may be laid in sand, covered with sphagnum, and kept in a close case for three to five months. They start more quickly in early spring. (Schneider, Book of Choice Ferns.)

**evécta**, Hoffm. Growing from a stout, fleshy, erect caudix, 2-6 ft. high: lvs. 6-15 ft. long, mostly bipinnate, with swollen rachises; lfts. 4-12 in. long,  $\frac{1}{2}$ -1 $\frac{1}{2}$  in. wide, the margin entire or slightly toothed. India and Japan to Madagascar and Queensland. S. 1:399.—Known under various names in cult., as *A. longifolia*, etc. The trade names, which appear to indicate species, may be regarded as varieties. R. C. BENEDICT.†

**ANGÓPHORA** (*vessel-bearing*; Greek, in allusion to shape of fruit). *Myrtacæ*. GUM MYRTLE. A genus of 4 species of Australian trees or shrubs, sometimes cult. in glasshouses in the Old World, but not known to the trade in this country, where their cult. seems to be confined to botanic gardens. They have large opposite lvs., corymbose fls., with a 5-6-cleft calyx. The commonest species in cult. are *A. cordifólia*, Cav., with yellowish fls. and sessile lvs., and *A. lanceolata*, Cav., with white fls. and petiolate lvs. See page 3565.

**ANGRÆCUM** (Latinized from *Angrek*, the Malay name for all orchids of this habit). *Orchidacæ*. Epiphytic hothouse orchids with the habit of *Vanda*.

Leaves flat or terete: fls. few to many in a raceme, or rarely solitary; sepals and petals nearly alike, spreading; lip adnate to the base of the column; lateral lobes small or obsolete; middle lobe entire; spur long and slender; pollinia 2, upon a single undivided stipe.—About 20 species, natives of Trop. Afr., Madagascar, and the Mascarene Isls.

These are valued for their winter-flowering habit and lasting qualities. All have peculiar or grotesque forms and some are fragrant. All need a warmhouse in winter, preferably the warmest corner, where it is moist. As the plants have no pseudobulbs they must never become dry. No soil is necessary at the roots, but a surfacing of live sphagnum may be placed over the crocks; this should be renewed as often as it becomes decayed. The angræcums may be classed with the aërides, vandas and saccolabiums as being true air-plants and the roots are impatient of confinement in pots or other receptacles. Care must be taken to secure the plants firm and upright when repotting, by means of stakes or wire. Frequent spraying overhead in bright weather is of great assistance, especially in the growing time. They must never be removed from the greenhouse for decoration elsewhere, for if the plants become chilled, there is total loss. (Orpet.)

A. Lvs. *semi-terete*, narrow.

**Scottianum**, Reichb. f. Sts. up to 2 ft. long, with brown sheaths below: lvs. terete, grooved on the upper side, 3-4 in. long, spreading or recurved; peduncles with 1-3 fls. which are inverted and 1 $\frac{1}{2}$ -2 in. across, the sepals and petals pale yellow, changing to white, linear, similar, acute, the sepals a little broader than the petals, the lip white, concave, transversely oblong, nuchronate; spur 4-5 in. long, reddish brown. Comoro Isls. G.C. II. 14, p. 137. F.M. 1880:421. B.M. 6723.

AA. Lvs. *flat*.

B. Plant dwarf: fls. few, 3-5, the clusters shorter than the lvs.

**falcátum**, Lindl. St. 1-2 in. tall: lvs. few, linear, falcate, 2-3 in. long, channeled above, keeled beneath: peduncles with 3-5 fls., fragrant, white, about  $\frac{3}{4}$  in. across, the sepals and petals acute, similar, linear-oblong; lip 3-lobed, the lateral lobes minute, the middle lobe narrow-oblong, retuse; spur curved, filiform. Japan. B.R. 4:283. B.M. 2097 (both as *Limodorum falcatum*).

BB. Plant larger than above; fls. numerous, in racemes usually longer than the lvs.

c. Fls. white or tinged with yellow.

d. Lip acute.

E. Spur less than 5 in. long, white.

F. Sepals lanceolate: fls. about 1 in. across; spur 2-3 in. long.

**modestum**, Hook. f. (*A. Sanderianum*, Reichb. f.). Lvs. oblong to obovate-oblong, acutish to emarginate, 3-6 in. long; racemes of numerous pure white fls. on orange pedicels; sepals lanceolate; petals ovate-lanceolate; lip broadly ovate. Madagascar and Comoro Isls. B.M. 6693. Lind. 2:92. R.H. 1888, p. 516. R.B. 15:217. A.F. 22:951; 35:381. O.R. 8:152; 12:337. O. 4: f. 24.

FF. Sepals elliptic: fls. about 1½ in. across; spur 3-4 in. long.

**articulatum**, Reichb. (*A. descendens*, Reichb.). Lvs. oval to obovate-oblong, 3-5 in. long, emarginate or 2-lobed: racemes pendulous, of numerous pure white fls. on pale orange pedicels; sepals and petals elliptic-oblong, acute, the lateral sepals narrower; lip broadly oblong-oval, acute; spur 3-4 in. long. Madagascar.

EE. Spur 6-7 in. long, tinged with orange-red.

**Éllisii**, Reichb. Sts. up to 1 ft. high: lvs. narrow, oblong, 5-8 in. long, emarginate or bilobed at apex: racemes pendulous, of 12 or more pure white fls.; sepals and petals elliptic-oblong, acute, the dorsal sepal inflexed at the summit, the lateral reflexed; lip oblong-elliptic, acute; spur slender, tinged with orange-red. Madagascar. G.C. II. 3:277. F.M. 1875:191. O.R. 7:81.

DD. Lip emarginate or 2-lobed at apex.

**citratum**, Thouars. Sts. 3-4 in. high: lvs. oblong-ovate, 3-5 in. long, acute or lobed at the apex: racemes pendulous, of 12 or more white or pale straw-color fls.; sepals obovate, obtuse; petals oblong-elliptic; lip flat, nearly orbicular, emarginate; spur slender. Madagascar. B.M. 5624. I.H. 33:592. Lind. 5:238.

cc. Fls. with green sepals and petals; lip white.

**superbum**, Thouars (*A. eburneum*, Lindl.). Fig. 207. Sts. up to 4 ft. or more long: lvs. up to 2 ft. long, 2 in. wide, coriaceous: racemes ascending, with 8 or more fls.; sepals and petals spreading, green, lanceolate; lip white, orbicular, fleshy, abruptly acuminate; spur green. Madagascar. B.M. 4761. B.R. 1522. Var. **virens**, Veitch (*A. virens*, Lindl.). Differs from the type in its smaller fls. with the labellum tinged green. B.M. 5170.

*A. augustatum*, Rolfe (*A. Augustii*) Allied to *A. Kotschyi*. Lvs. thick and fleshy, glaucous green: fls. in arched raceme, pure white, spur pale green. G.C. III. 45:Feb. 6, Suppl. O.R. 1908:246. Rhodeia. — *A. bilobum*, Lindl. Racemes of 6-10 fls. about 1 in. across, the sepals, petals and lips nearly alike, lanceolate-acuminate, the spur pale orange-red. W. Afr. J.H. III. 43:483. — *A. Buyssonii*, God. Resembles *A. articulatum*: fls. pure white; brown spurs.
